The DATA field, composed of SERVICE, PSDU, tail, and pad parts, shall be coded with a convolutional encoder of coding rate R = 1/2, 2/3, or 3/4, corresponding to the TXVECTOR parameter RATE. The convolutional encoder shall use the industry-standard generator polynomials, $g_0 = 133_8$ and $g_1 = 171_8$, of rate R = 1/2, as shown in Figure 17-8 (Convolutional encoder (k = 7)). The bit denoted as "A" shall be output from the encoder before the bit denoted as "B." Higher rates are derived from it by employing "puncturing." Puncturing is a procedure for omitting some of the encoded bits in the transmitter (thus reducing the number of transmitted bits and increasing the coding rate) and inserting a dummy "zero" metric into the convolutional decoder on the receive side in place of the omitted bits. The puncturing patterns are illustrated in Figure 17-9 (Example of the bit-stealing and bit-insertion procedure (r = 3/4, 2/3)). Decoding by the Viterbi algorithm is recommended.

An example of encoding operation is shown in I.1.6.1 (Coding the DATA bits).

### 17.3.5.7 Data interleaving

All encoded data bits shall be interleaved by a block interleaver with a block size corresponding to the number of bits in a single OFDM symbol, $N_{CBPS}$. The interleaver is defined by a two-step permutation. The first permutation causes adjacent coded bits to be mapped onto nonadjacent subcarriers. The second causes adjacent coded bits to be mapped alternately onto less and more significant bits of the constellation and, thereby, long runs of low reliability (LSB) bits are avoided.

The index of the coded bit before the first permutation shall be denoted by $k$; $i$ shall be the index after the first and before the second permutation; and $j$ shall be the index after the second permutation, just prior to modulation mapping.

The first permutation is defined by the rule

$$i = (N_{CBPS}/16) \times (k \bmod 16) + \lfloor k/16 \rfloor \qquad k = 0, 1, \ldots, N_{CBPS} - 1 \text{(\#515)} \qquad (17\text{-}15)$$

The second permutation is defined by the rule

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

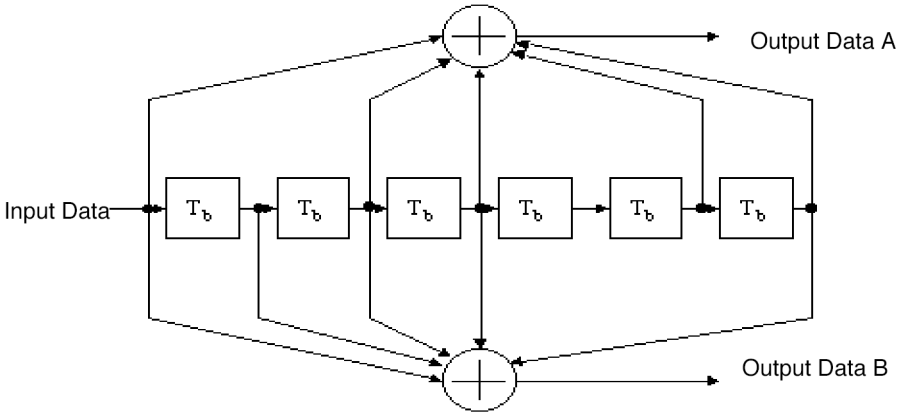

**Figure 17-8—Convolutional encoder (k = 7)**

$$j = s \times \left\lfloor \frac{i}{s} \right\rfloor + \left( i + N_{CBPS} - \left\lfloor \frac{16 \times i}{N_{CBPS}} \right\rfloor \right) \bmod s \quad i = 0, 1, \ldots, N_{CBPS} - 1 \text{(\#515)} \tag{17-16}$$

The value of s is determined by the number of coded bits per subcarrier, $N_{BPSC}$, according to

$$s = \max(N_{BPSC}/2,1) \tag{17-17}$$

The deinterleaver, which performs the inverse relation, is also defined by two permutations.

Here the index of the original received bit before the first permutation shall be denoted by *j*; *i* shall be the index after the first and before the second permutation; and *k* shall be the index after the second permutation, just prior to delivering the coded bits to the convolutional (Viterbi) decoder.

The first permutation is defined by the rule

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

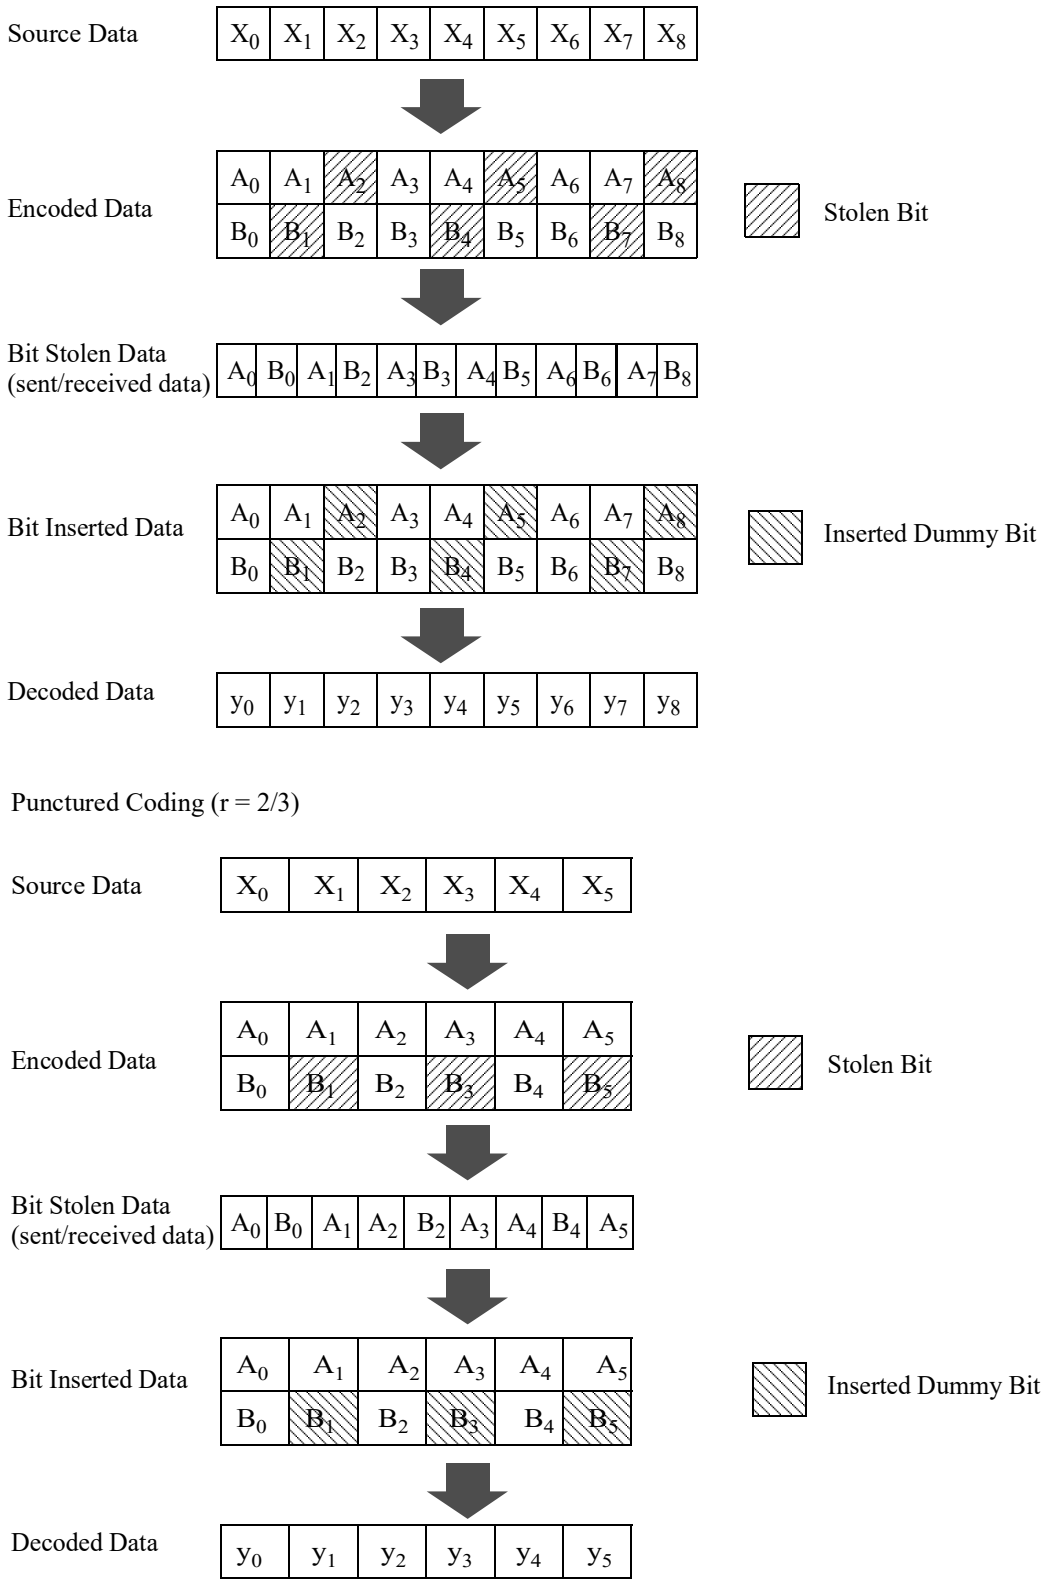

**Figure 17-9—Example of the bit-stealing and bit-insertion procedure (r = 3/4, 2/3)**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$i = s \times \lfloor j/s \rfloor + \left( j + \left\lfloor \frac{16 \times j}{N_{CBPS}} \right\rfloor \right) \bmod s \qquad j = 0, 1, \ldots, N_{CBPS} - 1 \text{(\#515)} \qquad (17\text{-}18)$$

where

$s$ is defined in Equation (17-17).

This permutation is the inverse of the permutation described in Equation (17-16).

The second permutation is defined by the rule

$$k = 16 \times i - (N_{CBPS} - 1) \times \left\lfloor \frac{16 \times i}{N_{CBPS}} \right\rfloor, \qquad i = 0, 1, \ldots, N_{CBPS} - 1 \text{(\#515)} \qquad (17\text{-}19)$$

This permutation is the inverse of the permutation described in Equation (17-15).

An example of interleaving operation is illustrated in I.1.6.2 (Interleaving the DATA bits).

#### 17.3.5.8 Subcarrier modulation mapping

The OFDM subcarriers shall be modulated by using BPSK, QPSK, 16-QAM, or 64-QAM, depending on the RATE requested. The encoded and interleaved binary serial input data shall be divided into groups of $N_{BPSC}$ (1, 2, 4, or 6) bits and converted into complex numbers representing BPSK, QPSK, 16-QAM, or 64-QAM constellation points. The conversion shall be performed according to Gray-coded constellation mappings,

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

shown in Figure 17-10 (BPSK, QPSK, 16-QAM, and 64-QAM constellation bit encoding), with the input bit, $B_0$, being the earliest in the stream.

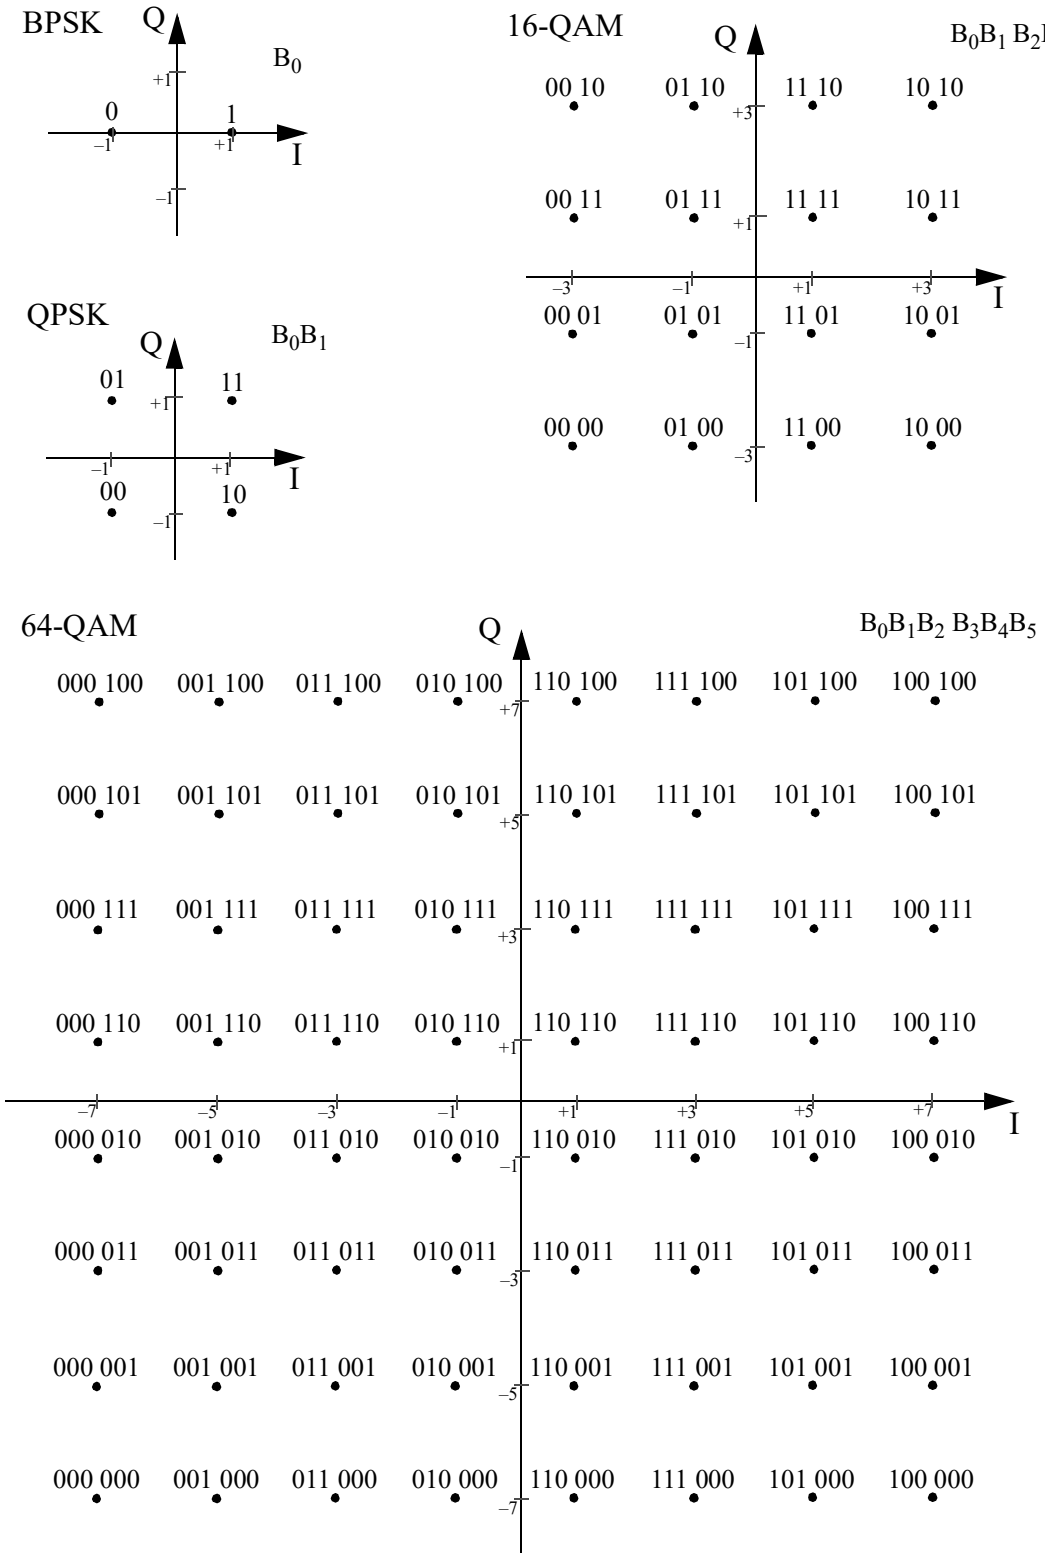

**Figure 17-10—BPSK, QPSK, 16-QAM, and 64-QAM constellation bit encoding**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The output values, d, are formed by multiplying the resulting (I+jQ) value by a normalization factor $K_{MOD}$, as described in Equation (17-20).

$$d = (I + jQ) \times K_{MOD} \quad (17\text{-}20)$$

The normalization factor, $K_{MOD}$, depends on the base modulation mode, as prescribed in Table 17-14 (Modulation-dependent normalization factor $K_{MOD}$). Note that the modulation type can be different from the start to the end of the transmission, as the signal changes from SIGNAL to DATA, as shown in Figure 17-1 (PPDU format). The purpose of the normalization factor is to achieve the same average power for all mappings. In practical implementations, an approximate value of the normalization factor may be used, as long as the device complies with the modulation accuracy requirements described in 17.3.9.7 (Modulation accuracy).

**Table 17-14—Modulation-dependent normalization factor $K_{MOD}$**

| Modulation | $K_{MOD}$ |
|---|---|
| BPSK | 1 |
| QPSK | $1/\sqrt{2}$ |
| 16-QAM | $1/\sqrt{10}$ |
| 64-QAM | $1/\sqrt{42}$ |

For BPSK, $B_0$ determines the I value, as illustrated in Table 17-15 (BPSK encoding table). For QPSK, $B_0$ determines the I value and $B_1$ determines the Q value, as illustrated in Table 17-16 (QPSK encoding table). For 16-QAM, $B_0B_1$ determines the I value and $B_2B_3$ determines the Q value, as illustrated in Table 17-17 (16-QAM encoding table). For 64-QAM, $B_0B_1B_2$ determines the I value and $B_3B_4B_5$ determines the Q value, as illustrated in Table 17-18 (64-QAM encoding table).

**Table 17-15—BPSK encoding table**

| Input bit ($B_0$) | I-out | Q-out |

### 17.3.5.9 Pilot subcarriers

In each OFDM symbol, four of the subcarriers are dedicated to pilot signals in order to make the coherent detection robust against frequency offsets and phase noise. These pilot signals shall be put in subcarriers –21, –7, 7, and 21. The pilots shall be BPSK modulated by a pseudo-random binary sequence to prevent the generation of spectral lines. The contribution of the pilot subcarriers to each OFDM symbol is described in 17.3.5.10 (OFDM modulation).

### 17.3.5.10 OFDM modulation

The stream of complex numbers is divided into groups of $N_{SD} = 48$ complex numbers. This shall be denoted by writing the complex number $d_{k,n}$, which corresponds to subcarrier k of OFDM symbol n, as follows:

$$d_{k,n} \equiv d_{k+N_{SD}\times n}, \qquad k = 0, \ldots N_{SD} - 1,\ n = 0, \ldots N_{SYM} - 1 \tag{17-21}$$

The number of OFDM symbols, $N_{SYM}$, was introduced in 17.3.5.4 (Pad bits (PAD)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

An OFDM symbol, $r_{DATA,n}(t)$, is defined as

$$r_{DATA,n}(t) = w_{TSYM}(t)\left(\sum_{k=0}^{N_{SD}-1} d_{k,n}\exp((j2\pi M(k)\Delta_F(t-T_{GI})) + p_{n+1}\sum_{k=-N_{ST}/2}^{N_{ST}/2} P_k\exp(j2\pi k\Delta_F(t-T_{GI}))\right) \quad (17\text{-}22)$$

where the function, *M(k)*, defines a mapping from the logical subcarrier number 0 to 47 into frequency offset index –26 to 26, while skipping the pilot subcarrier locations and the 0th (dc) subcarrier.

$$M(k) = \begin{cases} k-26 & 0 \le k \le 4 \\ k-25 & 5 \le k \le 17 \\ k-24 & 18 \le k \le 23 \\ k-23 & 24 \le k \le 29 \\ k-22 & 30 \le k \le 42 \\ k-21 & 43 \le k \le 47 \end{cases} \quad (17\text{-}23)$$

The contribution of the pilot subcarriers for the $n^{th}$ OFDM symbol is produced by inverse Fourier transform of sequence P, given by

$$P_{-26,26} = \{0,0,0,0,0,1,0,0,0,0,0,0,0,0,0,0,0,0,0,1,0,0,0,0,0,0,0,0,$$

$$0,0,0,0,0,0,1,0,0,0,0,0,0,0,0,0,0,0,0,0,0,-1,0,0,0,0,0\} \quad (17\text{-}24)$$

The polarity of the pilot subcarriers is controlled by the sequence, $p_n$, which is a cyclic extension of the 127 elements sequence and is given by

$$p_{0..126v} = \{1,1,1,1,\ -1,-1,-1,1,\ -1,-1,-1,-1,\ 1,1,-1,1,\ -1,-1,1,1,\ -1,1,1,-1,\ 1,1,1,1,\ 1,1,-1,1,$$
$$1,1,-1,1,\ 1,-1,-1,1,\ 1,1,-1,1,\ -1,-1,-1,1,\ -1,1,-1,-1,\ 1,-1,-1,1,\ 1,1,1,1,\ -1,-1,1,1,$$
$$-1,-1,1,-1,\ 1,-1,1,1,\ -1,-1,-1,1,\ 1,-1,-1,-1,\ -1,1,-1,-1,\ 1,-1,1,1,\ 1,1,-1,1,\ -1,1,-1,1,$$
$$-1,-1,-1,-1,\ -1,1,-1,1,\ 1,-1,1,-1,\ 1,1,1,-1,\ -1,1,-1,-1,\ -1,1,1,1,\ -1,-1,-1,-1,\ -1,-1,-1\} \quad (17\text{-}25)$$

The sequence $p_n$ is generated by the scrambler defined by Figure 17-7 (Data scrambler(11bd)(#602)(#7080)) when the all 1s initial state is used, and by replacing all 1s with –1 and all 0s with 1. Each sequence element is used for one OFDM symbol. The first element, $p_0$, multiplies the pilot subcarriers of the SIGNAL symbol, while the elements from $p_1$ on are used for the DATA symbols.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The subcarrier frequency allocation is shown in Figure 17-11 (Subcarrier frequency allocation). To avoid difficulties in D/A and A/D converter offsets and carrier feedthrough in the RF system, the subcarrier falling at DC ($0^{th}$ subcarrier) is not used.

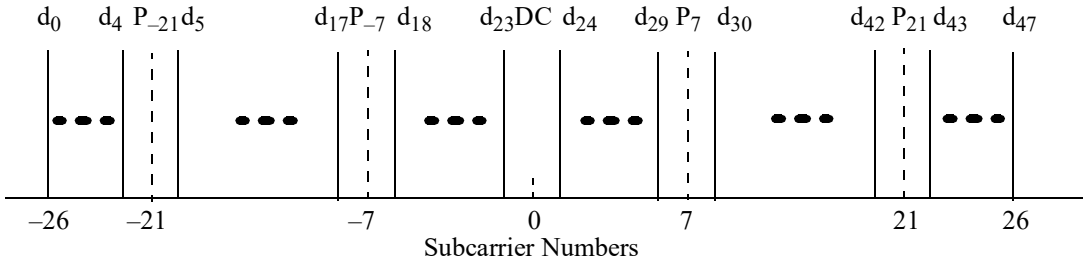

**Figure 17-11—Subcarrier frequency allocation**

The concatenation of $N_{SYM}$ OFDM symbols is written as

$$r_{DATA}(t) = \sum_{n=0}^{N_{SYM}-1} r_{DATA,n}(t - nT_{SYM}) \quad (17\text{-}26)$$

An example of mapping into symbols is shown in I.1.6.3 (Mapping into symbols), as well as the scrambling of the pilot signals (see I.1.7 (Generating the additional DATA symbols)). The final output of these operations is also shown in I.1.8 (The entire PPDU for the BCC example(#14)).

### 17.3.6 CCA

The PHY shall provide the capability to perform CCA and report the result to the MAC. The CCA mechanism shall detect a "medium busy" condition with requirements specified in 17.3.10.6 (CCA requirements) and 17.3.12 (Receive PHY). The PHY issues the PHY-CCA.indication primitive to provide this medium status report to the MAC.

### 17.3.7 PHY data modulation and modulation rate change

The SIGNAL field, which follows the non-HT preamble, shall indicate the modulation and coding rate that shall be used to transmit the (#14)PSDU. The transmitter (receiver) shall initiate the modulation (demodulation) constellation and the coding rate according to the RATE indicated in the SIGNAL field. The (#14)PSDU transmission rate shall be set by the DATARATE parameter in the TXVECTOR, issued with the PHY-TXSTART.request primitive described in 17.2.2 (TXVECTOR parameters(#1369)).

### 17.3.8 PHY operating specifications (general)

#### 17.3.8.1 General

General specifications for the BPSK OFDM, QPSK OFDM, 16-QAM OFDM, and 64-QAM OFDM PHY layers(#4114) are provided in 17.3.8.2 (Outline description) to 17.3.8.7 (Transmit and receive impedance at the antenna connector). These specifications apply to both the receive and transmit functions and general operation of the OFDM PHY.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 17.3.8.2 Outline description

The general block diagram of the transmitter and receiver for the OFDM PHY is shown in Figure 17-12 (Transmitter and receiver block diagram for the OFDM PHY). Major specifications for the OFDM PHY are listed in Table 17-19 (Major parameters of the OFDM PHY).

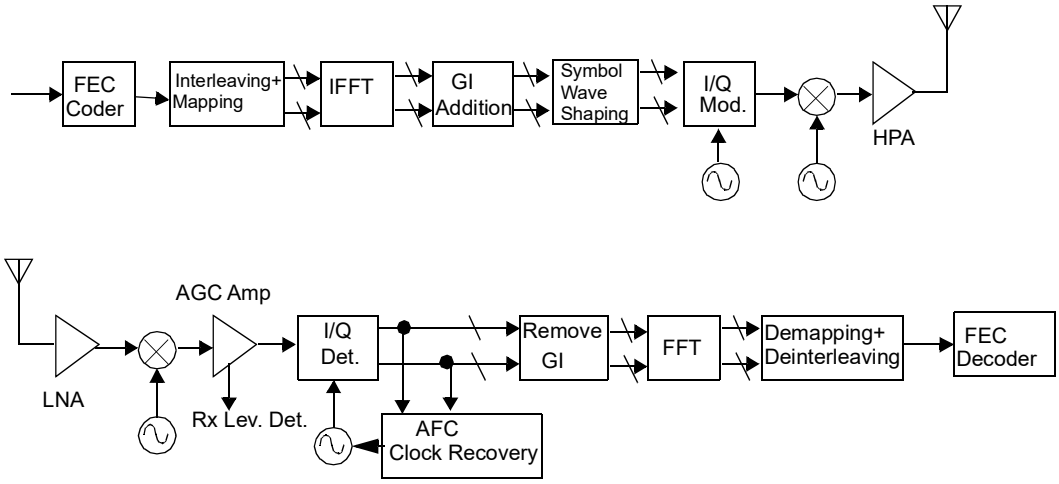

**Figure 17-12—Transmitter and receiver block diagram for the OFDM PHY**

#### 17.3.8.3 Regulatory requirements

WLANs implemented in accordance with this standard are subject to equipment certification and operating requirements established by regional and national regulatory administrations. The PHY specification establishes minimum technical requirements for interoperability, based upon established regulations at the time this standard was issued. These regulations are subject to revision, or may be superseded. Requirements that are subject to local geographic regulations are annotated within the PHY specification. Regulatory requirements that do not affect interoperability are not addressed in this standard. Implementers are referred to the regulatory sources in Annex D for further information. Operation in countries within defined regulatory domains may be subject to additional or alternative national regulations.

#### 17.3.8.4 Operating channel frequencies

##### 17.3.8.4.1 Operating frequency range

The OFDM PHY shall not operate in frequency bands not allocated by a regulatory body in its operational region. Regulatory requirements for a given frequency band are set by the regulatory authority responsible for spectrum management in a given geographic region or domain. The particular channelization to be used for this standard is dependent on such allocation, as well as the associated regulations for use of the allocations. These regulations are subject to revision, or may be superseded.

In some regulatory domains, several frequency bands may be available for OFDM PHY-based WLANs. These bands may be contiguous or not, and different regulatory limits may be applicable. An OFDM PHY shall support at least one frequency band in at least one regulatory domain. The support of specific regulatory domains, and bands within the domains, shall be indicated by PLME attributes dot11RegDomainsImplementedValue and dot11FrequencyBandsImplemented.

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for an OFDM PHY contains an OPERATING_CHANNEL parameter, which identifies the operating channel. The PHY shall set dot11CurrentFrequency to the value of this parameter.

##### 17.3.8.4.2 Channel numbering

Channel center frequencies are defined at every integer multiple of 5 MHz above the channel starting frequency. The relationship between center frequency and channel number is given by Equation (17-27):

$$\text{Channel center frequency} = \text{Channel starting frequency} + 5 \times n_{ch}\ (\text{MHz}) \quad (17\text{-}27)$$

where

$n_{ch}$ = 1, …, 200(#515).

Channel starting frequency is defined as dot11ChannelStartingFactor × 500 kHz or
is defined as 5 GHz where dot11OperatingClassesRequired is false or
not defined.

A channel center frequency of 5 GHz shall be indicated by dot11ChannelStartingFactor = 8000 and $n_{ch}$ = 200.

This definition provides a unique numbering system for all channels with 5 MHz between center frequencies, as well as the flexibility to define channelization sets for all current and future regulatory domains.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

#### 17.3.8.4.3 Channelization

The set of valid operating channel numbers by regulatory domain is defined in Annex E. As shown in Figure 17-11 (Subcarrier frequency allocation), no subcarrier is allocated on the channel center frequency.

### 17.3.8.5 Transmit and receive in-band and out-of-band spurious emissions

The OFDM PHY shall comply with in-band and out-of-band spurious emissions as set by regulatory bodies.

### 17.3.8.6 Slot time

The value of the slot time is found in Table 17-24 (OFDM PHY characteristics) (in 17.4.4 (OFDM PHY)).

### 17.3.8.7 Transmit and receive impedance at the antenna connector

The impedance at the transmit antenna connector and receive antenna connector shall be 50 Ω if that connector is exposed.

## 17.3.9 PHY transmit specifications

### 17.3.9.1 General

The transmit specifications associated with the PHY layer(#4114) are described in 17.3.9.2 (Transmit power levels) to 17.3.9.8 (Transmit modulation accuracy test).

### 17.3.9.2 Transmit power levels

The maximum allowable output power is measured in accordance with practices specified by the appropriate regulatory bodies.

### 17.3.9.3 Transmit spectrum mask

The transmit spectrum mask by regulatory domain is defined in Annex D and Annex E.

NOTE—In the presence of additional regulatory restrictions, the device needs to meet both the regulatory requirements and the mask defined here, i.e., its emissions need to be no higher at any frequency offset than the minimum of the values specified in the regulatory and default masks.

For rules regarding TX center frequency leakage levels by VHT STAs, see 21.3.17.4.2 (Transmit center frequency leakage).

For operation using 20 MHz channel spacing, the transmitted spectrum shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth not exceeding 18 MHz, –20 dBr at 11 MHz frequency offset, –28 dBr at 20 MHz frequency offset, and the maximum of –40 dBr and –39 dBm/MHz(M25) at 30 MHz frequency offset and above. The transmitted spectral density of the transmitted signal shall fall within the spectral mask, as shown in Figure 17-13 (Transmit spectrum mask for 20 MHz transmission). The measurements shall be made using a 100 kHz resolution bandwidth and a 30 kHz video bandwidth.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

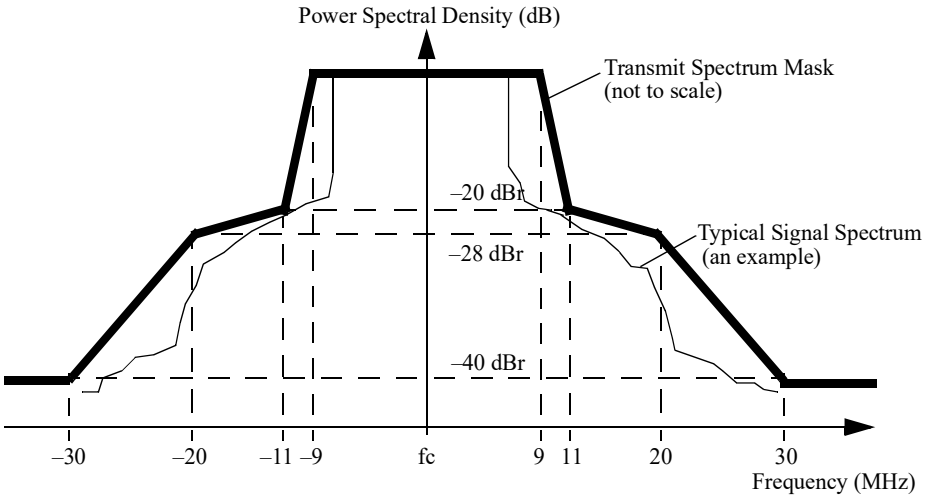

**Figure 17-13—Transmit spectrum mask for 20 MHz transmission**

For operation using 10 MHz channel spacing, the transmitted spectrum shall have a 0 dBr bandwidth not exceeding 9 MHz, –20 dBr at 5.5 MHz frequency offset, –28 dBr at 10 MHz frequency offset, and the maximum of –40 dBr and –50 dBm/MHz at 15 MHz frequency offset and above. The transmitted spectral density of the transmitted signal shall fall within the spectral mask, as shown in Figure 17-14 (Transmit spectrum mask for 10 MHz transmission). The measurements shall be made using a 100 kHz resolution bandwidth and a 30 kHz video bandwidth.

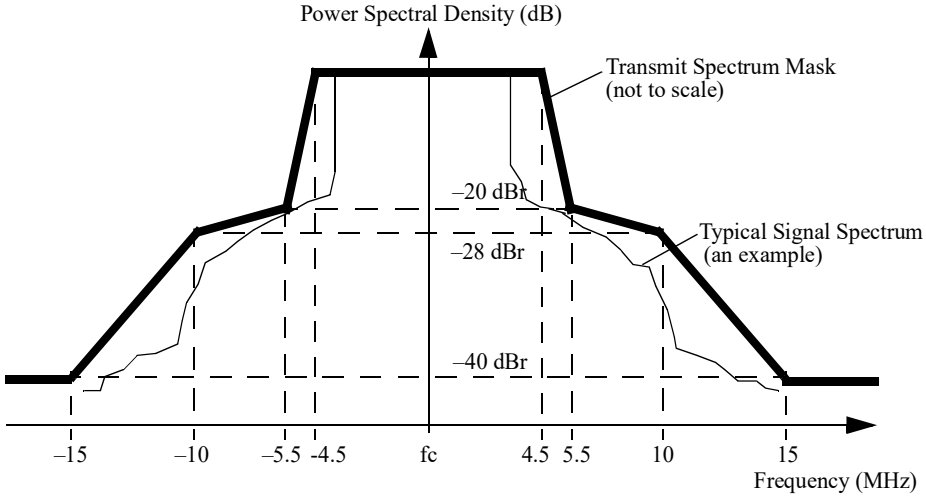

**Figure 17-14—Transmit spectrum mask for 10 MHz transmission**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

For operation using 5 MHz channel spacing, the transmitted spectrum shall have a 0 dBr bandwidth not exceeding 4.5 MHz, –20 dBr at 2.75 MHz frequency offset, –28 dBr at 5 MHz frequency offset, and the maximum of –40 dBr and –47 dBm/MHz at 7.5 MHz frequency offset and above. The transmitted spectral density of the transmitted signal shall fall within the spectral mask, as shown in Figure 17-15 (Transmit spectrum mask for 5 MHz transmission). The measurements shall be made using a 100 kHz resolution bandwidth and a 30 kHz video bandwidth.

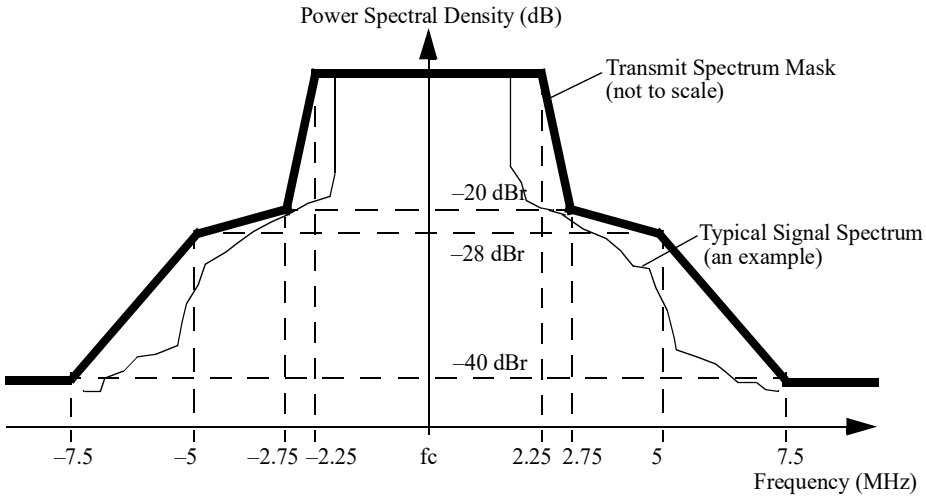

**Figure 17-15—Transmit spectrum mask for 5 MHz transmission**

#### 17.3.9.4 Transmission spurious

Spurious transmissions shall comply with national regulations.

#### 17.3.9.5 Transmit center frequency tolerance

The transmitted center frequency tolerance shall be ± 20 ppm for 20 MHz and 10 MHz channels and shall be ± 10 ppm for 5 MHz channels. The transmit center frequency and the symbol clock frequency shall be derived from the same reference oscillator.

#### 17.3.9.6 Symbol clock frequency tolerance

The symbol clock frequency tolerance shall be ± 20 ppm for 20 MHz and 10 MHz channels, and shall be ± 10 ppm for 5 MHz channels. The transmit center frequency and the symbol clock frequency shall be derived from the same reference oscillator.

#### 17.3.9.7 Modulation accuracy

##### 17.3.9.7.1 Introduction

Transmit modulation accuracy specifications are described in 17.3.9.7 (Modulation accuracy). The test method is described in 17.3.9.8 (Transmit modulation accuracy test).

##### 17.3.9.7.2 Transmitter center frequency leakage

For VHT STAs, the requirements on transmitter center frequency leakage are defined in 21.3.17.4.2 (Transmit center frequency leakage); otherwise, the requirements are defined in this subclause.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Certain transmitter implementations might cause leakage of the center frequency component. Such leakage (which manifests itself in a receiver as energy in the center frequency component) shall not exceed $max(P - 15, -20)$ dBm or, equivalently, +2 dB relative to the average energy of the rest of the subcarriers. The data for this test shall be derived from the channel estimation phase.

#### 17.3.9.7.3 Transmitter spectral flatness

The average energy of the constellations in each of the spectral lines –16.. –1 and +1.. +16 shall deviate no more than ± 4 dB from their average energy. The average energy of the constellations in each of the spectral lines –26.. –17 and +17.. +26 shall deviate no more than +4/–6 dB from the average energy of spectral lines –16.. –1 and +1.. +16. The data for this test shall be derived from the channel estimation step.

#### 17.3.9.7.4 Transmitter constellation error

The relative constellation RMS error, averaged over subcarriers and OFDM PPDUs, shall not exceed a data-rate dependent value according to Table 17-20 (Allowed relative constellation error versus data rate).

**Table 17-20—Allowed relative constellation error versus data rate**

| Relative constellation error (dB) | Modulation | Coding rate (R) |
|---|---|---|
| –5 | BPSK | 1/2 |
| –8 | BPSK | 3/4 |
| –10 | QPSK | 1/2 |
| –13 | QPSK | 3/4 |
| –16 | 16-QAM | 1/2 |
| –19 | 16-QAM | 3/4 |
| –22 | 64-QAM | 2/3 |
| –25 | 64-QAM | 3/4 |

### 17.3.9.8 Transmit modulation accuracy test

The transmit modulation accuracy test shall be performed by instrumentation capable of converting the transmitted signal into a stream of complex samples at 20 Msample/s or more, with sufficient accuracy in terms of I/Q arm amplitude and phase balance, dc offsets, phase noise, etc. A possible embodiment of such a setup is converting the signal to a low IF with a microwave synthesizer, sampling the signal with a digital oscilloscope and decomposing it digitally into quadrature components.

The sampled signal shall be processed in a manner similar to an actual receiver, according to the following steps, or an equivalent procedure:

a) (#14)Start of PPDU shall be detected.

b) Transition from short sequences to channel estimation sequences shall be detected, and fine timing (with one sample resolution) shall be established.

c) Coarse and fine frequency offsets shall be estimated.

d) The PPDU shall be derotated according to estimated frequency offset.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

e) The complex channel response coefficients shall be estimated for each of the subcarriers.

f) For each of the data OFDM symbols: transform the symbol into subcarrier received values, estimate the phase from the pilot subcarriers, derotate the subcarrier values according to estimated phase, and divide each subcarrier value with a complex estimated channel response coefficient.

g) For each data-carrying subcarrier, find the closest constellation point and compute the Euclidean distance from it.

h) Compute the RMS average of all errors (#14)in the (#2261)DATA field of a PPDU. It is given by

$$Error_{RMS} = \frac{\sum_{i=1}^{N_f} \sqrt{\frac{\sum_{j=1}^{L_P}\left[\sum_{k=1}^{52}\{(I(i,j,k)-I_0(i,j,k))^2+(Q(i,j,k)-Q_0(i,j,k))^2\}\right]}{52L_P \times P_0}}}{N_f} \quad (17\text{-}28)$$

where

$L_P$ is the length of the (#14)DATA field

$N_f$ is the number of (#14)PPDUs for the measurement

$(I_0(i,j,k), Q_0(i,j,k))$ denotes the ideal symbol point of the $i^{th}$ (#14)PPDU, $j^{th}$ OFDM symbol of the DATA field, $k^{th}$ subcarrier of the OFDM symbol in the complex plane

$(I(i,j,k), Q(i,j,k))$ denotes the observed point of the $i^{th}$ (#14)PPDU, $j^{th}$ OFDM symbol of the DATA field, $k^{th}$ subcarrier of the OFDM symbol in the complex plane (see Figure 17-16 (Constellation error))

$P_0$ is the average power of the constellation

The vector error on a phase plane is shown in Figure 17-16 (Constellation error).

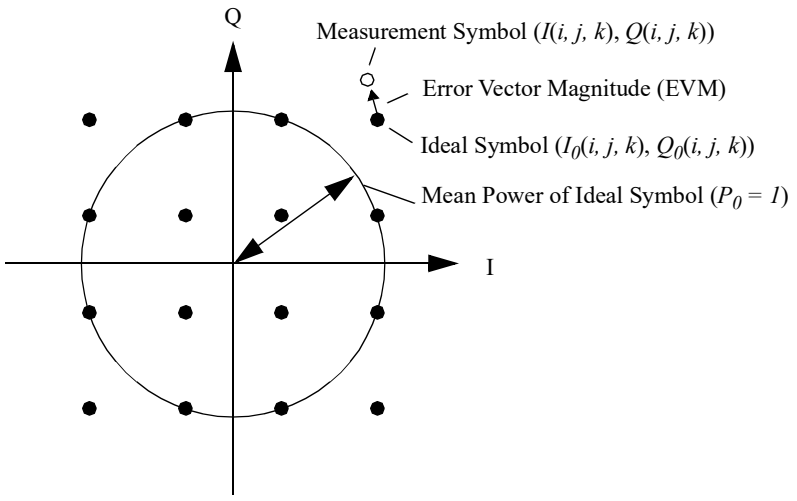

**Figure 17-16—Constellation error**

The test shall be performed over at least 20 (#14)PPDUs ($N_f$), and the RMS average shall be taken. The DATA fields under test shall be at least 16 OFDM symbols long. Random data shall be used for the symbols.

#### 17.3.9.9 Time of Departure accuracy

(#8048)The RMS accuracy of the time of departure provided in TIME_OF_DEPARTURE shall be less than or equal to 80 ns.

The Time of Departure accuracy test evaluates TIME_OF_DEPARTURE against aTxPHYTxStartRMS and aTxPHYTxStartRMS against TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH as defined Annex P with the following test parameters:

— MULTICHANNEL_SAMPLING_RATE is $20 \times 10^6\left(1 + \left\lceil \frac{f_H - f_L}{20\ \text{MHz}} \right\rceil\right)$ sample/s
where
$f_H$ is the nominal center frequency in Hz of the highest channel in the channel set
$f_L$ is the nominal center frequency in Hz of the lowest channel in the channel set, the channel set is the set of channels upon which (#14)PPDUs providing measurements are transmitted, the channel set comprises channels uniformly spaced across $f_H - f_L \geq 50$ MHz

— FIRST_TRANSITION_FIELD is the Short symbols.

— SECOND_TRANSITION_FIELD is the Long symbols.

— TRAINING_FIELD is the Long symbols windowed in a manner which should approximate the windowing described in 17.3.2.5 (Mathematical conventions in the signal descriptions) with $T_{TR}$ = 100 ns for 20 MHz channel spacing, $T_{TR}$ = 200 ns for 10 MHz channel spacing and $T_{TR}$ = 400 ns for 5 MHz channel spacing.

— TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH is 80 ns.

NOTE—The indicated windowing applies to the time of departure accuracy test equipment, and not the transmitter or receiver.

### 17.3.10 PHY receiver specifications

#### 17.3.10.1 Introduction

The receive specifications associated with the PHY layer(#4114) are described in 17.3.10.2 (Receiver minimum input level sensitivity(#256)) to 17.3.10.6 (CCA requirements).

#### 17.3.10.2 Receiver minimum input level sensitivity(#256)

The (#14)PER shall be 10% or less when the PSDU length is 1000 octets and the rate-dependent input level is as shown in Table 17-21 (Receiver performance requirements). The minimum input levels are measured at the antenna connector (noise factor of 10 dB and 5 dB implementation margins are assumed).

**Table 17-21—Receiver performance requirements**

| Modulation | Coding rate (R) | Adjacent channel rejection (dB) | Alternate adjacent channel rejection (dB) | Minimum sensitivity (dBm) (20 MHz channel spacing) | Minimum sensitivity (dBm) (10 MHz channel spacing) | Minimum sensitivity (dBm) (5 MHz channel spacing) |
|---|---|---|---|---|---|---|
| BPSK | 1/2 | 16 | 32 | –82 | –85 | –88 |
| BPSK | 3/4 | 15 | 31 | –81 | –84 | –87 |
| QPSK | 1/2 | 13 | 29 | –79 | –82 | –85 |
| QPSK | 3/4 | 11 | 27 | –77 | –80 | –83 |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 17-21—Receiver performance requirements**

| Modulation | Coding rate (R) | Adjacent channel rejection (dB) | Alternate adjacent channel rejection (dB) | Minimum sensitivity (dBm) (20 MHz channel spacing) | Minimum sensitivity (dBm) (10 MHz channel spacing) | Minimum sensitivity (dBm) (5 MHz channel spacing) |
|---|---|---|---|---|---|---|
| 16-QAM | 1/2 | 8 | 24 | –74 | –77 | –80 |
| 16-QAM | 3/4 | 4 | 20 | –70 | –73 | –76 |
| 64-QAM | 2/3 | 0 | 16 | –66 | –69 | –72 |
| 64-QAM | 3/4 | –1 | 15 | –65 | –68 | –71 |

### 17.3.10.3 Adjacent channel rejection

The adjacent channel rejection shall be measured by setting the desired signal's strength 3 dB above the rate-dependent sensitivity specified in Table 17-21 (Receiver performance requirements) and raising the power of the interfering signal until 10% PER is caused for a PSDU length of 1000 octets. The difference in power between the signals in the interfering channel and the desired channel is the corresponding adjacent channel rejection. The interfering signal in the adjacent channel shall be a signal compliant with the OFDM PHY, unsynchronized with the signal in the channel under test. In an OFDM PHY the corresponding rejection shall be no less than specified in Table 17-21 (Receiver performance requirements).

An optional enhanced performance specification is provided for systems requiring improved immunity to out-of-channel interfering emissions. If a STA has dot11ACRType equal to 2, the adjacent channel rejection shall be no less than specified in Table 17-22 (Optional enhanced receiver performance requirements). The interfering signal in the adjacent channel shall be a signal compliant with the OFDM PHY, using transmit mask M (see D.2.4 (Transmit Mask M)), unsynchronized with the signal in the channel under test. The corresponding minimum receiver sensitivities for each modulation and coding rate are the same as in Table 17-21 (Receiver performance requirements).

NOTE—Transmit mask M is equivalent to class C (see D.2.2 (Transmit power levels)).

**Table 17-22—Optional enhanced receiver performance requirements**

| Modulation | Coding rate (R) | Adjacent channel rejection (dB) | Nonadjacent channel rejection (dB) |
|---|---|---|---|
| BPSK | 1/2 | 28 | 42 |
| BPSK | 3/4 | 27 | 41 |
| QPSK | 1/2 | 25 | 39 |
| QPSK | 3/4 | 23 | 37 |
| 16-QAM | 1/2 | 20 | 34 |
| 16-QAM | 3/4 | 16 | 30 |
| 64-QAM | 2/3 | 12 | 26 |
| 64-QAM | 3/4 | 11 | 25 |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

#### 17.3.10.4 Nonadjacent channel rejection

The nonadjacent channel rejection shall be measured by setting the desired signal's strength 3 dB above the rate-dependent sensitivity specified in Table 17-21 (Receiver performance requirements), and raising the power of the interfering signal until a 10% PER occurs for a PSDU length of 1000 octets. The difference in power between the signals in the interfering channel and the desired channel is the corresponding nonadjacent channel rejection. The interfering signal in the nonadjacent channel shall be a signal compliant with the OFDM PHY, unsynchronized with the signal in the channel under test. In an OFDM PHY, the corresponding rejection shall be no less than specified in Table 17-21 (Receiver performance requirements).

An optional enhanced performance specification is provided for systems requiring improved immunity to out-of-channel interfering emissions. If a STA has dot11ACRType equal to 2, the nonadjacent channel rejection shall be no less than specified in Table 17-22 (Optional enhanced receiver performance requirements). The interfering signal in the nonadjacent channel shall be a signal compliant with the OFDM PHY, using transmit mask M (see D.2.4 (Transmit Mask M)), unsynchronized with the signal in the channel under test. The corresponding minimum receiver sensitivities for each modulation and coding rate are the same as in Table 17-21 (Receiver performance requirements).

#### 17.3.10.5 Receiver maximum input level

The receiver shall provide a maximum PER of 10% at a PSDU length of 1000 octets, for a maximum input level of –30 dBm measured at the antenna connector for any baseband modulation.

#### 17.3.10.6 CCA requirements

##### 17.3.10.6.1 General(#2365)

The PHY shall indicate a medium busy condition by issuing a PHY-CCA.indication primitive when the carrier sense/clear channel assessment (CS/CCA) mechanism detects a channel busy condition.

The start of an OFDM transmission at a receive level greater than or equal to the minimum modulation and coding rate sensitivity (–82 dBm for 20 MHz channel spacing, –85 dBm for 10 MHz channel spacing, and –88 dBm for 5 MHz channel spacing) shall cause CS/CCA to detect a channel busy condition with a probability > 90% within 4 μs for 20 MHz channel spacing, 8 μs for 10 MHz channel spacing, and 16 μs for 5 MHz channel spacing.

NOTE—CS/CCA detect time is based on finding the short sequences in the preamble, so when $T_{SYM}$ doubles, so does CS/CCA detect time.(#3299)

Additionally, the CS/CCA mechanism shall detect a medium busy condition within 4 μs of any signal with a received energy that is 20 dB above the minimum modulation and coding rate sensitivity (minimum modulation and coding rate sensitivity + 20 dB resulting in –62 dBm for 20 MHz channel spacing, –65 dBm for 10 MHz channel spacing, and –68 dBm for 5 MHz channel spacing)(#3299).

##### 17.3.10.6.2 CCA requirements for operating classes requiring CCA-OCSED(#2365)

For improved spectrum sharing, CCA-Operating Class Specific Energy Detect (CCA-OCSED) is required in some bands. The behavior class indicating CCA-OCSED is given in Table D-2 (Behavior limits). The operating classes requiring the corresponding CCA-OCSED behavior class are given in E.1 (Country information and operating classes). The PHY of a STA that is operating within an operating class that requires CCA-OCSED shall operate with CCA-OCSED.

For the operating class requiring CCA-OCSED, the PHY shall also indicate a medium busy condition when CCA-OCSED detects a channel busy condition. CCA-OCSED shall detect a channel busy condition when

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

the received signal strength exceeds the CCA-OCSED threshold as given by dot11OFDMOCSEDThreshold. The CCA-OCSED thresholds for the operating classes requiring CCA-OCSED are subject to the criteria in D.2.5 (CCA-OCSED threshold(#2365)).

NOTE—(#3299)The requirement to detect a channel busy condition as stated in 17.3.10.6.1 (General(#2365)) is a mandatory energy detect requirement on all Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) receivers. Support for CCA-OCSED is an additional requirement that relates specifically to the sensitivities described in D.2.5 (CCA-OCSED threshold(#2365)).

### 17.3.10.7 Received channel power indicator (RCPI) measurement

(#14)The RCPI is a measure of the received RF power in the selected channel for a received PPDU. This parameter shall be a (#1132)measurement by the PHY of the received RF power in the channel measured over the (#2011)SYNC field of the received PPDU or by other equivalent means that meet the specified accuracy.

RCPI shall equal the received RF power (#2011)in dBm within an accuracy of ± 5 dB (95% confidence interval) within the specified dynamic range of the receiver.

### 17.3.11 Transmit PHY

The transmit PHY is shown in Figure 17-17 (Transmit PHY). In order to transmit data, the PHY-TXSTART.request primitive shall be enabled so that the PHY entity shall be in the transmit state. Further, the PHY shall be set to operate at the appropriate frequency through STA management via the PLME. Other

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

transmit parameters, such as DATARATE and TX power, are set via the PHY SAP with the PHY-TXSTART.request(TXVECTOR) primitive, as described in 17.2.2 (TXVECTOR parameters(#1369)).

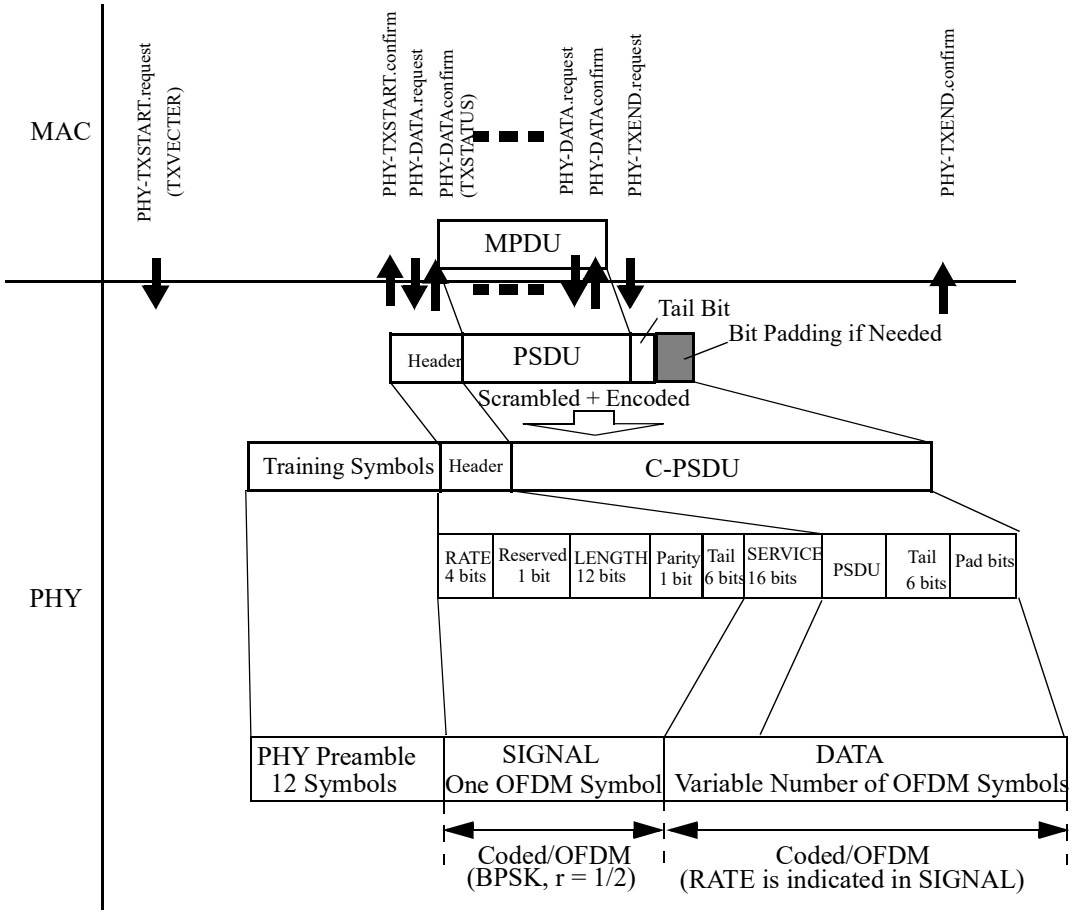

**Figure 17-17—Transmit PHY**

The PHY shall indicate a clear channel by issuing a PHY-CCA.indication(IDLE) primitive. The MAC considers this indication before issuing the PHY-TXSTART.request primitive. Transmission of the PPDU shall be initiated after receiving the PHY-TXSTART.request(TXVECTOR) primitive. The TXVECTOR elements for the PHY-TXSTART.request primitive are the PHY header parameters DATARATE, SERVICE, and LENGTH and the PHY parameters TXPWR_LEVEL_INDEX and TIME_OF_DEPARTURE_REQUESTED.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The PHY is configured with the TXVECTOR elements DATARATE and TXPWR_LEVEL_INDEX. Transmission of the PHY preamble and PHY header, based on the parameters passed in the PHY-TXSTART.request primitive, shall be immediately initiated.

Once PHY preamble transmission is started, the PHY entity shall immediately initiate PHY header encoding then data scrambling and data encoding, where the data shall be exchanged between the MAC and the PHY through a series of PHY-DATA.request(DATA) primitives issued by the MAC, and PHY-DATA.confirm primitives issued by the PHY. The modulation rate change, if any, shall be initiated from the SERVICE field data of the PHY header, as described in 17.3.2 (PPDU format).

The PHY proceeds with PSDU transmission through a series of data octet transfers from the MAC. The PHY header parameter, SERVICE, and PSDU are encoded by the convolutional encoder with the bit-stealing function described in 17.3.5.6 (Convolutional encoder). Transmission can be prematurely terminated by the MAC through the PHY-TXEND.request primitive. Normal termination occurs after the transmission of the final bit of the last PSDU octet, according to the number supplied in the LENGTH field of the SIGNAL field.

(#14)The PPDU transmission shall be completed and the PHY entity shall enter the receive state. Each PHY-TXEND.request primitive is acknowledged with a PHY-TXEND.confirm primitive from the PHY. If the coded PSDU (C-PSDU) length is not a multiple of the OFDM symbol length $N_{CBPS}$, the PSDU is padded prior to scrambling and coding (see 17.3.5.4 (Pad bits (PAD))).

In the PHY, the GI shall be inserted in every OFDM symbol as a countermeasure against severe delay spread.

A typical state machine implementation of the transmit PHY is provided in Figure 17-18 (PHY transmit state machine(#14)). Requests (.request) and confirmations (.confirm) are issued once with designated states.

### 17.3.12 Receive PHY

The receive PHY is shown in Figure 17-19 (Receive PHY(#1058)(#4122)). In order to receive data, the PHY-TXSTART.request primitive shall be disabled so that the PHY entity is in the receive state. Further, through STA management (via the PLME) the PHY is set to the appropriate frequency. Other receive parameters, such as RSSI, RCPI, and indicated DATARATE, may be accessed via the PHY SAP.

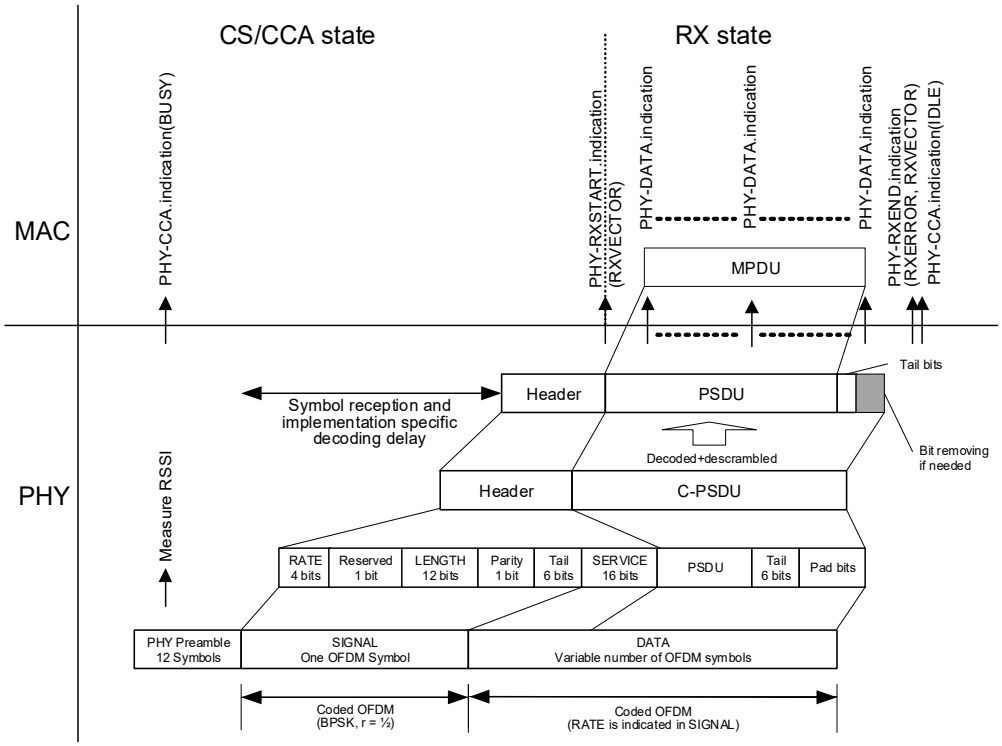

**Figure 17-19—Receive PHY(#1058)(#4122)**

Upon receiving the transmitted PHY preamble, the PHY measures the received signal strength level. This indicates activity to the MAC via PHY-CCA.indication primitive. A PHY-CCA.indication(BUSY) primitive shall be issued for reception of a signal prior to correct reception of the PPDU. The RSSI parameter is(#1759) reported to the MAC in the RXVECTOR.

After a PHY-CCA.indication primitive is issued, the PHY entity shall begin receiving the training symbols and searching for the SIGNAL in order to set the length of the PSDU(#2056), the demodulation type, and the decoding rate.

(#1062)(#3481)For an HT STA that determines it is receiving an ERP-OFDM format or OFDM PPDU, the STA's receive procedure shall resume here. Existing state, including knowledge of the L-SIG Parity and RATE checks, is retained.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

(#1062)If dot11TimingMsmtActivated is false, if the PHY header reception is successful (and the SIGNAL field is completely recognizable and supported), a PHY-RXSTART.indication(RXVECTOR) primitive shall be issued.

(#1062)If dot11TimingMsmtActivated is true, the PHY shall do the following:

— Complete receiving the PHY header and verify the validity of the PHY Header.

— If the PHY header reception is successful (and the SIGNAL field is completely recognizable and supported), a PHY-RXSTART.indication(RXVECTOR) primitive shall be issued and RX_START_OF_FRAME_OFFSET parameter within the RXVECTOR shall be forwarded (see 17.2.3 (RXVECTOR parameters(#1369))).

A VHT STA shall include the CH_BANDWIDTH_IN_NON_HT and DYN_BANDWIDTH_IN_NON_HT parameters in the RXVECTOR within the PHY-RXSTART.indication(RXVECTOR) primitive.

NOTE—The RX_START_OF_FRAME_OFFSET value is used (#3049)to estimate when the start of the preamble for the incoming (#14)PPDU was detected on the medium at the receive antenna connector.

The RXVECTOR associated with this primitive includes the SIGNAL field, the SERVICE field, the PSDU length in octets, and the RSSI. Also, in this case, the CCA of the OFDM PHY shall indicate a busy medium for the intended duration of the transmitted frame, as indicated by the LENGTH field.

The received PSDU bits are assembled into octets, decoded, and presented to the MAC using a series of PHY-DATA.indication(DATA) primitive exchanges. The rate change indicated in the SIGNAL field shall be initiated from the SERVICE field data of the PHY header, as described in 17.3.2 (PPDU format). The PHY shall proceed with PSDU reception. After the reception of the final bit of the last PSDU octet indicated by the LENGTH field of the SIGNAL field, the receiver shall be returned to the RX IDLE state, as shown in Figure 17-19 (Receive PHY(#1058)(#4122)). A PHY-RXEND.indication(NoError) primitive shall be issued.

In the event that a change in the RSSI causes the status of the CCA to return to the IDLE state before the complete reception of the PSDU, as indicated by the PHY LENGTH field, the error condition shall be reported to the MAC using a PHY-RXEND.indication(CarrierLost) primitive and the PHY receiver shall return to the RX IDLE state. The CCA of the OFDM PHY shall indicate a busy medium for the intended duration of the transmitted (#14)PPDU.

If the indicated rate in the SIGNAL field is not receivable, a PHY-RXSTART.indication primitive shall not be issued. The PHY shall indicate the error condition by issuing a PHY-RXEND.indication(UnsupportedRate) primitive and hold CCA busy for the calculated duration of the PPDU. If the PHY header is receivable, but the parity check of the PHY header is not valid (#18)or the RATE field is an undefined value, then a PHY-RXSTART.indication primitive shall not be issued. The PHY shall indicate the error condition using a PHY-RXEND.indication(FormatViolation) primitive.

Any data received after the indicated data length are considered pad bits (to fill out an OFDM symbol) and should be discarded.

A typical state machine implementation of the receive PHY is given in Figure 17-20 (PHY receive state machine(#1590)(#18)).

This is an unapproved IEEE Standards Draft, subject to change.

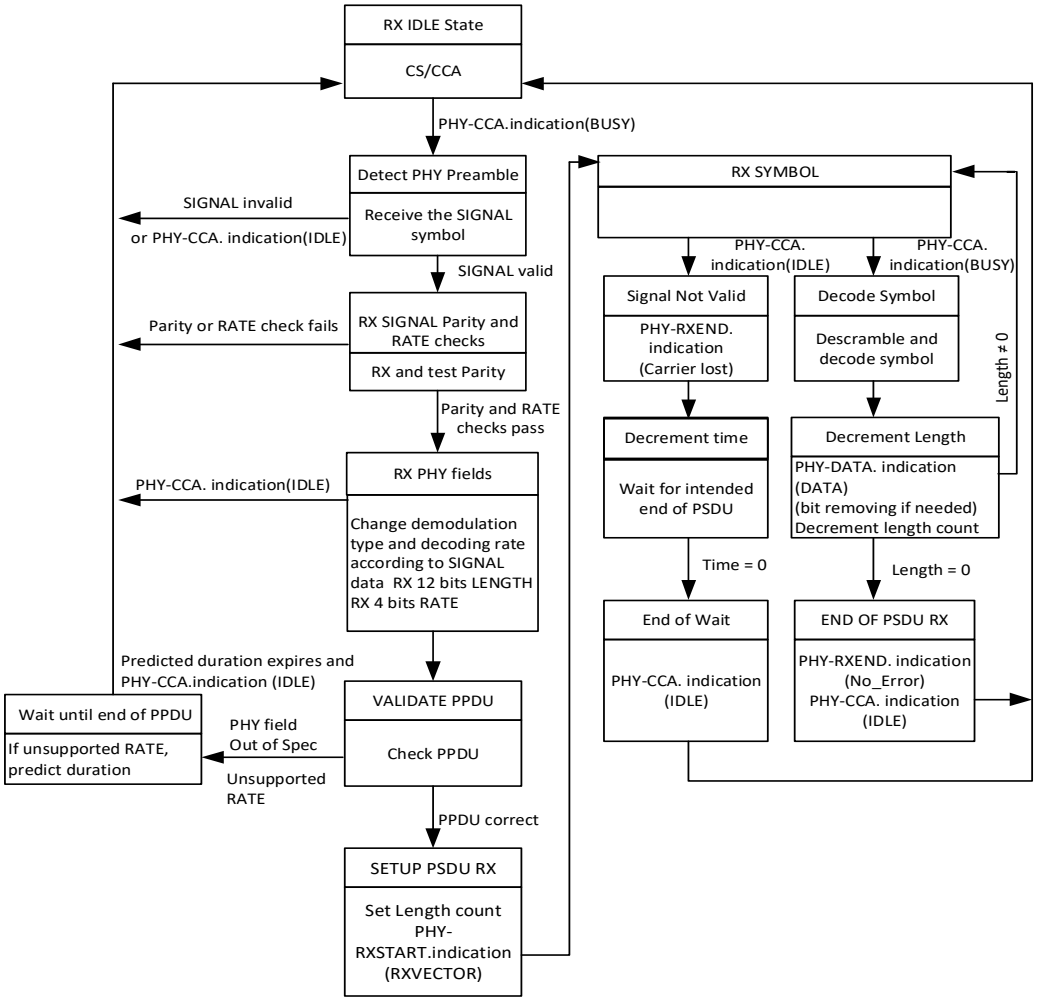

**Figure 17-20—PHY receive state machine(#1590)(#18)**

## 17.4 OFDM PLME

### 17.4.1 PLME SAP layer management primitives(#6320)

Table 17-23 (MIB attribute default values/ranges) lists the MIB attributes that may be accessed by the PHY entities and the intralayer of higher level LMEs. These attributes are accessed via the PLME-GET, PLME-SET, PLME-RESET, and PLME-CHARACTERISTICS primitives defined in 6.7 (PLME SAP interface).

### 17.4.2 OFDM PHY MIB

All OFDM PHY MIB attributes are defined in Annex C, with specific values defined in Table 17-23 (MIB attribute default values/ranges). The column titled “Operational semantics” in Table 17-23 (MIB attribute default values/ranges) contains two types: static and dynamic. Static MIB attributes are fixed and cannot be modified for a given PHY implementation. Dynamic MIB attributes can be modified by some management entity.

When MAX-ACCESS is read-only, the MIB attribute value may be updated by the PLME and read from the MIB attribute by management entities. When MAX-ACCESS is read-write, the MIB attribute may be read and written by management entities but shall not be updated by the PLME.

### 17.4.3 OFDM TXTIME calculation

The value of the TXTIME parameter returned by the PLME-TXTIME.confirm primitive shall be calculated according to the following equation:

$$\text{TXTIME} = T_{PREAMBLE} + T_{SIGNAL} + T_{SYM} \times N_{SYM} \quad (17\text{-}29)$$

where

$T_{PREAMBLE}$ is defined in Table 17-5 (Timing-related parameters)
$T_{SIGNAL}$ is defined in Table 17-5 (Timing-related parameters)
$T_{SYM}$ is defined in Table 17-5 (Timing-related parameters)
$N_{SYM}$ is given by Equation (17-11)

# 18. Extended Rate PHY (ERP) specification

## 18.1 Overview

### 18.1.1 General

This clause specifies further rate extension of the PHY for the DSSS system of Clause 15 (DSSS PHY specification for the 2.4 GHz band designated for ISM applications) and the extensions of Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification). Hereinafter the PHY defined in this clause is known as the ERP. This PHY operates in the 2.4 GHz ISM band. In addition, a variant capability PHY based on the ERP ("Class 2 ERP") is defined in this clause.

### 18.1.2 Introduction

The ERP builds on the payload data rates of 1 and 2 Mb/s, as described in Clause 15 (DSSS PHY specification for the 2.4 GHz band designated for ISM applications), that use DSSS modulation and builds on the payload data rates of 1, 2, 5.5, and 11 Mb/s, as described in Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification), that use DSSS and CCK. An ERP STA shall comply with all normative requirements of Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification). The ERP draws from Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) to provide additional payload data rates of 6, 9, 12, 18, 24, 36, 48, and 54 Mb/s. Of these rates, transmission and reception capability for 1, 2, 5.5, 6, 11, 12, and 24 Mb/s data rates is mandatory.

A non-AP STA is a Class 2 ERP STA if it satisfies all of the following requirements and is not an ERP STA:

1) The STA shall operate in the 2.4 GHz band, and shall have operating channel width 20 MHz.
2) The STA shall support transmission and reception of DSSS 1 Mb/s and 2 Mb/s.
3) The STA shall support transmission and reception of ERP-OFDM 6 Mb/s.
4) If the STA supports HR/DSSS 11 Mb/s, then it shall support HR/DSSS 5.5 Mb/s.
5) If the STA supports ERP-OFDM 24 Mb/s, then it shall support ERP-OFDM 12 Mb/s.
6) Subject to 4) and 5), each (non-DSSS) HR/DSSS, (non-6 Mb/s) ERP-OFDM, and HT data rate is optional.
7) The STA shall support transmission and reception of DSSS long preamble and short preamble.
8) The STA shall support short slot time.
9) The CCA functionality for ERP-OFDM in 18.4.6 (CCA performance) a), b) and for HT in 19.3.19.6.4 (CCA sensitivity in 20 MHz) shall be supported.
10) The minimum receiver sensitivity requirements of Clause 15 (DSSS PHY specification for the 2.4 GHz band designated for ISM applications), Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification), Clause 18 (Extended Rate PHY (ERP) specification), and Clause 19 (High Throughput (HT) PHY specification(#2297)) shall apply to all supported modes.
11) A class 2 ERP STA shall indicate support in the Supported Rates and BSS Membership Selectors element, and if applicable, the Extended Supported Rates and BSS Membership Selectors element, during association and reassociation, and in probe requests, for
    - 1, 2, 5.5, 11, 6, 12, and 24 Mb/s (whether it supports all of these rates of not), and
    - all ERP rates from the set 9, 18, 36, 48, and 54 Mb/s that the Class 2 ERP STA supports, and shall not indicate support for other ERP rates.
12) A class 2 ERP STA shall transmit the Supplemental Class 2 Capabilities element.
13) In all other respects the STA shall follow the requirements of the ERP.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

NOTE—A Class 2 ERP STA is not(M118) able to operate in a BSS whose AP includes in the basic rate set, and uses for transmission of (#1293)group addressed frames, only rates that the STA does not support.

### 18.1.3 Operational modes

(#4030)Clause 18 (Extended Rate PHY (ERP) specification) STAs implements all mandatory modes of Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) and Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification), except it uses the 2.4 GHz frequency band and channelization plan specified in 16.3.6 (PHY operating specifications, general). The ERP has the capability to decode Clause 15 (DSSS PHY specification for the 2.4 GHz band designated for ISM applications), Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification) and ERP PPDUs. An ERP shall support(#546) sending and receiving the short preamble that is (and remains) optional for Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification) PHYs.

The ERP has the capability to detect ERP and Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification) preambles whenever a CCA is requested. Because protection mechanisms are not required in all cases, the ERP CCA mechanisms for all preamble types shall be active at all times.

An ERP BSS is capable of operating in any combination of available ERP modes (Clause 18 (Extended Rate PHY (ERP) specification) PHYs) and non-ERP modes (Clause 15 (DSSS PHY specification for the 2.4 GHz band designated for ISM applications) or Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification) PHYs). For example, a BSS could operate in an ERP-OFDM-only mode, a mixed mode of ERP-OFDM and ERP-DSSS/CCK, or a mixed mode of ERP-DSSS/CCK and non-ERP. When options are enabled, combinations are also allowed.

The changes to other parts of this standard required to implement the ERP are summarized as follows:

a) ERP-DSSS/CCK
   1) The PHY uses the capabilities of Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification) with the following exceptions:
      i) Support of the short PPDU header format capability of 16.2.2.3 (Short PPDU format) is mandatory.
      ii) CCA (see 16.3.8.5 (CCA)) has a mechanism that detects all mandatory Clause 18 (Extended Rate PHY (ERP) specification) sync symbols.
      iii) The maximum input signal level (see 16.3.8.3 (Receiver maximum input level)) is –20 dBm.
      iv) Locking the transmit center frequency and the symbol clock frequency to the same reference oscillator is mandatory.

b) ERP-OFDM
   1) The PHY uses the capabilities of Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) with the following exceptions:
      i) The frequency plan is in accordance with 16.3.6.2 (Operating frequency range) and 16.3.6.3 (Channel Numbering of operating channels) instead of 17.3.8.4 (Operating channel frequencies).
      ii) CCA has a mechanism that detects all mandatory Clause 18 (Extended Rate PHY (ERP) specification) sync symbols.
      iii) The frequency accuracy (see 17.3.9.5 (Transmit center frequency tolerance) and 17.3.9.6 (Symbol clock frequency tolerance)) is ± 25 ppm.
      iv) The maximum input signal level (see 17.3.10.5 (Receiver maximum input level)) is –20 dBm.
      v) The value of the slot time is found in Table 18-5 (ERP characteristics).
      vi) SIFS is 10 μs in accordance with 16.3.3 (HR/DSSS PHY). See 18.3.2.4 (ERP-OFDM PPDU format) for more detail.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The 2.4 GHz ISM band is a shared medium, and coexistence with other devices such as Clause 15 (DSSS PHY specification for the 2.4 GHz band designated for ISM applications) and Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification) STAs is an important issue for maintaining high performance in Clause 18 (Extended Rate PHY (ERP) specification) (ERP) STAs. The ERP modulation (ERP-OFDM) has been designed to coexist with existing Clause 15 (DSSS PHY specification for the 2.4 GHz band designated for ISM applications) and Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification) STAs. This coexistence is achieved by several means, including virtual CS (RTS/CTS or CTS-to-self), CSMA/CA protocols, and MSDU fragmentation.

### 18.1.4 Scope of ERP PHY services

This clause specifies the ERP entity and the deviations from earlier clauses to accommodate it. It is organized by reference to the relevant earlier clauses to avoid excessive duplication.

The ERP consists of the following protocol functions:

a) A function that defines a method for mapping the (#14)PSDUs into a PPDU format suitable for sending and receiving data, management, and control information between two or more STAs using the associated PHY system. The PHY exchanges PPDUs that contain PSDUs. The MAC uses the PHY service, so each MPDU corresponds to a PSDU that is carried in a PPDU.

b) A function that defines the characteristics and method of transmitting and receiving data through a WM between two or more STAs; each using the ERP.

### 18.1.5 ERP functions

The ERP contains two functional entities: the PHY function and the layer management function.

The ERP service is provided to the MAC through the PHY service primitives described in Clause 8 (PHY service specification). Interoperability is addressed by use of the CS mechanism specified in 10.3.2.1 (CS mechanism) and the protection mechanism in 10.27 (Protection mechanisms). This mechanism allows non-ERP STAs to know of ERP traffic that they cannot demodulate so that they may defer the medium to that traffic.

## 18.2 PHY-specific service parameter list

The architecture of the IEEE 802.11 MAC is intended to be PHY independent. Some PHY implementations require PHY-dependent MAC state machines running in the MAC sublayer in order to meet certain PHY requirements. The PHY-dependent MAC state machine resides in a sublayer defined as the MLME. In certain PHY implementations, the MLME may need to interact with the PLME as part of the normal PHY SAP primitives. These interactions are defined by the PLME parameter list currently defined in the PHY service primitives as TXVECTOR, TXSTATUS, and RXVECTOR. The list of these parameters and the values they may represent are defined in the specific PHY specifications for each PHY. This subclause addresses the TXVECTOR, TXSTATUS, and RXVECTOR for the ERP.

Several service primitives include a parameter vector. DATARATE and LENGTH are described in 8.3.4.4 (Vector descriptions). The remaining parameters are considered to be management parameters and are specific to this PHY.

The parameters in Table 18-1 (TXVECTOR parameters) are defined as part of the TXVECTOR parameter list in the PHY-TXSTART.request and PLME-TXTIME.request primitives. (#400)Any additional parameters in Table 15-1 (TXVECTOR parameters), Table 16-5 (Parameter vectors), and Table 17-1 (TXVECTOR parameters) are also defined as part of the TXVECTOR parameter list when the TXVECTOR parameter MODULATION is ERP-DSSS, ERP-CCK, and ERP-OFDM, respectively.

**Table 18-1—TXVECTOR parameters**

| Parameter | Value |
|---|---|
| DATARATE | The rate used to transmit the PSDU in Mb/s.<br>Allowed value depends on value of MODULATION parameter:<br>ERP-DSSS: 1 and 2<br>ERP-CCK: 5.5 and 11<br>ERP-OFDM: 6, 9, 12, 18, 24, 36, 48, and 54 |
| LENGTH | The length of the PSDU in octets.<br>Range: 1–4095 |
| PREAMBLE_TYPE | The preamble used for the transmission of the PPDU.<br>Enumerated type for which the allowed value depends on value of MODULATION parameter:<br>ERP-OFDM: null<br>ERP-DSSS, ERP-CCK: SHORTPREAMBLE, LONGPREAMBLE |
| MODULATION | The modulation used for the transmission of this PSDU.<br>Enumerated type: ERP-DSSS, ERP-CCK, ERP-OFDM |
| SERVICE | The scrambler initialization vector.<br>Null. |
| TXPWR_LEVEL_INDEX | The transmit power level index. The definition of these levels is up to the implementer.<br>1–8 |
| TIME_OF_DEPARTURE_REQUESTED | false, true. When true, the MAC entity requests that the PHY entity measures and reports time of departure parameters corresponding to the time when the first (#14)PPDU energy is sent by the transmitting port; when false, the MAC entity requests that the PHY entity neither measures nor reports time of departure parameters. |
| CH_BAND-WIDTH_IN_NON_HT(11ax) | If present, CBW20 or CBW40. |
| DYN_BAND-WIDTH_IN_NON_HT(11ax) | If present, Static or Dynamic. |
| (#602)SCRAMBLER_INI-TIAL_VALUE | If present, an integer in the range 1–127. See 17.3.5.5 (PHY DATA scrambler and descrambler). |

This is an unapproved IEEE Standards Draft, subject to change.

The parameters in Table 18-2 (TXSTATUS parameters) are defined as part of the TXSTATUS parameter list in the PHY-TXSTART. confirm service primitive.

**Table 18-2—TXSTATUS parameters**

| Parameter | Value |
|---|---|
| TIME_OF_DEPARTURE | 0 to $2^{32}$– 1. The locally measured time when the first (#14)PPDU energy is sent by the transmitting port, in units equal to 1/ TIME_OF_DEPARTURE_ClockRate. This parameter is present only if TIME_OF_DEPARTURE_REQUESTED is true in the corresponding request. |
| TIME_OF_DEPARTURE_ClockRate | 0 to $2^{16}$– 1. The clock rate, in units of MHz, is used to generate the TIME_OF_DEPARTURE value. This parameter is present only if TIME_OF_DEPARTURE_REQUESTED is true in the corresponding request. |
| TX_START_OF_FRAME_OFFSET | 0 to $2^{32}$– 1. An estimate of the offset (in 10 ns units) from the point in time at which the start of the preamble (#14)of the PPDU was transmitted at the transmit antenna connector to the point in time at which this primitive is issued to the MAC. |

The parameters in Table 18-3 (RXVECTOR parameters) are defined as part of the RXVECTOR parameter list in the PHY-RXSTART.indication primitive. (#400)Any additional parameters in Table 15-2 (RXVECTOR parameters), Table 16-5 (Parameter vectors), and Table 17-2 (RXVECTOR parameters) are also defined as part of the RXVECTOR parameter list when the RXVECTOR parameter MODULATION is ERP-DSSS, ERP-CCK, and ERP-OFDM, respectively. When implementations require the use of these vectors, some or all of these parameters may be used in the vectors.

**Table 18-3—RXVECTOR parameters**

| Parameter | Value |
|---|---|
| DATARATE | The rate at which the PSDU was received in Mb/s.<br>Allowed value depends on value of MODULATION parameter:<br>ERP-DSSS: 1 and 2<br>ERP-CCK: 5.5 and 11<br>ERP-OFDM: 6, 9, 12, 18, 24, 36, 48, and 54 |
| LENGTH | The length of the PSDU in octets.<br>Range: 1–4095 |
| PREAMBLE_TYPE | The preamble type detected during reception of the PPDU.<br>Enumerated type for which the allowed value depends on value of MODULATION parameter:<br>ERP-OFDM: null<br>ERP-DSSS, ERP-CCK: SHORTPREAMBLE, LONGPREAMBLE. |
| MODULATION | The modulation used for the reception of this PSDU.<br>Enumerated types: ERP-DSSS, ERP-CCK, ERP-OFDM |
| SERVICE | Null. |
| RSSI | The RSSI is a measure of the RF energy received by the ERP. The 8-bit value is in the range 0 to RSSI maximum as described in (#1369)17.2.3 (RXVECTOR parameters(#1369)). |

**Table 18-3—RXVECTOR parameters *(continued)***

| Parameter | Value |
|---|---|
| RX_START_OF_FRAME_OFFSET | 0 to $2^{32}$– 1. An estimate of the offset (in 10 ns units) from the point in time at which the start of the preamble corresponding to the incoming frame arrived at the receive antenna connector to the point in time at which this primitive is issued to the MAC. |
| CH_BAND-WIDTH_IN_NON_HT(11ax) | If present, CBW20 or CBW40. |
| DYN_BAND-WIDTH_IN_NON_HT(11ax) | If present, Static or Dynamic. |
| (#602)SCRAMBLER_INI-TIAL_VALUE | If present, an integer in the range 1–127. See 17.3.5.5 (PHY DATA scrambler and descrambler). |

(#2115)The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for an ERP PHY contains an OPERATING_CHANNEL parameter, which identifies the operating channel. The PHY shall set dot11CurrentChannel to the value of this parameter.

## 18.3 Extended Rate PHY layer(#4114)

### 18.3.1 Introduction

Subclause 18.3 (Extended Rate PHY layer(#4114)) provides a PHY for the ERP. The convergence procedure specifies how PSDUs are converted to and from PPDUs at the transmitter and receiver. The PPDU is formed during data transmission by appending the PSDU to the Extended Rate PHY preamble and header. At the receiver, the PHY preamble and header are processed to aid in the demodulation and delivery of the PSDU.

### 18.3.2 PPDU format

#### 18.3.2.1 General

An ERP STA shall support three different preamble and header formats. The first is the long preamble and header described in 18.3.2.2 (Long preamble PPDU format) (and based on 16.2.2.2 (Long PPDU format) with redefinition of reserved bits defined therein). This PPDU provides interoperability with Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification) STAs when using the 1, 2, 5.5, and 11 Mb/s data rates. The second is the short preamble and header described in 18.3.2.3 (Short preamble PPDU format) (and based on 16.2.2.3 (Short PPDU format) where it is optional). The short preamble supports the rates 2, 5.5, and 11 Mb/s. The third is the ERP-OFDM preamble and header specified in 18.3.2.4 (ERP-OFDM PPDU format) (and based on 17.3.2 (PPDU format)).

#### 18.3.2.2 Long preamble PPDU format

Figure 16-1 (Long PPDU format) of 16.2.2.2 (Long PPDU format) shows the basic format for the long preamble PPDU. This preamble is appropriate for use with the 1, 2, 5.5, and 11 Mb/s (Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification)) modes and is compatible with BSSs using these modes.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The SERVICE field is defined in 16.2.3.5 (Long PHY SERVICE field). An ERP STA shall set the Locked clocks bit to 1, when transmitting at a data rate described in Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification).

#### 18.3.2.3 Short preamble PPDU format

Figure 16-2 (Short PPDU format) of 16.2.2.3 (Short PPDU format) shows the basic format for the short preamble PPDU. For the ERP, support for this preamble is mandatory. The short preamble is appropriate for use with 2, 5.5, and 11 Mb/s modes. The bits of the Short PHY SERVICE field and RATE field are the same as for the Long PHY SERVICE field and RATE field and are defined in 18.3.2.2 (Long preamble PPDU format).

#### 18.3.2.4 ERP-OFDM PPDU format

(#3290)The format of an ERP-OFDM PPDU is described in 17.3.2 (PPDU format) to 17.3.5 (DATA field).

(#3290)An ERP-OFDM PPDU is (#14)immediately followed by a period of no transmission with a duration of aSignalExtension(#14), and this period is called the signal extension. The purpose of this extension is to make the TXTIME calculation in 18.5.3 (TXTIME) result in a (#14)calculated time duration interval that includes an additional duration of aSignalExtension. The SIFS for Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) (#14)PPDUs is 16 µs, and the SIFS for Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification) (#14)PPDUs is 10 µs. The longer SIFS in Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) is to allow extra time for the convolutional decode process to finish. As Clause 18 (Extended Rate PHY (ERP) specification) (#14)PPDUs use a SIFS of 10 µs, this extra aSignalExtension length extension causes the transmitter to compute the Duration field in the MAC header incorporating the aSignalDuration of "idle time" following each ERP-OFDM transmission, which causes the NAV value of Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification) STAs to be set correctly.

(#14)The "CS mechanism" described in 10.3.2.1 (CS mechanism) combines the NAV state and the STA's transmitter status with physical CS to determine the busy/idle state of the medium. A STA shall determine that the medium is idle through the use of the CCA mechanism for the interval specified. The starting reference of slot boundaries is the end of the previous PPDU[+SigExt] on the medium. That is, for ERP-OFDM PPDUs, this includes the signal extension. For ERP-OFDM PPDUs, a STA shall generate the PHY-RXEND.indication aSignalDuration after the end of the last symbol of the previous PPDU on the medium. This adjustment shall be performed by the STA based on local configuration information set using the PLME SAP.

### 18.3.3 PHY data modulation and rate change

#### 18.3.3.1 Long and short preamble formats

The long and short PHY preamble and the long PHY header shall be transmitted using the 1 Mb/s DBPSK modulation. The short PHY header shall be transmitted using the 2 Mb/s modulation. The SIGNAL and SERVICE fields combined shall indicate the modulation and rate that shall be used to transmit the PSDU. The transmitter and receiver shall initiate the modulation and rate indicated by the SIGNAL and SERVICE fields, starting with the first octet of the PSDU. The PSDU transmission rate shall be set by the DATARATE parameter in the TXVECTOR, issued with the PHY-TXSTART.request primitive described in 16.3.5 (Vector descriptions).

Four modulation formats are mandatory, 1 Mb/s and 2 Mb/s ERP-DSSS and 5.5 Mb/s and 11 Mb/s ERP-CCK, and they are specified in 16.3.6.4 (Modulation and channel data rates).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

#### 18.3.3.2 ERP-OFDM format

PHY modulation and rate change for the ERP-OFDM (#14)PPDU format follows 17.3.7 (PHY data modulation and modulation rate change).

### 18.3.4 CCA

The PHY shall provide the capability to perform a CCA and report the results of the assessment to the MAC. The CCA mechanism shall detect a "medium busy" condition for all supported preamble and header types. That is, the CCA mechanism shall detect that the medium is busy for the PPDUs specified in 18.3.2 (PPDU format) and 16.2.2 (PPDU format). The CCA mechanism performance requirements are given in 18.4.6 (CCA performance).

The ERP shall provide the capability to perform CCA according to the following method:

> **CCA Mode** (ED and CS): A combination of CS and energy above threshold. CCA shall have a mechanism for CS that detects all mandatory Clause 18 (Extended Rate PHY (ERP) specification) sync symbols. This CCA's mode's CS shall include both Barker code sync detection and OFDM sync symbol detection. CCA shall report busy at least while a PPDU is being received with energy above the ED threshold at the antenna connector.

The PHY shall indicate a busy channel by issuing a PHY-CCA.indication(BUSY) primitive and shall indicate a clear channel by issuing a PHY-CCA.indication(IDLE) primitive.

### 18.3.5 PHY transmit procedure(#283)

The transmit procedure for Clause 18 (Extended Rate PHY (ERP) specification) when TXVECTOR parameter FORMAT is (#2157)NON_HT and TXVECTOR parameter NON_HT_MODULATION is ERP-DSSS or ERP-CCK is described in 15.3.6 (Transmit PHY) or 16.2.5 (Transmit PHY), respectively.

The transmit procedure and state machine when TXVECTOR parameter FORMAT is (#2157)NON_HT and TXVECTOR parameter NON_HT_MODULATION is ERP-OFDM is described in 17.3.11 (Transmit PHY), except for the signal extension (refer to 18.3.2.4 (ERP-OFDM PPDU format)).

### 18.3.6 PHY receive procedure

This subclause describes the procedure used by receivers of the ERP. An ERP receiver shall support(#546) receiving 1, 2, 5.5, and 11 Mb/s PPDUs using either the long or short preamble formats described in Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification) and shall support(#546) receiving the ERP-OFDM modulations at rates of 6, 12, and 24 Mb/s using the modulation and preamble described in Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification). The PHY may also be capable of receiving the ERP-OFDM modulations at rates of 9, 18, 36, 48, and 54 Mb/s using this modulation and preamble. The receiver shall support(#546) detecting the preamble type (ERP-OFDM, short preamble, or long preamble) and the modulation type. These values shall be reported in the RXVECTOR (see 18.2 (PHY-specific service parameter list)).

Upon the receipt of a PPDU, the receiver shall first distinguish between the ERP-OFDM preamble and the single carrier modulations (long or short preamble). In the case where the preamble is an ERP-OFDM preamble, the PHY receive procedure shall follow the procedure described in 17.3.12 (Receive PHY). Otherwise, the receiver shall then distinguish between the long preamble and short preamble as specified in 16.2.2 (PPDU format), except that the issuance of the PHY-RXEND.indication (and the following PHY-CCA.indication) is delayed by the signal extension (see 18.3.2.4 (ERP-OFDM PPDU format)). The receiver shall then demodulate the SERVICE field to determine the modulation type as specified in 18.3.2.2 (Long preamble PPDU format) or 18.3.2.3 (Short preamble PPDU format). For short preamble and long preamble

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

using ERP-DSSS or ERP-CCK, the receiver shall then follow the receive procedure described in 16.2.6 (Receive PHY).

## 18.4 ERP operating specifications (general)

### 18.4.1 Introduction

Subclauses 18.4.2 (Regulatory requirements) to 18.4.7 (PHY transmit specifications) provide general specifications for the ERP. These specifications are based on 17.3.8 (PHY operating specifications (general)) except where noted.

### 18.4.2 Regulatory requirements

All systems shall comply with the appropriate regulatory requirements for operation in the 2.4 GHz band.

### 18.4.3 Operating channel frequencies

The ERP shall operate in the frequency ranges specified in 16.3.6.3 (Channel Numbering of operating channels), as allocated by regulatory bodies in the United States and its territories(#296), Europe, and Japan. The channel numbering and the number of operating channels shall follow Table 16-6 (HR/DSSS PHY frequency channel plan) of 16.3.6.3 (Channel Numbering of operating channels).

### 18.4.4 Transmit and receive in-band and out-of-band spurious emissions

The ERP shall comply with in-band and out-of-band spurious emissions as set by the appropriate regulatory bodies for the 2.4 GHz band.

### 18.4.5 SIFS

The ERP shall use a SIFS of 10 μs.

### 18.4.6 CCA performance

The CCA parameters are subject to the following criteria:

a) When the start of an ERP-OFDM signal or DSSS, HR-DSSS, ERP-DSSS or ERP-CCK sync symbols at a receive level greater than or equal to –82 dBm at the receiver antenna connector are present at the start of the MAC slot, the receiver's CCA indicator shall report the channel busy with probability CCA_Detect_Probability within a aCCATime. CCA_Detect_Probabilty is the probability that the CCA does respond correctly to a signal and shall be at least 99% for long slot time and at least 90% for short slot time. The values for the other parameters are found in Table 18-5 (ERP characteristics). Note that the CCA Detect Probability and the power level are performance requirements.

b) In the event that a correct PHY header is received, the ERP shall hold the CCA signal inactive (channel busy) for the full duration, as indicated by the PHY LENGTH field. Should a loss of CS occur in the middle of reception, the CCA shall indicate a busy medium for the intended duration of the transmitted PPDU.

c) CCA shall report a busy medium upon detection of any energy above –62 dBm.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 18.4.7 PHY transmit specifications

#### 18.4.7.1 General

The PHY transmit specifications shall follow 17.3.9 (PHY transmit specifications) with the exception of the transmit power level (17.3.9.2 (Transmit power levels)), the transmit center frequency tolerance (17.3.9.5 (Transmit center frequency tolerance)), the symbol clock frequency tolerance (17.3.9.6 (Symbol clock frequency tolerance)), and the time of departure accuracy (17.3.9.9 (Time of Departure accuracy)). Regulatory requirements may have an effect on the combination of maximum transmit power and spectral mask if the resulting signals violate restricted band emission limits.

#### 18.4.7.2 Transmit power levels

The maximum transmit power level shall meet the requirements of the local regulatory body.

#### 18.4.7.3 Transmit spectral mask

The transmit spectral mask for (#3290)ERP-OFDM PPDUs shall follow 17.3.9.3 (Transmit spectrum mask) and is shown in Figure 17-13 (Transmit spectrum mask for 20 MHz transmission) therein. The transmit spectral mask for ERP-DSSS/CCK PPDUs shall follow 16.3.7.4 (Transmit spectrum mask) and is shown in Figure 16-8 (Transmit spectrum mask) therein.

#### 18.4.7.4 Transmit center frequency tolerance

The transmit center frequency tolerance shall be ± 25 ppm. The transmit center frequency and symbol clock frequency shall be derived from the same reference oscillator (locked).

#### 18.4.7.5 Symbol clock frequency tolerance

The symbol clock frequency tolerance shall be ± 25 ppm. The transmit center frequency and symbol clock frequency shall be derived from the same reference oscillator (locked oscillators). This means that the error in ppm for the carrier and the symbol timing shall be the same.

#### 18.4.7.6 Time of Departure accuracy

The time of departure specifications shall follow 17.3.9.9 (Time of Departure accuracy) for PPDUs transmitted using ERP-OFDM format and 16.3.7.10 (Time of Departure accuracy) for PPDUs transmitted using ERP-DSSS/CCK.

### 18.4.8 PHY receive specifications

#### 18.4.8.1 General

Subclause 18.4.8 (PHY receive specifications) describes the receive specifications for the PHY layer(#4114). The receive specification for ERP-OFDM PPDUs shall follow 17.3.10 (PHY receiver specifications) with the exception of the receiver maximum input level (17.3.10.5 (Receiver maximum input level)) and the adjacent channel rejection (17.3.10.3 (Adjacent channel rejection)). The receive specification for ERP-DSSS/CCK PPDUs shall follow 16.3.8 (PHY receiver specifications) with the exception of the receiver maximum input level (16.3.8.3 (Receiver maximum input level)).(#3290)

#### 18.4.8.2 Receiver minimum input level sensitivity

(#3290)The PER for ERP-OFDM PPDUs shall be less than 10% at a PSDU length of 1000 octets for the input levels of Table 17-21 (Receiver performance requirements) of 17.3.10 (PHY receiver specifications).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Input levels are specific for each data rate and are measured at the antenna connector. A noise figure of 10 dB and an implementation loss of 5 dB are assumed. (#1731)(#3290)The PER for ERP-CCK PPDUs shall be as specified in 16.3.8.2 (Receiver minimum input level sensitivity). The PER for ERP-DSSS PPDUs shall be as specified in 15.4.6.2 (Receiver minimum input level sensitivity).

#### 18.4.8.3 Adjacent channel rejection

Adjacent channels at 2.4 GHz are defined to be at ± 25 MHz spacing.

(#3290)For ERP-OFDM PPDUs, the adjacent channel rejection shall be measured by setting the desired signal's strength 3 dB above the rate-dependent sensitivity specified in Table 17-21 (Receiver performance requirements) of 17.3.10 (PHY receiver specifications) and raising the power of the interfering signal until 10% PER is caused for a PSDU length of 1000 octets. The difference in power between the signals in the interfering channel and the desired channel is the corresponding adjacent channel rejection. The interfering signal in the adjacent channel shall be a signal compliant with the ERP, unsynchronized with the signal in the channel under test. In an ERP the corresponding rejection shall be no less than specified in Table 17-21 (Receiver performance requirements) of 17.3.10 (PHY receiver specifications).

The alternative adjacent channel rejection of Table 17-21 (Receiver performance requirements) shall not be required for the ERP.

(#3290)For ERP-DSSS/CCK PPDUs, the adjacent channel rejection shall follow 16.3.8.4 (Receiver adjacent channel rejection).

#### 18.4.8.4 Receive maximum input level capability

The PER shall be less than 10% at a PSDU length of 1000 octets for an input level of –20 dBm measured at the antenna connector for any supported modulation signal or data rate (i.e., 1, 2, 5.5, 6, 9, 11, 12, 18, 22, 24, 33, 36, 48, 54 Mb/s).

## 18.5 ERP PLME

### 18.5.1 PLME SAP

Table 18-4 (MIB attribute default values/ranges) lists the additional MIB attributes that may be accessed by the PHY entities and the intralayer of higher LMEs. These attributes are accessed via the PLME-GET, PLME-SET, PLME-RESET, and PLME-CHARACTERISTICS primitives defined in 6.7 (PLME SAP interface).

### 18.5.2 MIB

HR/DSSS PHY MIB attributes are defined in Annex C with additions from this supplement and with specific values defined in Table 18-4 (MIB attribute default values/ranges).

**Table 18-4—MIB attribute default values/ranges**

When MAX-ACCESS is read-only, the MIB attribute value may be updated by the PLME and read from the MIB attribute by management entities. When MAX-ACCESS is read-write, the MIB attribute may be read and written by management entities but shall not be updated by the PLME.

### 18.5.3 TXTIME

#### 18.5.3.1 General

The value of TXTIME is calculated for each modulation type based on parameters in the TXVECTOR. For the 1, 2, 5.5, and 11 Mb/s modes with DSSS and CCK modulation formats, the value shall be calculated as described in 16.3.4 (HR/DSSS TXTIME calculation).

#### 18.5.3.2 ERP-OFDM TXTIME calculations

The value of the TXTIME parameter returned by the PLME-TXTIME.confirm primitive shall be calculated using the ERP-OFDM TXTIME calculation as shown in Equation (18-1).

$$\text{TXTIME} = T_{PREAMBLE} + T_{SIGNAL} + T_{SYM} \times \left\lceil \frac{16 + 8 \times \text{LENGTH} + 6}{N_{DBPS}} \right\rceil + T_{SE} \quad (18\text{-}1)$$

where

$T_{PREAMBLE}$, $T_{SIGNAL}$, and $T_{SYM}$ are defined in Table 17-5 (Timing-related parameters) in 17.3.2.4 (Timing-related parameters)

$N_{DBPS}$ is the number of data bits per symbol and is derived from the DATARATE parameter in Table 17-4 (Modulation-dependent parameters) in 17.3.2.3 (Modulation-dependent parameters)

$T_{SE}$ is aSignalExtension

# 19. High Throughput (HT) PHY specification(#2297)

## 19.1 Introduction

### 19.1.1 Introduction to the HT PHY

Clause 19 (High Throughput (HT) PHY specification(#2297)) specifies the PHY entity for a (#2297)high throughput (HT) orthogonal frequency division multiplexing (OFDM) system. In addition, a variant capability PHY based on the HT PHY ("Class 2 HT PHY") is defined in this clause.

In addition to the requirements found in Clause 19 (High Throughput (HT) PHY specification(#2297)), an HT STA shall support(#546) transmitting and receiving frames that are compliant with the mandatory PHY specifications defined as follows:

— In Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) when the HT STA is operating in a 20 MHz channel width in the 5 GHz band

— In Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification) and Clause 18 (Extended Rate PHY (ERP) specification) when the HT STA is operating in a 20 MHz channel width in the 2.4 GHz band

An HT STA that operates in the 5 GHz band shall comply with all normative requirements of Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification). An HT STA that operates in the 2.4 GHz band shall comply with all normative requirements of Clause 18 (Extended Rate PHY (ERP) specification).

The HT PHY is based on the OFDM PHY defined in Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification), with extensibility up to four spatial streams, operating in 20 MHz bandwidth. Additionally, transmission using one to four spatial streams is defined for operation in 40 MHz bandwidth. These features are capable of supporting data rates up to 600 Mb/s (four spatial streams, 40 MHz bandwidth).

The HT PHY data subcarriers are modulated using binary phase shift keying (BPSK), quadrature phase shift keying (QPSK), 16-quadrature amplitude modulation (16-QAM), or 64-QAM. Forward error correction (FEC) coding (convolutional coding) is used with a coding rate of 1/2, 2/3, 3/4, or 5/6. LDPC codes are added as an optional feature.

Other optional features at both transmit and receive sides are 400 ns (short) guard interval (GI), transmit beamforming, HT-greenfield format, and STBC.

The maximum HT PSDU length is 65 535 octets.

A non-AP STA is a Class 2 HT STA if it satisfies all of the following requirements and is not an HT STA:

1) The STA shall operate in the 2.4 GHz band, and shall have operating channel width 20 MHz.
2) The STA shall support transmission and reception of DSSS 1 Mb/s and 2 Mb/s.
3) The STA shall support transmission and reception of ERP-OFDM 6 Mb/s.
4) If the STA supports HR/DSSS 11 Mb/s, then it shall support HR/DSSS 5.5 Mb/s.
5) If the STA supports ERP-OFDM 24 Mb/s, then it shall support ERP-OFDM 12 Mb/s.
6) If the STA supports any $N_{SS}$ = 1 HT-MCS > 0, then it shall support all $N_{SS}$ = 1 HT lower HT-MCSs and all lower ERP rates.
7) Except as noted in 4), 5), and 6), each (non-DSSS) HR/DSSS and ERP-OFDM data rate and each HT-MCS is optional.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

8) The STA shall support DSSS long preamble and short preamble.
9) The STA shall support short slot time.
10) The CCA functionality for ERP-OFDM in 18.4.6 (CCA performance) a) and b) and for HT in 19.3.19.6.4 (CCA sensitivity in 20 MHz) shall be supported.
11) The minimum receiver sensitivity requirements of Clause 15 (DSSS PHY specification for the 2.4 GHz band designated for ISM applications), Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification), Clause 18 (Extended Rate PHY (ERP) specification), and Clause 19 (High Throughput (HT) PHY specification(#2297)) shall apply to all supported modes.
12) A Class 2 HT STA shall indicate support in the Supported Rates and BSS Membership Selectors element, and, if applicable, the Extended Supported Rates and BSS Membership Selectors element, during association and reassociation, and in probe requests, for
    — 1, 2, 5.5, 11, 6, 12, and 24 Mb/s (whether it supports all of these rates of not), and
    — All ERP rates from the set 9, 18, 36, 48, and 54 Mb/s that the Class 2 HT STA supports, and shall not indicate support for other ERP rates.
13) A Class 2 HT STA shall transmit the HT Capabilities element during association and reassociation, and in probe requests, and shall indicate in the Supported MCS Set field support for HT-MCSs 0-7 (whether it supports all of these HT-MCSs or not).
14) A Class 2 HT STA shall transmit the Supplemental Class 2 Capabilities element.
15) In all other respects the STA shall follow the requirements of the ERP and the HT PHY.

NOTE—A Class 2 HT STA is not(M118) able to operate in a BSS whose AP includes in the basic rate/HT-MCS set, and uses for transmission of (#1293)group addressed frames, only rates/HT-MCSs that the STA does not support.

### 19.1.2 Scope of HT PHY services

The services provided to the MAC by the HT PHY consist of the following protocol functions:

a) A function that defines a method of mapping the PSDUs into a (#14)PPDU format suitable for sending and receiving PSDUs between two or more STAs.
b) A function that defines the characteristics and method of transmitting and receiving data through a wireless medium between two or more STAs. Depending on the PPDU format, these STAs support a mixture of HT PHY and Clause 15 (DSSS PHY specification for the 2.4 GHz band designated for ISM applications), Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification), Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification), or Clause 18 (Extended Rate PHY (ERP) specification) PHYs.

### 19.1.3 HT PHY functions

#### 19.1.3.1 General

The HT PHY contains two functional entities: the PHY and the layer management function (i.e., the PLME). Both of these functions are described in detail in 19.3 (HT PHY) and 19.4 (HT PLME).

The HT PHY service is provided to the MAC through the PHY service primitives defined in Clause 8 (PHY service specification).

#### 19.1.3.2 PHY management entity (PLME)

The PLME performs management of the local PHY functions in conjunction with the MLME.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

#### 19.1.3.3 Service specification method

The models represented by figures and state diagrams are intended to be illustrations of the functions provided. It is important to distinguish between a model and a real implementation. The models are optimized for simplicity and clarity of presentation, but do not necessarily reflect any particular implementation. The service of a layer or sublayer is the set of capabilities that it offers to a user in the next higher layer (or sublayer). Abstract services are specified here by describing the service primitives and parameters that characterize each service. This definition is independent of any particular implementation.

### 19.1.4 PPDU formats

The structure of the PPDU transmitted by an HT STA is determined by the TXVECTOR FORMAT, CH_BANDWIDTH, CH_OFFSET, and MCS parameters as defined in Table 19-1 (TXVECTOR and RXVECTOR parameters). The effect of the CH_BANDWIDTH, CH_OFFSET, and MCS parameters on PPDU format is described in 19.2.4 (Effect of CH_BANDWIDTH, CH_OFFSET, and MCS parameters on PPDU format).

The FORMAT parameter determines the overall structure of the PPDU as follows:

— *Non-HT format* **(NON_HT):** (#14)(#2262)PPDUs of this format are structured according to the Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) (OFDM) or Clause 18 (Extended Rate PHY (ERP) specification) (ERP) specification. Support for non-HT format is mandatory.

— *HT-mixed format* **(HT_MF):** (#14)(#2263)PPDUs of this format contain a preamble compatible with Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) and Clause 18 (Extended Rate PHY (ERP) specification) receivers. The non-HT-STF (L-STF), the non-HT-LTF (L-LTF), and the non-HT SIGNAL field (L-SIG) are defined so they can be decoded by non-HT Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) and Clause 18 (Extended Rate PHY (ERP) specification) STAs. The rest of the (#14)PPDU cannot be decoded by Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) or Clause 18 (Extended Rate PHY (ERP) specification) STAs. Support for HT-mixed format is mandatory.

— *HT-greenfield format* **(HT_GF):** (#14)(#2263)PPDUs of this format do not contain a non-HT compatible part. Support for HT-greenfield format is optional. (#181)An HT STA that does not support the reception of an HT-greenfield format (#14)PPDU shall support detection that an HT-greenfield format packet is an HT transmission (as opposed to a non-HT transmission). In this case, the receiver shall decode the HT-SIG and determine whether the HT-SIG cyclic redundancy check (CRC) passes.

## 19.2 HT PHY service interface

### 19.2.1 Introduction

The PHY interfaces to the MAC through the TXVECTOR, TXSTATUS, RXVECTOR, and PHYCONFIG_VECTOR. Using the TXVECTOR, the MAC supplies the PHY with per-PPDU transmit parameters. Status of the transmission is reported from PHY to MAC by parameters within TXSTATUS. Using the RXVECTOR, the PHY informs the MAC of the received (#14)PPDU's parameters. Using the PHYCONFIG_VECTOR, the MAC configures the PHY for operation, independent of (#14)PPDU transmission or reception.

This interface is an extension of the generic PHY service interface defined in 8.3.4 (Basic service and options).

This is an unapproved IEEE Standards Draft, subject to change.

### 19.2.2 TXVECTOR and RXVECTOR parameters

The parameters in Table 19-1 (TXVECTOR and RXVECTOR parameters) are defined as part of the TXVECTOR parameter list in the PHY-TXSTART.request primitive and/or as part of the RXVECTOR parameter list in the PHY-RXSTART.indication primitive.

**Table 19-1—TXVECTOR and RXVECTOR parameters**

| Parameter | Condition | Value | TXVECTOR See NOTE 1 | RXVECTOR See NOTE 1 |
|---|---|---|---|---|
| FORMAT | | Determines the format of the PPDU.<br>Enumerated type:<br>NON_HT indicates DSSS, HR/DSSS, OFDM or ERP PPDU formats or non-HT duplicates PPDU format. In this case, the modulation is determined by the NON_HT_MODULATION parameter.<br>HT_MF indicates HT-mixed format.<br>HT_GF indicates HT-greenfield format. | Y | Y |
| NON_HT_MODULATION | FORMAT is NON_HT | Enumerated type:<br>ERP-DSSS<br>ERP-CCK<br>ERP-OFDM<br>OFDM<br>NON_HT_DUP_OFDM | Y | Y |
| | Otherwise | Not present | | |
| L_LENGTH | FORMAT is NON_HT | Indicates the length of the PSDU in octets in the range 1 to 4095. This value is used by the PHY to determine the number of octet transfers that occur between the MAC and the PHY. | Y | Y |
| | FORMAT is HT_MF | Indicates the value in the Length field of the L-SIG field(#4145) in the range 1 to 4095. This use is defined in 10.27.4 (L_LENGTH and L_DATARATE parameter values for HT-mixed format PPDUs). | Y | Y |
| | FORMAT is HT_GF | Not present | N | N |
| L_DATARATE | FORMAT is NON_HT | Indicates the rate used to transmit the PSDU in Mb/s(#4148). Allowed values depend on the value of the NON_HT_MODULATION parameter as follows:<br>ERP-DSSS: 1 and 2<br>ERP-CCK: 5.5 and 11<br>ERP-OFDM, NON_HT_DUP_OFDM:<br>6, 9, 12, 18, 24, 36, 48, and 54<br>OFDM: 6, 9, 12, 18, 24, 36, 48, and 54 | Y | Y |
| | FORMAT is HT_MF | Indicates the data rate value that is in the L-SIG field(#4145). This use is defined in 10.27.4 (L_LENGTH and L_DATARATE parameter values for HT-mixed format PPDUs). | Y | Y |
| | FORMAT is HT_GF | Not present | N | N |

This is an unapproved IEEE Standards Draft, subject to change.

**Table 19-1—TXVECTOR and RXVECTOR parameters *(continued)***

| Parameter | Condition | Value | TXVECTOR | RXVECTOR |
|---|---|---|---|---|
| | | | See NOTE 1 | |
| LSIGVALI | FORMAT is HT_MF | true if L-SIG Parity is valid<br>false if L-SIG Parity is not valid | N | Y |
| | Otherwise | Not present | N | N |
| SERVICE | FORMAT is NON_HT and NON_HT_MODULATION is one of<br>— ERP-OFDM<br>— OFDM | Scrambler initialization, null | Y | N |
| | FORMAT is HT_MF or HT_GF | Scrambler initialization, null | Y | N |
| | Otherwise | Not present | N | N |
| TXPWR_LEVEL_INDEX | | The allowed values for the TXPWR_LEVEL_INDEX parameter are in the range 1 to 8. This parameter is used to indicate which of the available TxPowerLevel attributes defined in the MIB shall be used for the current transmission. | Y | N |
| RSSI | | The allowed values for the RSSI parameter are in the range 0 to 255. This parameter is a (#1132)measurement by the PHY of the power observed at the antenna connector used to receive the current PPDU. RSSI shall be measured during the reception of the PHY preamble. In HT-mixed format, the reported RSSI shall be measured during the reception of the HT-LTFs. RSSI is intended to be used in a relative manner, and it shall be a monotonically increasing function of the received power. | N | Y |
| PREAMBLE_TYPE | FORMAT is NON_HT and NON_HT_MODULATION is one of<br>— ERP-DSSS<br>— ERP-CCK | Enumerated type:<br>SHORTPREAMBLE<br>LONGPREAMBLE | Y | Y |
| | Otherwise | Not present | N | N |

This is an unapproved IEEE Standards Draft, subject to change.

**Table 19-1—TXVECTOR and RXVECTOR parameters *(continued)***

| Parameter | Condition | Value | TXVECTOR See NOTE 1 | RXVECTOR See NOTE 1 |
|---|---|---|---|---|
| MCS | FORMAT is HT_MF or HT_GF | Selects the modulation and coding scheme used in the transmission of the (#14)PPDU. The value used in each MCS is the index defined in 19.5 (Parameters for HT-MCSs).<br>Integer: range 0 to 76. Values of 77 to 127 are reserved.<br>The interpretation of the MCS index is defined in 19.5 (Parameters for HT-MCSs). | Y | Y |
| | Otherwise | Not present | N | N |
| REC_MCS | FORMAT is HT_MF or HT_GF | Indicates the MCS that the STA's receiver recommends. | N | O |
| | Otherwise | Not present | N | N |
| CH_BANDWIDTH | FORMAT is HT_MF or HT_GF | Indicates whether the (#14)PPDU is transmitted using 40 MHz or 20 MHz channel width.<br>Enumerated type:<br>HT_CBW20 for 20 MHz and 40 MHz upper and 40 MHz lower modes<br>HT_CBW40 for 40 MHz | Y | Y |
| | FORMAT is NON_HT | Enumerated type:<br>NON_HT_CBW40 for non-HT duplicate format<br>NON_HT_CBW20 for all other non-HT formats | Y | Y |
| CH_OFFSET | | Indicates which portion of the channel is used for transmission. Refer to Table 19-2 (Interpretation of FORMAT, CH_BANDWIDTH, and CH_OFFSET parameters) for valid combinations of CH_OFFSET and CH_BANDWIDTH.<br><br>Enumerated type:<br>CH_OFF_20 indicates the use of a 20 MHz channel (that is not part of a 40 MHz channel).<br>CH_OFF_40 indicates the entire 40 MHz channel.<br>CH_OFF_20U indicates the upper 20 MHz of the 40 MHz channel<br>CH_OFF_20L indicates the lower 20 MHz of the 40 MHz channel. | Y | N |
| LENGTH | FORMAT is HT_MF or HT_GF | Indicates the length of an HT PSDU in the range 0 to 65 535 octets. A value of 0 indicates (#2137)an NDP that contains no data symbols after the HT preamble (see 19.3.9 (HT preamble)). | Y | Y |
| | Otherwise | Not present | N | N |
| SMOOTHING | FORMAT is HT_MF or HT_GF | Indicates whether frequency domain smoothing is recommended as part of channel estimation. (See NOTE 2.)<br>Enumerated type:<br>SMOOTHING_REC indicates that smoothing is recommended.<br>SMOOTHING_NOT_REC indicates that smoothing is not recommended. | Y | Y |
| | Otherwise | Not present | N | N |

NOTE 2—Setting the Smoothing bit is defined in 19.3.11.11.2 (Spatial mapping).

### 19.2.3 PHYCONFIG_VECTOR parameters

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for an HT PHY contains an OPERATING_CHANNEL parameter, which identifies the operating or primary channel. The PHY shall set dot11CurrentPrimaryChannel to the value of this parameter.

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for an HT PHY contains a SECONDARY_CHANNEL_OFFSET parameter, which takes one of the following values:

— SECONDARY_CHANNEL_NONE if no secondary channel is present; in this case the PHY shall set dot11CurrentSecondaryChannel to 0.

— SECONDARY_CHANNEL_ABOVE if the secondary channel is above the primary channel; in this case the PHY shall set dot11CurrentSecondaryChannel to dot11CurrentPrimaryChannel + 4.

— SECONDARY_CHANNEL_BELOW if the secondary channel is below the primary channel; in this case the PHY shall set dot11CurrentSecondaryChannel to dot11CurrentPrimaryChannel – 4.

### 19.2.4 Effect of CH_BANDWIDTH, CH_OFFSET, and MCS parameters on PPDU format

The structure of the PPDU transmitted by an HT STA is determined by the TXVECTOR FORMAT, CH_BANDWIDTH, CH_OFFSET, and MCS parameters as defined in Table 19-1 (TXVECTOR and RXVECTOR parameters). The effect of the FORMAT parameter is described in 19.1.4 (PPDU formats).

The operation of the PHY in the frequency domain is determined by the FORMAT, CH_BANDWIDTH, and CH_OFFSET parameters. Table 19-2 (Interpretation of FORMAT, CH_BANDWIDTH, and CH_OFFSET

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

parameters) shows the valid combinations of FORMAT, CH_BANDWIDTH, and CH_OFFSET and the corresponding PPDU format. Other combinations are reserved.

**Table 19-2—Interpretation of FORMAT, CH_BANDWIDTH, and CH_OFFSET parameters**

| FORMAT | CH_BANDWIDTH | CH_OFFSET |
|---|---|---|
| HF_MF, HF_GF | HT_CBW20 | CH_OFF_20: *20 MHz HT format*—The STA has a 20 MHz operating channel width and transmits an HT-mixed or HT-greenfield format PPDU of 20 MHz bandwidth.<br>CH_OFF_20U: *40 MHz HT upper format*—The STA transmits an HT-mixed or HT-greenfield format PPDU of 20 MHz bandwidth in the upper 20 MHz of a 40 MHz channel.<br>CH_OFF_20L: *40 MHz HT lower format*—The STA transmits an HT-mixed or HT-greenfield format PPDU of 20 MHz bandwidth in the lower 20 MHz of a 40 MHz channel. |
| HT_MF, HT_GF | HT_CBW40 | CH_OFF_40: *40 MHz HT format*—The STA transmits an HT-mixed or HT-greenfield format PPDU of 40 MHz bandwidth. |
| NON_HT | NON_HT_CBW20 and the SECONDARY_CHANNEL_OFFSET parameter of the PHYCONFIG_VECTOR is SECONDARY_CHANNEL_NONE | CH_OFF_20: *20 MHz non-HT format*—The STA has a 20 MHz operating channel width and transmits an (#1368)ERP-DSSS, ERP-CCK or ERP-OFDM format PPDU, or OFDM PPDU. |
| NON_HT | NON_HT_CBW20 and the SECONDARY_CHANNEL_OFFSET parameter of the PHYCONFIG_VECTOR is SECONDARY_CHANNEL_BELOW | CH_OFF_20U: *40 MHz non-HT upper format*—The STA transmits an (#1368)ERP-DSSS, ERP-CCK or ERP-OFDM format PPDU, or OFDM PPDU, in the upper 20 MHz of a 40 MHz channel. |
| NON_HT | NON_HT_CBW20 and the SECONDARY_CHANNEL_OFFSET parameter of the PHYCONFIG_VECTOR is SECONDARY_CHANNEL_ABOVE | CH_OFF_20L: *40 MHz non-HT lower format*—The STA transmits an (#1368)ERP-DSSS, ERP-CCK or ERP-OFDM format PPDU, or OFDM PPDU, in the lower 20 MHz of a 40 MHz channel. |
| NON_HT | NON_HT_CBW40 | CH_OFF_40: *Non-HT duplicate format*—The STA transmits an (#2095)ERP-OFDM format PPDU or OFDM PPDU in each of the 20 MHz channels of a 40 MHz channel. The upper channel (higher frequency) is rotated by +90° relative to the lower channel. See 19.3.11.12 (Non-HT duplicate transmission). |

### 19.2.5 Support for NON_HT formats

When the FORMAT parameter is equal to NON_HT, the behavior of the HT PHY is defined in other clauses as shown in Table 19-3 (Mapping of the HT PHY parameters for NON_HT operation), dependent on the operational band. In this case, the PHY-TXSTART.request primitive is handled by mapping the TXVECTOR parameters as defined in Table 19-3 (Mapping of the HT PHY parameters for NON_HT operation) and following the operation as defined in the referenced clause. Likewise the PHY-RXSTART.indication primitive emitted when a non-HT PPDU is received is defined in the referenced clauses, with mapping of RXVECTOR parameters as defined in Table 19-3 (Mapping of the HT PHY parameters for NON_HT operation).

**Table 19-3—Mapping of the HT PHY parameters for NON_HT operation**

| HT PHY parameter | 2.4 GHz operation defined by Clause 15 (DSSS PHY specification for the 2.4 GHz band designated for ISM applications) | 2.4 GHz operation defined by Clause 16 (High rate direct sequence spread spectrum (HR/ DSSS) PHY specification) | 2.4 GHz operation defined by Clause 18 (Extended Rate PHY (ERP) specification) | 5 GHz(#4147) operation defined by Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) |

NOTE—A dash (—) in an entry above indicates that the related parameter is not present.

(#2095)Non-HT PPDUs structured according to Clause 15 (DSSS PHY specification for the 2.4 GHz band designated for ISM applications), Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification), Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification), or Clause 18 (Extended Rate PHY (ERP) specification) are transmitted

- Within the limits of the transmit spectrum mask specified in the respective clauses, or
- As non-HT duplicate PPDUs within the limits of the 40 MHz transmit spectrum mask defined in 19.3.18.1 (Transmit spectrum mask), or
- As 20 MHz format non-HT PPDUs, within the limits of the 40 MHz transmit spectrum mask defined in 19.3.18.1 (Transmit spectrum mask), in the upper (CH_BANDWIDTH of value NON_HT_CBW20 and CH_OFFSET of value CH_OFF_20U) or lower (CH_BANDWIDTH of value NON_HT_CBW20 and CH_OFFSET of value CH_OFF_20U) 20 MHz of the 40 MHz channel.

Non-HT PPDUs transmitted using the 40 MHz transmit spectrum mask are referred to as *40 MHz mask non-HT PPDUs*. Refer to 11.15.9 (STA CCA sensing in a 20/40 MHz BSS) for CCA sensing rules for transmission of 40 MHz mask non-HT PPDUs.

### 19.2.6 TXSTATUS parameters

The parameters listed in Table 19-4 (TXSTATUS parameters) are defined as part of the TXSTATUS parameter list in the PHY-TXSTART.confirm service primitive.

**Table 19-4—TXSTATUS parameters**

| Parameter | Value |
|---|---|
| TIME_OF_DEPARTURE | 0 to $2^{32}$– 1. The locally measured time when the first (#14)PPDU energy is sent by the transmitting port, in units equal to 1/ TIME_OF_DEPARTURE_ClockRate. This parameter is present only if TIME_OF_DEPARTURE_REQUESTED is true in the corresponding request. |
| TIME_OF_DEPARTURE_ClockRate | 0 to $2^{16}$– 1. The clock rate, in units of MHz, is used to generate the TIME_OF_DEPARTURE value. This parameter is present only if TIME_OF_DEPARTURE_REQUESTED is true in the corresponding request. |
| TX_START_OF_FRAME_OFFSET | 0 to $2^{32}$– 1. An estimate of the offset (in 10 ns units) from the point in time at which the start of the preamble (#14)of the PPDU was transmitted at the transmit antenna connector to the point in time at which this primitive is issued to the MAC. |

## 19.3 HT PHY

### 19.3.1 Introduction

Subclause 19.3 (HT PHY) provides a procedure in which PSDUs are converted to and from PPDUs. During transmission, the PSDU is processed (i.e., scrambled and coded) and appended to the PHY preamble to create the PPDU. At the receiver, the PHY preamble is processed to aid in demodulation and delivery of the PSDU.

Two preamble formats are defined. For HT-mixed format operation, the preamble has a non-HT portion and an HT portion. The non-HT portion of the HT-mixed format preamble enables detection of the PPDU and acquisition of carrier frequency and timing by both HT STAs and STAs that are compliant with Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) and/or Clause 18 (Extended Rate PHY (ERP) specification). The non-HT portion of the HT-mixed format preamble also consists of the SIGNAL field defined in Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) and is thus decodable by STAs compliant with Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) and Clause 18 (Extended Rate PHY (ERP) specification) as well as HT STAs.

The HT portion of the HT-mixed format preamble enables estimation of the MIMO channel to support demodulation of the HT data by HT STAs. The HT portion of the HT-mixed format preamble also includes the HT-SIG field, which supports HT operation. The SERVICE field is prepended to the PSDU.

For HT-greenfield operation, compatibility with Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) and Clause 18 (Extended Rate PHY (ERP) specification) STAs is not required. Therefore, the non-HT portions of the preamble are not included in the HT-greenfield format preamble.

This is an unapproved IEEE Standards Draft, subject to change.

### 19.3.2 PPDU format

Two formats are defined for the PPDU: HT-mixed format and HT-greenfield format. These two formats are called *HT formats*. Figure 19-1 (PPDU format) shows the non-HT format[42] and the HT formats. The HT formats can be used for MCS 32 that provides the lowest rate in a 40 MHz channel (see in 19.3.11.11.5 (Transmission in MCS 32 format)). In addition to the HT formats, there is a non-HT duplicate format (specified in 19.3.11.12 (Non-HT duplicate transmission)) that duplicates the 20 MHz non-HT (#14)PPDU in two 20 MHz halves of a 40 MHz channel.

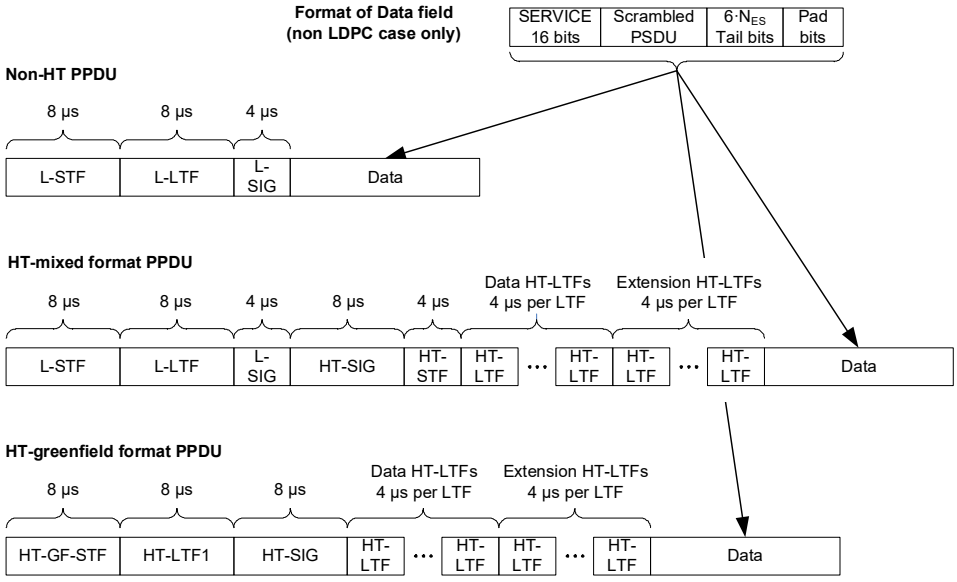

**Figure 19-1—PPDU format**

The elements of the PPDU are summarized in Table 19-5 (Elements of the HT PPDU).

**Table 19-5—Elements of the HT PPDU**

| Element | Description |
|---|---|
| L-STF | Non-HT Short Training field |
| L-LTF | Non-HT Long Training field |
| L-SIG | Non-HT SIGNAL field |
| HT-SIG | HT SIGNAL field |
| HT-STF | HT Short Training field |
| HT-GF-STF | HT-Greenfield Short Training field |
| HT-LTF1 | First HT Long Training field (Data) |

[42] The non-HT format is shown related to the terminology of this subclause. The (#2095)non-HT format is defined in 17.3.3 (PHY preamble (SYNC)) and 17.3.2 (PPDU format).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 19-5—Elements of the HT PPDU *(continued)***

| Element | Description |
|---|---|
| HT-LTFs | Additional HT Long Training fields (Data and Extension) |
| Data | The Data field includes the PSDU |

The HT-SIG, HT-STF, HT-GF-STF, HT-LTF1, and HT-LTFs exist only in HT PPDUs(#14). In non-HT packets only the L-STF, L-LTF, L-SIG, and Data fields exist.

In both HT-mixed format and HT-greenfield format PPDUs(#14), there are two types of HT-LTFs: Data HT-LTFs (HT-DLTFs) and Extension HT-LTFs (HT-ELTFs). HT-DLTFs are always included in HT PPDUs to provide the necessary reference for the receiver to form a channel estimate that allows it to demodulate (#14)the Data field. The number of HT-DLTFs, $N_{HT\text{-}DLTF}$, may be 1, 2, or 4 and is determined by the number of space-time streams being transmitted in the (#14)PPDU (see Table 19-13 (Number of HT-DLTFs required for data space-time streams(#83))). HT-ELTFs provide additional reference in sounding PPDUs so that the receiver can form an estimate of additional dimensions of the channel beyond those that are used by (#14)the Data field. The number of HT-ELTFs, $N_{HT\text{-}ELTF}$, may be 0, 1, 2, or 4 (see Table 19-14 (Number of HT-ELTFs required for extension spatial streams)). PHY preambles in which HT-DLTFs are followed by HT-ELTFs are referred to as *staggered preambles*. The HT-mixed format and HT-greenfield format (#14)PPDUs shown in Figure 19-1 (PPDU format) both contain staggered preambles for illustrative purposes.

(#14)A PPDU with the TXVECTOR parameter NO_SIG_EXTN equal to false is immediately followed by a period of no transmission for a duration of aSignalExtension. See 10.3.8 (Signal extension).

A signal extension shall be present in a transmitted PPDU, based on the parameters of the TXVECTOR, when the NO_SIG_EXTN parameter is equal to false and either of the following is true:

— The FORMAT parameter is equal to HT_MF or HT_GF.
— The FORMAT parameter is equal to NON_HT, and the NON_HT_MODULATION parameter is equal to ERP-OFDM, or NON_HT_DUP_OFDM.

A signal extension shall be assumed to be present (for the purpose of timing of PHY-RXEND.indication and PHY-CCA.indication primitives, as described below and in 19.3.21 (PHY receive procedure)) in a received PPDU when either of the following is true, based on the determined parameter values of the RXVECTOR:

— The FORMAT parameter is equal to HT_MF or HT_GF.
— The FORMAT parameter is equal to NON_HT, and the NON_HT_MODULATION parameter is equal to ERP-OFDM, or NON_HT_DUP_OFDM.

A PPDU containing a signal extension is called a *signal extended PPDU*. When transmitting a signal extended PPDU, the PHY-TXEND.indication primitive shall be emitted a period of aSignalExtension after the end of the last symbol of the PPDU. When receiving a signal extended PPDU, the PHY-RXEND.indication primitive shall be emitted a period of aSignalExtension after the end of the last symbol of the PPDU.

### 19.3.3 Transmitter block diagram

HT-mixed format and HT-greenfield format transmissions can be generated using a transmitter consisting of the following blocks:

a) *Scrambler* scrambles the data to reduce the probability of long sequences of 0s or 1s; see 19.3.11.3 (Scrambler).

b) *Encoder parser*, if binary convolutional code (BCC) encoding is to be used, demultiplexes the scrambled bits among $N_{ES}$ (number of BCC encoders for the Data field) BCC encoders, in a round robin manner.

c) *FEC encoders* encode the data to enable error correction. An FEC encoder may include a binary convolutional encoder followed by a puncturing device, or it may include a low-density parity check (LDPC) encoder.

d) *Stream parser* divides the outputs of the encoders into blocks that are sent to different interleaver and mapping devices. The sequence of the bits sent to an interleaver is called a *spatial stream*.

e) *Interleaver* interleaves the bits of each spatial stream (changes order of bits) to prevent long sequences of adjacent noisy bits from entering the BCC decoder. Interleaving is applied only when BCC encoding is used.

f) *Constellation mapper* maps the sequence of bits in each spatial stream to constellation points (complex numbers).

g) *STBC* encoder spreads constellation points from $N_{SS}$ spatial streams into $N_{STS}$ space-time streams using a space-time block code. STBC is used only when $N_{SS} < N_{STS}$; see 19.3.11.9.2 (Space-time block coding (STBC)).

h) *Spatial mapper* maps space-time streams to transmit chains. This may include one of the following:

   1) *Direct mapping*: Constellation points from each space-time stream are mapped directly onto the transmit chains (one-to-one mapping).

   2) *Spatial expansion*: Vectors of constellation points from all of the space-time streams are expanded via matrix multiplication to produce the input to all of the transmit chains.

   3) *Beamforming*: Similar to spatial expansion, each vector of constellation points from all of the space-time streams is multiplied by a matrix of steering vectors to produce the input to the transmit chains.

i) *Inverse discrete Fourier transform (IDFT)* converts a block of constellation points to a time domain block.

j) *Cyclic shift (CSD) insertion* is where the insertion of the cyclic shifts prevents unintentional beamforming. CSD insertion may occur before or after the IDFT. There are three cyclic shift types as follows:

   1) A cyclic shift specified per transmitter chain with the values defined in Table 19-9 (Cyclic shift for non-HT portion of PPDU) (a possible implementation is shown in Figure 19-2 (Transmitter block diagram 1)).

   2) A cyclic shift specified per space-time stream with the values defined in Table 19-10 (Cyclic shift values of HT portion of PPDU) (a possible implementation is shown in Figure 19-3 (Transmitter block diagram 2)).

   3) A cyclic shift $M_{CSD}(k)$ that may be applied as a part of the spatial mapper; see 19.3.11.11.2 (Spatial mapping).

k) *GI insertion* prepends to the symbol a circular extension of itself.

l) *Windowing* optionally smooths the edges of each symbol to increase spectral decay.

This is an unapproved IEEE Standards Draft, subject to change.

Figure 19-2 (Transmitter block diagram 1) and Figure 19-3 (Transmitter block diagram 2) show example transmitter block diagrams. In particular, Figure 19-2 (Transmitter block diagram 1) shows the transmitter blocks used to generate the HT-SIG of the HT-mixed format PPDU. These transmitter blocks are also used to generate the non-HT portion of the HT-mixed format PPDU, except that the BCC encoder and interleaver are not used when generating the L-STF and L-LTFs. Figure 19-3 (Transmitter block diagram 2) shows the transmitter blocks used to generate the Data field of the HT-mixed format and HT-greenfield format PPDUs. A subset of these transmitter blocks consisting of the constellation mapper and CSD blocks, as well as the blocks to the right of, and including, the spatial mapping block, are also used to generate the HT-STF, HT-GF-STF, and HT-LTFs. The HT-greenfield format SIGNAL field is generated using the transmitter blocks shown in Figure 19-2 (Transmitter block diagram 1), augmented by additional CSD and spatial mapping blocks.

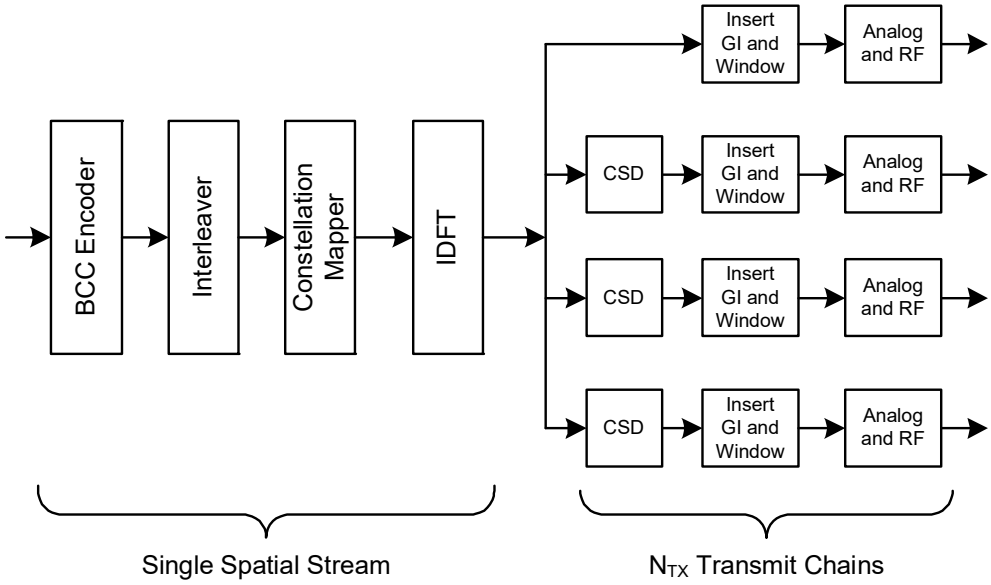

**Figure 19-2—Transmitter block diagram 1**

### 19.3.4 Overview of the PPDU encoding process

The encoding process is composed of the steps described below. The following overview is intended to facilitate an understanding of the details of the convergence procedure:

a) Determine the number of transmit chains, $N_{TX}$, from the N_TX parameter(#1875) of the TXVECTOR. Produce the PHY preamble training fields for each of the $N_{TX}$ transmit chains based on the FORMAT, NUM_EXTEN_SS, CH_BANDWIDTH, and MCS parameters of the TXVECTOR. The format and relative placement of the PHY preamble training fields vary depending on the (#14)PPDU format being used, as indicated by these parameters. Apply cyclic shifts. Determine spatial mapping to be used for HT-STF and HT-LTFs in (#14)an HT-mixed format PPDU and HT-GF-STF and HT-LTFs in an HT-greenfield format PPDU from the EXPANSION_MAT parameter of the TXVECTOR. Refer to 19.3.9 (HT preamble) for details.

b) Construct the PHY preamble SIGNAL fields from the appropriate parameters(#1875) of the TXVECTOR by adding tail bits, applying convolutional coding, formatting into one or more OFDM symbols, applying cyclic shifts, applying spatial processing, calculating an inverse Fourier transform for each OFDM symbol and transmit chain, and prepending a cyclic prefix or GI to each OFDM symbol in each transmit chain. The number and placement of the PHY preamble SIGNAL fields depend on the (#14)PPDU format being used. Refer to 19.3.9.3.5 (L-SIG definition), 19.3.9.4.3 (HT-SIG definition), and 19.3.9.5.4 (HT-greenfield format HT-SIG).

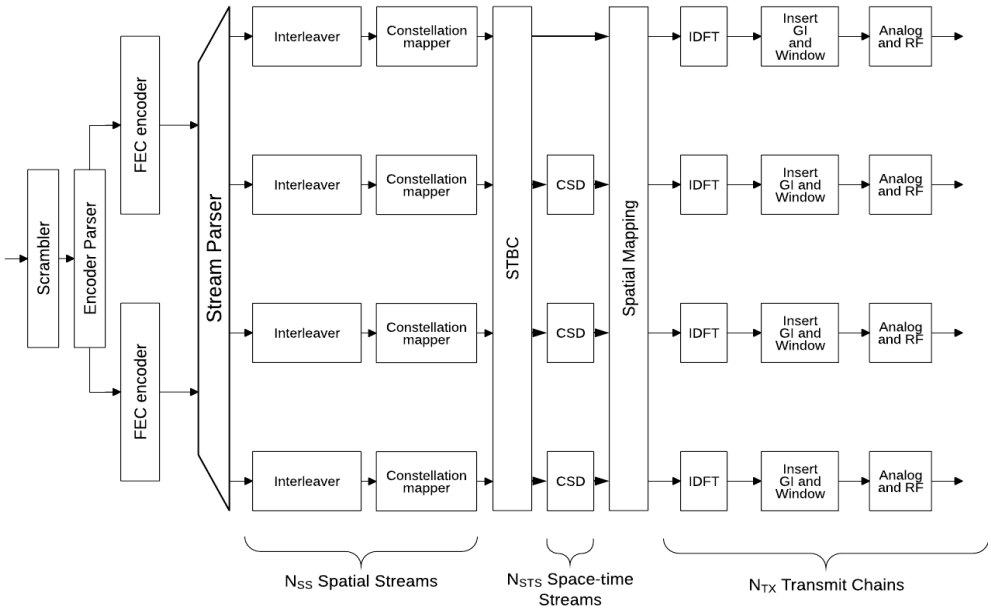
This is an unapproved IEEE Standards Draft, subject to change.



NOTE: The particular case shown here has two FEC encoders, four spatial streams, BCC coding, no STBC, and four transmit chains. The actual transmission mode may differ from the one shown here in various ways:
—There might be 1 or 2 FEC encoders when BCC encoding is used.
—The stream parser might have 1, 2, 3 or 4 outputs.
—When LDPC encoding is used, the interleavers are not used.
—When STBC is used, the STBC block has more outputs than inputs (otherwise the ouputs equal the inputs).
—When spatial mapping is used, there might be more transmit chains than space-time streams.
—The number of inputs to the spatial mapper might be 1, 2, 3, or 4.

**Figure 19-3—Transmitter block diagram 2**

c) Concatenate the PHY preamble training and SIGNAL fields for each transmit chain one field after another, in the appropriate order, as described in 19.3.2 (PPDU format) and 19.3.7 (Mathematical description of signals).

d) Use the MCS and CH_BANDWIDTH parameters of the TXVECTOR to determine the number of data bits per OFDM symbol ($N_{DBPS}$), the coding rate ($R$), the number of coded bits in each OFDM subcarrier ($N_{BPSC}$), and the number of coded bits per OFDM symbol ($N_{CBPS}$). Determine the number of encoding streams ($N_{ES}$) from the MCS, CH_BANDWIDTH, and FEC_CODING parameters of the TXVECTOR. Refer to 19.3.11.4 (Coding) for details.

e) Append the PSDU to the SERVICE field (see 19.3.11.2 (SERVICE field)). If BCC encoding is to be used, as indicated by the FEC_CODING parameter of the TXVECTOR, tail bits are appended to the PSDU. If a single BCC encoder is used (i.e., when the value of $N_{ES}$ is 1), the bit string is extended by 6 zero bits. If two BCC encoders are used (i.e., when the value of $N_{ES}$ is 2), the bit string is extended by 12 zero bits. The number of symbols, $N_{SYM}$, is calculated according to Equation (19-32), and if necessary, the bit string is further extended with zero bits so that the resulting length is a multiple of $N_{SYM} \times N_{DBPS}$, as described in 19.3.11 (Data field). If LDPC encoding is to be used, as indicated by the FEC_CODING parameter of the TXVECTOR, the resulting bit string is padded, if needed, by repeating coded bits rather than using zero bits, as given in the encoding procedure of 19.3.11.7.5 (LDPC PPDU encoding process). The number of resulting symbols is given by Equation (19-41), and the number of repeated coded bits used for padding is given by Equation (19-42). The resulting bit string constitutes the Data field of the (#14)PPDU.

This is an unapproved IEEE Standards Draft, subject to change.

f) (#602)Generate a scrambling sequence, and exclusive-OR (XOR) it with the string of data bits, as described in 19.3.11.3 (Scrambler).

g) If BCC encoding is to be used, replace the scrambled zero bits that served as tail bits (6 bits if the value of $N_{ES}$ is 1, or 12 bits if the value of $N_{ES}$ is 2) following the data with the same number of nonscrambled zero bits, as described in 17.3.5.3 (PPDU TAIL field). (These bits return the convolutional encoder to the zero state.)

h) If BCC encoding is to be used and the value of $N_{ES}$ is 2, divide the scrambled data bits between two BCC encoders by sending alternating bits to the two different encoders, as described in 19.3.11.5 (Encoder parsing operation for two BCC FEC encoders).

i) If BCC encoding is to be used, encode the extended, scrambled data string with a rate 1/2 convolutional encoder (see 17.3.5.6 (Convolutional encoder)). Omit (puncture) some of the encoder output string (chosen according to puncturing pattern) to reach the coding rate, *R*, corresponding to the TXVECTOR parameters MCS or L_DATARATE. Refer to 19.3.11.6 (BCC coding and puncturing) for details. If LDPC encoding is to be used, encode the scrambled data stream according to 19.3.11.7.5 (LDPC PPDU encoding process).

j) Parse the coded bit stream that results from the BCC encoding or LDPC encoding into $N_{SS}$ spatial streams, where the value of $N_{SS}$ is determined from the MCS parameter of the TXVECTOR. See 19.3.11.8.2 (Stream parser) for details.

k) Divide each of the $N_{SS}$ encoded and parsed spatial streams of bits into groups of $N_{CBPSS}(i)$ bits. If BCC encoding is to be used, within each spatial stream and group, perform an interleaving (reordering) of the bits according to a rule corresponding to $N_{BPSCS}(i)$, where $i$ is the index of the spatial stream. Refer to 19.3.6 (Timing-related parameters) for details.

l) For each of the $N_{SS}$ encoded, parsed, and interleaved spatial streams, divide the resulting coded and interleaved data string into groups of $N_{BPSCS}(i)$ bits, where $i$ is the index of the spatial stream. For each of the bit groups, convert the bit group into a complex number according to the modulation encoding tables. Refer to 17.3.5.8 (Subcarrier modulation mapping) for details.

m) Divide the complex number string for each of the resulting $N_{SS}$ spatial streams into groups of $N_{SD}$ complex numbers, where the value of $N_{SD}$ is determined from the CH_OFFSET parameter of TXVECTOR and the CH_BANDWIDTH parameter of TXVECTOR. Each such group is associated with one OFDM symbol in one spatial stream. In each group, the complex numbers are indexed 0 to $N_{SD}-1$, and these indices have an associated one-to-one correspondence with subcarrier indices via the mapping function $M^{r}(k)$ as described in 19.3.11.11 (OFDM modulation), 19.3.11.11.3 (Transmission in 20 MHz HT format), 19.3.11.11.4 (Transmission in 40 MHz HT format), 19.3.11.11.5 (Transmission in MCS 32 format), and 19.3.11.12 (Non-HT duplicate transmission).

n) If STBC is to be applied, as indicated by the STBC parameter in the TXVECTOR, operate on the complex number associated with each data subcarrier in sequential pairs of OFDM symbols as described in 19.3.11.9.2 (Space-time block coding (STBC)) to generate $N_{STS}$ OFDM symbols for every $N_{SS}$ OFDM symbols associated with the $N_{SS}$ spatial streams. If STBC is not to be used, the number of space-time streams is the same as the number of spatial streams, and the sequences of OFDM symbols in each space-time stream are composed of the sequences of OFDM symbols in the corresponding spatial stream. In each group of $N_{SD}$ resulting complex numbers in each space-time stream, the complex numbers indexed 0 to $N_{SD}-1$ are mapped onto OFDM subcarriers via the mapping function $M^{r}(k)$ as described in 19.3.11.11 (OFDM modulation), 19.3.11.11.3 (Transmission in 20 MHz HT format), 19.3.11.11.4 (Transmission in 40 MHz HT format), 19.3.11.11.5 (Transmission in MCS 32 format), and 19.3.11.12 (Non-HT duplicate transmission).

This is an unapproved IEEE Standards Draft, subject to change.

o) Determine whether 20 MHz or 40 MHz operation is to be used from the CH_BANDWIDTH parameter of the TXVECTOR. Specifically, when CH_BANDWIDTH is HT_CBW20 or NON_HT_CBW20, 20 MHz operation is to be used. When CH_BANDWIDTH is HT_CBW40 or NON_HT_CBW40, 40 MHz operation is to be used. For 20 MHz operation (with the exception of non-HT formats), insert four subcarriers as pilots into positions –21, –7, 7, and 21. The total number of the subcarriers, $N_{ST}$, is 56. For 40 MHz operation (with the exception of MCS 32 and non-HT duplicate format), insert six subcarriers as pilots into positions –53, –25, –11, 11, 25, and 53, resulting in a total of $N_{ST} = 114$ subcarriers. See 19.3.11.11.5 (Transmission in MCS 32 format) for pilot locations when using MCS 32 and 19.3.11.12 (Non-HT duplicate transmission) for pilot locations when using non-HT duplicate format. The pilots are modulated using a pseudorandom cover sequence. Refer to 19.3.11.10 (Pilot subcarriers) for details. For 40 MHz operation, apply a +90° phase shift to the complex value in each OFDM subcarrier with an index greater than 0, as described in 19.3.11.11.4 (Transmission in 40 MHz HT format), 19.3.11.11.5 (Transmission in MCS 32 format), and 19.3.11.12 (Non-HT duplicate transmission).

p) Map each of the complex numbers in each of the $N_{ST}$ subcarriers in each of the OFDM symbols in each of the $N_{STS}$ space-time streams to the $N_{TX}$ transmit chain inputs. For direct-mapped operation, $N_{TX} = N_{STS}$, and there is a one-to-one correspondence between space-time streams and transmit chains. In this case, the OFDM symbols associated with each space-time stream are also associated with the corresponding transmit chain. Otherwise, a spatial mapping matrix associated with each OFDM subcarrier, as indicated by the EXPANSION_MAT parameter of the TXVECTOR, is used to perform a linear transformation on the vector of $N_{STS}$ complex numbers associated with each subcarrier in each OFDM symbol. This spatial mapping matrix maps the vector of $N_{STS}$ complex numbers in each subcarrier into a vector of $N_{TX}$ complex numbers in each subcarrier. The sequence of $N_{ST}$ complex numbers associated with each transmit chain (where each of the $N_{ST}$ complex numbers is taken from the same position in the $N_{TX}$ vector of complex numbers across the $N_{ST}$ subcarriers associated with an OFDM symbol) constitutes an OFDM symbol associated with the corresponding transmit chain. For details, see 19.3.11.11 (OFDM modulation). Spatial mapping matrices may include cyclic shifts, as described in 19.3.11.11.2 (Spatial mapping).

q) If the CH_BANDWIDTH and CH_OFFSET parameters of the TXVECTOR indicate that upper or lower 20 MHz are to be used in 40 MHz, move the complex numbers associated with subcarriers –28 to 28 in each transmit chain to carriers 4 to 60 in the upper channel or –60 to –4 in the lower channel. Note that this shifts the signal in frequency from the center of the 40 MHz channel to +10 MHz or –10 MHz offset from the center of the 40 MHz channel. The complex numbers in the other subcarriers are set to 0.

r) For each group of $N_{ST}$ subcarriers and each of the $N_{TX}$ transmit chains, convert the subcarriers to time domain using IDFT. Prepend to the Fourier-transformed waveform a circular extension of itself, thus forming a GI, and truncate the resulting periodic waveform to a single OFDM symbol length by applying time domain windowing. Determine the length of the GI according to the GI_TYPE parameter of the TXVECTOR. Refer to 19.3.11.11 (OFDM modulation) and 19.3.11.12 (Non-HT duplicate transmission) for details. When beamforming is not used, it is sometimes possible to implement the cyclic shifts in the time domain.

s) Append the OFDM symbols associated with each transmit chain one after another, starting after the final field of the PHY preamble. Refer to 19.3.2 (PPDU format) and 19.3.7 (Mathematical description of signals) for details.

t) Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 19.3.7 (Mathematical description of signals) for details. The transmit chains are connected to antenna elements according to ANTENNA_SET of the TXVECTOR if ASEL is applied.

### 19.3.5 Modulation and coding scheme (MCS)

The MCS is a value that determines the modulation, coding, and number of spatial channels. It is a compact representation that is carried in the HT-SIG. Rate-dependent parameters for the full set of MCSs are shown in Table 19-27 (MCS parameters for mandatory 20 MHz, $N_{SS}$ = 1, $N_{ES}$ = 1) to Table 19-41 (MCS parameters for optional 40 MHz, $N_{SS}$ = 4, UEQM) (in 19.5 (Parameters for HT-MCSs)). These tables give rate-dependent parameters for MCSs with indices 0 to 76. MCSs with indices 0 to 7 and 32 have a single spatial stream; MCSs with indices 8 to 31 have multiple spatial streams using equal modulation (EQM) on all of the streams; MCSs with indices 33 to 76 have multiple spatial streams using unequal modulation (UEQM) on the spatial streams. MCS indices 77 to 127 are reserved.

Table 19-27 (MCS parameters for mandatory 20 MHz, $N_{SS}$ = 1, $N_{ES}$ = 1) to Table 19-30 (MCS parameters for optional 20 MHz, $N_{SS}$ = 4, $N_{ES}$ = 1, EQM) show rate-dependent parameters for EQM MCSs for one, two, three, and four streams for 20 MHz operation. Table 19-31 (MCS parameters for optional 40 MHz, $N_{SS}$ = 1, $N_{ES}$ = 1) to Table 19-34 (MCS parameters for optional 40 MHz, $N_{SS}$ = 4, EQM) show rate-dependent parameters for EQM MCSs in one, two, three, and four streams for 40 MHz operation. The same EQM MCSs are used for 20 MHz and 40 MHz operation. Table 19-35 (MCS parameters for optional 40 MHz MCS 32 format, $N_{SS}$ = 1, $N_{ES}$ = 1) shows rate-dependent parameters for the 40 MHz, 6 Mb/s MCS 32 format.

The remaining tables, Table 19-36 (MCS parameters for optional 20 MHz, $N_{SS}$ = 2, $N_{ES}$ = 1, UEQM) to Table 19-41 (MCS parameters for optional 40 MHz, $N_{SS}$ = 4, UEQM), show rate-dependent parameters for the MCSs with UEQM of the spatial streams for use with $N_{SS} > 1$.

UEQM MCSs are detailed in the following tables:

- Table 19-36 (MCS parameters for optional 20 MHz, $N_{SS}$ = 2, $N_{ES}$ = 1, UEQM) to Table 19-38 (MCS parameters for optional 20 MHz, $N_{SS}$ = 4, $N_{ES}$ = 1, UEQM) are for 20 MHz operation.
- Table 19-39 (MCS parameters for optional 40 MHz, $N_{SS}$ = 2, $N_{ES}$ = 1, UEQM) to Table 19-41 (MCS parameters for optional 40 MHz, $N_{SS}$ = 4, UEQM) are for 40 MHz operation.

An HT STA shall support all equal modulation (EQM) rates for one spatial stream (MCSs 0 to 7) using a 20 MHz channel width. An HT AP that is not a VHT AP shall support all EQM rates for two spatial streams (MCSs 8 to 15) using a 20 MHz channel width. All other MCSs and modes are optional, specifically including transmit and receive support of 400 ns GI, operation in 40 MHz, and support of MCSs with indices 16 to 76.

### 19.3.6 Timing-related parameters

Table 19-6 (Timing-related constants) defines the timing-related parameters.

**Table 19-6—Timing-related constants**

| Parameter | TXVECTOR CH_BANDWIDTH | | | |
|---|---|---|---|---|
| | NON_HT_CBW20 | HT_CBW20 | HT_CBW40 or NON_HT_CBW40 | |
| | | | HT format | MCS 32 and non-HT duplicate |
| $N_{SD}$: Number of complex data numbers | 48 | 52 | 108 | 48 |
| $N_{SP}$: Number of pilot values | 4 | 4 | 6 | 4 |
| $N_{ST}$: Total number of subcarriers See NOTE 1 | 52 | 56 | 114 | 104 |
| $N_{SR}$: Highest data subcarrier index | 26 | 28 | 58 | 58 |
| $\Delta_F$ : Subcarrier frequency spacing | 312.5 kHz (20 MHz/64) | 312.5 kHz | 312.5 kHz (40 MHz/128) | |
| $T_{DFT}$: IDFT/DFT period | 3.2 µs | 3.2 µs | 3.2 µs | |
| $T_{GI}$: Guard interval duration | 0.8 µs= $T_{DFT}$/4 | 0.8 µs | 0.8 µs | |
| $T_{GI2}$: Double guard interval | 1.6 µs | 1.6 µs | 1.6 µs | |
| $T_{GIS}$: Short guard interval duration | N/A | 0.4 µs = $T_{DFT}$/8 | 0.4 µs See NOTE 2 | |
| $T_{L\text{-}STF}$: Non-HT short training sequence duration | 8 µs=10× $T_{DFT}$/4 | 8 µs | 8 µs | |
| $T_{HT\text{-}GF\text{-}STF}$: HT-greenfield short training field duration | N/A | 8 µs=10× $T_{DFT}$/4 | 8 µs See NOTE 2 | |
| $T_{L\text{-}LTF}$: Non-HT long training field duration | 8 µs=2× $T_{DFT}$+$T_{GI2}$ | 8 µs | 8 µs | |
| $T_{SYM}$: Symbol interval | 4 µs= $T_{DFT}$+$T_{GI}$ | 4 µs | 4 µs | |
| $T_{SYMS}$: Short GI symbol interval | N/A | 3.6 µs = $T_{DFT}$+$T_{GIS}$ | 3.6 µs See NOTE 2 | |
| $T_{L\text{-}SIG}$: Non-HT SIGNAL field duration | 4 µs= $T_{SYM}$ | 4 µs | 4 µs | |
| $T_{HT\text{-}SIG}$: HT SIGNAL field duration | N/A | 8 µs= 2$T_{SYM}$ | 8 µs See NOTE 2 | |
| $T_{HT\text{-}STF}$: HT short training field duration | N/A | 4 µs | 4 µs See NOTE 2 | |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 19-6—Timing-related constants *(continued)***

| Parameter | TXVECTOR CH_BANDWIDTH | | | |
|---|---|---|---|---|
| | NON_HT_CBW20 | HT_CBW20 | HT_CBW40 or NON_HT_CBW40 | |
| | | | HT format | MCS 32 and non-HT duplicate |
| $T_{HT\text{-}LTF1}$: First HT long training field duration | N/A | 4 μs in HT-mixed format, 8 μs in HT-greenfield format | 4 μs in HT-mixed format, 8 μs in HT-greenfield format See NOTE 2 | |
| $T_{HT\text{-}LTFs}$: Second, and subsequent, HT long training fields duration | N/A | 4 μs | 4 μs See NOTE 2 | |

NOTE 1—$N_{ST} = N_{SD} + N_{SP}$ except in the cases of MCS 32 and non-HT duplicate, where the number of data subcarriers differs from the number of complex data numbers, and the number of pilot subcarriers differs from the number of pilot values. In those cases, data numbers and pilot values are replicated in upper and lower 20 MHz portions of 40 MHz signal to make a total of 104 subcarriers.

NOTE 2—Not applicable in non-HT formats.

NOTE 3—N/A = Not applicable.

Table 19-7 (Frequently used parameters) defines parameters used frequently in Clause 19 (High Throughput (HT) PHY specification(#2297)).

**Table 19-7—Frequently used parameters**

| Symbol | Explanation |
|---|---|
| $N_{CBPS}$ | Number of coded bits per symbol |
| $N_{CBPSS}(i)$ | Number of coded bits per symbol per the *i*-th spatial stream |
| $N_{DBPS}$ | Number of data bits per symbol |
| $N_{BPSC}$ | Number of coded bits per single carrier |
| $N_{BPSCS}(i)$ | Number of coded bits per single carrier for spatial stream *i* |
| $N_{RX}$ | Number of receive chains |
| $N_{STS}$ | Number of space-time streams |
| $N_{SS}$ | Number of spatial streams |
| $N_{ESS}$ | Number of extension spatial streams |
| $N_{TX}$ | Number of transmit chains |
| $N_{ES}$ | Number of BCC encoders for the Data field |
| $N_{HT\text{-}LTF}$ | Number of HT Long Training fields (see 19.3.9.4.6 (HT-LTF definition)) |
| $N_{HT\text{-}DLTF}$ | Number of Data HT Long Training fields |
| $N_{HT\text{-}ELTF}$ | Number of Extension HT Long Training fields |
| $R$ | Coding rate |

### 19.3.7 Mathematical description of signals

For the description of the convention on mathematical description of signals, see 17.3.2.5 (Mathematical conventions in the signal descriptions).

In the case of either a 20 MHz non-HT format (TXVECTOR parameter FORMAT equal to NON_HT, MODULATION parameter equal to one of {ERP-OFDM, OFDM}) transmission or a 20 MHz HT format (TXVECTOR parameter FORMAT equal to HT_MF or HT_GF, CH_BANDWIDTH equal to HT_CBW20) transmission, the channel is divided into 64 subcarriers. In the 20 MHz non-HT format, the signal is transmitted on subcarriers –26 to –1 and 1 to 26, with 0 being the center (dc) carrier. In the 20 MHz HT format, the signal is transmitted on subcarriers –28 to –1 and 1 to 28.

In the case of the 40 MHz HT format, a 40 MHz channel is used. The channel is divided into 128 subcarriers. The signal is transmitted on subcarriers –58 to –2 and 2 to 58.

In the case of 40 MHz HT upper format or 40 MHz HT lower format, the upper or lower 20 MHz is divided into 64 subcarriers. The signal is transmitted on subcarriers –60 to –4 in the case of a 40 MHz HT lower format transmission and on subcarriers 4 to 60 in the case of a 40 MHz HT upper format transmission.

In the case of the MCS 32 and non-HT duplicate formats, the same data are transmitted over two adjacent 20 MHz channels. In this case, the 40 MHz channel is divided into 128 subcarriers, and the data are transmitted on subcarriers –58 to –6 and 6 to 58.

The transmitted signal is described in complex baseband signal notation. The actual transmitted signal is related to the complex baseband signal by the relation shown in Equation (19-1).

$$r_{RF}(t) = \mathrm{Re}\{r(t)\exp(j2\pi f_c t)\} \tag{19-1}$$

where

$f_c$ is the center frequency of the carrier

The transmitted RF signal is derived by modulating the complex baseband signal, which consists of several fields. The timing boundaries for the various fields are shown in Figure 19-4 (Timing boundaries for PPDU fields).

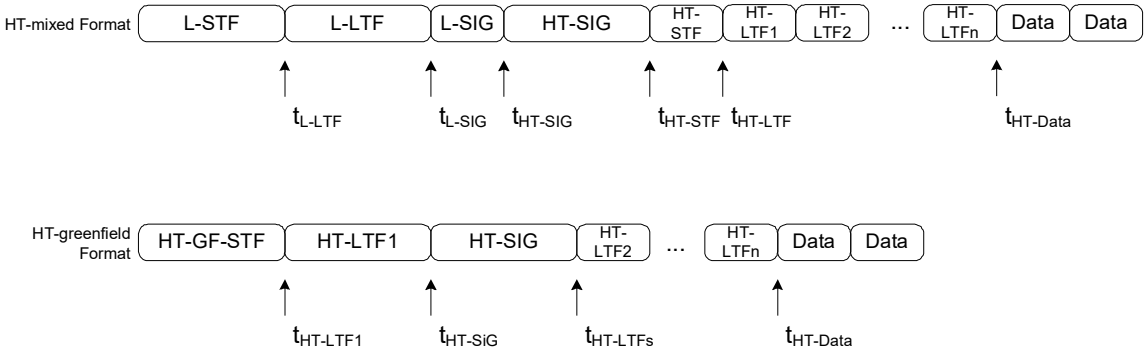

**Figure 19-4—Timing boundaries for PPDU fields**

The time offset, $t_{Field}$, determines the starting time of the corresponding field.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

In HT-mixed format, the signal transmitted on transmit chain $i_{TX}$ shall be as shown in Equation (19-2).

$$\begin{aligned} r_{PPDU}^{(i_{TX})}(t) &= r_{L\text{-}STF}^{(i_{TX})}(t) + r_{L\text{-}LTF}^{(i_{TX})}(t - t_{L\text{-}LTF}) \\ &+ r_{L\text{-}SIG}^{(i_{TX})}(t - t_{L\text{-}SIG}) + r_{HT\text{-}SIG}^{(i_{TX})}(t - t_{HT\text{-}SIG}) + r_{HT\text{-}STF}^{(i_{TX})}(t - t_{HT\text{-}STF}) \\ &+ \sum_{i_{LTF}=1}^{N_{HTLTF}} r_{HT\text{-}LTF}^{(i_{TX}, i_{LTF})}(t - t_{HT\text{-}LTF} - (i_{LTF} - 1)T_{HT\text{-}LTFs}) + r_{HT\text{-}DATA}^{(i_{TX})}(t - t_{HT\text{-}DATA}) \end{aligned} \quad (19\text{-}2)$$

where

$t_{L\text{-}LTF} = T_{L\text{-}STF}$

$t_{L\text{-}SIG} = t_{L\text{-}LTF} + T_{L\text{-}LTF}$

$t_{HT\text{-}SIG} = t_{L\text{-}SIG} + T_{L\text{-}SIG}$

$t_{HT\text{-}STF} = t_{HT\text{-}SIG} + T_{HT\text{-}SIG}$

$t_{HT\text{-}LTF} = t_{HT\text{-}STF} + T_{HT\text{-}STF}$

$t_{HT\text{-}Data} = t_{HT\text{-}LTF} + N_{HT\text{-}LTF} \cdot T_{HT\text{-}LTFs}$

In the case of HT-greenfield format, the transmitted signal on transmit chain $i_{TX}$ shall be as shown in Equation (19-3).

$$\begin{aligned} r_{PPDU}^{(i_{TX})}(t) &= r_{HT-GF-STF}^{(i_{TX})}(t) + r_{HT-LTF1}^{(i_{TX})}(t - t_{HT-LTF1}) \\ &+ r_{HT-SIG}^{(i_{TX})}(t - t_{HT-SIG}) \\ &+ \sum_{i_{LTF}=2}^{N_{HTLTF}} r_{HT-LTF}^{(i_{TX}, i_{LTF})}(t - t_{HT-LTFs} - (i_{LTF} - 2)T_{HT-LTFs}) \\ &+ r_{HT-DATA}^{(i_{TX})}(t - t_{HT-DATA}) \end{aligned} \quad (19\text{-}3)$$

where

$t_{HT-LTF1} = T_{HT-GF-STF}$

$t_{HT\text{-}SIG} = t_{HT\text{-}LTF1} + T_{HT\text{-}LTF1}$

$t_{HT\text{-}LTFs} = t_{HT\text{-}SIG} + T_{HT\text{-}SIG}$

$t_{HT\text{-}Data} = t_{HT\text{-}LTFs} + (N_{HT\text{-}LTF} - 1) \cdot T_{HT\text{-}LTFs}$

Each baseband waveform, $r_{\text{Field}}^{(i_{TX})}(t)$, is defined via the discrete Fourier transform (DFT) per OFDM symbol as shown in Equation (19-4).

$$r_{\text{Field}}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{\text{Field}}^{\text{Tone}} \cdot N_{Norm}}} w_{T_{\text{Field}}}(t) \sum_{k} \Upsilon_k X_k^{(i_{TX})} \exp(j2\pi k \Delta_F t) \quad (19\text{-}4)$$

(#569)

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

This general representation holds for all fields. A suggested definition of the windowing function, $w_{\mathrm{T_{Field}}}(t)$, is given in 17.3.2.5 (Mathematical conventions in the signal descriptions). The frequency domain symbols $X_k^{(i_{TX})}$ represent the output of any spatial processing in subcarrier $k$ for transmit chain $i_{TX}$ required for the field.

The function $\Upsilon_k$ is used to represent a rotation of the upper tones in a 40 MHz channel as shown in Equation (19-5) and Equation (19-6).

$$\Upsilon_k = \begin{cases} 1, k \le 0, \text{ in a 40 MHz channel} \\ j, k > 0, \text{ in a 40 MHz channel} \end{cases} \quad (19\text{-}5)$$

$$\Upsilon_k = 1, \text{ in a 20 MHz channel} \quad (19\text{-}6)$$

The $1/\sqrt{N_{\mathrm{Field}}^{\mathrm{Tone}} \cdot N_{Norm}}$ (#569)scale factor in Equation (19-4) causes the total power of the time domain signal as summed over all transmit chains to be either 1 or lower than 1 when required. Table 19-8 (Value of tone scaling factor) summarizes the various values of $N_{\mathrm{Field}}^{\mathrm{Tone}}$. (#569)For L-STF, L-LTF, L-SIG, and HT-SIG

**Table 19-8—Value of tone scaling factor $N_{Field}^{Tone}$**

| Field | $N_{Field}^{Tone}$, see NOTE 1 | |
|---|---|---|
| | 20 MHz | 40 MHz |
| L-STF | 12 | 24 |
| HT-GF-STF | 12 | 24 |
| L-LTF | 52 | 104 |
| L-SIG | 52 | 104 |
| HT-SIG | 52/56, see NOTE 2 | 104/114, see NOTE 2 |
| HT-STF | 12 | 24 |
| HT-LTF | 56 | 114 |
| HT-DATA | 56 | 114 |
| MCS 32 | — | 104 |
| Non-HT Duplicate | — | 104 |

NOTE 1—The numbers in the table refer only to the value of $N_{Field}^{Tone}$ as it appears in Equation (19-4) and in subsequent specification of various fields. This value might be different from the actual number of tones being transmitted.
NOTE 2—The values 56 and 114 are for HT-greenfield format; the values 52 and 104 are for HT-mixed format.

fields in an HT PPDU using the HT-mixed format, $N_{Norm} = N_{TX}$. For all other fields in an HT PPDU using the HT-mixed format, $N_{Norm} = N_{STS}$. In an HT PPDU using the HT-greenfield format, $N_{Norm} = N_{STS}$ for all fields.

### 19.3.8 Transmission in the upper/lower 20 MHz of a 40 MHz channel

When transmitting in the upper/lower 20 MHz portion of a 40 MHz channel, the mathematical definition of transmission shall follow that of a 20 MHz channel with $f_c$ in Equation (19-1) replaced by $f_c \pm 10$ MHz.

This rule applies to 20 MHz HT transmission in the upper/lower 20 MHz of a 40 MHz channel (TXVECTOR primitive CH_BANDWIDTH equal to HT_CBW20 and CH_OFFSET primitive equal to CH_OFF_20U or CH_OFF_20L) and to 20 MHz non-HT transmission in the upper/lower 20 MHz of a 40 MHz channel (TXVECTOR primitive CH_BANDWIDTH equal to NON_HT_CBW20 and CH_OFFSET primitive equal to CH_OFF_20U or CH_OFF_20L).

### 19.3.9 HT preamble

#### 19.3.9.1 Introduction

The HT preambles are defined in HT-mixed format and in HT-greenfield format to carry the required information to operate in a system with multiple transmit and multiple receive antennas.

In the HT-mixed format, to provide compatibility with non-HT STAs, specific non-HT fields are defined so that they can be received by non-HT STAs compliant with Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) or Clause 18 (Extended Rate PHY (ERP) specification) followed by the fields specific to HT STAs.

In the HT-greenfield format, all of the non-HT fields are omitted. The specific HT fields used are as follows:

— One HT-GF-STF for automatic gain control convergence, timing acquisition, and coarse frequency acquisition,

— One or several HT-LTFs, provided as a way for the receiver to estimate the channel between each spatial mapper input and receive chain. The first HT-LTFs (HT-DLTFs) are necessary for demodulation of the (#14)Data field and are followed, for sounding PPDUs only, by optional HT-LTFs (HT-ELTFs) to sound extra spatial dimensions of the MIMO channel,

— HT-SIG, which provides all the information required to interpret the (#14)HT PPDU format.

In the case of multiple transmit chains, the HT preambles use cyclic shift techniques to prevent unintentional beamforming.

#### 19.3.9.2 HT-mixed format preamble

In HT-mixed format (#14)PPDUs, the preamble has fields that support compatibility with Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) and Clause 18 (Extended Rate PHY (ERP) specification) STAs and fields that support HT operation. The non-HT portion of the HT-mixed format preamble enables detection of the PPDU and acquisition of carrier frequency and timing by both HT STAs and STAs that are compliant with Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) or Clause 18 (Extended Rate PHY (ERP) specification). The non-HT portion of the HT-mixed format preamble contains the SIGNAL field (L-SIG) defined in Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) and is thus decodable by STAs compliant with Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) and Clause 18 (Extended Rate PHY (ERP) specification) as well as HT STAs.

The HT portion of the HT-mixed format preamble enables estimation of the MIMO channel to support demodulation of the (#14)Data field by HT STAs. The HT portion of the HT-mixed format preamble also contains the HT-SIG field that supports HT operation.

### 19.3.9.3 Non-HT portion of the HT-mixed format preamble

#### 19.3.9.3.1 Introduction

The transmission of the L-STF, L-LTF and the L-SIG fields(#4145) as part of an HT-mixed format (#14)PPDU is described in 19.3.9.3.2 (Cyclic shift definition) to 19.3.9.3.5 (L-SIG definition).

#### 19.3.9.3.2 Cyclic shift definition

The cyclic shift values defined in this subclause apply to the non-HT fields in the HT-mixed format preamble and the HT-SIG in the HT-mixed format preamble.

Cyclic shifts are used to prevent unintentional beamforming when the same signal or scalar multiples of one signal are transmitted through different spatial streams or transmit chains. A cyclic shift of duration $T_{CS}$ on a signal $s(t)$ on interval $0 \le t \le T$ is defined as follows, where $T$ is defined as $T_{DFT}$ as referenced in Table 19-6 (Timing-related constants).

With $T_{CS} \le 0$, replace $s(t)$ with $s(t - T_{CS})$ when $0 \le t < T + T_{CS}$ and with $s(t - T_{CS} - T)$ when $T + T_{CS} \le t \le T$. The cyclic-shifted signal is defined as shown in Equation (19-7).

$$s_{CS}(t;T_{CS})\big|_{T_{CS}<0} = \begin{cases} s(t - T_{CS}) & 0 \le t < T + T_{CS} \\ s(t - T_{CS} - T) & T + T_{CS} \le t \le T \end{cases} \quad (19\text{-}7)$$

The cyclic shift is applied to each OFDM symbol in the (#14)PPDU separately. Table 19-9 (Cyclic shift for non-HT portion of PPDU) specifies the values for the cyclic shifts that are applied in the L-STF (in an HT-mixed format (#14)PPDU), the L-LTF, and L-SIG. It also applies to the HT-SIG in an HT-mixed format (#14)PPDU.

**Table 19-9—Cyclic shift for non-HT portion of PPDU**

| $T_{CS}^{i_{TX}}$ values for non-HT portion of PPDU | | | | |
|---|---|---|---|---|
| **Number of transmit chains** | **Cyclic shift for transmit chain 1 (ns)** | **Cyclic shift for transmit chain 2 (ns)** | **Cyclic shift for transmit chain 3 (ns)** | **Cyclic shift for transmit chain 4 (ns)** |
| 1 | 0 | — | — | — |
| 2 | 0 | –200 | — | — |
| 3 | 0 | –100 | –200 | — |
| 4 | 0 | –50 | –100 | –150 |

With more than four transmit chains, each cyclic shift on the additional transmit chains shall be between –200 ns and 0 ns.

This is an unapproved IEEE Standards Draft, subject to change.

#### 19.3.9.3.3 L-STF definition

The non-HT short training OFDM symbol in the 20 MHz channel width is shown in Equation (19-8).

$$S_{-26,26} = \sqrt{1/2} \{0, 0, 1+j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, -1-j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, 0, 0, 0, 0, -1-j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0\} \quad (19\text{-}8)$$

The normalization factor $\sqrt{1/2}$ is the QPSK normalization.

NOTE—Other than the scaling difference, Equation (19-8) represents the same BPSK constellations per subcarrier as those represented in Equation (17-8).

The non-HT short training OFDM symbol in a 40 MHz channel width is given by Equation (19-9), after rotating the tones in the upper subchannel (subcarriers 6–58) by +90° (#4181)(see Equation (19-10)).

$$S_{-58,58} = \sqrt{1/2} \{0, 0, 1+j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, -1-j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, 0, 0, 0, 0, -1-j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 1+j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, -1-j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, 0, 0, 0, 0, -1-j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0\} \quad (19\text{-}9)$$

In HT-mixed format, the L-STF on transmit chain $i_{TX}$ shall be as shown in Equation (19-10).

$$r_{L-STF}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{TX} \cdot N_{L-STF}^{Tone}}} w_{T_{L-STF}}(t) \sum_{k=-N_{SR}}^{N_{SR}} \Upsilon_k S_k \exp(j2\pi k \Delta_F (t - T_{CS}^{i_{TX}})) \quad (19\text{-}10)$$

where

$T_{CS}^{i_{TX}}$ represents the cyclic shift for transmit chain $i_{TX}$ and takes values from Table 19-9 (Cyclic shift for non-HT portion of PPDU)

$\Upsilon_k$ is defined in Equation (19-5) and Equation (19-6)

The L-STF has a period of 0.8 µs. The entire STF includes ten such periods, with a total duration of $T_{L\text{-}STF}$ = 8 µs.

#### 19.3.9.3.4 L-LTF definition

The non-HT long training OFDM symbol is identical to the Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) long training OFDM symbol. In the 20 MHz channel width, the long training OFDM symbol is given by Equation (19-11).

$$L_{-26,26} = \{1, 1, -1, -1, 1, 1, -1, 1, -1, 1, 1, 1, 1, 1, 1, -1, -1, 1, 1, -1, 1, -1, 1, 1, 1, 1, 0, 1, -1, -1, 1, 1, -1, 1, -1, 1, -1, -1, -1, -1, -1, 1, 1, -1, -1, 1, -1, 1, -1, 1, 1, 1, 1\} \quad (19\text{-}11)$$

The non-HT long training OFDM symbol in a 40 MHz channel width is given by Equation (19-12), after rotating the tones in the upper subchannel (subcarriers 6–58) by +90° (#4181)(see Equation (19-13)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$L_{-58,58} = \{1, 1, -1, -1, 1, 1, -1, 1, -1, 1, 1, 1, 1, 1, 1, -1, -1, 1, 1, -1, 1, -1, 1, -1, 1, 1, 1, 1, 1, 0,$$
$$1, -1, -1, 1, 1, 1, -1, 1, -1, 1, -1, -1, -1, -1, -1, 1, 1, 1, -1, 1, -1, 1, -1, 1, -1, 1, 1, 1, 1, 1, 0, 0, 0, 0, 0,$$
$$0, 0, 0, 0, 0, 0, 0, 1, 1, -1, -1, 1, 1, -1, 1, -1, 1, -1, 1, 1, 1, 1, 1, 1, -1, -1, 1, 1, -1, 1, -1, 1, 1, 1, 1, 0,$$
$$1, -1, -1, 1, 1, -1, 1, -1, 1, -1, -1, -1, -1, -1, 1, 1, -1, -1, 1, -1, 1, -1, 1, -1, 1, 1, 1, 1\} \quad (19\text{-}12)$$

The subcarriers at ± 32 in 40 MHz, which are the dc subcarriers for the non-HT 20 MHz transmission, are both nulled in the L-LTF. Such an arrangement allows proper synchronization of a 20 MHz non-HT STA.

The L-LTF waveform shall be as shown in Equation (19-13).

$$r_{L-LTF}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{TX} \cdot N_{L-LTF}^{Tone}}} w_{T_{L-LTF}}(t) \sum_{k=-N_{SR}}^{N_{SR}} \Upsilon_k L_k \exp(j2\pi k \Delta_F (t - T_{GI2} - T_{CS}^{i_{TX}})) \quad (19\text{-}13)$$

where

$T_{GI2}$ is 1.6 μs

$T_{CS}^{i_{TX}}$ represents the cyclic shift for transmit chain $i_{TX}$ and takes values specified in Table 19-9 (Cyclic shift for non-HT portion of PPDU)

$\Upsilon_k$ is defined in Equation (19-5) and Equation (19-6)

The entire LTF includes two 3.2 μs IDFT/DFT periods and an additional 1.6 μs double GI. The entire LTF is modulated with the L-LTF waveform.

#### 19.3.9.3.5 L-SIG definition

The L-SIG field(#4145) is used to communicate rate and length information. The structure of the L-SIG field(#4145) is shown in Figure 19-5 (L-SIG structure).

| Rate (4 bits) | | | | R | Length (12 bits) | | | | | | | | | | | | P | Tail (6 bits) | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| R1 | R2 | R3 | R4 | | | | | | | | | | | | | | | "0" | "0" | "0" | "0" | "0" | "0" |
| 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 | 13 | 14 | 15 | 16 | 17 | 18 | 19 | 20 | 21 | 22 | 23 |

**Figure 19-5—L-SIG structure**

The value in the Rate field is obtained from the L_DATARATE parameter(#1875) of the TXVECTOR. The value in the Length field is obtained from the L_LENGTH parameter(#1875) of the TXVECTOR. The Length field is transmitted LSB first.

The reserved bit shall be set to 0 (#455)on transmit and ignored on receive.

The parity field has the even parity of bits 0–16.

The L-SIG field(#4145) shall be encoded, interleaved and mapped, and it shall have pilots inserted following the steps described in 17.3.5.6 (Convolutional encoder), 17.3.5.7 (Data interleaving), and 17.3.5.9 (Pilot subcarriers). The stream of 48 complex numbers generated by the steps described in 17.3.5.7 (Data interleaving) is denoted by $d_k, k = 0 \ldots 47$. The time domain waveform of the L-SIG field(#4145) in 20 MHz transmission shall be as given by Equation (19-14).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$r_{L-SIG}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{TX} \cdot N_{L-SIG}^{Tone}}} w_{T_{SYM}}(t) \sum_{k=-26}^{26} (D_k + p_0 P_k) \exp(j2\pi k \Delta_F (t - T_{GI} - T_{CS}^{i_{TX}})) \quad (19\text{-}14)$$

In a 40 MHz transmission the time domain waveform of the L-SIG field(#4145) shall be as given by Equation (19-15).

$$r_{L-SIG}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{TX} \cdot N_{L-SIG}^{Tone}}} w_{T_{SYM}}(t) \sum_{k=-26}^{26} (D_k + p_0 P_k) \cdot (\exp(j2\pi(k-32)\Delta_F(t - T_{GI} - T_{CS}^{i_{TX}})) + j\exp(j2\pi(k+32)\Delta_F(t - T_{GI} - T_{CS}^{i_{TX}}))) \quad (19\text{-}15)$$

where

$$D_k = \begin{cases} 0, k = 0, \pm 7, \pm 21 \\ d_{M^r(k)}, \text{otherwise} \end{cases}$$

$$M^r(k) = \begin{cases} k + 26, -26 \le k \le -22 \\ k + 25, -20 \le k \le -8 \\ k + 24, -6 \le k \le -1 \\ k + 23, 1 \le k \le 6 \\ k + 22, 8 \le k \le 20 \\ k + 21, 22 \le k \le 26 \end{cases}$$

$P_k$ is defined in 17.3.5.10 (OFDM modulation)

$p_0$ is the first pilot value in the sequence defined in 17.3.5.10 (OFDM modulation)

$N_{L-SIG}^{Tone}$ has the value given in Table 19-8 (Value of tone scaling factor)

$T_{CS}^{i_{TX}}$ represents the cyclic shift for transmit chain $i_{TX}$ and is defined by Table 19-9 (Cyclic shift for non-HT portion of PPDU) for HT-mixed format PPDUs

NOTE—$D_k$ exists for $-N_{SR} \le k \le N_{SR}$ and takes the values from $d_k$ that exists for $0 \le k \le N_{SD} - 1$. $M^r(k)$ is a "reverse" function of the function $M(k)$ defined in 17.3.5.10 (OFDM modulation).

### 19.3.9.4 HT portion of HT-mixed format preamble

#### 19.3.9.4.1 Introduction

When an HT-mixed format preamble is transmitted, the HT preamble consists of the HT-STF, the HT-LTFs, and the HT-SIG.

All numeric fields are transmitted in unsigned format, LSB first.

#### 19.3.9.4.2 Cyclic shift definition

The cyclic shift values defined in this subclause apply to the HT-STF and HT-LTFs of the HT-mixed format preamble. The cyclic shift values defined in 19.3.9.3.2 (Cyclic shift definition) apply to the HT-SIG in an HT-mixed format preamble.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Throughout the HT portion of an HT-mixed format preamble, cyclic shift is applied to prevent beamforming when similar signals are transmitted in different space-time streams. The same cyclic shift is applied to these streams during the transmission of the (#14)Data field. The values of the cyclic shifts to be used during the HT portion of the HT-mixed format preamble (with the exception of the HT_SIG) and the (#14)Data field are specified in Table 19-10 (Cyclic shift values of HT portion of PPDU).

**Table 19-10—Cyclic shift values of HT portion of PPDU**

| $T_{CS}^{i_{STS}}$ values for HT portion of PPDU | | | | |
|---|---|---|---|---|
| **Number of space-time streams** | **Cyclic shift for space-time stream 1 (ns)** | **Cyclic shift for space-time stream 2 (ns)** | **Cyclic shift for space-time stream 3 (ns)** | **Cyclic shift for space-time stream 4 (ns)** |
| 1 | 0 | — | — | — |
| 2 | 0 | –400 | — | — |
| 3 | 0 | –400 | –200 | — |
| 4 | 0 | –400 | –200 | –600 |

### 19.3.9.4.3 HT-SIG definition

The HT-SIG is used to carry information required to interpret the HT (#14)PPDU formats. The fields of the HT-SIG are described in Table 19-11 (HT-SIG fields).

**Table 19-11—HT-SIG fields**

| Field | Number of bits | Explanation and coding |
|---|---|---|
| Modulation and Coding Scheme | 7 | Index into the MCS table. |
| CBW 20/40 | 1 | Set to 0 for 20 MHz or 40 MHz upper/lower.<br>Set to 1 for 40 MHz. |
| HT Length | 16 | The number of octets of data in the PSDU.<br>See NOTE. |
| Smoothing | 1 | Set to 1 indicates that channel estimate smoothing is recommended.<br>Set to 0 indicates that only per-carrier independent (unsmoothed) channel estimate is recommended.<br>See 19.3.11.11.2 (Spatial mapping). |
| Not Sounding | 1 | Set to 0 indicates that PPDU is a sounding PPDU.<br>Set to 1 indicates that the PPDU is not a sounding PPDU. |
| Reserved | 1 | (#455)Set to 1 on transmit. See 19.3.21 (PHY receive procedure) for behavior on receive. |
| Aggregation | 1 | Set to 1 to indicate that the (#14)PSDU contains an A-MPDU; otherwise, set to 0. |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 19-11—HT-SIG fields *(continued)***

| Field | Number of bits | Explanation and coding |
|---|---|---|
| STBC | 2 | Set to a nonzero number, to indicate the difference between the number of space-time streams ($N_{STS}$) and the number of spatial streams ($N_{SS}$) indicated by the MCS.<br>Set to 00 to indicate no STBC ($N_{STS} = N_{SS}$). |
| FEC Coding | 1 | Set to 1 for LDPC.<br>Set to 0 for BCC. |
| Short GI | 1 | Set to 1 to indicate that the short GI is used after the HT-LTFs.<br>Set to 0 otherwise. |
| Number of Extension Spatial Streams | 2 | Indicates the number of extension spatial streams ($N_{ESS}$).<br>Set to 0 for no extension spatial stream.<br>Set to 1 for 1 extension spatial stream.<br>Set to 2 for 2 extension spatial streams.<br>Set to 3 for 3 extension spatial streams. |
| CRC | 8 | CRC of bits 0–23 in HT-SIG$_1$ and bits 0–9 in HT-SIG$_2$. See 19.3.9.4.4 (CRC calculation for HT-SIG). The first bit to be transmitted is bit C7 as explained in 19.3.9.4.4 (CRC calculation for HT-SIG). |
| Tail Bits | 6 | Used to terminate the trellis of the convolution coder. Set to 0. |
| (#14)NOTE—A value of 0 in the HT Length field indicates a PPDU that does not include a Data field, i.e., NDP. NDP transmissions are used for sounding purposes only (see 10.35.2 (Transmission of an HT NDP)). The NDP ends after the last HT-LTF or the HT-SIG. | | |

The structure of the HT-SIG$_1$ and HT-SIG$_2$ fields is defined in Figure 19-6 (Format of HT-SIG1 and HT-SIG2).

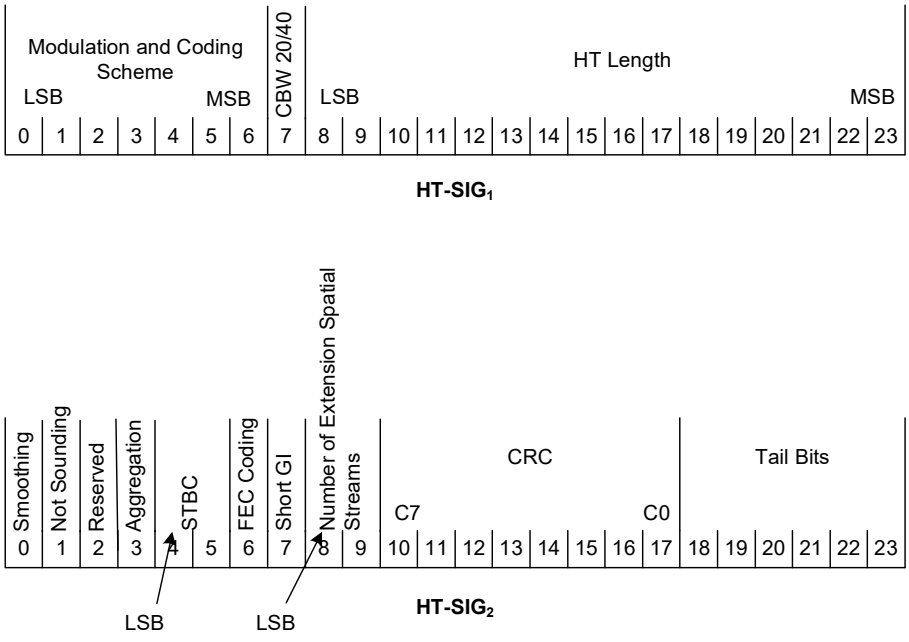

**Figure 19-6—Format of HT-SIG$_1$ and HT-SIG$_2$**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The HT-SIG is composed of two parts, HT-SIG$_1$ and HT-SIG$_2$, each containing 24 bits, as shown in Figure 19-6 (Format of HT-SIG1 and HT-SIG2). All of the fields in the HT-SIG are transmitted LSB first, and HT-SIG$_1$ is transmitted before HT-SIG$_2$.

The HT-SIG parts shall be encoded at R = 1/2, interleaved, and mapped to a BPSK constellation, and they have pilots inserted following the steps described in 17.3.5.6 (Convolutional encoder), 17.3.5.7 (Data interleaving), 17.3.5.8 (Subcarrier modulation mapping), and 17.3.5.9 (Pilot subcarriers), respectively. The BPSK constellation is rotated by 90° relative to the L-SIG field(#4145) in order to accommodate detection of the start of the HT-SIG. The stream of 96 complex numbers generated by these steps is divided into two groups of 48 complex numbers: $d_{k,n}$, $0 \le k \le 47$, $n = 0, 1$ . The time domain waveform for the HT-SIG in an HT-mixed format (#14)PPDU in a 20 MHz transmission shall be as shown in Equation (19-16).

$$r_{HT-SIG}^{i_{TX}}(t) = \frac{1}{\sqrt{N_{TX} \cdot N_{HT-SIG}^{Tone}}} \sum_{n=0}^{1} w_{T_{SYM}}(t - nT_{SYM}) \cdot \sum_{k=-26}^{26} (jD_{k,n} + p_{n+1}P_k) \exp(j2\pi k\Delta_F(t - nT_{SYM} - T_{GI} - T_{CS}^{i_{TX}})) \quad (19\text{-}16)$$

In a 40 MHz transmission the time domain waveform shall be as shown in Equation (19-17).

$$r_{HT-SIG}^{i_{TX}}(t) = \frac{1}{\sqrt{N_{TX} \cdot N_{HT-SIG}^{Tone}}} \sum_{n=0}^{1} w_{T_{SYM}}(t - nT_{SYM}) \cdot \sum_{k=-26}^{26} (jD_{k,n} + p_{n+1}P_k)(\exp(j2\pi(k-32)\Delta_F(t - nT_{SYM} - T_{GI} - T_{CS}^{i_{TX}})) + j\exp(j2\pi(k+32)\Delta_F(t - nT_{SYM} - T_{GI} - T_{CS}^{i_{TX}}))) \quad (19\text{-}17)$$

where

$$D_{k,n} = \begin{cases} 0, k = 0, \pm 7, \pm 21 \\ d_{M^r(k),n}, \text{otherwise} \end{cases}$$

$M^r(k)$ is defined in 19.3.9.3 (Non-HT portion of the HT-mixed format preamble)

$P_k$ and $p_n$ are defined in 17.3.5.10 (OFDM modulation)

$N_{HT-SIG}^{Tone}$ has the value given in Table 19-8 (Value of tone scaling factor)

$T_{CS}^{i_{TX}}$ represents the cyclic shift for transmit chain $i_{TX}$ and is defined by Table 19-9 (Cyclic shift for non-HT portion of PPDU) for HT-mixed format PPDUs

NOTE—This definition results in a quadrature binary phase shift keying (QBPSK) modulation in which the constellation of the data tones is rotated by 90° relative to the L-SIG field(#4145) in HT-mixed format PPDUs and relative to the first HT-LTF in HT-greenfield format PPDUs (see Figure 19-7 (Data tone constellations in an HT-mixed format PPDU)). In HT-mixed format PPDUs, the HT-SIG is transmitted with the same number of subcarriers and the same cyclic shifts as the preceding non-HT portion of the preamble. This is done to accommodate the estimation of channel parameters needed to robustly demodulate and decode the information contained in the HT-SIG.

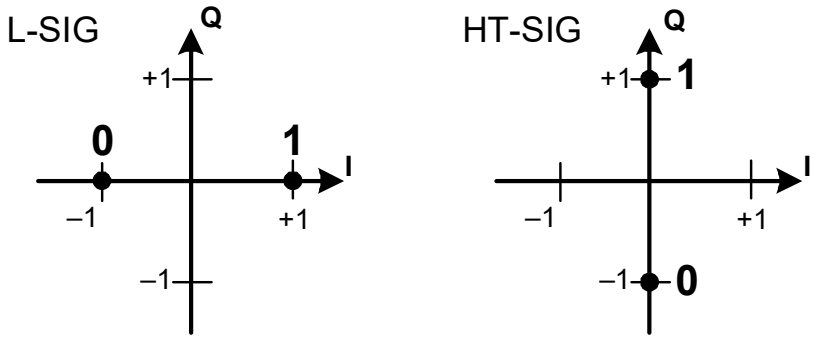

**Figure 19-7—Data tone constellations in an HT-mixed format PPDU**

#### 19.3.9.4.4 CRC calculation for HT-SIG

The CRC protects bits 0–33 of the HT-SIG (bits 0–23 of HT-SIG$_1$ and bits 0–9 of HT-SIG$_2$). The value of the CRC field shall be the 1s complement of

$$crc(D) = (M(D) \oplus I(D))D^8 \bmod G(D) \tag{19-18}$$

where

$M(D) = m_0 D^{33} + m_1 D^{32} + \ldots + m_{32} D + m_{33}$ is the HT-SIG represented as a polynomial

where

$m_0$ is bit 0 of HT-SIG$_1$

$m_{33}$ is bit 9 of HT-SIG$_2$

$I(D) = \sum_{i=26}^{33} D^i$ are initialization values that are added modulo 2 to the first 8 bits of HT-SIG$_1$

$G(D) = D^8 + D^2 + D + 1$ is the CRC generating polynomial

$crc(D) = c_0 D^7 + c_1 D^6 + \ldots + c_6 D + c_7$

The CRC field is transmitted with $c_7$ first.

Figure 19-8 (HT-SIG CRC calculation) shows the operation of the CRC. First, the shift register is reset to all 1s. The bits are then passed through the XOR operation at the input. When the last bit has entered, the output is generated by shifting the bits out of the shift register, C7 first, through an inverter.

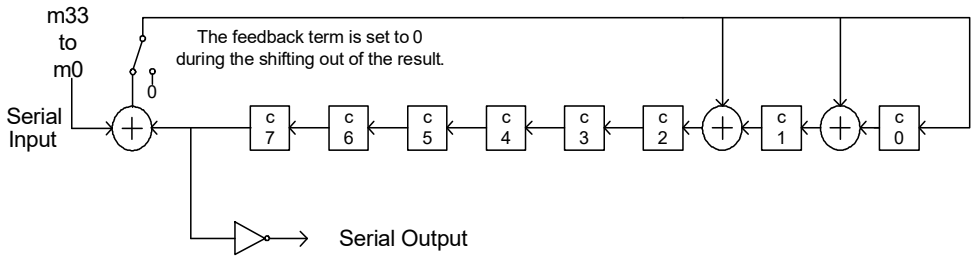

**Figure 19-8—HT-SIG CRC calculation**

This is an unapproved IEEE Standards Draft, subject to change.

As an example, if bits $\{m_0 \ldots m_{33}\}$ are given by $\{1\,1\,1\,1\,0\,0\,0\,1\,0\,0\,1\,0\,0\,1\,1\,0\,0\,0\,0\,0\,0\,0\,0\,0\,1\,1\,1\,0\,0\,0\,0\,0\,0\}$, the output bits $\{B_7 \ldots B_0\}$, where $B_7$ is output first, are $\{1\,0\,1\,0\,1\,0\,0\,0\}$.

#### 19.3.9.4.5 HT-STF definition

The purpose of the HT-STF is to improve automatic gain control estimation in a MIMO system. The duration of the HT-STF is 4 μs. In a 20 MHz transmission, the frequency sequence used to construct the HT-STF is identical to L-STF. In a 40 MHz transmission, the HT-STF is constructed from the 20 MHz version by duplicating and frequency shifting and by rotating the upper subcarriers by 90°. The frequency sequences are shown in Equation (19-19) and Equation (19-20).

For 20 MHz:

$$\begin{aligned} HTS_{-28,28} = \sqrt{1/2} \\ \{&0, 0, 0, 0, 1+j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, -1-j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, \\ &0, 0, 0, 0, -1-j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 0\} \end{aligned} \tag{19-19}$$

For 40 MHz:

$$\begin{aligned} HTS_{-58,58} = \sqrt{1/2} \\ \{&0, 0, 1+j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, -1-j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, \\ &0, 0, 0, 0, -1-j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 0, 0, \\ &0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 1+j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, -1-j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, \\ &0, 0, 0, 0, 0, 0, 0, -1-j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0\} \end{aligned} \tag{19-20}$$

The time domain representation of the transmission in transmit chain $i_{TX}$ shall be as shown in Equation (19-21).

$$\begin{aligned} r_{HT-STF}^{i_{TX}}(t) = &\frac{1}{\sqrt{N_{STS} \cdot N_{HT-STF}^{Tone}}} w_{\mathrm{T}_{HT-STF}}(t) \\ &\sum_{k=-N_{SR}}^{N_{SR}} \sum_{i_{STS}=1}^{N_{STS}} [Q_k]_{i_{TX}, i_{STS}} \Upsilon_k HTS_k \exp(j2\pi k \Delta_F (t - T_{CS}^{i_{STS}})) \end{aligned} \tag{19-21}$$

where

$T_{CS}^{i_{STS}}$ represents the cyclic shift for the space-time stream $i_{STS}$ and takes the values given in Table 19-10 (Cyclic shift values of HT portion of PPDU)

$Q_k$ is defined in 19.3.11.11.2 (Spatial mapping)

$\Upsilon_k$ is defined in Equation (19-5) and Equation (19-6)

#### 19.3.9.4.6 HT-LTF definition

The HT-LTF provides a means for the receiver to estimate the MIMO channel between the set of QAM mapper outputs (or, if STBC is applied, the STBC encoder outputs) and the receive chains. If the transmitter is providing training for exactly the space-time streams (spatial mapper inputs) used for the transmission of the PSDU, the number of training symbols, $N_{LTF}$, is equal to the number of space-time streams, $N_{STS}$, except that for three space-time streams, four training symbols are required. If the transmitter is providing

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

training for more space-time streams (spatial mapper inputs) than the number used for the transmission of the PSDU, the number of training symbols is greater than the number of space-time streams. This latter case happens in a sounding PPDU.

The HT-LTF portion has one or two parts. The first part consists of one, two, or four HT-LTFs that are necessary for demodulation of the (#14)Data field. These HT-LTFs are referred to as *HT-DLTFs*. The optional second part consists of zero, one, two, or four HT-LTFs that may be used to sound extra spatial dimensions of the MIMO channel that are not utilized by the (#14)Data field. These HT-LTFs are referred to as *HT-ELTFs*. If a receiver has not advertised its ability to receive HT-ELTFs, it shall either issue a PHY-RXEND.indication(UnsupportedRate) primitive upon reception of a (#14)PPDU that includes HT-ELTFs or decode that (#14)PPDU. (When an HT packet includes one or more HT-ELTFs, it is optional for a receiver that has not advertised its capability to receive HT-ELTFs to decode the (#14)Data field.)

The number of HT-DLTFs is denoted $N_{HT\text{-}DLTF}$. The number of HT-ELTFs is denoted $N_{HT\text{-}ELTF}$. The total number of HT-LTFs is shown in Equation (19-22).

$$N_{HT\text{-}LTF} = N_{HT\text{-}DLTF} + N_{HT\text{-}ELTF} \tag{19-22}$$

$N_{HT\text{-}LTF}$ shall not exceed 5. Table 19-12 (Determining the number of space-time streams) shows the determination of the number of space-time streams from the MCS and STBC fields in the HT-SIG. Table 19-13 (Number of HT-DLTFs required for data space-time streams(#83)) shows the number of HT-DLTFs as a function of the number of space-time streams ($N_{STS}$). Table 19-14 (Number of HT-ELTFs required for extension spatial streams) shows the number of HT-ELTFs as a function of the number of extension spatial streams ($N_{ESS}$). $N_{STS}$ plus $N_{ESS}$ is less than or equal to 4. In the case where $N_{STS}$ equals 3, $N_{ESS}$ cannot exceed one; if $N_{ESS}$ equals one in this case then $N_{LTF}$ equals 5.

**Table 19-12—Determining the number of space-time streams**

| Number of spatial streams (from MCS) $N_{SS}$ | STBC field | Number of space-time streams $N_{STS}$ |
|---|---|---|
| 1 | 0 | 1 |
| 1 | 1 | 2 |
| 2 | 0 | 2 |
| 2 | 1 | 3 |
| 2 | 2 | 4 |
| 3 | 0 | 3 |
| 3 | 1 | 4 |
| 4 | 0 | 4 |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 19-13—Number of HT-DLTFs required for data space-time streams(#83)**

| $N_{STS}$ | $N_{HT\text{-}DLTF}$ |
|---|---|
| 1 | 1 |
| 2 | 2 |
| 3 | 4 |
| 4 | 4 |

**Table 19-14—Number of HT-ELTFs required for extension spatial streams**

| $N_{ESS}$ | $N_{HT\text{-}ELTF}$ |
|---|---|
| 0 | 0 |
| 1 | 1 |
| 2 | 2 |
| 3 | 4 |

The HT-LTF sequence shown in Equation (19-23) is transmitted in the case of 20 MHz operation.

$$HT\text{-}LTF_{-28,28} = \{1, 1, 1, 1, -1, -1, 1, 1, -1, 1, -1, 1, 1, 1, 1, 1, 1, -1, -1, 1, 1, -1, 1, -1, 1, 1, 1, 1, 0,$$
$$1, -1, -1, 1, 1, -1, 1, -1, 1, -1, -1, -1, -1, -1, 1, 1, -1, -1, 1, -1, 1, -1, 1, 1, 1, 1, -1, -1\} \quad (19\text{-}23)$$

NOTE 1—This sequence is an extension of the L-LTF where the four extra subcarriers are filled with +1 for negative frequencies and –1 for positive frequencies.

In 40 MHz transmissions, including MCS 32 format (#14)PPDUs, the sequence to be transmitted is shown in Equation (19-24).

$$HT\text{-}LTF_{-58,58} = \{1, 1, -1, -1, 1, 1, -1, 1, -1, 1, 1, 1, 1, 1, 1, -1, -1, 1, 1, -1, 1, -1, 1, 1, 1, 1, 1,$$
$$1, -1, -1, 1, 1, -1, 1, -1, 1, -1, -1, -1, -1, -1, 1, 1, -1, -1, 1, -1, 1, -1, 1, 1, 1, 1, -1, -1, -1, 1, 0,$$
$$0, 0, -1, 1, 1, -1, 1, 1, -1, -1, 1, 1, -1, 1, -1, 1, 1, 1, 1, 1, 1, 1, -1, -1, 1, 1, -1, 1, -1, 1, 1, 1, 1, 1,$$
$$1, -1, -1, 1, 1, -1, 1, -1, 1, -1, -1, -1, -1, -1, 1, 1, -1, -1, 1, -1, 1, -1, 1, 1, 1, 1, 1\} \quad (19\text{-}24)$$

NOTE 2—This sequence is also constructed by extending the L-LTF in the following way: first, the L-LTF is duplicated and shifted as explained in 19.3.9.3.4 (L-LTF definition) for the non-HT duplicate format; then the missing subcarriers [–32, –5, –4, –3, –2, 2, 3, 4, 5, 32] are filled with the values [1, –1, –1, –1, 1, –1, 1, 1, –1, 1], respectively.

This sequence, occupying 114 tones, is used even if the data portion is transmitted with MCS 32 format, which uses 104 tones.

NOTE 3—This sequence uses 114 tones when MCS 32 format is used to retain consistency with other 40 MHz formats and to facilitate channel estimation for beamforming and link adaptation.

In an HT-mixed format preamble, each HT-LTF consists of a single occurrence of the sequence plus a GI insertion and has a duration of 4 μs. In case of multiple space-time streams, cyclic shift is invoked as specified in Table 19-10 (Cyclic shift values of HT portion of PPDU).

This is an unapproved IEEE Standards Draft, subject to change.

The generation of HT-DLTFs is shown in Figure 19-9 (Generation of HT-DLTFs). The generation of HT-ELTFs is shown in Figure 19-10 (Generation of HT-ELTFs). In these figures, and in the following text, the following notational conventions are used:

— $[X]_{m,\,n}$ indicates the element in row $m$ and column $n$ of matrix $X$

— $[X]_{N}$ indicates a matrix consisting of the first $N$ columns of matrix $X$

— $[X]_{M:N}$ indicates a matrix consisting of columns $M$ to $N$ of matrix $X$

where

$M \le N$

$X$ is either $Q_k$ or $P_{HT\text{-}LTF}$

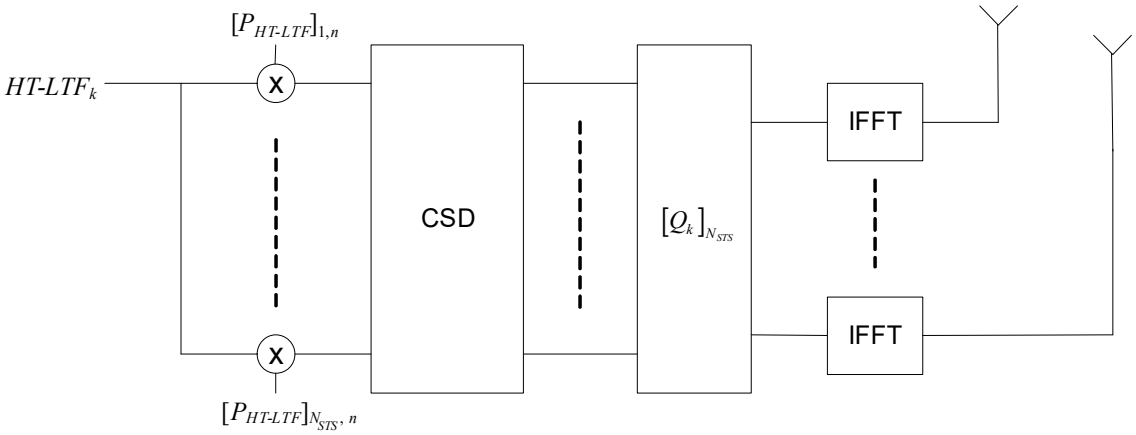

**Figure 19-9—Generation of HT-DLTFs**

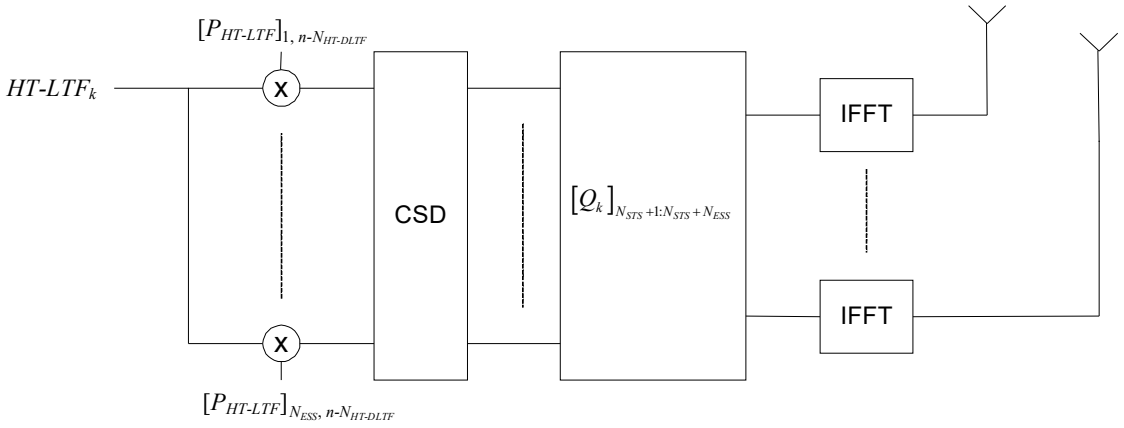

**Figure 19-10—Generation of HT-ELTFs**

The mapping between space-time streams and transmit chains is defined by the columns of an antenna map matrix $Q_k$ for subcarrier $k$. The first $N_{STS}$ columns define the space-time streams used for data transmission, and the next $N_{ESS}$ columns (up to $N_{TX} - N_{STS}$ columns) define the extension spatial streams. Thus, for the purpose of defining HT-LTFs, $Q_k$ is an $N_{TX} \times (N_{STS} + N_{ESS})$ dimension matrix. Columns

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$1 \ldots N_{STS}$ of $Q_k$ are excited by the HT-DLTFs, and columns $N_{STS}+1 \ldots N_{STS}+N_{ESS}$ are excited by the HT-ELTFs, where $N_{STS}+N_{ESS} \le N_{TX}$ is the total number of spatial streams being probed by the HT-LTFs.

Possible forms of $Q_k$ and other limitations on $Q_k$ are specified in 19.3.11.11.2 (Spatial mapping). $P_{HT\text{-}LTF}$ is defined in Equation (19-27).

The time domain representation of the waveform transmitted on transmit chain $i_{TX}$ during HT-DLTF $n$, where $1 \le n \le N_{HT\text{-}DLTF}$, shall be as shown in Equation (19-25).

$$r_{HT-LTF}^{n,i_{TX}}(t) = \frac{1}{\sqrt{N_{STS} \cdot N_{HT-LTF}^{Tone}}} w_{T_{HT-LTFs}}(t) \cdot \sum_{k=-N_{SR}}^{N_{SR}} \sum_{i_{STS}=1}^{N_{STS}} [Q_k]_{i_{TX}, i_{STS}} [P_{HT\text{-}LTF}]_{i_{STS}, n} \Upsilon_k HT\text{-}LTF_k \exp(j2\pi k \Delta_F (t - T_{GI} - T_{CS}^{i_{STS}})) \quad (19\text{-}25)$$

For the HT-ELTFs ($N_{HT\text{-}DLTF} < n \le N_{HT\text{-}LTF}$), it shall be as shown in Equation (19-26)(#83).

$$r_{HT-LTF}^{n,i_{TX}}(t) = \frac{1}{\sqrt{N_{HT-LTF}^{Tone} \cdot N_{ESS}}} w_{T_{HT-LTFs}}(t) \cdot \sum_{k=-N_{SR}}^{N_{SR}} \sum_{i_{ESS}=1}^{N_{ESS}} \Big( [Q_k]_{i_{TX}, N_{STS}+i_{ESS}} [P_{HT\text{-}LTF}]_{i_{ESS}, n-N_{HT\text{-}DLTF}} \Upsilon_k HT\text{-}LTF_k \cdot \exp(j2\pi k \Delta_F (t - T_{GI} - T_{CS}^{i_{ESS}})) \Big) \quad (19\text{-}26)$$

where

$T_{CS}^{i_{STS}}$ cyclic shift values are given in Table 19-10 (Cyclic shift values of HT portion of PPDU)

$T_{CS}^{i_{ESS}}$ cyclic shift values are given in Table 19-10 (Cyclic shift values of HT portion of PPDU) with $i_{ESS} = i_{STS}$

$Q_k$ is defined in 19.3.11.11.2 (Spatial mapping)

$\Upsilon_k$ is defined in Equation (19-5) and Equation (19-6)

$P_{HT\text{-}LTF}$ the HT-LTF mapping matrix, is given by Equation (19-27)

$$P_{HT\text{-}LTF} = \begin{bmatrix} 1 & -1 & 1 & 1 \\ 1 & 1 & -1 & 1 \\ 1 & 1 & 1 & -1 \\ -1 & 1 & 1 & 1 \end{bmatrix} \quad (19\text{-}27)$$

#### 19.3.9.5 HT-greenfield format preamble

##### 19.3.9.5.1 General

For HT-greenfield operation, compatibility with Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) and Clause 18 (Extended Rate PHY (ERP) specification) STAs is not required. Therefore, the portions of the preamble that are compatible with Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) and Clause 18 (Extended Rate PHY (ERP) specification) STAs are not included. The result is a shorter and more efficient (#14)PPDU format that includes a STF, LTF(s), and an HT-SIG.

##### 19.3.9.5.2 Cyclic shift definition for HT-greenfield format preamble

Throughout the HT-greenfield format preamble, cyclic shift is applied to prevent beamforming when similar signals are transmitted on different spatial streams. The same cyclic shift is applied to these streams during the transmission of the (#14)Data field. The values of the cyclic shift to be used during the HT-greenfield format preamble, as well as the (#14)Data field of the HT-greenfield format PPDU, are specified in Table 19-10 (Cyclic shift values of HT portion of PPDU).

##### 19.3.9.5.3 HT-GF-STF definition

The HT-GF-STF is placed at the beginning of an HT-greenfield format (#14)PPDU. The time domain waveform for the HT-GF-STF on transmit chain $i_{TX}$ shall be as shown in Equation (19-28).

$$r_{HT-GF-STF}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{STS} \cdot N_{HT-GF-STF}^{Tone}}} w_{T_{HT-GF-STF}}(t) \cdot \sum_{k=-N_{SR}}^{N_{SR}} \sum_{i_{STS}=1}^{N_{STS}} [Q_k]_{i_{TX}, i_{STS}} [P_{HT\text{-}LTF}]_{i_{STS}, 1} \Upsilon_k S_k \exp(j2\pi k \Delta_F (t - T_{CS}^{i_{STS}})) \quad (19\text{-}28)$$

where

$T_{CS}^{i_{STS}}$ represents the cyclic shift for the space-time stream $i_{STS}$ and takes values from Table 19-10 (Cyclic shift values of HT portion of PPDU)

$Q_k$ is defined in 19.3.11.11.2 (Spatial mapping)

$P_{HT\text{-}LTF}$ is defined in Equation (19-27)

$S_k$ is defined in non-HT-STF (L-STF), Equation (19-8) for 20 MHz operation and Equation (19-9) for 40 MHz operation

$\Upsilon_k$ is defined in Equation (19-5) and Equation (19-6)

The waveform defined by Equation (19-28) has a period of 0.8 μs, and the HT-GF-STF includes ten such periods, with a total duration of $T_{HT-GF-STF} = 8$ μs.

##### 19.3.9.5.4 HT-greenfield format HT-SIG

The content and format of the HT-SIG of an HT-greenfield format (#14)PPDU is identical to the HT-SIG in an HT-mixed format (#14)PPDU as described in 19.3.9.4.3 (HT-SIG definition). The placement of the HT-SIG in an HT-greenfield format (#14)PPDU is shown in Figure 19-1 (PPDU format). In HT-greenfield format (#14)PPDUs, the HT-SIG is transmitted with the same cyclic shifts and the same spatial mapping as the preceding portions of the preamble. This use of the same cyclic shifts and spatial mapping is done to

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

accommodate the estimation of channel parameters needed to robustly demodulate and decode the information contained in the HT-SIG.

The time domain waveform for the HT-SIG on transmit chain $i_{TX}$ with 20 MHz operation shall be as shown in Equation (19-29).

$$r_{HT-SIG}^{i_{TX}}(t) = \frac{1}{\sqrt{N_{STS} \cdot N_{HT-SIG}^{Tone}}} \sum_{n=0}^{1} w_{T_{SYM}}(t - nT_{SYM}) \cdot \sum_{k=-26}^{26} \sum_{i_{STS}=1}^{N_{STS}} [Q_k]_{i_{TX}, i_{STS}} [P_{HT\text{-}LTF}]_{i_{STS}, 1} (jD_{k,n} + p_n P_k) \cdot \exp(j2\pi k \Delta_F (t - nT_{SYM} - T_{GI} - T_{CS}^{i_{STS}})) \quad (19\text{-}29)$$

where

$P_k$ and $p_n$ are defined in 17.3.5.10 (OFDM modulation)

$D_{k,n}$ is defined in 19.3.9.4.3 (HT-SIG definition)

$T_{CS}^{i_{STS}}$ represents the cyclic shift for space-time stream $i_{STS}$ and takes values from Table 19-10 (Cyclic shift values of HT portion of PPDU)

$Q_k$ is defined in 19.3.11.11.2 (Spatial mapping)

$P_{HT\text{-}LTF}$ is defined in Equation (19-27)

The time domain waveform for the HT-SIG on transmit chain $i_{TX}$ with 40 MHz operation shall be as shown in Equation (19-30).

$$r_{HT-SIG}^{i_{TX}}(t) = \frac{1}{\sqrt{N_{STS} \cdot N_{HT-SIG}^{Tone}}} \sum_{n=0}^{1} w_{T_{SYM}}(t - nT_{SYM}) \cdot \sum_{k=-26}^{26} \sum_{i_{STS}=1}^{N_{STS}} [P_{HT\text{-}LTF}]_{i_{STS}, 1} (jD_{k,n} + p_n P_k) \cdot ([Q_{k-32}]_{i_{TX}, i_{STS}} \exp(j2\pi(k-32)\Delta_F (t - nT_{SYM} - T_{GI} - T_{CS}^{i_{STS}})) + j[Q_{k+32}]_{i_{TX}, i_{STS}} \exp(j2\pi(k+32)\Delta_F (t - nT_{SYM} - T_{GI} - T_{CS}^{i_{STS}}))) \quad (19\text{-}30)$$

where

$p_n$ and $P_k$ are defined in 17.3.5.10 (OFDM modulation)

$D_{k,n}$ is defined in 19.3.9.4.3 (HT-SIG definition)

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$T_{CS}^{i_{STS}}$ represents the cyclic shift for space-time stream $i_{STS}$ and takes values from Table 19-10 (Cyclic shift values of HT portion of PPDU)

$Q_k$ is defined in 19.3.11.11.2 (Spatial mapping)

$P_{HT\text{-}LTF}$ is defined in Equation (19-27)

#### 19.3.9.5.5 HT-greenfield format LTF

The format of the LTF portion of the preamble in an HT-greenfield format frame is similar to that of the HT-LTF in an HT-mixed format (#14)PPDU, as described in 19.3.9.4.6 (HT-LTF definition), with the difference that the first HT-LTF (HT-LTF1) is twice as long (8 μs) as the other HT-LTFs. The time domain waveform for the long training symbol on transmit chain $i_{TX}$ for the first HT-LTF in an HT-greenfield format (#14)PPDU shall be as shown in Equation (19-31).

$$r_{HT-LTF}^{1,i_{TX}}(t) = \frac{1}{\sqrt{N_{STS} \cdot N_{HT-LTF}^{Tone}}} w_{T_{HT-LTF1}}(t) \cdot \sum_{k=-N_{SR}}^{N_{SR}} \sum_{i_{STS}=1}^{N_{STS}} [Q_k]_{i_{TX}, i_{STS}} [P_{HT\text{-}LTF}]_{i_{STS},1} \Upsilon_k HT\text{-}LTF(k) \exp(j2\pi k \Delta_F (t - T_{GI2} - T_{CS}^{i_{STS}})) \quad (19\text{-}31)$$

where

$T_{CS}^{i_{STS}}$ represents the cyclic shift for space-time stream $i_{STS}$ and takes values from Table 19-10 (Cyclic shift values of HT portion of PPDU)

$Q_k$ is defined in 19.3.11.11.2 (Spatial mapping)

$P_{HT\text{-}LTF}$ is defined in Equation (19-27)

The first HT-LTF (HT-LTF1) consists of two periods of the long training symbol, preceded by a double-length (1.6 μs) cyclic prefix. The placement of the first and subsequent HT-LTFs in an HT-greenfield format (#14)PPDU is shown in Figure 19-1 (PPDU format).

### 19.3.10 Transmission of NON_HT PPDUs with more than one transmit chain(#2095)

When an HT device transmits a (#2095)NON_HT PPDU with the MODULATION parameter equal to OFDM or ERP-OFDM using more than one transmit chain, it shall apply the cyclic shifts defined in Table 19-9 (Cyclic shift for non-HT portion of PPDU) to the transmission in each chain.

### 19.3.11 Data field

#### 19.3.11.1 General

When BCC encoding is used, the Data field consists of the 16-bit SERVICE field, the PSDU, either six or twelve tail bits, depending on whether one or two encoding streams are represented, and pad bits. When LDPC encoding is used, the Data field consists of the 16-bit SERVICE field and the PSDU, processed by the procedure in 19.3.11.7.5 (LDPC PPDU encoding process).

The number of OFDM symbols in the (#14)Data field when BCC encoding is used is computed as shown in Equation (19-32).

$$N_{SYM} = m_{STBC} \left\lceil \frac{8 \cdot length + 16 + 6 \cdot N_{ES}}{m_{STBC} \cdot N_{DBPS}} \right\rceil \quad (19\text{-}32)$$

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

where

$m_{STBC}$ is 2 if STBC is used and 1 otherwise (making sure that the number of symbols is even when STBC is used)

*length* is the value of the HT Length field in the HT-SIG field defined in Table 19-11 (HT-SIG fields)

$N_{DBPS}$ takes the values defined in Table 19-27 (MCS parameters for mandatory 20 MHz, $N_{SS}$ = 1, $N_{ES}$ = 1) to Table 19-41 (MCS parameters for optional 40 MHz, $N_{SS}$ = 4, UEQM)

The number of "zero" pad bits is thus $N_{SYM} \times N_{DBPS} - 8 \times length - 16 - 6 \times N_{ES}$. The number of symbols in the (#14)Data field when LDPC encoding is used is described in 19.3.11.7 (LDPC codes).

For LDPC encoding, the number of encoded data bits, $N_{\text{avbits}}$, is given by Equation (19-39); the number of OFDM symbols, $N_{\text{SYM}}$, is given by Equation (19-41); and the number of repeated encoded bits for padding, $N_{\text{rep}}$, is given by Equation (19-42), in 19.3.11.7.5 (LDPC PPDU encoding process).

### 19.3.11.2 SERVICE field

The SERVICE field is used for scrambler initialization. The SERVICE field is composed of 16 bits, all set to 0 before scrambling. In non-HT PPDUs, the SERVICE field is the same as in 17.3.5.2 (SERVICE field). In HT PPDUs, the SERVICE field is composed of 16 zero bits, scrambled by the scrambler, as defined in 19.3.11.3 (Scrambler).

### 19.3.11.3 Scrambler

The (#404)Data field shall be scrambled by the scrambler defined in 17.3.5.5 (PHY DATA scrambler and descrambler). The Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) TXVECTOR parameters (#602)CH_BANDWIDTH_IN_NON_HT, DYN_BANDWIDTH_IN_NON_HT, and SCRAMBLER_INITIAL_VALUE are not present in an HT PPDU; therefore, the first 7 bits of the scrambling sequence are set to a 7-bit pseudorandom nonzero integer.

### 19.3.11.4 Coding

The Data field shall be encoded using either the BCC defined in 17.3.5.6 (Convolutional encoder) or the LDPC code defined in 19.3.11.7 (LDPC codes). The encoder is selected by the FEC coding field in the HT-SIG, as described in 19.3.9.4.3 (HT-SIG definition). A single FEC encoder is always used when LDPC coding is used. When the BCC FEC encoder is used, a single encoder is used, except that two encoders are used when the selected MCS has a PHY rate greater than 300 Mb/s (see 19.5 (Parameters for HT-MCSs)). To determine whether to use one or two BCC FEC encoders, the rate is calculated based on the use of an 800 ns GI. The operation of the BCC FEC is described in 19.3.11.6 (BCC coding and puncturing). The operation of the LDPC coder is described in 19.3.11.7 (LDPC codes).

Support for the reception of (#14)PPDUs with BCC-encoded Data fields is mandatory.

### 19.3.11.5 Encoder parsing operation for two BCC FEC encoders

If two BCC encoders are used, the scrambled data bits are divided between the encoders by sending alternating bits to different encoders. Bit with index $i$ sent to the encoder $j$, denoted $x_i^{(j)}$, is shown in Equation (19-33).

$$x_i^{(j)} = b_{N_{ES} \cdot i + j} \quad ; \quad 0 \le j \le N_{ES} - 1 \tag{19-33}$$

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Following the parsing operation, 6 scrambled "zero" bits following the end of the message bits in each BCC input sequence are replaced by unscrambled "zero" bits, as described in 17.3.5.3 (PPDU TAIL field).

The replaced bits are shown in Equation (19-34).

$$x_i^{(j)} \quad : \quad 0 \le j \le N_{ES} - 1 \quad ; \quad \frac{length \cdot 8 + 16}{N_{ES}} \le i \le \frac{length \cdot 8 + 16}{N_{ES}} + 5 \tag{19-34}$$

### 19.3.11.6 BCC coding and puncturing

When BCC encoding is used, the encoder parser output sequences $\{x_i^0\}$, and $\{x_i^1\}$ where applicable, are each encoded by the rate 1/2 convolutional encoder defined in 17.3.5.6 (Convolutional encoder). After encoding, the encoded data shall be punctured by the method defined in 17.3.5.7 (Data interleaving) to achieve the rate selected by the MCS.

If rate 5/6 coding is selected, the puncturing scheme is defined in Figure 19-11 (Puncturing at rate 5/6).

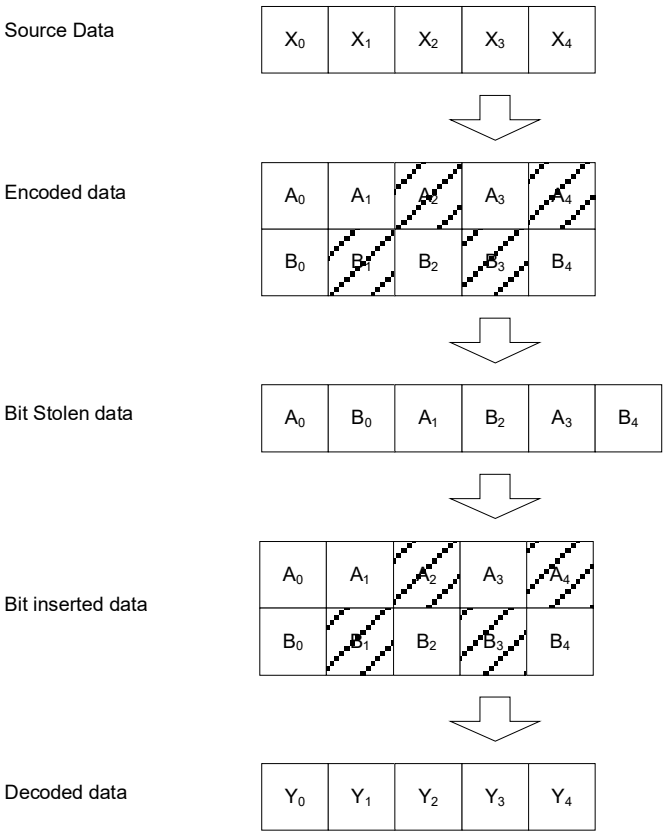

**Figure 19-11—Puncturing at rate 5/6**

### 19.3.11.7 LDPC codes

#### 19.3.11.7.1 Introduction

HT LDPC codes are described in 19.3.11.7.2 (LDPC coding rates and codeword block lengths) to 19.3.11.7.6 (LDPC parser). These codes are optionally used in the HT system as a high-performance error

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

correcting code instead of the convolutional code (19.3.11.6 (BCC coding and puncturing)). The LDPC encoder shall use the rate-dependent parameters in Table 19-27 (MCS parameters for mandatory 20 MHz, $N_{SS}$ = 1, $N_{ES}$ = 1) to Table 19-41 (MCS parameters for optional 40 MHz, $N_{SS}$ = 4, UEQM), with the exception of the $N_{ES}$ parameter.

Support for LDPC codes is optional.

#### 19.3.11.7.2 LDPC coding rates and codeword block lengths

The supported coding rates, information block lengths, and codeword block lengths are described in Table 19-15 (LDPC parameters).

**Table 19-15—LDPC parameters**

| Coding rate (R) | LDPC information block length (bits) | LDPC codeword block length (bits) |
|---|---|---|
| 1/2 | 972 | 1944 |
| 1/2 | 648 | 1296 |
| 1/2 | 324 | 648 |
| 2/3 | 1296 | 1944 |
| 2/3 | 864 | 1296 |
| 2/3 | 432 | 648 |
| 3/4 | 1458 | 1944 |
| 3/4 | 972 | 1296 |
| 3/4 | 486 | 648 |
| 5/6 | 1620 | 1944 |
| 5/6 | 1080 | 1296 |
| 5/6 | 540 | 648 |

#### 19.3.11.7.3 LDPC encoder

For each of the three available codeword block lengths, the LDPC encoder supports rate 1/2, rate 2/3, rate 3/4, and rate 5/6 encoding. The LDPC encoder is systematic, i.e., it encodes an information block, $\mathbf{c}=(i_0, i_1, ..., i_{(k-1)})$, of size $k$, into a codeword, **c,** of size $n$, (#515)$\mathbf{c}=(i_0, i_1,..., i_{(k-1)}, p_0, p_1, ..., p_{(n-k-1)})$, by adding $n-k$ parity bits obtained so that $\mathbf{H}\times\mathbf{c}^T = \mathbf{0}$, where **H** is an $(n-k)\times n$ parity-check matrix. The selection of the codeword block length ($n$) is achieved via the LDPC PPDU encoding process described in 19.3.11.7.5 (LDPC PPDU encoding process).

#### 19.3.11.7.4 Parity-check matrices

Each of the parity-check matrices is partitioned into square subblocks (submatrices) of size $Z \times Z$. These submatrices are either cyclic-permutations of the identity matrix or null submatrices.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The cyclic-permutation matrix $P_i$ is obtained from the $Z \times Z$ identity matrix by cyclically shifting the columns to the right by $i$ elements. The matrix $P_0$ is the $Z \times Z$ identity matrix. Figure 19-12 (Examples of cyclic-permutation matrices with Z=8(#577)) illustrates examples (for a subblock size of 8 × 8) of cyclic-permutation matrices $P_i$.

$$P_0 = \begin{bmatrix} 1&0&0&0&0&0&0&0 \\ 0&1&0&0&0&0&0&0 \\ 0&0&1&0&0&0&0&0 \\ 0&0&0&1&0&0&0&0 \\ 0&0&0&0&1&0&0&0 \\ 0&0&0&0&0&1&0&0 \\ 0&0&0&0&0&0&1&0 \\ 0&0&0&0&0&0&0&1 \end{bmatrix}, P_1 = \begin{bmatrix} 0&1&0&0&0&0&0&0 \\ 0&0&1&0&0&0&0&0 \\ 0&0&0&1&0&0&0&0 \\ 0&0&0&0&1&0&0&0 \\ 0&0&0&0&0&1&0&0 \\ 0&0&0&0&0&0&1&0 \\ 0&0&0&0&0&0&0&1 \\ 1&0&0&0&0&0&0&0 \end{bmatrix}, P_5 = \begin{bmatrix} 0&0&0&0&0&1&0&0 \\ 0&0&0&0&0&0&1&0 \\ 0&0&0&0&0&0&0&1 \\ 1&0&0&0&0&0&0&0 \\ 0&1&0&0&0&0&0&0 \\ 0&0&1&0&0&0&0&0 \\ 0&0&0&1&0&0&0&0 \\ 0&0&0&0&1&0&0&0 \end{bmatrix}$$

**Figure 19-12—Examples of cyclic-permutation matrices with Z=8(#577)**

Table F-1 (Matrix prototypes for codeword block length n = 648 bits, subblock size is Z = 27 bits) displays the "matrix prototypes" of parity-check matrices for all four coding rates at block length $n$=648 bits. The integer $i$ denotes the cyclic-permutation matrix $P_i$, as illustrated in Figure 19-12 (Examples of cyclic-permutation matrices with Z=8(#577)). Vacant entries of the table denote null (zero) submatrices.

Table F-2 (Matrix prototypes for codeword block length n = 1296 bits, subblock size is Z = 54 bits) displays the matrix prototypes of parity-check matrices for block length $n$=1296 bits, in the same fashion.

Table F-3 (Matrix prototypes for codeword block length n = 1944 bits, subblock size is Z = 81 bits) displays the matrix prototypes of parity-check matrices for block length $n$=1944 bits, in the same fashion.

### 19.3.11.7.5 LDPC PPDU encoding process

To encode an LDPC PPDU, step a) to step g) shall be performed in sequence:

a) Compute the number of available bits, $N_{avbits}$, in the minimum number of OFDM symbols in which the Data field of the (#14)PPDU may fit.

$$N_{pld} = length \times 8 + 16 \tag{19-35}$$

$$N_{avbits} = N_{CBPS} \times m_{STBC} \times \left\lceil \frac{N_{pld}}{N_{CBPS} \times R \times m_{STBC}} \right\rceil \tag{19-36}$$

where

| | |
|---|---|
| $m_{STBC}$ | is 2 if STBC is used and 1 otherwise |
| $length$ | is the value of the HT Length field in the HT-SIG field defined in Table 19-11 (HT-SIG fields) |
| $N_{pld}$ | is the number of bits in the PSDU and SERVICE field |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

b) Compute the integer number of LDPC codewords to be transmitted, $N_{CW}$, and the length of the codewords to be used, $L_{LDPC}$ from Table 19-16 (PPDU encoding parameters).

**Table 19-16—PPDU encoding parameters**

| Range of $N_{avbits}$ (bits) | Number of LDPC codewords ($N_{CW}$) | LDPC codeword length $L_{LDPC}$ (bits) |
|---|---|---|
| $N_{avbits} \le 648$ | 1 | 1296, if $N_{avbits} \ge N_{pld} + 912 \times (1\text{-}R)$<br>648, otherwise |
| $648 < N_{avbits} \le 1296$ | 1 | 1944, if $N_{avbits} \ge N_{pld} + 1464 \times (1\text{-}R)$<br>1296, otherwise |
| $1296 < N_{avbits} \le 1944$ | 1 | 1944 |
| $1944 < N_{avbits} \le 2592$ | 2 | 1944, if $N_{avbits} \ge N_{pld} + 2916 \times (1\text{-}R)$<br>1296, otherwise |
| $2592 < N_{avbits}$ | $\left\lceil \frac{N_{pld}}{1944 \cdot R} \right\rceil$ | 1944 |

c) Compute the number of shortening bits, $N_{shrt}$, to be padded to the $N_{pld}$ data bits before encoding, as shown in Equation (19-37).

$$N_{shrt} = \max(0, (N_{CW} \times L_{LDPC} \times R) - N_{pld}) \quad (19\text{-}37)$$

When $N_{shrt} = 0$, shortening is not performed. (Note that $N_{shrt}$ is inherently restricted to be non-negative due to the codeword length and count selection of Table 19-16 (PPDU encoding parameters)). When $N_{shrt} > 0$, shortening bits shall be equally distributed over all $N_{CW}$ codewords with the first $N_{shrt}$ mod $N_{CW}$ codewords shortened 1 bit more than the remaining codewords. Define $N_{spcw} = \lfloor N_{shrt} / N_{CW} \rfloor$. Then, when $N_{shrt} > 0$, the shortening is performed by setting information bits $i_{k-N_{spcw}-1}, \ldots, i_{k-1}$ to 0 in the first $N_{shrt}$ mod $N_{CW}$ codewords and setting information bits $i_{k-N_{spcw}}, \ldots, i_{k-1}$ to 0 in the remaining codewords. For all values of $N_{shrt}$, encode each of the $N_{CW}$ codewords using the LDPC encoding technique described in 19.3.11.7.2 (LDPC coding rates and codeword block lengths) to 19.3.11.7.4 (Parity-check matrices). When $N_{shrt} > 0$, the shortened bits shall be discarded after encoding.

d) Compute the number of bits to be punctured, $N_{punc}$, from the codewords after encoding, as shown in Equation (19-38).

$$N_{punc} = \max(0, (N_{CW} \times L_{LDPC}) - N_{avbits} - N_{shrt}) \quad (19\text{-}38)$$

If $\left((N_{punc} > 0.1 \times N_{CW} \times L_{LDPC} \times (1-R)) \text{ AND} \left(N_{shrt} < 1.2 \times N_{punc} \times \frac{R}{1-R}\right)\right)$ is true OR if $(N_{punc} > 0.3 \times N_{CW} \times L_{LDPC} \times (1-R))$ is true, increment $N_{avbits}$ and recompute $N_{punc}$ by the following two equations once:

$$N_{avbits} = N_{avbits} + N_{CBPS} \times m_{STBC} \quad (19\text{-}39)$$

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$N_{punc} = \max(0, (N_{CW} \times L_{LDPC}) - N_{avbits} - N_{shrt}) \quad (19\text{-}40)$$

The punctured bits shall be equally distributed over all $N_{CW}$ codewords with the first $N_{punc} \bmod N_{CW}$ codewords punctured 1 bit more than the remaining codewords. Define $N_{\text{ppcw}} = \lfloor N_{\text{punc}} / N_{\text{CW}} \rfloor$. When $N_{\text{ppcw}} > 0$, the puncturing is performed by discarding parity bits $p_{n-k-N_{ppcw}-1}, \ldots, p_{n-k-1}$ of the first $N_{punc}$ mod $N_{CW}$ codewords and discarding parity bits $(p_{n-k-N_{ppcw}}, \ldots, p_{n-k-1})$ of the remaining codewords after encoding. The number of OFDM symbols to be transmitted in the PPDU is computed as shown in Equation (19-41).

$$N_{SYM} = N_{avbits} / N_{CBPS} \quad (19\text{-}41)$$

e) Compute the number of coded bits to be repeated, $N_{rep}$, as shown in Equation (19-42).

$$N_{rep} = \max(0, N_{avbits} - N_{CW} \times L_{LDPC} \times (1 - R) - N_{pld}) \quad (19\text{-}42)$$

The number of coded bits to be repeated shall be equally distributed over all $N_{CW}$ codewords with one more bit repeated for the first $N_{rep}$ mod $N_{CW}$ codewords than for the remaining codewords.

NOTE—When puncturing occurs, the coded bits are not repeated, and vice versa.

The coded bits to be repeated for any codeword shall be copied only from that codeword itself, starting from information bit $i_0$ and continuing sequentially through the information bits and, when necessary, into the parity bits, until the required number of repeated bits is obtained for that codeword. Note that these repeated bits are copied from the codeword after the shortening bits have been removed. If for a codeword the required number of repeated bits are not obtained in this manner (i.e., repeating the codeword once), the procedure is repeated until the required number is achieved. These repeated bits are then concatenated to the codeword after the parity bits in their same order. This process is illustrated in Figure 19-13 (LDPC PPDU encoding padding and puncturing of a single codeword). In this figure, the outlined arrows indicate the encoding procedure steps, while the solid arrows indicate the direction of puncturing and padding with repeated bits.

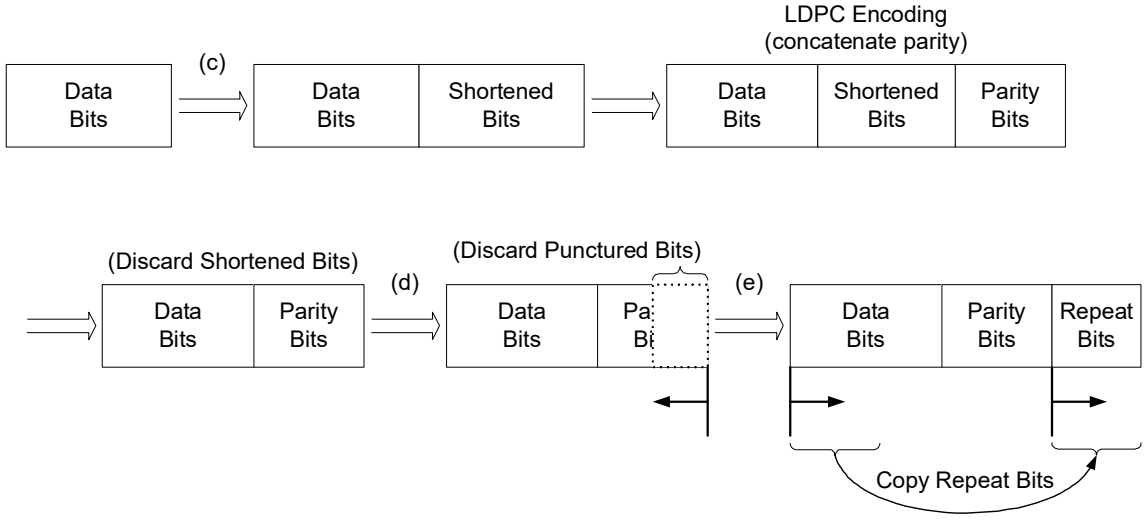

**Figure 19-13—LDPC PPDU encoding padding and puncturing of a single codeword**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

f) For each of the $N_{CW}$ codewords, process the data using the number of shortening bits per codeword as computed in step c) for encoding, and puncture or repeat bits per codeword as computed per step d) and step e), as illustrated in Figure 19-13 (LDPC PPDU encoding padding and puncturing of a single codeword).

g) Aggregate all codewords and parse as defined in 19.3.11.7.6 (LDPC parser).

#### 19.3.11.7.6 LDPC parser

The succession of LDPC codewords that result from the encoding process of 19.3.11.7.5 (LDPC PPDU encoding process) shall be converted into a bitstream in sequential fashion. Within each codeword, bit $i_0$ is ordered first. The parsing of this encoded data stream into spatial streams shall follow exactly the parsing rules defined for the BCC encoder, as defined in 19.3.11.8.1 (Overview). However, the frequency interleaver of 19.3.11.8.3 (Frequency interleaver) is bypassed.

### 19.3.11.8 Data interleaver

#### 19.3.11.8.1 Overview

After coding and puncturing, the data bit streams at the output of the FEC encoders are rearranged into blocks of $N_{CBPSS}(i_{SS})$ bits, where $i_{SS} = 1, 2, \ldots N_{SS}$ is the spatial stream index. This operation is referred to as *stream parsing* and is described in 19.3.11.8.2 (Stream parser). If BCC encoding was used, each of these blocks is then interleaved by an interleaver that is a modification of the Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) interleaver.

#### 19.3.11.8.2 Stream parser

The number of bits assigned to a single axis (real or imaginary) in a constellation point in spatial stream $i_{SS}$ is denoted by Equation (19-43).

$$s(i_{SS}) = \max\left\{1, \frac{N_{BPSCS}(i_{SS})}{2}\right\} \tag{19-43}$$

The sum of these over all streams is $S = \sum_{i_{SS}=1}^{N_{SS}} s(i_{SS})$.

NOTE—If equal MCS is used for all spatial streams, this sum becomes $N_{SS} \cdot s$, where $s$ is the number of bits for an axis common to all streams.

Consecutive blocks of $s(i_{SS})$ bits are assigned to different spatial streams in a round robin fashion.

If two encoders are present, the output of each encoder is used alternately for each round robin cycle, i.e., at the beginning $S$ bits from the output of first encoder are fed into all spatial streams, and then $S$ bits from the output of second encoder are used, and so on.

Input $k$ to spatial stream $i_{SS}$ shall be $y_i^{(j)}$, which is output bit $i$ of the encoder $j$,

where

$$j = \left\lfloor \frac{k}{s(i_{SS})} \right\rfloor \bmod N_{ES} \tag{19-44}$$

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$i = \sum_{i' = 1}^{i_{SS}-1} s(i') + S \cdot \left\lfloor \frac{k}{N_{ES} \cdot s(i_{SS})} \right\rfloor + k \bmod s(i_{SS}) \qquad (19\text{-}45)$$

$$1 \le i_{SS} \le N_{SS}$$

For $i_{SS} = 1$, the first term in Equation (19-45) has a value of 0.

#### 19.3.11.8.3 Frequency interleaver

MCS 32 interleaving shall be as defined in 17.3.5.7 (Data interleaving). Interleaving for all other MCSs is defined in this subclause.

The bits at the output of the stream parser are divided into blocks of $N_{CBPSS}(i_{SS})$, $i_{SS} = 1, 2, \ldots N_{SS}$ bits; and if BCC encoding was used, each block shall be interleaved by an interleaver based on the Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) interleaver. This interleaver, which is based on entering the data in rows and reading them out in columns, has a different number of columns and rows depending on whether a 20 MHz channel or a 40 MHz channel is used. Table 19-17 (Number of rows and columns in the interleaver) defines the interleaver parameters. If LDPC encoding was used, no frequency interleaving is performed; hence the parsed streams are immediately mapped to symbols as defined in 19.3.11.9 (Constellation mapping).

**Table 19-17—Number of rows and columns in the interleaver**

| Parameter | 20 MHz | 40 MHz |
|---|---|---|
| $N_{COL}$ | 13 | 18 |
| $N_{ROW}$ | $4 \times N_{BPSCS}(i_{SS})$ | $6 \times N_{BPSCS}(i_{SS})$ |
| $N_{ROT}$ | 11 | 29 |

If more than one spatial stream exists after the operations based on the Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) interleaver have been applied, a third operation called *frequency rotation* shall be applied to the additional spatial streams. The parameter for the frequency rotation is $N_{ROT}$.

The interleaving is defined using three permutations. The first permutation is defined by the rule shown in Equation (19-46).

$$i = N_{ROW} \times (k \bmod N_{COL}) + \lfloor k / N_{COL} \rfloor, \qquad k = 0, 1, \ldots, N_{CBPSS}(i_{SS}) - 1 \qquad (19\text{-}46)$$

The second permutation is defined by the rule shown in Equation (19-47).

$$j = s(i_{SS}) \times \lfloor i / s(i_{SS}) \rfloor + (i + N_{CBPSS}(i_{SS}) - \lfloor N_{COL} \times i / N_{CBPSS}(i_{SS}) \rfloor) \bmod s(i_{SS}); \quad i = 0, 1, \ldots, N_{CBPSS}(i_{SS}) - 1 \qquad (19\text{-}47)$$

The value of $s(i_{SS})$ is determined by the number of coded bits per subcarrier as shown in Equation (19-48).

$$s(i_{SS}) = \max(N_{BPSCS}(i_{SS})/2, 1) \qquad (19\text{-}48)$$

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

If more than one spatial stream exists, a frequency rotation is applied to the output of the second permutation as shown in Equation (19-49).

$$r = \left(j - \left(((i_{SS}-1)\times 2) \bmod 3 + 3\times\left\lfloor\frac{i_{SS}-1}{3}\right\rfloor\right)\times N_{ROT}\times N_{BPSCS}(i_{SS})\right) \bmod N_{CBPSS}(i_{SS}); \quad j = 0, 1, \ldots, N_{CBPSS}(i_{SS})-1 \tag{19-49}$$

where

$i_{SS} = 1, 2, \ldots, N_{SS}$ is the index of the spatial stream on which this interleaver is operating

The deinterleaver uses the following operations to perform the inverse rotation. The index of the bit in the received block (per spatial stream) is denoted by *r*. The first permutation reverses the third (frequency rotation) permutation of the interleaver as shown in Equation (19-50).

$$j = \left(r + \left(((i_{SS}-1)\times 2) \bmod 3 + 3\times\left\lfloor\frac{i_{SS}-1}{3}\right\rfloor\right)\times N_{ROT}\times N_{BPSCS}(i_{SS})\right) \bmod N_{CBPSS}(i_{SS}); \quad r = 0, 1, \ldots, N_{CBPSS}(i_{SS})-1 \tag{19-50}$$

The second permutation reverses the second permutation in the interleaver as shown in Equation (19-51).

$$i = s(i_{SS})\times\left\lfloor j/s(i_{SS})\right\rfloor + \left(j + \left\lfloor N_{COL}\times j/N_{CBPSS}(i_{SS})\right\rfloor\right) \bmod s(i_{SS}); \quad j = 0, 1, \ldots, N_{CBPSS}(i_{SS})-1 \tag{19-51}$$

where $s(i_{SS})$ is defined in Equation (19-48).

The third permutation reverses the first permutation of the interleaver as shown in Equation (19-52).

$$k = N_{COL}\times i - (N_{CBPSS}(i_{SS})-1)\times\left\lfloor i/N_{ROW}\right\rfloor \qquad i = 0, 1, \ldots, N_{CBPSS}(i_{SS})-1 \tag{19-52}$$

### 19.3.11.9 Constellation mapping

#### 19.3.11.9.1 General

The mapping between bits at the output of the interleaver and complex constellation points for BPSK, QPSK, 16-QAM, and 64-QAM follows the rules defined in 17.3.5.8 (Subcarrier modulation mapping).

The streams of complex numbers are denoted as shown in Equation (19-53).

$$d_{k,l,n},\ 0 \le k \le N_{SD}-1;1 \le l \le N_{SS};0 \le n \le N_{SYM}-1 \tag{19-53}$$

#### 19.3.11.9.2 Space-time block coding (STBC)

This subclause defines a set of optional robust transmission formats that are applicable only when $N_{STS}$ is greater than $N_{SS}$. In this case, $N_{SS}$ spatial streams are mapped to $N_{STS}$ space-time streams, which are mapped to $N_{TX}$ transmit chains. These formats are based on STBC. When the use of STBC is indicated in the STBC field of the HT-SIG, a symbol operation shall occur between the constellation mapper and the spatial mapper (see Figure 19-3 (Transmitter block diagram 2)) as defined in this subclause.

If STBC is applied, the stream of complex numbers, $d_{k,i,n}; k = 0\ldots N_{SD}-1; i = 1\ldots N_{SS}; n = 0\ldots N_{SYM}-1$, generated by the constellation mapper, is the input of the STBC encoder, which produces as output the

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

stream of complex numbers $\tilde{d}_{k,i,n}; k = 0 \ldots N_{SD} - 1; i = 1 \ldots N_{STS}; n = 0 \ldots N_{SYM} - 1$. For given values of $k$ and $i$, STBC processing operates on the complex modulation symbols in sequential pairs of OFDM symbols so that the value of $\tilde{d}_{k,i,2m}$ depends on $d_{k,i,2m}$ and $d_{k,i,2m+1}$, and $\tilde{d}_{k,i,2m+1}$ also depends on $d_{k,i,2m}$ and $d_{k,i,2m+1}$, as defined in Table 19-18 (Constellation mapper output to spatial mapper input for STBC).

**Table 19-18—Constellation mapper output to spatial mapper input for STBC**

| $N_{STS}$ | HT-SIG MCS field (bits 0–6 in HT-SIG$_1$) | $N_{SS}$ | HT-SIG STBC field (bits 4–5 in HT-SIG$_2$) | $i_{STS}$ | $\tilde{d}_{k,i,2m}$ | $\tilde{d}_{k,i,2m+1}$ |
|---|---|---|---|---|---|---|
| 2 | 0–7 | 1 | 1 | 1 | $d_{k,1,2m}$ | $d_{k,1,2m+1}$ |
| | | | | 2 | $-d^*_{k,1,2m+1}$ | $d^*_{k,1,2m}$ |
| 3 | 8–15, 33–38 | 2 | 1 | 1 | $d_{k,1,2m}$ | $d_{k,1,2m+1}$ |
| | | | | 2 | $-d^*_{k,1,2m+1}$ | $d^*_{k,1,2m}$ |
| | | | | 3 | $d_{k,2,2m}$ | $d_{k,2,2m+1}$ |
| 4 | 8–15 | 2 | 2 | 1 | $d_{k,1,2m}$ | $d_{k,1,2m+1}$ |
| | | | | 2 | $-d^*_{k,1,2m+1}$ | $d^*_{k,1,2m}$ |
| | | | | 3 | $d_{k,2,2m}$ | $d_{k,2,2m+1}$ |
| | | | | 4 | $-d^*_{k,2,2m+1}$ | $d^*_{k,2,2m}$ |
| 4 | 16–23, 39, 41, 43, 46, 48, 50 | 3 | 1 | 1 | $d_{k,1,2m}$ | $d_{k,1,2m+1}$ |
| | | | | 2 | $-d^*_{k,1,2m+1}$ | $d^*_{k,1,2m}$ |
| | | | | 3 | $d_{k,2,2m}$ | $d_{k,2,2m+1}$ |
| | | | | 4 | $d_{k,3,2m}$ | $d_{k,3,2m+1}$ |

NOTE—The '*' operator represents the complex conjugate.

If STBC is not applied, $\tilde{d}_{k,i,n} = d_{k,i,n}$ and $N_{SS} = N_{STS}$.

NOTE 1—The specific STBC schemes for single spatial streams ($N_{SS} = 1$) with $N_{TX} \geq 3$ are not detailed in this subclause since they are covered through the use of spatial expansion as detailed in 19.3.11.11.2 (Spatial mapping).

NOTE 2—STBC is applied only for the HT-SIG MCS field values specified in Table 19-18 (Constellation mapper output to spatial mapper input for STBC) and is not used with MCS 32.

### 19.3.11.10 Pilot subcarriers

In a 20 MHz transmission four pilot tones shall be inserted in the same subcarriers used in Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification), i.e., in subcarriers –21, –7, 7, and 21. The pilot sequence for the $n^{\text{th}}$ symbols and $i_{STS}{}^{\text{th}}$ space-time stream shall be as shown in Equation (19-54).

$$P^{-28,28}_{(i_{STS},n)} = \left\{ 0,0,0,0,0,0,0,\Psi^{(N_{STS})}_{i_{STS},\,n \bmod 4},0,0,0,0,0,0,0,0,0,0,0,0,0,0,\Psi^{(N_{STS})}_{i_{STS},\,(n+1) \bmod 4},0,0,0,0,0,0,0, \right.$$
$$\left. 0,0,0,0,0,0,\Psi^{(N_{STS})}_{i_{STS},\,(n+2) \bmod 4},0,0,0,0,0,0,0,0,0,0,0,0,0,\Psi^{(N_{STS})}_{i_{STS},\,(n+3) \bmod 4},0,0,0,0,0,0,0 \right\} \quad (19\text{-}54)$$

In a 40 MHz transmission (excluding MCS 32; see 19.3.11.11.5 (Transmission in MCS 32 format)), pilot signals shall be inserted in subcarriers –53, –25, –11, 11, 25, and 53. The pilot sequence for symbol $n$ and space-time stream $i_{STS}$ shall be as shown in Equation (19-55).

$$P^{-58,58}_{(i_{STS},n)} = \left\{ 0,0,0,0,0,0,\Psi^{(N_{STS})}_{i_{STS},\,n \bmod 6},0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0, \right.$$
$$0,0,\Psi^{(N_{STS})}_{i_{STS},\,(n+1) \bmod 6},0,0,0,0,0,0,0,0,0,0,0,0,0,0,\Psi^{(N_{STS})}_{i_{STS},\,(n+2) \bmod 6},0,0,0,0,0,0,0,0,0,$$
$$0,0,0,0,0,0,0,0,0,0,0,0,0,\Psi^{(N_{STS})}_{i_{STS},\,(n+3) \bmod 6},0,0,0,0,0,0,0,0,0,0,0,0,0,\Psi^{(N_{STS})}_{i_{STS},\,(n+4) \bmod 6}, \quad (19\text{-}55)$$
$$\left. 0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,\Psi^{(N_{STS})}_{i_{STS},\,(n+5) \bmod 6},0,0,0,0,0 \right\}$$

where the patterns $\Psi^{(N_{STS})}_{i_{STS},n}$ are defined in Table 19-19 (Pilot values for 20 MHz transmission) and Table 19-20 (Pilots values for 40 MHz transmission (excluding MCS 32)).

NOTE—For each space-time stream, there is a different pilot pattern, and the pilot patterns are cyclically rotated over symbols.

The basic patterns are also different according to the total number of space-time streams for the (#14)Data field of the PPDU.

**Table 19-19—Pilot values for 20 MHz transmission**

| $N_{STS}$ | $i_{STS}$ | $\Psi^{(N_{STS})}_{i_{STS},0}$ | $\Psi^{(N_{STS})}_{i_{STS},1}$ | $\Psi^{(N_{STS})}_{i_{STS},2}$ | $\Psi^{(N_{STS})}_{i_{STS},3}$ |

### 19.3.11.11 OFDM modulation

#### 19.3.11.11.1 General

The time domain signal is composed from the stream of complex numbers as shown in Equation (19-56).

$$\tilde{d}_{k,l,n},\ 0 \le k \le N_{SD}-1; 1 \le l \le N_{STS}; 0 \le n \le N_{SYM}-1 \tag{19-56}$$

and from the pilot signals. In a 40 MHz transmission, the upper subcarriers are rotated 90° relative to the lower subcarriers.

#### 19.3.11.11.2 Spatial mapping

The transmitter may choose to rotate and/or scale the constellation mapper output vector (or the space-time block coder output, if applicable). This rotation and/or scaling is useful in the following cases:

— When there are more transmit chains than space-time streams, $N_{STS} < N_{TX}$

— As part of (an optional) sounding PPDU

— As part of (an optional) calibration procedure

— When the (#14)PPDU is transmitted using one of the (optional) beamforming techniques

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

If the data to be transmitted on subcarrier $k$ on space-time stream $i_{STS}$ are $X_k^{(i_{STS})}$, the transmitted data on the transmit chain $i_{TX}$ shall be as shown in Equation (19-57).

$$r_{Field}^{(i_{TX})} = \frac{1}{\sqrt{N_{STS} \cdot N_{Field}^{Tone}}} w_{\mathrm{T}_{Field}}(t) \sum_{k=-N_{SR}}^{N_{SR}} \sum_{i_{STS}=1}^{N_{STS}} [Q_k]_{i_{TX}, i_{STS}} X_k^{(i_{STS})} \exp(j2\pi k \Delta_F (t - T_{CS}^{i_{STS}})) \quad (19\text{-}57)$$

where

$[Q_k]_{i_{TX}, i_{STS}}$ is the element in row $i_{TX}$ and column $i_{STS}$ in a matrix $Q_k$ with $N_{TX}$ rows and $N_{STS}$ columns; $Q_k$ may be frequency dependent

*Field* is any field, as defined in 19.3.7 (Mathematical description of signals), excluding L-STF, L-LTF, L-SIG, and HT-SIG in (#2095)HT-mixed format PPDU

Below are examples of spatial mapping matrices that might be used. There exist many other alternatives; implementation is not restricted to the spatial mapping matrices shown. The examples are as follows:

a) *Direct mapping*: $Q_k$ is a diagonal matrix of unit magnitude complex values that takes one of two forms:

   1) $Q_k = \mathbf{I}$, the identity matrix

   2) A CSD matrix in which the diagonal elements represent cyclic shifts in the time domain: $[Q_k]_{i,i} = \exp(-j2\pi k \Delta_F \tau_{CS}^i)$, where $\tau_{CS}^i$, $i = 1, \ldots, N_{TX}$ represents the CSD applied.

b) *Indirect mapping:* $Q_k$ may be the product of a CSD matrix and a unitary matrix such as the Hadamard matrix or the Fourier matrix.

c) *Spatial expansion:* $Q_k$ is the product of a CSD matrix and a square matrix formed of orthogonal columns. As an illustration:

   1) The spatial expansion may be performed by duplicating some of the $N_{STS}$ streams to form the $N_{TX}$ streams, with each stream being scaled by the normalization factor $\sqrt{N_{STS}/N_{TX}}$. The spatial expansion may be performed by using, for instance, one of the following matrices, denoted $D$, left-multiplied by a CSD matrix, denoted $M_{CSD}(k)$, and/or possibly multiplied by any unitary matrix. The resulting spatial mapping matrix is then $Q_k = M_{CSD}(k) \cdot D$, where $D$ may take on one of the following values:

      i) $N_{TX}$=2, $N_{STS}$=1, $D = \frac{1}{\sqrt{2}}\begin{bmatrix}1 & 1\end{bmatrix}^T$

      ii) $N_{TX}$=3, $N_{STS}$=1, $D = \frac{1}{\sqrt{3}}\begin{bmatrix}1 & 1 & 1\end{bmatrix}^T$

      iii) $N_{TX}$=4, $N_{STS}$=1, $D = \frac{1}{2}\begin{bmatrix}1 & 1 & 1 & 1\end{bmatrix}^T$

      iv) $N_{TX}$=3, $N_{STS}$=2, $D = \sqrt{\frac{2}{3}}\begin{bmatrix}1 & 0\\ 0 & 1\\ 1 & 0\end{bmatrix}$

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

v) $N_{TX}$=4, $N_{STS}$=2, $D = \frac{1}{\sqrt{2}}\begin{bmatrix}1 & 0\\ 0 & 1\\ 1 & 0\\ 0 & 1\end{bmatrix}$

vi) $N_{TX}$=4, $N_{STS}$=3, $D = \frac{\sqrt{3}}{2}\begin{bmatrix}1 & 0 & 0\\ 0 & 1 & 0\\ 0 & 0 & 1\\ 1 & 0 & 0\end{bmatrix}$

2) Different spatial expansion over subcarriers should be used in HT-mixed format only and with the Smoothing bit equal to 0:

i) $N_{TX}$=2, $N_{STS}$=1, $[Q_k]_{N_{STS}} = \begin{bmatrix}1 & 0\end{bmatrix}^T$ or $[Q_k]_{N_{STS}} = \begin{bmatrix}0 & 1\end{bmatrix}^T$

ii) $N_{TX}$=3, $N_{STS}$=2, $[Q_k]_{N_{STS}} = \begin{bmatrix}1 & 0\\ 0 & 0\\ 0 & 1\end{bmatrix}, \begin{bmatrix}1 & 0\\ 0 & 1\\ 0 & 0\end{bmatrix}$ or $\begin{bmatrix}0 & 0\\ 1 & 0\\ 0 & 1\end{bmatrix}$

iii) $N_{TX}$=4, $N_{STS}$=2, $[Q_k]_{N_{STS}} = \begin{bmatrix}1 & 0\\ 0 & 0\\ 0 & 0\\ 0 & 1\end{bmatrix}, \begin{bmatrix}1 & 0\\ 0 & 0\\ 0 & 1\\ 0 & 0\end{bmatrix}, \begin{bmatrix}0 & 0\\ 1 & 0\\ 0 & 0\\ 0 & 1\end{bmatrix}$ or $\begin{bmatrix}0 & 0\\ 1 & 0\\ 0 & 1\\ 0 & 0\end{bmatrix}$

iv) $N_{TX}$=4, $N_{STS}$=3, $[Q_k]_{N_{STS}} = \begin{bmatrix}1 & 0 & 0\\ 0 & 1 & 0\\ 0 & 0 & 0\\ 0 & 0 & 1\end{bmatrix}$ or $\begin{bmatrix}1 & 0 & 0\\ 0 & 0 & 0\\ 0 & 1 & 0\\ 0 & 0 & 1\end{bmatrix}$

d) *Beamforming steering matrix:* $Q_k$ is any matrix that improves the reception in the receiver based on some knowledge of the channel between the transmitter and the receiver. With transmit beamforming with explicit feedback, the steering matrix $Q_k$ is determined using either $H_{eff}$ for CSI feedback or $V_k$ for noncompressed and compressed matrices feedback from the STA to which the beamformed (#14)PPDU is addressed.

When there are fewer space-time streams than transmit chains, the first $N_{STS}$ columns of the matrices above that are square might be used.

The same matrix $Q_k$ shall be applied to subcarrier *k* during all parts of the (#14)PPDU in HT-greenfield format and all parts of the (#14)PPDU following and including the HT-STF field in an HT-mixed format (#14)PPDU. This operation is transparent to the receiver.

When a beamforming steering matrix is applied, the Smoothing bit should be set to 0.

The CSD of Table 19-10 (Cyclic shift values of HT portion of PPDU) shall be applied at the input of the spatial mapper.

For the identity matrix direct mapping, the Smoothing bit should be set to 1.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

If no spatial mapping is applied, the matrix $Q_k$ is equal to the identity matrix and $N_{STS} = N_{TX}$.

Sounding PPDUs using spatial expansion shall use an orthonormal column matrix $Q_k$. When the number of rows and columns is equal, the orthonormal column matrix becomes a unitary matrix.

#### 19.3.11.11.3 Transmission in 20 MHz HT format

For 20 MHz HT transmissions, the signal from transmit chain $i_{TX}, 1 \le i_{TX} \le N_{TX}$ shall be as shown in Equation (19-58).

$$r_{HT-DATA}^{i_{TX}}(t) = \frac{1}{\sqrt{N_{STS} \cdot N_{HT-DATA}^{Tone}}} \sum_{n=0}^{N_{SYM}-1} w_{T_{SYM}}(t - nT_{SYM}) \cdot \sum_{k=-N_{SR}}^{N_{SR}} \sum_{i_{STS}=1}^{N_{STS}} ([Q_k]_{i_{TX}, i_{STS}} (\tilde{D}_{k, i_{STS}, n} + p_{n+z} P_{(i_{STS}, n)}^{k}) \cdot \exp(j2\pi k\Delta_F (t - nT_{SYM} - T_{GI} - T_{CS}^{i_{STS}})))) \quad (19\text{-}58)$$

where

$z$ (#14)is 3 in an HT-mixed format PPDU and 2 in an HT-greenfield format PPDU

$p_n$ is defined in 17.3.5.10 (OFDM modulation)

$$\tilde{D}_{k, i_{STS}, n} = \begin{cases} 0, k = 0, \pm 7, \pm 21 \\ \tilde{d}_{M^r(k), i_{STS}, n}, \text{otherwise} \end{cases}$$

$$M^r(k) = \begin{cases} k + 28, -28 \le k \le -22 \\ k + 27, -20 \le k \le -8 \\ k + 26, -6 \le k \le -1 \\ k + 25, 1 \le k \le 6 \\ k + 24, 8 \le k \le 20 \\ k + 23, 22 \le k \le 28 \end{cases}$$

$P_{(i_{STS}, n)}^{k}$ is defined in Equation (19-54)

#### 19.3.11.11.4 Transmission in 40 MHz HT format

For 40 MHz HT transmissions, the signal from transmit chain $i_{TX}$ shall be as shown in Equation (19-59).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$r_{HT-DATA}^{i_{TX}}(t) = \frac{1}{\sqrt{N_{STS} \cdot N_{HT-DATA}^{Tone}}} \sum_{n=0}^{N_{SYM}-1} w_{T_{SYM}}(t - nT_{SYM})$$

$$\cdot \sum_{k=-N_{SR}}^{N_{SR}} \sum_{i_{STS}=1}^{N_{STS}} ([Q_k]_{i_{TX}, i_{STS}} (\tilde{D}_{k, i_{STS}, n} + p_{n+z} P_{(i_{STS}, n)}^{k})) \Upsilon_k \quad (19\text{-}59)$$

$$\cdot \exp(j2\pi k \Delta_F (t - nT_{SYM} - T_{GI} - T_{CS}^{i_{STS}})))$$

where

$z$ (#14)is 3 in an HT-mixed format PPDU and 2 in an HT-greenfield format PPDU

$p_n$ is defined in 17.3.5.10 (OFDM modulation)

$$\tilde{D}_{k, i_{STS}, n} = \begin{cases} 0, k = 0, \pm 1, \pm 11, \pm 25, \pm 53 \\ \tilde{d}_{M^r(k), i_{STS}, n}, \text{otherwise} \end{cases}$$

$$M^r(k) = \begin{cases} k + 58, -58 \le k \le -54 \\ k + 57, -52 \le k \le -26 \\ k + 56, -24 \le k \le -12 \\ k + 55, -10 \le k \le -2 \\ k + 52, 2 \le k \le 10 \\ k + 51, 12 \le k \le 24 \\ k + 50, 26 \le k \le 52 \\ k + 49, 54 \le k \le 58 \end{cases}$$

$P_{(i_{STS}, n)}^{k}$ is defined in Equation (19-55)

NOTE—The 90° rotation that is applied to the upper part of the 40 MHz channel is applied in the same way to the HT-STF, HT-LTF, and HT-SIG. The rotation applies to both pilots and the data in the upper part of the 40 MHz channel.

### 19.3.11.11.5 Transmission in MCS 32 format

The use of MCS 32 format is deprecated.

MCS 32 format provides the lowest transmission rate in 40 MHz. It is used only for one spatial stream and only with BPSK modulation and rate 1/2 coding.

In the MCS 32 format, the signal shall be as shown in Equation (19-60).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$r_{HT-DATA}^{i_{TX}}(t) = \frac{1}{\sqrt{N_{HT-Duplicate}^{Tone}}} \sum_{n=0}^{N_{SYM}-1} w_{T_{SYM}}(t - nT_{SYM}) \cdot \sum_{k=-N_{SR}}^{N_{SR}} (D_{k,n} + p_{n+z}P_k)([Q_{k-32}]_{i_{TX},1} \exp(j2\pi(k-32)\Delta_F(t - nT_{SYM} - T_{GI})) + j[Q_{k+32}]_{i_{TX},1} \exp(j2\pi(k+32)\Delta_F(t - nT_{SYM} - T_{GI})))$$ (19-60)

where

$z$ is defined in 19.3.11.11.3 (Transmission in 20 MHz HT format)

$P_k$ and $p_n$ are defined in 17.3.5.10 (OFDM modulation)

$D_{k,n}$ is defined in 19.3.9.4.3 (HT-SIG definition)

$N_{SR}$ has the value defined for non-HT 20 MHz transmission

$[Q_k]_{i_{TX},1}$ is an element from a vector of length $N_{TX}$, which may be frequency dependent

$N_{HT-Duplicate}^{Tone}$ is defined in Table 19-8 (Value of tone scaling factor)

The rules of spatial expansion CSD limitation, as specified in 19.3.11.11.2 (Spatial mapping), shall apply to $[Q_k]_{i_{TX},1}$.

### 19.3.11.11.6 Transmission with a short GI

Short GI is used in the (#14)Data field of the (#14)PPDU when the Short GI field in the HT-SIG is equal to 1. When it is used, the same formula for the formation of the signal shall be used as in 19.3.11.11.3 (Transmission in 20 MHz HT format), 19.3.11.11.4 (Transmission in 40 MHz HT format), and 19.3.11.11.5 (Transmission in MCS 32 format), with $T_{GI}$ replaced by $T_{GIS}$ and $T_{SYM}$ replaced by $T_{SYMS}$.

NOTE—Short GI is not used in HT-greenfield format with one spatial stream, in which case the HT-SIG is immediately followed by data. It is very difficult to parse the HT-SIG in time to demodulate these data with the correct GI length if the GI length is not known in advance.

### 19.3.11.12 Non-HT duplicate transmission

Non-HT duplicate transmission is used to transmit to Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) STAs, Clause 18 (Extended Rate PHY (ERP) specification) STAs, and Clause 19 (High Throughput (HT) PHY specification(#2297)) STAs that may be present in either the upper or lower halves of the 40 MHz channel. The L-STF, L-LTF, and L-SIG shall be transmitted in the same way as in the HT 40 MHz transmission. The HT-SIG, HT-STF, and HT-LTF are not transmitted. Data transmission shall be as defined in Equation (19-61).(#568)

$$r_{LEG-DUP}^{i_{TX}}(t) = \frac{1}{\sqrt{N_{TX} N_{Non\text{-}HT\ Duplicate}^{Tone}}} \sum_{n=0}^{N_{SYM}-1} w_{T_{SYM}}(t - nT_{SYM}) \cdot \sum_{k=-26}^{26} (D_{k,n} + p_{n+1}P_k)(\exp(j2\pi(k-32)\Delta_F(t - nT_{SYM} - T_{GI} - T_{CS}^{i_{TX}})) + j\exp(j2\pi(k+32)\Delta_F(t - nT_{SYM} - T_{GI} - T_{CS}^{i_{TX}}))) \quad (19\text{-}61)$$

where

$P_k$ and $p_n$ are defined in 17.3.5.10 (OFDM modulation)

$D_{k,n}$ is defined in 19.3.9.4.3 (HT-SIG definition)

$T_{CS}^{i_{TX}}$ represents the cyclic shift of the transmit chain $i_{TX}$ and is defined in Table 19-9 (Cyclic shift for non-HT portion of PPDU)

$N_{Non\text{-}HT\ Duplicate}^{Tone}$ is defined in Table 19-8 (Value of tone scaling factor)

## 19.3.12 Beamforming

### 19.3.12.1 General

Beamforming is a technique in which the beamformer utilizes the knowledge of the MIMO channel to generate a steering matrix $Q_k$ that improves reception in the beamformee.

The equivalent complex baseband MIMO channel model (3×2 example) is one in which, when a vector $\mathbf{x}_k = [x_1, x_2, \ldots x_{N_{TX}}]^T$ is transmitted in subcarrier $k$, the received vector $\mathbf{y}_k = [y_1, y_2, \ldots y_{N_{RX}}]^T$ is modeled as shown in Equation (19-62).

$$\mathbf{y}_k = H_k \mathbf{x}_k + \mathbf{n} \quad (19\text{-}62)$$

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

where

$H_k$ is channel matrix of dimensions $N_{RX} \times N_{TX}$

**n** is white (spatially and temporally) Gaussian noise as illustrated in Figure 19-14 (Beamforming MIMO channel model (3×2 example))

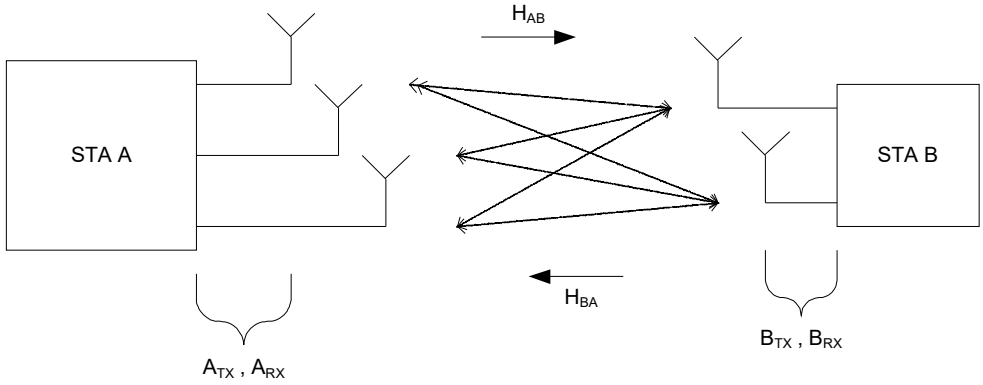

**Figure 19-14—Beamforming MIMO channel model (3×2 example)**

When beamforming is used, the beamformer replaces $\mathbf{x}_k$, which in this case has $N_{STS} \leq N_{TX}$ elements, with $Q_k\mathbf{x}_k$, where $Q_k$ has $N_{TX}$ rows and $N_{STS}$ columns, so that the received vector is as shown in Equation (19-63).

$$\mathbf{y}_k = H_k Q_k \mathbf{x}_k + \mathbf{n} \tag{19-63}$$

The beamforming steering matrix that is computed (or updated) from a new channel measurement replaces the existing $Q_k$ for the next beamformed data transmission. There are several methods of beamforming, differing in the way the beamformer acquires the knowledge of the channel matrices $H_k$ and on whether the beamformer generates $Q_k$ or the beamformee provides feedback information for the beamformer to generate $Q_k$.

### 19.3.12.2 Implicit feedback beamforming

Implicit feedback beamforming is a technique that relies on reciprocity in the time division duplex channel to estimate the channel over which a device is transmitting based on the MIMO reference that is received from the device to which it plans to transmit. This technique allows the transmitting device to calculate a set of transmit steering matrices, $Q_k$, one for each subcarrier, which are intended to optimize the performance of the link.

Referring to Figure 19-14 (Beamforming MIMO channel model (3×2 example)), beamforming transmissions from STA A to STA B using implicit techniques are enabled when STA B sends STA A a sounding PPDU, the reception of which allows STA A to form an estimate of the MIMO channel from STA B to STA A, for all subcarriers. In a TDD channel in which the forward and reverse channels are reciprocal, the channel from STA A to STA B in subcarrier $k$ is the matrix transpose of the channel from STA B to STA A in subcarrier $k$ to within a complex scaling factor, i.e., $H_{\mathrm{AB},k} = \rho[H_{\mathrm{BA},k}]^T$. Here $H_{\mathrm{AB},k}$ is the MIMO channel matrix from STA A to STA B at subcarrier $k$, and $H_{\mathrm{BA},k}$ is the channel matrix from STA B

This is an unapproved IEEE Standards Draft, subject to change.

to STA A at subcarrier $k$. STA A uses this relationship to compute transmit steering matrices that are suitable for transmitting to STA B over $H_{\mathrm{AB},k}$.

NOTE 1—In order for the recipient of the sounding to compute steering matrices when steered or unsteered sounding is used, the steering matrices need to have the property $(H_kQ_k)(H_kQ_k)^H = H_kH_k^H$, where $X^H$ indicates the conjugate transpose of the matrix $X$.

While the over-the-air channel between the antenna(s) at one STA and the antenna(s) at a second STA is reciprocal, the observed baseband-to-baseband channel used for communication might not be, as it includes the transmit and receive chains of the STAs. Differences in the amplitude and phase characteristics of the transmit and receive chains associated with individual antennas degrade the reciprocity of the over-the-air channel and cause degradation of performance of implicit beamforming techniques. The over-the-air calibration procedure described in 10.33.2.4 (Calibration) may be used to restore reciprocity. The procedure provides the means for calculating a set of correction matrices that can be applied at the transmit side of a STA to correct the amplitude and phase differences between the transmit and receive chains in the STA. If this correction is done at least at the STA that serves as the beamformer, there is sufficient reciprocity for implicit feedback in the baseband-to-baseband response of the forward link and reverse channel.

Figure 19-15 (Baseband-to-baseband channel) illustrates the observed baseband-to-baseband channel, including reciprocity correction. Spatial mapping matrices $Q_{\mathrm{A},k}$ and $Q_{\mathrm{B},k}$ are assumed to be identity matrices here for simplicity of illustration.

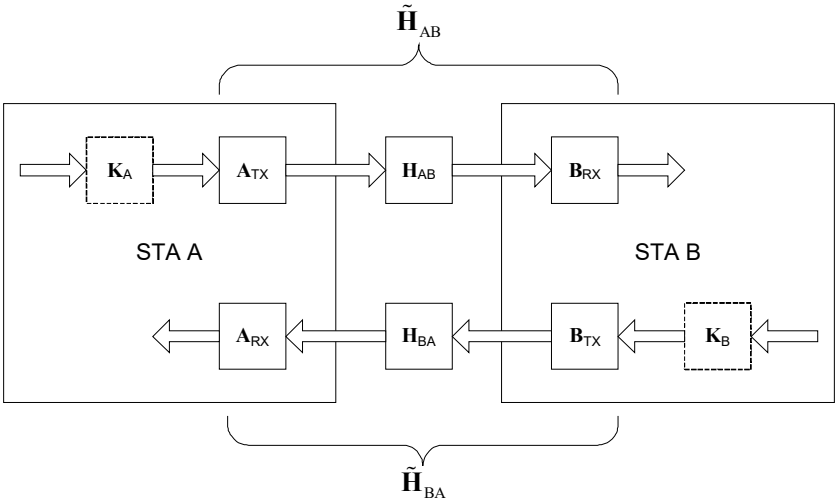

**Figure 19-15—Baseband-to-baseband channel**

NOTE 2—Spatial mapping matrix for sounding PPDUs are specified in 19.3.13.3 (Sounding PPDU for calibration).

The amplitude and phase responses of the transmit and receive chains can be expressed as diagonal matrices with complex valued diagonal entries, of the form $A_{TX,k}$ and $A_{RX,k}$ at STA A. The relationship between the baseband-to-baseband channel, $\tilde{H}_{\mathrm{AB},k}$, and the over-the-air channel, $H_{\mathrm{AB},k}$, is shown in Equation (19-64).

$$\tilde{H}_{\mathrm{AB},k} = B_{\mathrm{RX},k}H_{\mathrm{AB},k}A_{\mathrm{TX},k} \tag{19-64}$$

Similarly, the relationship between $\tilde{H}_{\mathrm{BA},k}$ and $H_{\mathrm{BA},k}$ is shown in Equation (19-65).

$$\tilde{H}_{\mathrm{BA},k} = A_{\mathrm{RX},k}H_{\mathrm{BA},k}B_{\mathrm{TX},k} \tag{19-65}$$

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

As an example, consider the case where calibration is performed at both STA A and STA B. The objective is to compute correction matrices, $K_{\mathrm{A},k}$ and $K_{\mathrm{B},k}$, that restore reciprocity so that Equation (19-66) is true.

$$\tilde{H}_{\mathrm{AB},k}K_{\mathrm{A},k} = \rho[\tilde{H}_{\mathrm{BA},k}K_{\mathrm{B},k}]^{\mathrm{T}} \tag{19-66}$$

The correction matrices are diagonal matrices with complex valued diagonal entries. The reciprocity condition in Equation (19-66) is enforced when Equation (19-67) and Equation (19-68) are true.

$$K_{\mathrm{A},k} = \alpha_{\mathrm{A},k}[A_{\mathrm{TX},k}]^{-1}A_{\mathrm{RX},k} \tag{19-67}$$

and

$$K_{\mathrm{B},k} = \alpha_{\mathrm{B},k}[B_{\mathrm{TX},k}]^{-1}B_{\mathrm{RX},k} \tag{19-68}$$

where $\alpha_{\mathrm{A},k}$ and $\alpha_{\mathrm{B},k}$ are complex valued scaling factors.

Using these expressions for the correction matrices, the calibrated baseband-to-baseband channel between STA A and STA B is expressed as shown in Equation (19-69).

$$\hat{H}_{\mathrm{AB},k} = \tilde{H}_{\mathrm{AB},k}K_{\mathrm{A},k} = \alpha_{\mathrm{A},k}B_{\mathrm{RX},k}H_{\mathrm{AB},k}A_{\mathrm{RX},k} \tag{19-69}$$

If both sides apply the correction matrices, the calibrated baseband-to-baseband channel between STA A and STA B is expressed as shown in Equation (19-70).

$$\hat{H}_{\mathrm{BA},k} = \alpha_{\mathrm{B},k}A_{\mathrm{RX},k}H_{\mathrm{BA},k}B_{\mathrm{RX},k} = \frac{\alpha_{\mathrm{B},k}}{\alpha_{\mathrm{A},k}}[\hat{H}_{\mathrm{AB},k}]^{\mathrm{T}} \tag{19-70}$$

Focusing on STA A, the procedure for estimating $K_{\mathrm{A},k}$ is as follows:

a) STA A sends STA B a sounding PPDU, the reception of which allows STA B to estimate the channel matrices $\tilde{H}_{\mathrm{AB},k}$.

b) STA B sends STA A a sounding PPDU, the reception of which allows STA A to estimate the channel matrices $\tilde{H}_{\mathrm{BA},k}$.

c) STA B sends the quantized estimates of $\tilde{H}_{\mathrm{AB},k}$ to STA A.

d) STA A uses its local estimates of $\tilde{H}_{\mathrm{BA},k}$ and the quantized estimates of $\tilde{H}_{\mathrm{AB},k}$ received from STA B to compute the correction matrices $K_{\mathrm{A},k}$.

NOTE 3—When a nonidentity matrix is used for $Q_{A,k}$, STA A is responsible for accounting for the spatial mapping in its local channel estimate as well as in the quantized CSI fed back since the channel feedback received in step c) is actually $\tilde{H}_{\mathrm{AB},k}Q_{\mathrm{A},k}$ and not $\tilde{H}_{\mathrm{AB},k}$. Furthermore, since $Q_{\mathrm{B},k}$ is defined in 19.3.13.3 (Sounding PPDU for calibration), additional steps might be taken in STA A to remove the effect of $Q_{\mathrm{B},k}$ when computing the correction matrix $K_{A,k}$.

Steps a) and b) occur over a short time interval to so the channel changes as little as possible between measurements. A similar procedure is used to estimate $K_{\mathrm{B},k}$ at STA B. The details of the computation of the correction matrices is implementation specific and beyond the scope of this standard.

### 19.3.12.3 Explicit feedback beamforming

#### 19.3.12.3.1 General

In explicit beamforming, in order for STA A to transmit a beamformed (#14)PPDU to STA B, STA B measures the channel matrices and sends STA A either the effective channel, $H_{eff,k}$, or the beamforming feedback matrix, $V_k$, for STA A to determine a steering matrix, $Q_{\text{steer},k} = Q_k V_k$, with $V_k$ found from $H_k Q_k$, where $Q_k$ is the orthonormal spatial mapping matrix that was used to transmit the sounding PPDU that elicited the $V_k$ feedback. The effective channel, $H_{eff,k} = H_k Q_k$, is the product of the spatial mapping matrix used on transmit with the channel matrix. When new steering matrix $Q_{\text{steer},k}$ is found, $Q_{\text{steer},k}$ may replace $Q_k$ for the next beamformed data transmission.

NOTE—$Q_{\text{steer},k}$ is a mathematical term to update a new steering matrix for $Q_k$ in the next beamformed data transmission.

#### 19.3.12.3.2 CSI matrices feedback

In CSI matrices feedback, the beamformer receives the quantized MIMO channel matrix, $H_{eff}$, from the beamformee. The beamformer then may use this matrix to compute a set of transmit steering matrices, $Q_k$. The CSI matrix, $H_{eff}$, shall be determined from the transmitter spatial mapper input to the receiver FFT outputs. The beamformee shall remove the CSD in Table 19-10 (Cyclic shift values of HT portion of PPDU) from the measured channel matrix.

The matrices $H_{eff}(k)$, where $k$ is the subcarrier index, are encoded so that applying the procedure in 19.3.12.3.3 (CSI matrices feedback decoding procedure) optimally reconstructs the matrix.

#### 19.3.12.3.3 CSI matrices feedback decoding procedure

The received, quantized matrix $H^{q}_{eff}(k)$ (of a specific subcarrier, $k$) shall be decoded as follows:

a) The real and imaginary parts of each element of the matrix, $H^{q(R)}_{eff(m,l)}(k)$ and $H^{q(I)}_{eff(m,l)}(k)$, are decoded as a pair of 2s complement numbers to create the complex element, where $1 \le m \le N_r$ and $1 \le l \le N_c$.

b) Each element in the matrix of subcarrier $k$ is then scaled using the value in the carrier matrix amplitude field (3 bits), $M_H(k)$, interpreted as a positive integer, in decibels, as follows:

   1) Calculate the linear value as defined in Equation (19-71).
   2) Calculate decoded values of the real and imaginary parts of the matrix element as defined in Equation (19-72) and Equation (19-73).

$$r(k) = 10^{M_H(k)/20} \tag{19-71}$$

$$\text{Re}\{\tilde{H}_{eff(m,l)}(k)\} = \frac{H^{q(R)}_{eff(m,l)}(k)}{r(k)} \tag{19-72}$$

$$\text{Im}\{\tilde{H}_{eff(m,l)}(k)\} = \frac{H^{q(I)}_{eff(m,l)}(k)}{r(k)} \tag{19-73}$$

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

#### 19.3.12.3.4 Example of CSI matrices feedback encoding

The following is an example of an encoding process:

a) The maximums of the real and imaginary parts of each element of the matrix in each subcarrier are found, as defined by Equation (19-74).

$$m_H(k) = \max\left\{\max\left\{\left|\mathrm{Re}(H_{eff(m,l)}(k))\right|_{m=1,l=1}^{m=N_r,l=N_c}\right\}, \max\left\{\left|\mathrm{Im}(H_{eff(m,l)}(k))\right|_{m=1,l=1}^{m=N_r,l=N_c}\right\}\right\} \quad (19\text{-}74)$$

b) The scaling ratio is calculated and quantized to 3 bits as defined by Equation (19-75)(#315). A linear scaler is given by Equation (19-76).

$$M_H(k) = \min\left\{7, \left\lfloor 20\log 10\left(\frac{\max\{m_H(z)\}_{z=-N_{SR}}^{z=N_{SR}}}{m_H(k)}\right)\right\rfloor\right\} \quad (19\text{-}75)$$

where

$$M_H^{\mathrm{lin}}(k) = \frac{\max\{m_H(z)\}_{z=-N_{SR}}^{z=N_{SR}}}{10^{M_H(k)/20}} \quad (19\text{-}76)$$

c) The real and imaginary parts of each element in the matrix $H_{eff(m,l)}(k)$ are quantized to $N_b$ bits in 2s complement encoding as defined by Equation (19-77) and Equation (19-78).

$$H_{eff(m,l)}^{q(R)}(k) = \left\lfloor \frac{\mathrm{Re}\{H_{eff(m,l)}(k)\}}{M_H^{\mathrm{lin}}(k)}(2^{N_b-1}-1)+0.5 \right\rfloor \quad (19\text{-}77)$$

$$H_{eff(m,l)}^{q(I)}(k) = \left\lfloor \frac{\mathrm{Im}\{H_{eff(m,l)}(k)\}}{M_H^{\mathrm{lin}}(k)}(2^{N_b-1}-1)+0.5 \right\rfloor \quad (19\text{-}78)$$

Each matrix is encoded using $3 + 2 \times N_b \times N_r \times N_c$ bits, where $N_r$ and $N_c$ are the number of rows and columns, respectively, in the channel matrix estimate computed by the receiving station and where $N_b$ may have the value of 4, 5, 6, or 8 bits.

#### 19.3.12.3.5 Noncompressed beamforming feedback matrix

In noncompressed beamforming feedback matrix, the beamformee shall remove the space-time stream CSD in Table 19-10 (Cyclic shift values of HT portion of PPDU) from the measured channel before computing a set of matrices for feedback to the beamformer. The beamforming feedback matrices, $V(k)$, found by the beamformee are sent to the beamformer in the order of real and imaginary components per tone as specified in 9.4.1.26 (Noncompressed Beamforming Report field). The beamformer might use these matrices to determine the steering matrices, $Q_k$.

The beamformee shall encode the matrices $V(k)$ so a beamformer applying the procedure below optimally reconstructs the matrix.

The received matrix $V^q(k)$ (of a specific subcarrier $k$) shall be decoded as follows:

a) The real and imaginary parts of each element of the matrix, $V_{m,l}^{q,R}$ and $V_{m,l}^{q,I}$, shall be decoded as a pair of 2s complement numbers to create the complex element, where $1 \le m \le N_r$ and $1 \le l \le N_c$.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

b) The dimensions of the beamforming feedback matrices are $N_r \times N_c$, where $N_r$ and $N_c$ are the number of rows and columns, respectively, in the beamforming feedback matrix computed by the receiving station. Each matrix is encoded using $2 \times N_b \times N_r \times N_c$ bits. $N_b$ may have the value of 2, 4, 6, or 8 bits.

c) Columns $1 \ldots N_c$ of the beamforming feedback matrix correspond to spatial streams $1 \ldots N_c$, respectively. The mapping of spatial stream to modulation is defined in the MCS tables in 19.5 (Parameters for HT-MCSs). A transmitter shall not reorder the columns of the beamforming feedback matrices.

#### 19.3.12.3.6 Compressed beamforming feedback matrix

In compressed beamforming feedback matrix, the beamformee shall remove the space-time stream CSD in Table 19-10 (Cyclic shift values of HT portion of PPDU) from the measured channel before computing a set of matrices for feedback to the beamformer. The beamforming feedback matrices, $V(k)$, found by the beamformee are compressed in the form of angles, which are sent to the beamformer. The beamformer might use these angles to decompress the matrices and determine the steering matrices $Q_k$.

The matrix $V$ per tone shall be compressed as follows: The $N_r \times N_c$ beamforming feedback orthonormal column matrix $V$ found by the beamformee shall be represented as shown in Equation (19-79). When the number of rows and columns is equal, the orthonormal column matrix becomes a unitary matrix.

$$V = \left[ \prod_{i=1}^{\min(N_c, N_r - 1)} \left[ D_i\left( 1_{i-1} \; e^{j\phi_{i,i}} \; \ldots \; e^{j\phi_{N_r-1,i}} \; 1 \right) \prod_{l=i+1}^{N_r} G_{li}^{T}(\psi_{li}) \right] \right] \tilde{I}_{N_r \times N_c} \tag{19-79}$$

The matrix $D_i\left( 1_{i-1} \; e^{j\phi_{i,i}} \; \ldots \; e^{j\phi_{N_r-1,i}} \; 1 \right)$ is an $N_r \times N_r$ diagonal matrix, where $1_{i-1}$ represents a sequence of 1s with length of *i*–1, as shown in Equation (19-80).

$$D\left( 1_{i-1} \; e^{j\phi_{i,i}} \ldots \; e^{j\phi_{N_r-1,i}} \; 1 \right) = \begin{bmatrix} I_{i-1} & 0 & \ldots & \ldots & 0 \\ 0 & e^{j\phi_{i,i}} & 0 & \ldots & 0 \\ \ldots & 0 & \ddots & 0 & 0 \\ \ldots & \ldots & 0 & e^{j\phi_{N_r-1,i}} & 0 \\ 0 & 0 & 0 & 0 & 1 \end{bmatrix} \tag{19-80}$$

The matrix $G_{li}(\psi)$ is an $N_r \times N_r$ Givens rotation matrix as shown in Equation (19-81).

$$G_{li}(\psi) = \begin{bmatrix} I_{i-1} & 0 & 0 & 0 & 0 \\ 0 & \cos(\psi) & 0 & \sin(\psi) & 0 \\ 0 & 0 & I_{l-i-1} & 0 & 0 \\ 0 & -\sin(\psi) & 0 & \cos(\psi) & 0 \\ 0 & 0 & 0 & 0 & I_{N_r-l} \end{bmatrix} \tag{19-81}$$

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

where each $I_m$ is an $m \times m$ identity matrix, and $\cos(\psi)$ and $\sin(\psi)$ are located at row $l$ and column $i$. $\tilde{I}_{N_r \times N_c}$ is an identity matrix padded with 0s to fill the additional rows or columns when $N_r \neq N_c$.

For example, a 4×2 $V$ matrix has the representation shown in Equation (19-82).

$$V = \begin{bmatrix} e^{j\phi_{11}} & 0 & 0 & 0 \\ 0 & e^{j\phi_{21}} & 0 & 0 \\ 0 & 0 & e^{j\phi_{31}} & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} \times \begin{bmatrix} \cos\psi_{21} & \sin\psi_{21} & 0 & 0 \\ -\sin\psi_{21} & \cos\psi_{21} & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}^T \times \begin{bmatrix} \cos\psi_{31} & 0 & \sin\psi_{31} & 0 \\ 0 & 1 & 0 & 0 \\ -\sin\psi_{31} & 0 & \cos\psi_{31} & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}^T \times \begin{bmatrix} \cos\psi_{41} & 0 & 0 & \sin\psi_{41} \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ -\sin\psi_{41} & 0 & 0 & \cos\psi_{41} \end{bmatrix}^T$$
$$\times \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & e^{j\phi_{22}} & 0 & 0 \\ 0 & 0 & e^{j\phi_{32}} & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} \times \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & \cos\psi_{32} & \sin\psi_{32} & 0 \\ 0 & -\sin\psi_{32} & \cos\psi_{32} & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}^T \times \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & \cos\psi_{42} & 0 & \sin\psi_{42} \\ 0 & 0 & 1 & 0 \\ 0 & -\sin\psi_{42} & 0 & \cos\psi_{42} \end{bmatrix}^T \times \begin{bmatrix} 1 & 0 \\ 0 & 1 \\ 0 & 0 \\ 0 & 0 \end{bmatrix} \quad (19\text{-}82)$$

The procedure for finding a compressed $V$ matrix is described as follows:

A $N_r \times N_c$ beamforming feedback orthonormal column matrix $V$ is column-wise phase invariant because the steering matrix needs a reference in phase per each column. When the number of rows and columns is equal, the orthonormal column matrix becomes a unitary matrix. In other words, $V$ is equivalent to $\tilde{V}\tilde{D}$, where $\tilde{D}$ is a column-wise phase shift matrix such as $\tilde{D} = \text{diag}\left(e^{j\theta_1}, e^{j\theta_2}, \ldots, e^{j\theta_{N_c}}\right)$. When the beamformee estimates the channel, it may find $\tilde{V}$ for the beamforming feedback matrix for the beamformer, but it should send $\tilde{V}\tilde{D}$ back to the beamformer, where $V = \tilde{V}\tilde{D}$. The angle, $\theta_i$, in $\tilde{D}$ is found to make the last row of $\tilde{V}\tilde{D}$ to be non-negative real numbers.

The angles $\phi_{1,1} \ldots \phi_{N_r-1,1}$ in the diagonal matrix $D_1\left(e^{j\phi_{11}} \ldots e^{j\phi_{N_r-1,1}} \; 1\right)^*$ shall satisfy the constraint that all elements in the first column of $D_1^* V$ are non-negative real numbers. Now, the first column of $(G_{N_r1} \ldots G_{31} G_{21} D_1^*) \times V$ can be $\begin{bmatrix} 1 & 0 & \ldots & 0 \end{bmatrix}^T$ by the Givens rotations $G_{l1}$ such as shown in Equation (19-83)(#2375).

$$\begin{bmatrix} \cos\psi_{N_r1} & 0 & \sin\psi_{N_r1} \\ 0 & I_{N_r-2} & 0 \\ -\sin\psi_{N_r1} & 0 & \cos\psi_{N_r1} \end{bmatrix} \ldots \begin{bmatrix} \cos\psi_{31} & 0 & \sin\psi_{31} & 0 \\ 0 & 1 & 0 & 0 \\ -\sin\psi_{31} & 0 & \cos\psi_{31} & 0 \\ 0 & 0 & 0 & I_{N_r-3} \end{bmatrix} \begin{bmatrix} \cos\psi_{21} & \sin\psi_{21} & 0 \\ -\sin\psi_{21} & \cos\psi_{21} & 0 \\ 0 & 0 & I_{N_r-2} \end{bmatrix} \begin{bmatrix} e^{j\phi_{11}} & 0 & 0 & 0 \\ 0 & \text{O} & 0 & 0 \\ 0 & 0 & e^{j\phi_{N_r-1,1}} & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}^* \times V = \begin{bmatrix} 1 & 0 \\ 0 & V_2 \end{bmatrix} \quad (19\text{-}83)$$

For a new $(N_r - 1) \times (N_c - 1)$ submatrix $V_2$, this process is applied in the same way. Then, the angles $\phi_{2,2} \ldots \phi_{N_r-1,2}$ in the diagonal matrix $D_2\left(1 \; e^{j\phi_{22}} \ldots e^{j\phi_{N_r-1,2}} \; 1\right)^*$ shall satisfy the constraint that all

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

elements in the second column of $D_2^* \times \text{diag}(1, V_2)$ are non-negative real numbers. Now, the first two columns of $(G_{N_r 2} \ldots G_{32} D_2^*)(G_{N_r 1} \ldots G_{31} G_{21} D_1^*) \times V$ can be $\tilde{I}_{N_r \times 2}$ by the Givens rotations $G_{l2}$ such as shown in Equation (19-84)(#2375).

$$\begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & \cos\psi_{N_r 2} & 0 & \sin\psi_{N_r 2} \\ 0 & 0 & I_{N_r-3} & 0 \\ 0 & -\sin\psi_{N_r 2} & 0 & \cos\psi_{N_r 2} \end{bmatrix} \cdots \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & \cos\psi_{32} & \sin\psi_{32} & 0 \\ 0 & -\sin\psi_{32} & \cos\psi_{32} & 0 \\ 0 & 0 & 0 & I_{N_r-3} \end{bmatrix} \begin{bmatrix} 1 & 0 & 0 & 0 & 0 \\ 0 & e^{j\phi_{22}} & 0 & 0 & 0 \\ 0 & 0 & \text{O} & 0 & 0 \\ 0 & 0 & 0 & e^{j\phi_{N_r-1,2}} & 0 \\ 0 & 0 & 0 & 0 & 1 \end{bmatrix}^* \times G_{N,1} \ldots G_{31} G_{21} D_1^* \times V = \begin{bmatrix} I_2 & 0 \\ 0 & V_3 \end{bmatrix} \quad (19\text{-}84)$$

This process continues until the first $N_c$ columns of the right side matrix become $\tilde{I}_{N_r \times N_c}$. When $N_c < N_r$, this process does not need to continue because $V_{N_c+1}$ is nulled out by $\tilde{I}_{N_r \times N_c}$. Then, by multiplying the complex conjugate transpose of the products of the $D_i$ and $G_{li}$ matrices on the left, $V$ can be expressed as shown in Equation (19-85).

$$V = D_1 G_{21}^T G_{31}^T \ldots G_{N_r 1}^T \times D_2 G_{32}^T G_{42}^T \ldots G_{N_r 2}^T \times \ldots \times D_p G_{p+1,p}^T G_{p+2,p}^T \ldots G_{N_r p}^T \times \tilde{I}_{N_r \times N_C} \quad (19\text{-}85)$$

where $p = \min(N_c, N_r - 1)$, which can be written in short form as in Equation (19-79).

The angles found from the decomposition process above, e.g., the values of $\psi_{i,j}$ and $\phi_{k,l}$, are quantized as described in 9.6.11.6 (Compressed Beamforming frame format).

Columns $1 \ldots N_c$ of the beamforming feedback matrix correspond to spatial streams $1 \ldots N_c$, respectively. The mapping of spatial stream to modulation is defined in the MCS tables in 19.5 (Parameters for HT-MCSs). A transmitter shall not reorder the columns of the beamforming feedback matrices in determining steering matrices.

### 19.3.13 HT Preamble format for sounding PPDUs

#### 19.3.13.1 General

The MIMO channel measurement takes place in every PPDU as a result of transmitting the HT-LTFs as part of the PHY preamble. The number of HT-LTFs transmitted shall be determined by the number of space-time streams transmitted unless additional dimensions are optionally sounded using HT-ELTFs and these are transmitted using the same spatial transformation that is used for the Data field of the HT PPDU. The use of the same spatial transformation enables the computation of the spatial equalization at the receiver.

When the number of space-time streams, $N_{STS}$, is less than the number of transmit antennas, or less than $\min(N_{TX}, N_{RX})$, sending only $N_{STS}$ HT-LTFs does not allow the receiver to recover a full characterization of the MIMO channel, even though the resulting MIMO channel measurement is sufficient for receiving the Data field of the HT PPDU.

However, it is often desirable to obtain as full a characterization of the channel as possible. This involves the transmission of a sufficient number of HT-LTFs to sound the full dimensionality of the channel, which is in some cases $N_{TX}$ and in other cases $\min(N_{TX}, N_{RX})$. These cases of MIMO channel measurement are referred to as *MIMO channel sounding*. A sounding PPDU may be used to sound available channel

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

dimensions. A sounding PPDU is identified by setting the Not Sounding field in the HT-SIG to 0. A sounding PPDU may have any allowed number of HT-LTFs satisfying $N_{HT\text{-}LTF} \geq N_{STS}$. In general, if the Not Sounding field in the HT-SIG is equal to 0 and $N_{HT\text{-}LTF} > N_{STS}$, HT-ELTFs are used, except where $N_{SS} = 3$ and $N_{HT\text{-}LTF} = 4$ or in an NDP.

#### 19.3.13.2 Sounding with an NDP(#2137)

A STA may sound the channel using (#2137)an NDP (indicated by the HT Length field in the HT-SIG equal to 0) with the Not Sounding field equal to 0. The number of LTFs is the number implied by the MCS, which shall indicate two or more spatial streams. The last HT-LTF of an NDP shall not be followed by a Data field (see Figure 19-16 (Example of an NDP used for sounding)).

It is optional for a STA to process an NDP.

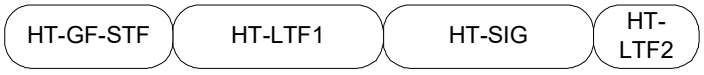

**Figure 19-16—Example of an NDP used for sounding**

#### 19.3.13.3 Sounding PPDU for calibration

In the case of a bidirectional calibration exchange, two STAs exchange sounding PPDUs, the exchange of which enables the receiving STA to compute an estimate of the MIMO channel matrix $H_k$ for each subcarrier $k$. In general, in an exchange of calibration messages, the number of spatial streams is less than the number of transmit antennas. In such cases, HT-ELTFs are used. In the case of sounding PPDUs for calibration, the antenna mapping matrix shall be as shown in Equation (19-86).

$$Q_k = C_{CSD}(k)P_{CAL} \tag{19-86}$$

where

$C_{CSD}(k)$ is a diagonal cyclic shift matrix in which the diagonal elements carry frequency domain representation of the cyclic shifts given in Table 19-9 (Cyclic shift for non-HT portion of PPDU)

$P_{CAL}$ is one of the following unitary matrices:

For $N_{TX} = 1, P_{CAL} = 1$

For $N_{TX} = 2, P_{CAL} = \frac{\sqrt{2}}{2}\begin{bmatrix} 1 & -1 \\ 1 & 1 \end{bmatrix}$

For $N_{TX} = 3, P_{CAL} = \frac{\sqrt{3}}{3}\begin{bmatrix} 1 & 1 & 1 \\ 1 & e^{-j2\pi/3} & e^{-j4\pi/3} \\ 1 & e^{-j4\pi/3} & e^{-j2\pi/3} \end{bmatrix}$

For $N_{TX} = 4, P_{CAL} = \frac{1}{2}\begin{bmatrix} 1 & -1 & 1 & 1 \\ 1 & 1 & -1 & 1 \\ 1 & 1 & 1 & -1 \\ -1 & 1 & 1 & 1 \end{bmatrix}$

#### 19.3.13.4 Sounding PPDU for channel quality assessment

In response to an MRQ, sent by STA A to STA B, the responding STA B returns to the requesting STA A an MCS selection that STA B determines to be a suitable MCS for STA A to use in subsequent transmissions to STA B. In determining the MCS, STA B performs a channel quality assessment, which entails using whatever information STA B has about the channel, such as an estimate of the MIMO channel derived from the sounding PPDU that carries the MRQ. To enable this calculation, the MRQ is sent in conjunction with a sounding PPDU.

The STA sending the MRQ (STA A) determines how many HT-LTFs to send, and whether to use HT-ELTFs or an NDP, based on the Transmit Beamforming Capabilities field, number of space-time streams used in the PPDU carrying the MRQ, the number of transmit chains it is using ($N_{TX}$), whether the transmit and receive STAs support STBC, and in some cases, the number of receive chains at the responding STA ($N_{RX}$).

The maximum number of available space-time streams is set by the number of transmit and receive chains and the STBC capabilities of the transmitter and receiver, as is shown in Table 19-21 (Maximum available space-time streams). While the number of receive chains is not communicated in a capabilities indicator, the maximum number of space-time streams supported may be inferred from the MCS capabilities and the STBC capabilities of the receiving STA. When the number of receive chains is known at the transmitter, the number of HT-LTFs sent to obtain a full channel quality assessment is determined according to the maximum number of space-time streams indicated in Table 19-21 (Maximum available space-time streams). The number of HT-LTFs to use in conjunction with the indicated number of space-time streams is determined according to 19.3.9.4.6 (HT-LTF definition).

**Table 19-21—Maximum available space-time streams**

| $N_{TX}$ | $N_{RX}$ | $N_{STS,\,\max}$ without STBC | $N_{STS,\,\max}$ with STBC |
|---|---|---|---|
| 1 | 1 | 1 | N/A |
| 2 | 1 | 1 | 2 |
| 3 | 1 | 1 | 2 |
| 3 | 2 | 2 | 3 |
| 4 | 1 | 1 | 2 |
| 4 | 2 | 2 | 4 |

If the requesting STA A sends an MRQ in a PPDU that uses fewer space-time streams in the data portion than the maximum number of space-time streams possible given the number of antennas at STA A and the responding STA B, the channel quality assessment made by STA B may be based on the HT-DLTFs alone. In this case, the MFB is limited to MCSs using the number of streams used in the Data field of the HT PPDU, or fewer. To determine whether an MCS should be chosen that uses more spatial streams than the PPDU containing the MRQ, it is necessary for the requesting STA A to either use HT-ELTFs (i.e., send the MRQ in a staggered sounding PPDU) or use an NDP (i.e., send the MRQ in conjunction with an NDP).

The sounding PPDU may have nonidentity spatial mapping matrix $Q_k$. For different receiving STAs, $Q_k$ may vary.

### 19.3.14 Regulatory requirements

Wireless LANs (WLANs) implemented in accordance with this standard are subject to equipment certification and operating requirements established by regional and national regulatory administrations. The PHY specification establishes minimum technical requirements for interoperability, based upon established regulations at the time this standard was issued. These regulations are subject to revision or may be superseded. Requirements that are subject to local geographic regulations are annotated within the PHY specification. Regulatory requirements that do not affect interoperability are not addressed in this standard. Implementers are referred to the regulatory sources in Annex D for further information. Operation in countries within defined regulatory domains may be subject to additional or alternative national regulations.

### 19.3.15 Channel numbering and channelization

#### 19.3.15.1 General

The STA may operate in the 5 GHz band and/or 2.4 GHz band. When using 20 MHz channels, it uses channels defined in 17.3.8.4 (Operating channel frequencies) (5 GHz band) or 16.3.6 (PHY operating specifications, general) (2.4 GHz band). When using 40 MHz channels, it can operate in the channels defined in 19.3.15.2 (Channel allocation in the 2.4 GHz band) and 19.3.15.3 (Channel allocation in the 5 GHz band).

The set of valid operating channel numbers by regulatory domain is defined in Annex E.

#### 19.3.15.2 Channel allocation in the 2.4 GHz band

Channel center frequencies are defined at every integer multiple of 5 MHz in the 2.4 GHz band. The relationship between center frequency and channel number is given by Equation (19-87).

$$\text{Channel center frequency} = 2407 + 5 \times n_{ch}(\text{MHz}) \tag{19-87}$$

where

$n_{ch}$ = 1, 2, …, 13

#### 19.3.15.3 Channel allocation in the 5 GHz band

Channel center frequencies are defined at every integer multiple of 5 MHz above the channel starting frequency. The relationship between center frequency and channel number is given in Equation (19-88).

$$\text{Channel center frequency} = \text{Channel starting frequency} + 5 \times n_{ch}(\text{MHz}) \tag{19-88}$$

where

$n_{ch}$ = 1, …, 200

Channel starting frequency is defined as dot11ChannelStartingFactor × 500 kHz or is defined as 5 GHz where dot11OperatingClassesRequired is false or not defined.

A channel center frequency of 5 GHz shall be indicated by dot11ChannelStartingFactor = 8000 and $n_{ch}$ = 200.

#### 19.3.15.4 40 MHz channelization

The set of valid operating channel numbers by regulatory domain is defined in Annex E.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The 40 MHz channels are specified by two fields: (*Nprimary_ch*, *Secondary*). The first field represents the channel number of the primary channel, and the second field indicates whether the secondary channel is above or below the primary channel (1 indicates above, –1 indicates below). The secondary channel number shall be $Nprimary\_ch + Secondary \times 4$.

For example, a 40 MHz channel consisting of 40 MHz channel number 36 and Secondary 1 specifies the primary channel is 36 and the secondary channel is 40.

### 19.3.16 Slot time

The slot time shall follow 17.3.8.6 (Slot time) for 5 GHz bands and 18.5.4 (ERP) for 2.4 GHz bands.

The slot time for 40 MHz channel spacing shall be the same as that for 20 MHz channel spacing.

### 19.3.17 Transmit and receive impedance at the antenna connector

(#1247)The impedance of exposed transmit and receive antenna connectors are defined in 17.3.8.7 (Transmit and receive impedance at the antenna connector).

### 19.3.18 PHY transmit specification

### 19.3.18.1 Transmit spectrum mask

NOTE 1—In the presence of additional regulatory restrictions, the device has to meet both the regulatory requirements and the mask defined in this subclause, i.e., its emissions can be no higher at any frequency offset than the minimum of the values specified in the regulatory and default masks.

NOTE 2—The transmit spectral mask figures in this subclause are not drawn to scale.

For rules regarding TX center frequency leakage levels by VHT STAs, see 21.3.17.4.2 (Transmit center frequency leakage).

For the 2.4 GHz band, when transmitting in a 20 MHz channel, the transmitted spectrum shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth not exceeding 18 MHz, –20 dBr at 11 MHz frequency offset, –28 dBr at 20 MHz frequency offset, and the maximum of (#3778)–40 dBr and –53 dBm/MHz at 30 MHz frequency offset and above. The transmitted spectral density of the transmitted signal shall fall within the spectral mask, as shown in Figure 19-17 (Transmit

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

spectral mask for 20 MHz transmission in the 2.4 GHz band(#3778)). The measurements shall be made using a 100 kHz resolution bandwidth and a 30 kHz video bandwidth.

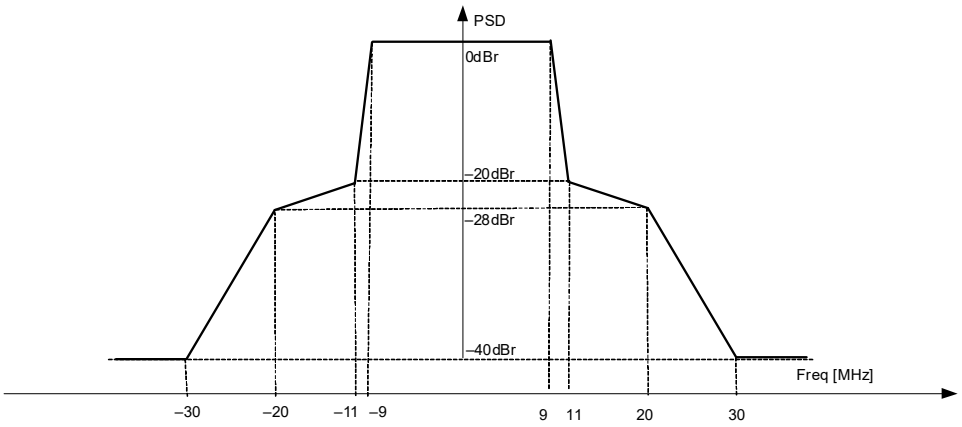

**Figure 19-17—Transmit spectral mask for 20 MHz transmission in the 2.4 GHz band(#3778)**

For the 2.4 GHz band, when transmitting in a 40 MHz channel, the transmitted spectrum shall have a 0 dBr bandwidth not exceeding 38 MHz, –20 dBr at 21 MHz frequency offset, –28 dBr at 40 MHz offset, and the maximum of (#3778)–40 dBr and –56 dBm/MHz at 60 MHz frequency offset and above. The transmitted spectral density of the transmitted signal shall fall within the spectral mask, as shown in Figure 19-18 (Transmit spectral mask for a 40 MHz channel in the 2.4 GHz band(#3778)).

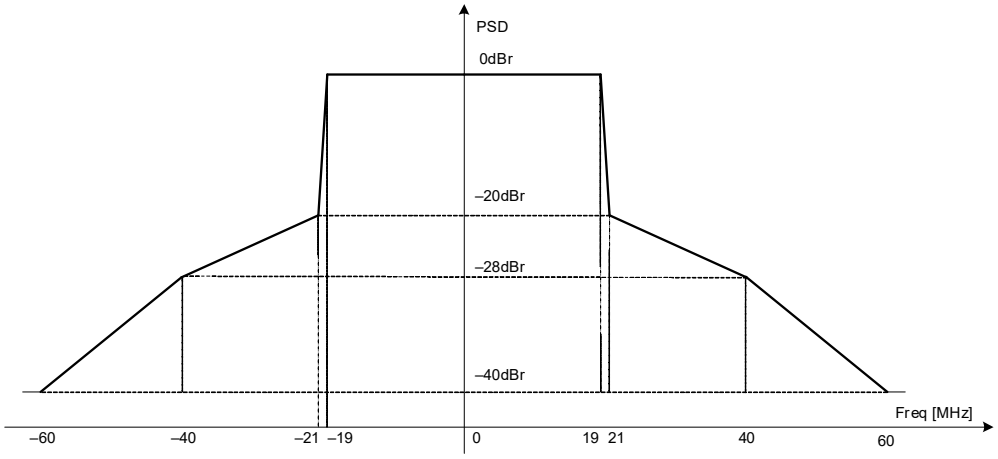

**Figure 19-18—Transmit spectral mask for a 40 MHz channel in the 2.4 GHz band(#3778)**

For the 5 GHz band, when transmitting in a 20 MHz channel, the transmitted spectrum shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth not exceeding 18 MHz, –20 dBr at 11 MHz frequency offset, –28 dBr at 20 MHz frequency offset, and the maximum of –40 dBr and –39 dBm/MHz(M25) at 30 MHz frequency offset and above. The transmitted spectral density of the transmitted signal shall fall within the spectral mask, as shown in Figure 19-19 (Transmit

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

spectral mask for 20 MHz transmission in the 5 GHz band). The measurements shall be made using a 100 kHz resolution bandwidth and a 30 kHz video bandwidth.

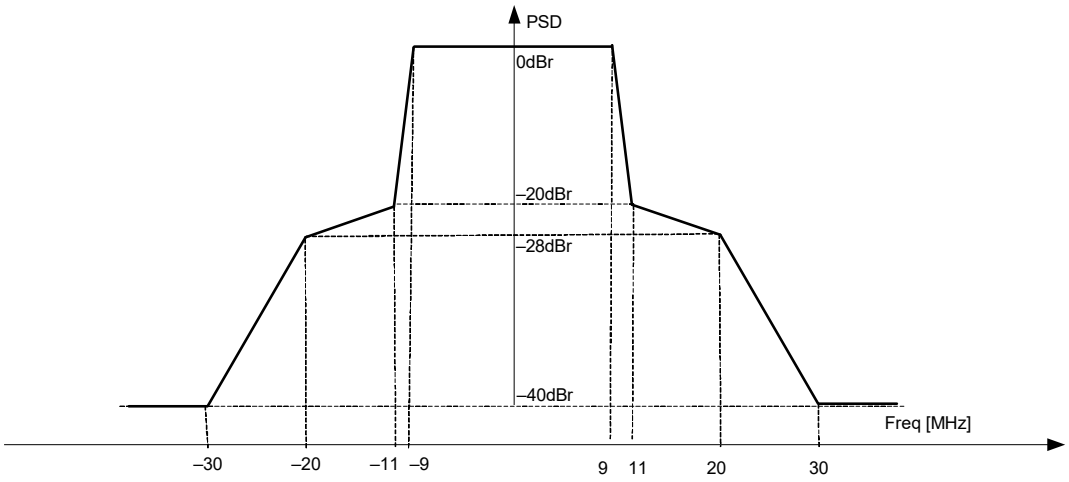

**Figure 19-19—Transmit spectral mask for 20 MHz transmission in the 5 GHz band**

For the 5 GHz band, when transmitting in a 40 MHz channel, the transmitted spectrum shall have a 0 dBr bandwidth not exceeding 38 MHz, –20 dBr at 21 MHz frequency offset, –28 dBr at 40 MHz offset, and the maximum of –40 dBr and –39 dBm/MHz(M25) at 60 MHz frequency offset and above. The transmitted spectral density of the transmitted signal shall fall within the spectral mask, as shown in Figure 19-20 (Transmit spectral mask for a 40 MHz channel in the 5 GHz band).

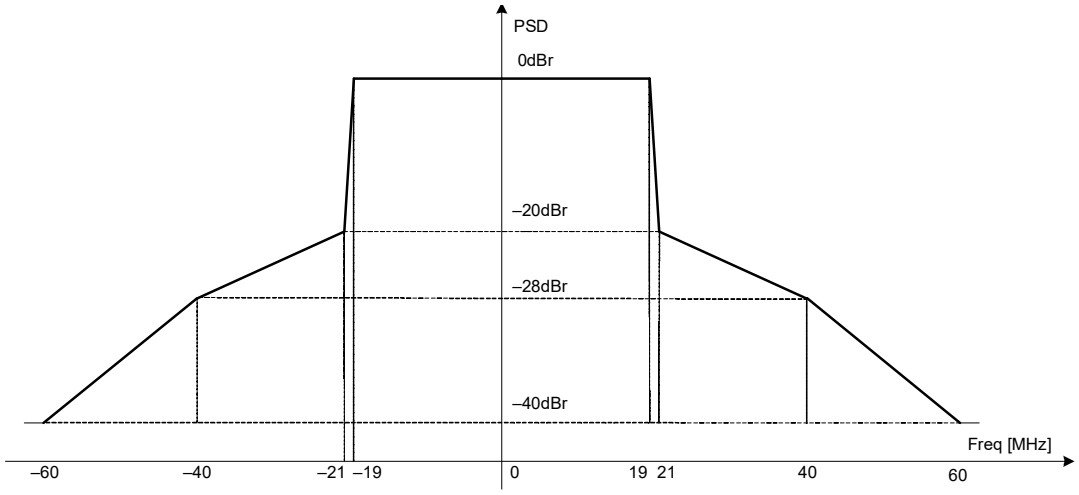

**Figure 19-20—Transmit spectral mask for a 40 MHz channel in the 5 GHz band**

Transmission with CH_OFF_20U, CH_OFF_20L, or CH_OFF_40 shall comply with the same mask that is used for the 40 MHz channel.

### 19.3.18.2 Spectral flatness

In a 20 MHz channel and in corresponding 20 MHz transmission in a 40 MHz channel, the average energy of the constellations in each of the subcarriers with indices –16 to –1 and +1 to +16 shall deviate no more

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

than ± 4 dB from their average energy. The average energy of the constellations in each of the subcarriers with indices –28 to –17 and +17 to +28 shall deviate no more than +4/–6 dB from the average energy of subcarriers with indices –16 to –1 and +1 to +16.

In a 40 MHz transmission (excluding PPDUs in MCS 32 format and non-HT duplicate format), the average energy of the constellations in each of the subcarriers with indices –42 to –2 and +2 to +42 shall deviate no more than ± 4 dB from their average energy. The average energy of the constellations in each of the subcarriers with indices –43 to –58 and +43 to +58 shall deviate no more than +4/–6 dB from the average energy of subcarriers with indices –42 to –2 and +2 to +42.

In MCS 32 format and non-HT duplicate format, the average energy of the constellations in each of the subcarriers with indices –42 to –33, –31 to –6, +6 to +31, and +33 to +42 shall deviate no more than ± 4 dB from their average energy. The average energy of the constellations in each of the subcarriers with indices –43 to –58 and +43 to +58 shall deviate no more than +4/–6 dB from the average energy of subcarriers with indices –42 to –33, –31 to –6, +6 to +31, and +33 to +42.

The tests for the spectral flatness requirements may be performed with spatial mapping $Q_k$ = **I** (see 19.3.11.11.2 (Spatial mapping)).

#### 19.3.18.3 Transmit power

The maximum allowable output power is measured in accordance with practices specified by the appropriate regulatory bodies.

#### 19.3.18.4 Transmit center frequency tolerance

The transmitter center frequency tolerance shall be ± 20 ppm for the 5 GHz band and ± 25 ppm for the 2.4 GHz band. The different transmit chain center frequencies (LO) and each transmit chain symbol clock frequency shall all be derived from the same reference oscillator.

#### 19.3.18.5 PPDU alignment(#14)

If no signal extension is required (see 19.3.2 (PPDU format)), the receiver shall emit a PHY-CCA.indication(IDLE) primitive (see 8.3.5.12 (PHY-CCA.indication)) at the 4 µs boundary following the reception of the last symbol of the (#14)PPDU. If a signal extension is required, the receiver shall emit a PHY-CCA.indication(IDLE) primitive a duration of aSignalExtension after the 4 µs boundary following the reception of the last symbol of the (#14)PPDU. This situation is illustrated for an HT-greenfield format (#14)PPDU using short GI in Figure 19-21 (PHY-TXEND.confirm alignment (HT-greenfield format with short GI)).

If no signal extension is required, the transmitter shall emit a PHY-TXEND.confirm primitive (see 8.3.5.8 (PHY-TXEND.confirm)) at the 4 µs boundary following the trailing boundary of the last symbol of the PPDU on the WM. If a signal extension is required, the transmitter shall emit a PHY-TXEND.confirm primitive (see 8.3.5.8 (PHY-TXEND.confirm)) a duration of aSignalExtension after the 4 µs boundary following the trailing boundary of the last symbol of the PPDU on the WM. This situation is illustrated in Figure 19-21 (PHY-TXEND.confirm alignment (HT-greenfield format with short GI)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

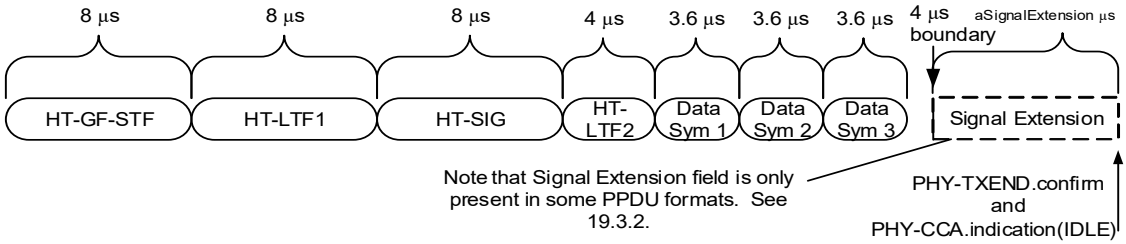

**Figure 19-21—PHY-TXEND.confirm alignment (HT-greenfield format with short GI)**

#### 19.3.18.6 Symbol clock frequency tolerance

The symbol clock frequency tolerance shall be ± 20 ppm for 5 GHz bands and ± 25 ppm for 2.4 GHz bands. The transmit center frequency and the symbol clock frequency for all transmit antennas shall be derived from the same reference oscillator.

#### 19.3.18.7 Modulation accuracy

##### 19.3.18.7.1 Introduction to modulation accuracy tests

Transmit modulation accuracy specifications are described in 19.3.18.7.2 (Transmit center frequency leakage) and 19.3.18.7.3 (Transmitter constellation error). The test method is described in 19.3.18.7.4 (Transmitter modulation accuracy (EVM) test).

##### 19.3.18.7.2 Transmit center frequency leakage

For VHT STAs the requirements on transmitter center frequency leakage are defined in 21.3.17.4.2 (Transmit center frequency leakage); otherwise, the requirements are defined in this subclause.

The transmitter center frequency leakage shall follow 17.3.9.7.2 (Transmitter center frequency leakage) for all transmissions in a 20 MHz channel width. For transmissions in a 40 MHz channel width, the center frequency leakage shall not exceed $max(P - 20, -20)$ dBm, or, equivalently, 0 dB relative to the average energy of the rest of the subcarriers. For upper or lower 20 MHz transmissions in a 40 MHz channel, the center frequency leakage (center of a 40 MHz channel) shall not exceed $max(P - 17, -20)$ dBm. The transmit center frequency leakage is specified per antenna.

##### 19.3.18.7.3 Transmitter constellation error

The relative constellation (#14)PPDU-averaged RMS error, calculated first by averaging over subcarriers, (#14)spatial streams, and OFDM symbols, shall not exceed a data-rate-dependent value according to Table 19-22 (Allowed relative constellation error versus constellation size and coding rate). The number of spatial streams under test shall be equal to the number of utilized transmitting STA antenna (output) ports and also equal to the number of utilized testing instrumentation input ports. In the test, $N_{SS} = N_{STS}$ with EQM MCSs shall be used and no beamforming steering matrix shall be used. Each output port of the transmitting STA shall be connected through a cable to one input port of the testing instrumentation. The same requirement applies both to 20 MHz channels and 40 MHz channels.

##### 19.3.18.7.4 Transmitter modulation accuracy (EVM) test

The transmit modulation accuracy test shall be performed by instrumentation capable of converting the transmitted signals into a streams of complex samples at 40 Msample/s or more, with sufficient accuracy in

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 19-22—Allowed relative constellation error versus constellation size and coding rate**

| Modulation | Coding rate | Relative constellation error (dB) |
|---|---|---|
| BPSK | 1/2 | –5 |
| QPSK | 1/2 | –10 |
| QPSK | 3/4 | –13 |
| 16-QAM | 1/2 | –16 |
| 16-QAM | 3/4 | –19 |
| 64-QAM | 2/3 | –22 |
| 64-QAM | 3/4 | –25 |
| 64-QAM | 5/6 | –27 |

terms of I/Q arm amplitude and phase balance, dc offsets, phase noise, and analog-to-digital quantization noise. Each transmit chain is connected directly through a cable to the setup input port. A possible embodiment of such a setup is converting the signals to a low intermediate frequency with a microwave synthesizer, sampling the signal with a digital oscilloscope, and decomposing it digitally into quadrature components. The sampled signal shall be processed in a manner similar to an actual receiver, according to the following steps, or an equivalent procedure:

a) Detect the start of (#14)PPDU.

b) Detect the transition from short sequences to channel estimation sequences, and establish fine timing (with one sample resolution).

c) Estimate the coarse and fine frequency offsets.

d) Derotate the (#14)PPDU according to estimated frequency offset.

e) Estimate the complex channel response coefficients for each of the subcarriers and each of the transmit chains.

f) For each of the data OFDM symbols, transform the symbol into subcarrier received values, estimate the phase from the pilot subcarriers in all spatial streams, derotate the subcarrier values according to estimated phase, group the results from all of the receiver chains in each subcarrier to a vector, multiply the vector by a zero-forcing equalization matrix generated from the channel estimated during the channel estimation phase.

g) For each data-carrying subcarrier in each spatial stream, find the closest constellation point and compute the Euclidean distance from it.

h) Compute the average of the RMS of all errors (#14)in the Data field. It is given by Equation (19-89).

$$Error_{RMS} = \frac{\sum_{i_f=1}^{N_f} \sqrt{\frac{\sum_{i_s=1}^{N_{SYM}} \left[ \sum_{i_{ss}=1}^{N_{SS}} \left( \sum_{i_{sc}=1}^{N_{ST}} \left( (I(i_f, i_s, i_{ss}, i_{sc}) - I_0(i_f, i_s, i_{ss}, i_{sc}))^2 + (Q(i_f, i_s, i_{ss}, i_{sc}) - Q_0(i_f, i_s, i_{ss}, i_{sc}))^2 \right) \right) \right]}{N_{SYM} \times N_{SS} \times N_{ST} \times P_0}}}{N_f} \quad (19\text{-}89)$$

where

$N_f$ is the number of frames for the measurement

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

| | |
|---|---|
| $I_0(i_f, i_s, i_{ss}, i_{sc}), Q_0(i_f, i_s, i_{ss}, i_{sc})$ | denotes the ideal symbol point in the complex plane in subcarrier $i_{sc}$, spatial stream $i_{ss}$, and OFDM symbol $i_s$ of (#14)the Data field in PPDU $i_f$ |
| $I(i_f, i_s, i_{ss}, i_{sc}), Q(i_f, i_s, i_{ss}, i_{sc})$ | denotes the observed symbol point in the complex plane in subcarrier $i_{sc}$, spatial stream $i_{ss}$, and OFDM symbol $i_s$ of (#14)the Data field in PPDU $i_f$ |
| $P_0$ | is the average power of the constellation |

The vector error on a phase plane is shown in Figure 17-16 (Constellation error).

The test shall be performed over at least 20 (#14)PPDUs ($N_f$), and the average of the RMS shall be taken. The (#14)Data fields under test shall be at least 16 OFDM symbols long. Random data shall be used for the symbols.

### 19.3.18.8 Time of Departure accuracy

(#8049)The RMS accuracy of the time of departure provided in TIME_OF_DEPARTURE shall be less than or equal to 80 ns.

The Time of Departure accuracy test evaluates TIME_OF_DEPARTURE against aTxPHYTxStartRMS and aTxPHYTxStartRMS against TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH as defined in Annex P with the following test parameters:

— MULTICHANNEL_SAMPLING_RATE is

$20 \times 10^6 \left(1 + \left\lceil \frac{f_H - f_L}{20\ \text{MHz}} \right\rceil\right)$ sample/s, for a CH_BANDWIDTH parameter equal to HT_CBW20

$40 \times 10^6 \left(1 + \left\lceil \frac{f_H - f_L}{40\ \text{MHz}} \right\rceil\right)$ sample/s, for a CH_BANDWIDTH parameter equal to HT_CBW40

where

$f_H$ is the nominal center frequency in Hz of the highest channel in the channel set

$f_L$ is the nominal center frequency in Hz of the lowest channel in the channel set, the channel set is the set of channels upon which (#14)PPDUs providing measurements are transmitted, the channel set comprises channels uniformly spaced across $f_H - f_L \geq 50$ MHz

— FIRST_TRANSITION_FIELD is L-STF (for HT-mixed format) or HT-GF-STF (for HT-greenfield format)

— SECOND_TRANSITION_FIELD is L-LTF (for HT-mixed format) or HT-GF-LTF1 (for HT-greenfield format)

— TRAINING_FIELD is L-LTF (for HT-mixed format) or HT-LTF1 (for HT-greenfield format) windowed in a manner which should approximate the windowing described in 17.3.2.5 (Mathematical conventions in the signal descriptions) with $T_{TR}$ = 100 ns.

— TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH is 80 ns (for a CH_BANDWIDTH parameter equal to HT_CBW20) or 80 ns (for a CH_BANDWIDTH parameter equal to HT_CBW40).

NOTE—The indicated windowing applies to the time of departure accuracy test equipment, and not the transmitter or receiver.

This is an unapproved IEEE Standards Draft, subject to change.

### 19.3.19 HT PHY receiver specification

#### 19.3.19.1 General(#2091)

For tests in this subclause, the input levels are measured at the antenna connector and are referenced as the average power per receive antenna. For tests in 19.3.19.2 (Receiver minimum input level sensitivity(#256)), 19.3.19.3 (Adjacent channel rejection), and 19.3.19.4 (Nonadjacent channel rejection), the number of spatial streams under test shall be equal to the number of utilized transmitting STA antenna (output) ports and also equal to the number of utilized (#1768)receiving STA antenna (input) ports. Except where otherwise noted, each output port of the transmitting STA shall be connected through a cable to one input port of the (#1768)receiving STA.

#### 19.3.19.2 Receiver minimum input level sensitivity(#256)

The (#14)PER shall be less than 10% for a PSDU length of 4096 octets with the rate-dependent input levels listed in Table 19-23 (Receiver minimum input level sensitivity) or less(#2091). The test in this subclause and the minimum sensitivity levels specified in Table 19-23 (Receiver minimum input level sensitivity) apply only to non-STBC modes, MCSs 0–31, 800 ns GI, and BCC.

**Table 19-23—Receiver minimum input level sensitivity**

| Modulation | Rate (R) | Adjacent channel rejection (dB) | Nonadjacent channel rejection (dB) | Minimum sensitivity (20 MHz channel spacing) (dBm) | Minimum sensitivity (40 MHz channel spacing) (dBm) |
|---|---|---|---|---|---|
| BPSK | 1/2 | 16 | 32 | –82 | –79 |
| QPSK | 1/2 | 13 | 29 | –79 | –76 |
| QPSK | 3/4 | 11 | 27 | –77 | –74 |
| 16-QAM | 1/2 | 8 | 24 | –74 | –71 |
| 16-QAM | 3/4 | 4 | 20 | –70 | –67 |
| 64-QAM | 2/3 | 0 | 16 | –66 | –63 |
| 64-QAM | 3/4 | –1 | 15 | –65 | –62 |
| 64-QAM | 5/6 | –2 | 14 | –64 | –61 |

#### 19.3.19.3 Adjacent channel rejection

For all transmissions in a 20 MHz channel width, the adjacent channel rejection shall be measured by setting the desired signal's strength 3 dB above the rate-dependent sensitivity specified in Table 19-23 (Receiver minimum input level sensitivity) and raising the power of an interfering signal of 20 MHz bandwidth until 10% PER is caused for a PSDU length of 4096 octets. The difference in power between the signals in the interfering channel and the desired channel is the corresponding adjacent channel rejection. The adjacent channel center frequencies shall be separated by 20 MHz when operating in the 5 GHz band, and the adjacent channel center frequencies shall be separated by 25 MHz when operating in the 2.4 GHz band.

For all transmissions in a 40 MHz channel width, the adjacent channel rejection shall be measured by setting the desired signal's strength 3 dB above the rate-dependent sensitivity specified in Table 19-23 (Receiver minimum input level sensitivity) and raising the power of an interfering signal of 40 MHz bandwidth until 10% PER is caused for a PSDU length of 4096 octets. The difference in power between the signals in the

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

interfering channel and the desired channel is the corresponding adjacent channel rejection. The adjacent channel center frequencies shall be separated by 40 MHz.

The interfering signal in the adjacent channel shall be a signal compliant with the HT PHY, unsynchronized with the signal in the channel under test. The corresponding rejection shall be no less than specified in Table 19-23 (Receiver minimum input level sensitivity). The interference signal shall have a minimum duty cycle of 50%.

The test in this subclause and the adjacent channel rejection levels specified in Table 19-23 (Receiver minimum input level sensitivity) apply only to non-STBC modes, MCSs 0–31, 800 ns GI, and BCC.

#### 19.3.19.4 Nonadjacent channel rejection

For all transmissions in a 20 MHz channel width in the 5 GHz band, the nonadjacent channel rejection shall be measured by setting the desired signal's strength 3 dB above the rate-dependent sensitivity specified in Table 19-23 (Receiver minimum input level sensitivity) and raising the power of an interfering signal of 20 MHz bandwidth until a 10% PER occurs for a PSDU length of 4096 octets. The difference in power between the signals in the interfering channel and the desired channel is the corresponding nonadjacent channel rejection. The nonadjacent channel center frequencies shall be separated by 40 MHz or more.

For all transmissions in a 40 MHz channel width in the 5 GHz band, the nonadjacent channel rejection shall be measured by setting the desired signal's strength 3 dB above the rate-dependent sensitivity specified in Table 19-23 (Receiver minimum input level sensitivity) and raising the power of an interfering signal of 40 MHz bandwidth until a 10% PER occurs for a PSDU length of 4096 octets. The difference in power between the signals in the interfering channel and the desired channel is the corresponding nonadjacent channel rejection. The nonadjacent channel center frequencies shall be separated by 80 MHz or more.

The interfering signal in the nonadjacent channel shall be a signal compliant with the HT PHY, unsynchronized with the signal in the channel under test. The corresponding rejection shall be no less than specified in Table 19-23 (Receiver minimum input level sensitivity). The interference signal shall have a minimum duty cycle of 50%. The nonadjacent channel rejection for transmissions in a 20 MHz or 40 MHz channel width is applicable only to 5 GHz band.

The test in this subclause and the nonadjacent channel rejection level specified in Table 19-23 (Receiver minimum input level sensitivity) apply only to non-STBC modes, MCSs 0–31, 800 ns GI, and BCC.

#### 19.3.19.5 Receiver maximum input level

The receiver shall provide a maximum PER of 10% at a PSDU length of 4096 octets, for a maximum input level of –30 dBm in the 5 GHz band and –20 dBm in the 2.4 GHz band, measured at each antenna for any baseband modulation.

#### 19.3.19.6 CCA sensitivity

#### 19.3.19.6.1 General

The thresholds in this subclause are compared with the signal level at each receiving antenna.

#### 19.3.19.6.2 CCA-Operating Class Specific Energy Detect (CCA-OCSED)(#2365)

For the operating classes requiring CCA-Operating Class Specific Energy Detect (CCA-OCSED), the PHY shall also indicate a medium busy condition when CCA-OCSED detects a channel busy condition.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

For improved spectrum sharing, CCA-OCSED is required in some bands. The behavior class indicating CCA-OCSED is given in Table D-2 (Behavior limits). The operating classes requiring the corresponding CCA-OCSED behavior class are given in E.1 (Country information and operating classes). The PHY of a STA that is operating within an operating class that requires CCA-OCSED shall operate with CCA-OCSED.

CCA-OCSED shall detect a channel busy condition when the received signal strength exceeds the CCA-OCSED threshold as given by dot11OFDMEDThreshold for the primary channel and dot11OFDMEDThreshold for the secondary channel (if present). The CCA-OCSED thresholds for the operating classes requiring CCA-OCSED are subject to the criteria in D.2.5 (CCA-OCSED threshold(#2365)).

NOTE—The requirement to detect a channel busy condition as stated in 19.3.19.6.3 (CCA sensitivity for non-HT PPDUs), 19.3.19.6.4 (CCA sensitivity in 20 MHz), and 19.3.19.6.5 (CCA sensitivity in 40 MHz) is a mandatory energy detection requirement on all Clause 19 (High Throughput (HT) PHY specification(#2297)) receivers. Support for CCA-OCSED is an additional requirement that relates specifically to the sensitivities described in D.2.5 (CCA-OCSED threshold(#2365)).

### 19.3.19.6.3 CCA sensitivity for non-HT PPDUs

CCA sensitivity requirements for non-HT PPDUs in the primary channel are described in 17.3.10.6 (CCA requirements) and 18.4.6 (CCA performance).

### 19.3.19.6.4 CCA sensitivity in 20 MHz

For an HT STA with the operating channel width equal to 20 MHz, the start of a 20 MHz HT signal at a receive level greater than or equal to the minimum modulation and coding rate sensitivity of –82 dBm shall cause the PHY to set PHY-CCA.indication(BUSY) with a probability > 90% within 4 μs. The receiver shall indicate a channel busy condition for any signal 20 dB or more above the minimum modulation and coding rate sensitivity (–82 + 20 = –62 dBm) in the 20 MHz channel.

An HT STA that does not support the reception of (#2095)HT-greenfield format PPDUs shall indicate a channel busy condition [PHY-CCA.indication(BUSY)] for any valid HT_GF signal in the 20 MHz channel at a receive level greater than or equal to –72 dBm.

### 19.3.19.6.5 CCA sensitivity in 40 MHz

This subclause describes the CCA sensitivity requirements for an HT STA with the operating channel width equal to 40 MHz.

The receiver of a 20/40 MHz STA with the operating channel width equal to 40 MHz shall provide CCA on both the primary and secondary channels.

When the secondary channel is idle, the start of a 20 MHz HT signal in the primary channel at a receive level greater than or equal to the minimum modulation and coding rate sensitivity of –82 dBm shall cause the PHY to generate a PHY-CCA.indication(BUSY, {primary}) primitive with a probability > 90% within 4 μs. The start of a 40 MHz HT signal that occupies both the primary and secondary channels at a receive level greater than or equal to the minimum modulation and coding rate sensitivity of –79 dBm shall cause the PHY to generate a PHY-CCA.indication(BUSY, {primary, secondary}) primitive for both the primary and secondary channels with a probability per channel > 90% within 4 μs.

An HT STA that does not support the reception of (#2095)HT-greenfield format PPDUs shall indicate a {primary} channel busy condition (PHY-CCA.indication(BUSY, {primary}) primitive) for any valid HT_GF signal in the primary channel at a receive level greater than or equal to –72 dBm when the secondary channel is idle. An HT STA that does not support the reception of (#2095)HT-greenfield format PPDUs shall indicate a {primary, secondary} channel busy condition (PHY-CCA.indication(BUSY, {primary,

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

secondary}) primitive) for any valid 40 MHz HT_GF signal in both the primary and secondary channels at a receive level greater than or equal to –69 dBm.

The receiver shall indicate a {primary} channel busy condition for any signal at or above –62 dBm in the 20 MHz primary channel. This level is 20 dB above the minimum modulation and coding rate sensitivity for a 20 MHz PPDU. When the primary channel is idle, the receiver indicate a {secondary} channel busy condition for any signal at or above –62 dBm in the 20 MHz secondary channel. The receiver shall indicate a {primary, secondary} channel busy condition for any signal present in both the primary and secondary channels that is at or above –62 dBm in the primary channel and at or above –62 dBm in the secondary channel.

#### 19.3.19.7 Received channel power indicator (RCPI) measurement

The RCPI is a measure of the received RF power in the selected channel for a received (#14)PPDU. This parameter shall be a (#1132)measurement by the PHY of the received RF power in the channel measured over the (#2011)HT-STF or HT-LTF field of the received (#14)PPDU. The received power shall be the average of the power in all active receive chains.

RCPI shall equal the received RF power (#2011)in dBm within an accuracy of ± 5 dB (95% confidence interval) within the specified dynamic range of the receiver.

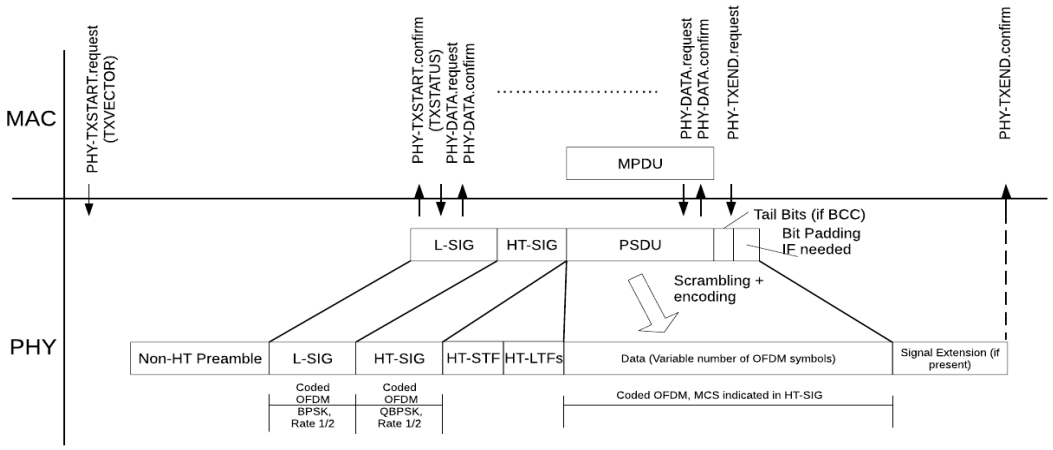
#### 19.3.19.8 Reduced interframe space (RIFS)

(#181)The receiver shall support decoding a PPDU that was transmitted with a RIFS separation from the previous PPDU.

### 19.3.20 PHY transmit procedure

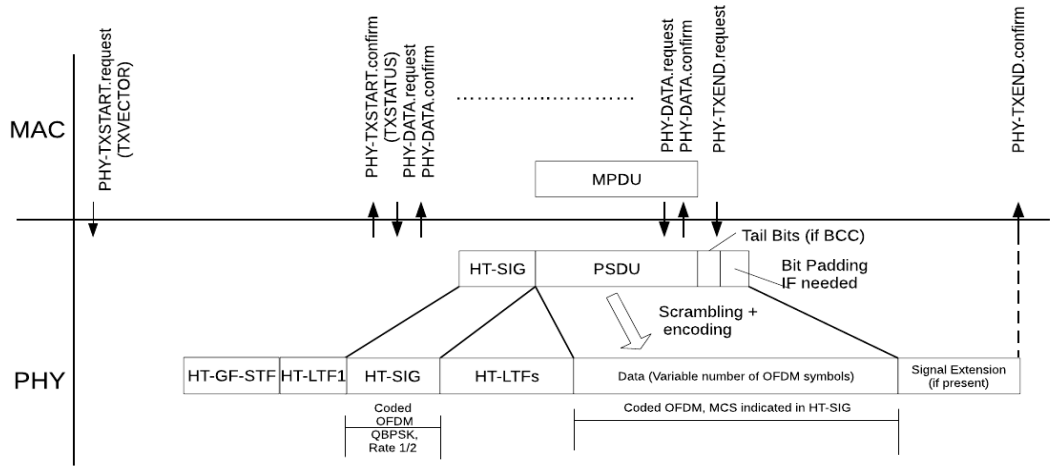
There are three options for the transmit PHY procedure. The first two options, for which typical transmit procedures are shown in Figure 19-22 (PHY transmit procedure (HT-mixed format PPDU)) and Figure 19-23 (PHY transmit procedure (HT-greenfield format PPDU)), are selected if the FORMAT field of the PHY-TXSTART.request(TXVECTOR) primitive is equal to HT_MF or HT_GF, respectively. These transmit procedures do not describe the operation of optional features, such as LDPC or STBC. The third option is to follow the transmit procedure in Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) or Clause 18 (Extended Rate PHY (ERP) specification) if the FORMAT field is equal to NON_HT. Additionally, if the FORMAT field is equal to NON_HT, CH_BANDWIDTH indicates NON_HT_CBW20, and NON_HT_MODULATION indicates OFDM, follow the transmit procedure in Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification). If the FORMAT field is equal to NON_HT, CH_BANDWIDTH indicates NON_HT_CBW20, and NON_HT_MODULATION indicates other than OFDM, follow the transmit procedure in Clause 18 (Extended Rate PHY (ERP) specification). And furthermore, if the FORMAT field is equal to NON_HT and CH_BANDWIDTH indicates NON_HT_CBW40, follow the transmit procedure in Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification), except that the signal in Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) is generated simultaneously on each of the upper and lower 20 MHz channels that constitute the 40 MHz channel as defined in 19.3.8 (Transmission in the upper/lower 20 MHz of a 40 MHz channel) and 19.3.11.12 (Non-HT duplicate transmission). In all these options, in order to transmit data, the PHY-TXSTART.request primitive shall be enabled so that the PHY entity shall be in the transmit state. Further, the PHY shall be set to operate at the appropriate frequency through station management via the PLME, as specified in 19.4 (HT PLME). Other transmit parameters, such as MCS coding types and transmit power, are set via the PHY SAP with the PHY-TXSTART.request(TXVECTOR) primitive, as described in 19.2.2 (TXVECTOR and RXVECTOR parameters).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.



NOTE—This procedure does not describe the operation of optional features, such as LDPC or STBC

**Figure 19-22—PHY transmit procedure (HT-mixed format PPDU)**



NOTE—This procedure does not describe the operation of optional features, such as LDPC or STBC.

**Figure 19-23—PHY transmit procedure (HT-greenfield format PPDU)**

This is an unapproved IEEE Standards Draft, subject to change.

A clear channel shall be indicated by issuing a PHY-CCA.indication(IDLE) primitive. Note that under some circumstances, the MAC uses the latest value of the PHY-CCA.indication primitive before issuing the PHY-TXSTART.request primitive. Transmission of the PPDU shall be initiated after receiving the PHY-TXSTART.request(TXVECTOR) primitive. The TXVECTOR elements for the PHY-TXSTART.request primitive are specified in Table 19-1 (TXVECTOR and RXVECTOR parameters).

Transmission of the PHY preamble may start if TIME_OF_DEPARTURE_REQUESTED is false, and shall start immediately if TIME_OF_DEPARTURE_REQUESTED is true, based on the parameters passed in the PHY-TXSTART.request primitive.

The data shall then be exchanged between the MAC and the PHY through a series of PHY-DATA.request(DATA) primitives issued by the MAC and PHY-DATA.confirm primitives issued by the PHY. Once PHY preamble transmission is started, the PHY entity shall immediately initiate data scrambling and data encoding. The encoding method shall be based on the FEC_CODING, CH_BANDWIDTH, and MCS parameter of the TXVECTOR. A modulation rate change, if any, shall be initiated starting with the SERVICE field data, as described in 19.3.2 (PPDU format).

The PHY proceeds with PSDU transmission through a series of data octet transfers from the MAC. The SERVICE field and PSDU are encoded by the encoder selected by the FEC_CODING, CH_BANDWIDTH, and MCS parameters of the TXVECTOR as described in 19.3.3 (Transmitter block diagram). Transmission can be prematurely terminated by the MAC through the primitive PHY-TXEND.request primitive. Normal termination occurs after the transmission of the final bit of the last PSDU octet, according to the number supplied in the LENGTH field.

The (#14)PPDU transmission shall be completed, and the PHY entity shall enter the receive state. Each PHY-TXEND.request primitive is acknowledged with a PHY-TXEND.confirm primitive from the PHY. If the length of the coded PSDU is not an integer multiple of the OFDM symbol length, bits shall be stuffed to make the coded PSDU length an integer multiple of the OFDM symbol length.

The GI shall be inserted in every OFDM symbol as a countermeasure against delay spread.

In some PPDU formats (as defined in 19.3.2 (PPDU format)), a signal extension is present. When no signal extension is present, the PHY-TXEND.confirm primitive is generated at the end of last symbol of the PPDU. When a signal extension is present, the PHY-TXEND.confirm primitive is generated at the end of the signal extension.

A typical state machine implementation of the transmit PHY is provided in Figure 19-24 (PHY transmit state machine(#14)). Requests (.request) and confirmations (.confirm) are issued once per state as shown. This state machine does not describe the operation of optional features, such as LDPC or STBC. If the TXVECTOR parameter FORMAT is equal to NON_HT and NON_HT_MODULATION is equal to ERP-OFDM or OFDM, refer to the transmit procedure and state machine in 17.3.11 (Transmit PHY). If the TXVECTOR parameter FORMAT is equal to NON_HT and NON_HT_MODULATION is equal to ERP-DSSS or ERP-CCK, refer to the transmit procedure in 15.3.6 (Transmit PHY) or 16.2.5 (Transmit PHY), respectively.

NOTE—The transmit procedure and state machine for Clause 18 (Extended Rate PHY (ERP) specification) when TXVECTOR parameter NON_HT_MODULATION is ERP-OFDM is described in 17.3.11 (Transmit PHY), except for the signal extension (refer to 18.3.2.4 (ERP-OFDM PPDU format)).

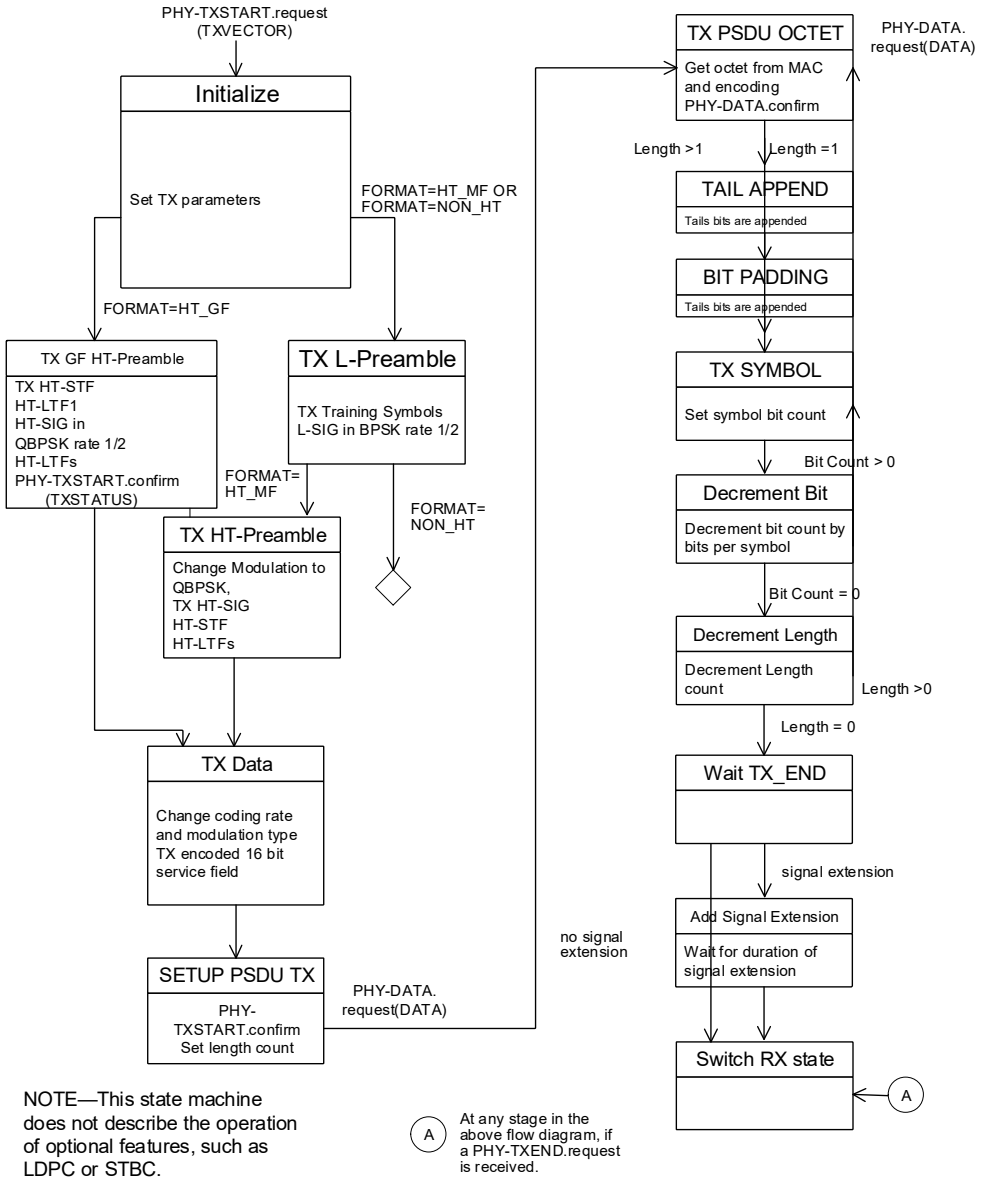

**Figure 19-24—PHY transmit state machine(#14)**

### 19.3.21 PHY receive procedure

Typical PHY receive procedures are shown in Figure 19-25 (PHY receive procedure for HT-mixed format PPDU(#1058)(#3480)(#4122)) and Figure 19-26 (PHY receive procedure for HT-greenfield format PPDU(#1058)(#3480)(#4122)). The receive procedures correspond to HT-mixed format and HT-greenfield format, respectively. A typical state machine implementation of the receive PHY is given in Figure 19-27 (PHY receive state machine(#1590)(#6467)). These receive procedures and state machine do not describe the operation of optional features, such as LDPC or STBC. If the detected format indicates (#2095)a non-HT format (denoted "Not HT-SIG" in Figure 19-27 (PHY receive state machine(#1590)(#6467))), refer to the receive procedure and state machine in 17.3.12 (Receive PHY) or 18.3.6 (PHY receive procedure). Further,

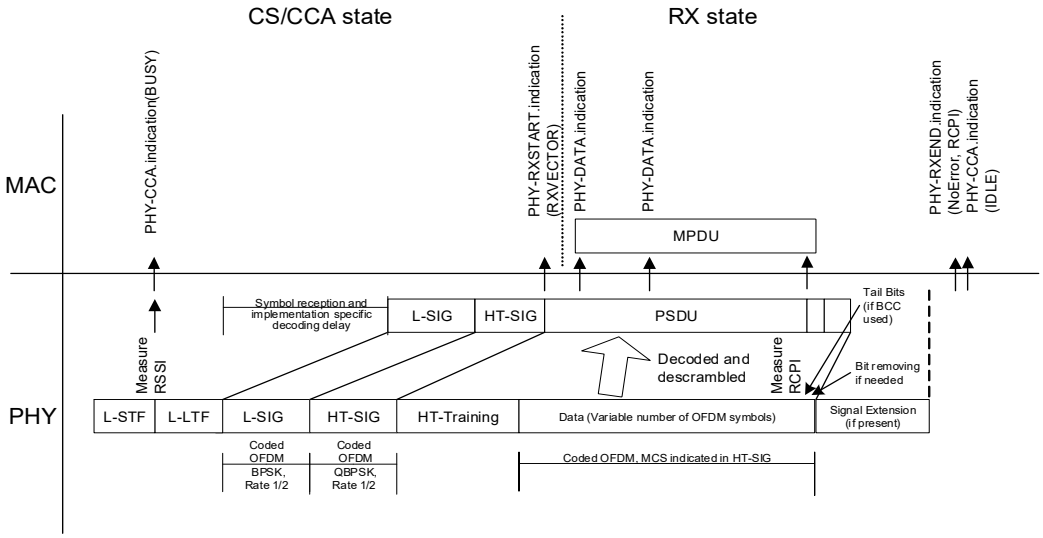
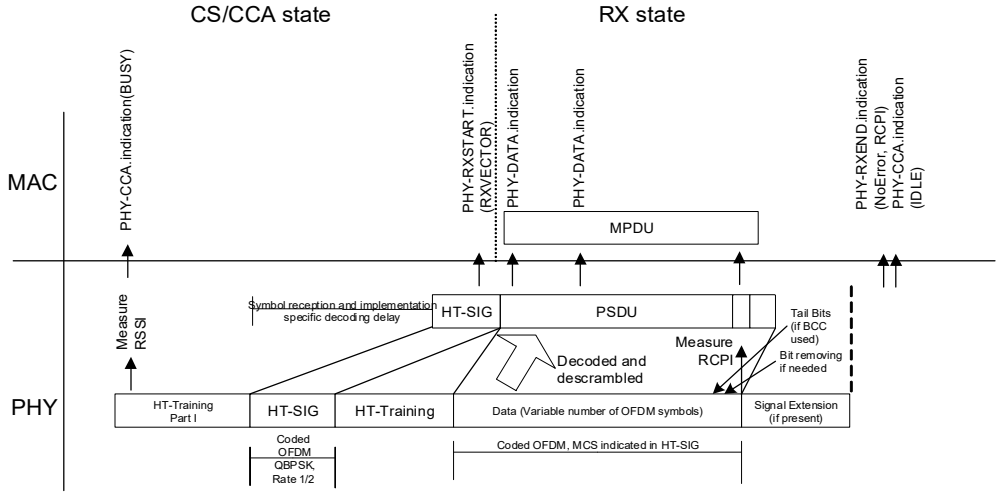
through station management (via the PLME), the PHY is set to the appropriate frequency, as specified in 19.4 (HT PLME). Other receive parameters, such as RSSI and indicated DATARATE, may be accessed via the PHY SAP.



NOTE—This procedure does not describe the operation of optional features, such as LDPC or STBC.

**Figure 19-25—PHY receive procedure for HT-mixed format PPDU(#1058)(#3480)(#4122)**



NOTE—This procedure does not describe the operation of optional features, such as LDPC or STBC.

**Figure 19-26—PHY receive procedure for HT-greenfield format PPDU(#1058)(#3480)(#4122)**

This is an unapproved IEEE Standards Draft, subject to change.

Upon receiving the transmitted PHY preamble, the PHY measures a receive signal strength. This indicates activity to the MAC via the PHY-CCA.indication primitive. A PHY-CCA.indication(BUSY, channel-list) primitive shall also be issued as an initial indication of reception of a signal. The channel-list parameter of the PHY-CCA.indication primitive is set as follows:

- It is absent when the operating channel width is 20 MHz.
- It is set to {primary} when the operating channel width is 40 MHz and the signal is present only in the primary channel.
- It is set to {secondary} when the operating channel width is 40 MHz and the signal is present only in the secondary channel.
- It is set to {primary, secondary} when the operating channel width is 40 MHz and the signal is present in both the primary and secondary channels.

The RSSI parameter is reported to the MAC in the RXVECTOR.

After the PHY-CCA.indication(BUSY, channel-list) primitive is issued, the PHY entity shall begin receiving the training symbols and searching for SIGNAL and HT-SIG in order to set the length of the PSDU(#2056), the demodulation type, code type, and the decoding rate.

(#1062)For a VHT STA, or an HE STA operating in the 2.4 GHz band, that determines it is receiving an HT PPDU, the STA's receive procedure shall resume here. Existing state, including knowledge of the L-SIG Parity and RATE checks, is retained.

If signal loss occurs before validating L-SIG and/or HT-SIG, the HT PHY shall not generate a PHY-CCA.indication(IDLE) primitive until the received level drops below the CCA sensitivity level (for a missed preamble) specified in 19.3.19.6 (CCA sensitivity). If the check of the HT-SIG CRC is not valid, a PHY-RXSTART.indication primitive is not issued. The PHY shall indicate the error condition by issuing a PHY-RXEND.indication(FormatViolation) primitive. The HT PHY shall not generate a PHY-CCA.indication(IDLE) primitive until the received level drops below the CCA sensitivity level (for a missed preamble) specified in 19.3.19.6 (CCA sensitivity).

If the PHY preamble reception is successful and a valid HT-SIG CRC is indicated:

- Upon reception of an HT-mixed format preamble, the HT PHY shall not generate a PHY-CCA.indication(IDLE) primitive for the predicted duration of the (#14)PPDU, as defined by TXTIME in 19.4.3 (TXTIME calculation), for all supported and unsupported modes except Reserved HT-SIG Indication. Reserved HT-SIG Indication is defined in the fourth item below.
- Upon reception of a GF preamble by an HT STA that does not support GF, the HT PHY shall not generate a PHY-CCA.indication(IDLE) primitive until either the predicted duration of the (#14)PPDU from the contents of the HT-SIG field, as defined by TXTIME in 19.4.3 (TXTIME calculation), except Reserved HT-SIG Indication, elapses or until the received level drops below the receiver minimum sensitivity level of BPSK, R=1/2 in Table 19-23 (Receiver minimum input level sensitivity) + 10 dB (–72 dBm for 20 MHz, –69 dBm for 40 MHz). Reserved HT-SIG Indication is defined in the fourth item below.
- Upon reception of a GF preamble by an HT STA that supports GF, the HT PHY shall not generate a PHY-CCA.indication(IDLE) primitive for the predicted duration of the (#14)PPDU, as defined by TXTIME in 19.4.3 (TXTIME calculation), for all supported and unsupported modes except Reserved HT-SIG Indication. Reserved HT-SIG Indication is defined in the fourth item below.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

— If the HT-SIG indicates a Reserved HT-SIG Indication, the HT PHY shall not generate a PHY-CCA.indication(IDLE) primitive until the received level drops below the CCA sensitivity level (minimum modulation and coding rate sensitivity + 20 dB) specified in 19.3.19.6 (CCA sensitivity). Reserved HT-SIG Indication is defined as an HT-SIG with MCS field in the range 77–127 or Reserved field = 0 or STBC field = 3 and any other HT-SIG field bit combinations that do not correspond to modes of PHY operation defined in Clause 19 (High Throughput (HT) PHY specification(#2297)).

Subsequent to an indication of a valid HT-SIG CRC, a PHY-RXSTART.indication(RXVECTOR) primitive shall be issued. If dot11TimingMsmtActivated is true, the PHY shall do the following:

— Complete receiving the PHY header and verify the validity of the PHY Header.

— If the PHY header reception is successful (and the SIGNAL field is completely recognizable and supported), a PHY-RXSTART.indication(RXVECTOR) primitive shall be issued and RX_START_OF_FRAME_OFFSET parameter within the RXVECTOR shall be forwarded (see 19.2.2 (TXVECTOR and RXVECTOR parameters)).

NOTE—The RX_START_OF_FRAME_OFFSET value is used (#3049)to estimate when the start of the preamble for the incoming (#14)PPDU was detected on the medium at the receive antenna connector.

The RXVECTOR associated with this primitive includes the parameters specified in Table 19-1 (TXVECTOR and RXVECTOR parameters). Upon reception of a GF preamble by an HT STA that does not support GF, the FORMAT field of RXVECTOR is equal to HT_GF, the remaining fields may be empty, and the PHY shall indicate the error condition by issuing a PHY-RXEND.indication(FormatViolation) primitive. If the HT-SIG indicates an unsupported mode or Reserved HT-SIG Indication, the PHY shall indicate the error condition by issuing a PHY-RXEND.indication(UnsupportedRate) primitive.

Following training and SIGNAL fields, the coded PSDU (which comprises the coded PHY SERVICE field and scrambled and coded PSDU) shall be received. If signal loss occurs during reception prior to completion of the PSDU reception, the error condition shall be reported to the MAC using a PHY-RXEND.indication(CarrierLost) primitive. After waiting for the intended end of the PSDU, if no signal extension is present (as defined in 19.3.2 (PPDU format)), the PHY shall generate a PHY-CCA.indication(IDLE) primitive and return to RX IDLE state. Otherwise, the receiver waits for the duration of the signal extension before returning to the RX IDLE state.

The received PSDU bits are assembled into octets, decoded, and presented to the MAC using a series of PHY-DATA.indication(DATA) primitive exchanges. The number of PSDU octets is indicated in the HT Length field of the HT-SIG. The PHY shall proceed with PSDU reception. After the reception of the final bit of the last PSDU octet and possible tail and padding bits, the receiver shall be returned to the RX IDLE state if no signal extension is present (as defined in 19.3.2 (PPDU format)), as shown in Figure 19-27 (PHY receive state machine(#1590)(#6467)). Otherwise, the receiver waits for the duration of the signal extension before returning to the RX IDLE state. A PHY-RXEND.indication(NoError) primitive shall be issued on entry to the RX IDLE state.

While in the Signal Extension state, if the receiver detects a CS/CCA event, it issues an RXEND.indication primitive (with the RXERROR parameter set to NoError or CarrierLost, depending on whether a carrier lost event occurred during the reception of the PPDU), leaves the Signal Extension state, and enters the Detect SIG state. This sequence occurs when signal-extended PPDUs are transmitted while separated by a RIFS.

If the BCC is used, any data received after the indicated data length are considered pad bits (to fill out an OFDM symbol) and should be discarded.

## 19.4 HT PLME

### 19.4.1 PLME SAP layer management primitives(#6320)

Table 19-24 (HT PHY MIB attributes) lists the MIB attributes that may be accessed by the PHY entities and the intralayer of higher level LMEs. These attributes are accessed via the PLME-GET, PLME-SET, PLME-RESET, and PLME-CHARACTERISTICS primitives defined in 6.2 (Generic management primitives) and 6.7.4 (PLME-CHARACTERISTICS.confirm).

### 19.4.2 PHY MIB

HT PHY MIB attributes are defined in Annex C with specific values defined in Table 19-24 (HT PHY MIB attributes). The (#4177)Operational semantics column in Table 19-24 (HT PHY MIB attributes) contains two types: static and dynamic.

— Static MIB attributes are fixed and cannot be modified for a given PHY implementation.

— Dynamic MIB attributes are interpreted according to the MAX-ACCESS field of the MIB attribute. When MAX-ACCESS is equal to read-only, the MIB attribute value may be updated by the PLME and read from the MIB attribute by management entities. When MAX-ACCESS is equal to read-write, the MIB attribute may be read and written by management entities.

### 19.4.3 TXTIME calculation

The value of the TXTIME parameter returned by the PLME-TXTIME.confirm primitive or calculated for the PHY receive procedure shall be calculated for HT-mixed format according to the Equation (19-90) and Equation (19-91) for short and long GI, respectively, and for HT-greenfield format according to Equation (19-92) and Equation (19-93) for short and long, respectively:

$$\text{TXTIME} = T_{LEG\_PREAMBLE} + T_{L\text{-}SIG} + T_{HT\_TRAINING} + T_{HT\text{-}SIG} + T_{SYM} \times \left\lceil \frac{T_{SYMS} \times N_{SYM}}{T_{SYM}} \right\rceil + SignalExtension \quad \text{(19-90)}$$

(#84)

$$\text{TXTIME} = T_{LEG\_PREAMBLE} + T_{L\text{-}SIG} + T_{HT\_TRAINING} + T_{HT\text{-}SIG} + T_{\text{SYM}} \times N_{SYM} + SignalExtension \quad \text{(19-91)}$$

(#85)

$$\text{TXTIME} = T_{GF\_HT\_TRAINING} + T_{HT\text{-}SIG} + T_{SYMS} \times N_{SYM} + SignalExtension \quad \text{(19-92)}$$

(#86)

$$\text{TXTIME} = T_{GF\_HT\_TRAINING} + T_{HT\text{-}SIG} + T_{SYM} \times N_{SYM} + SignalExtension \quad \text{(19-93)}$$

(#87)

where

$T_{LEG\_PREAMBLE} = T_{L\text{-}STF} + T_{L\text{-}LTF}$ is the duration of the non-HT preamble

$T_{HT\_TRAINING}$ is the duration of the HT-STF and HT-LTFs in HT-mixed format, given by $T_{HT-STF} + T_{HT-LTF1} + (N_{HT\text{-}LTF} - 1)T_{HT-LTFs}$

$T_{GF\_HT\_TRAINING}$ is the duration of the HT-GF-STF, HT-LTF1 and HT-LTFs in HT-greenfield format, given by $T_{HT-GF-STF} + T_{HT-LTF1} + (N_{HT\text{-}LTF} - 1)T_{HT-LTFs}$

$T_{SYM}$, $T_{SYMS}$, (#88)$T_{L\text{-}SIG}$, $T_{HT\text{-}SIG}$, $T_{L\text{-}STF}$, $T_{HT\text{-}STF}$, $T_{HT\text{-}GF\text{-}STF}$, $T_{L\text{-}LTF}$, $T_{HT\text{-}LTF1}$ and $T_{HT\text{-}LTFs}$ are defined in Table 19-6 (Timing-related constants)

*SignalExtension* is 0 µs when TXVECTOR parameter NO_SIG_EXTN is true and is aSignalExtension as defined in Table 19-25 (HT PHY characteristics) when TXVECTOR parameter NO_SIG_EXTN is false

$N_{HT\text{-}LTF}$ is defined in Equation (19-22)

$N_{SYM}$ is defined in Equation (19-32) for BCC and Equation (19-41) for LDPC

For non-HT modes of operation, refer to Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) and Clause 18 (Extended Rate PHY (ERP) specification) for TXTIME calculations, except that (#14)PPDUs transmitted with a value of NON_HT_DUP_OFDM for the TXVECTOR parameter NON_HT_MODULATION shall use Equation (18-1) for TXTIME calculation.

### 19.4.4 HT PHY

(#2123)The HT PHY characteristics, provided through the PLME-CHARACTERISTICS service primitive, are shown in Table 19-25 (HT PHY characteristics). The definitions for these characteristics are given in 6.7.4 (PLME-CHARACTERISTICS.confirm)

**Table 19-25—HT PHY characteristics**

| Characteristics | Value |
|---|---|
| aRIFSTime | 2 μs |
| aSlotTime | When operating in the 2.4 GHz band:<br>If dot11OperatingClassesRequired is false, long slot time = 20 μs<br>If dot11OperatingClassesRequired is true, long slot time = 20 μs plus any coverage-class-dependent aAirPropagationTime (see Table 9-133 (Coverage Class field parameters))<br><br>If dot11OperatingClassesRequired is false, short slot time = 9 μs<br>If dot11OperatingClassesRequired is true, short slot time= 9 μs plus any coverage-class-dependent aAirPropagationTime (see Table 9-133 (Coverage Class field parameters))<br><br>When operating in the 5 GHz band:<br>If dot11OperatingClassesRequired is false, 9 μs<br>If dot11OperatingClassesRequired is true, 9 μs plus any coverage-class-dependent aAirPropagationTime (see Table 9-133 (Coverage Class field parameters)) |
| aSIFSTime | 10 μs when operating in the 2.4 GHz band<br>16 μs when operating in the 5 GHz bands |
| aSignalExtension | 0 μs when operating in the 5 GHz band<br>6 μs when operating in the 2.4 GHz band |
| aCCATime | Implementation dependent, see 10.3.7 (DCF timing relations). |
| aRxPHYStartDelay | (#3038)24 μs |

For non-HT modes of operation, refer to Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) and Clause 18 (Extended Rate PHY (ERP) specification) for PHY characteristics.

## 19.5 Parameters for HT-MCSs

Table 19-26 (Symbols used in MCS parameter tables) defines the symbols used in the rate-dependent parameter tables.

**Table 19-26—Symbols used in MCS parameter tables**

| Symbol | Explanation |
|---|---|
| $N_{SS}$ | Number of spatial streams |
| $R$ | Coding rate |
| $N_{BPSC}$ | Number of coded bits per single carrier (total across spatial streams) |
| $N_{BPSCS}(i_{SS})$ | Number of coded bits per single carrier for each spatial stream, $i_{SS} = 1,...,N_{SS}$ |
| $N_{SD}$ | Number of complex data numbers per spatial stream per OFDM symbol |
| $N_{SP}$ | Number of pilot values per OFDM symbol |
| $N_{CBPS}$ | Number of coded bits per OFDM symbol |
| $N_{DBPS}$ | Number of data bits per OFDM symbol |
| $N_{ES}$ | Number of BCC encoders for the DATA field |

In the MCS parameter tables that follow, data rates for a 400 ns GI are rounded to 1 decimal place.

The rate-dependent parameters for mandatory 20 MHz, $N_{SS} = 1$ MCSs with $N_{ES} = 1$ shall be as shown in Table 19-27 (MCS parameters for mandatory 20 MHz, $N_{SS} = 1$, $N_{ES} = 1$).

**Table 19-27—MCS parameters for mandatory 20 MHz, $N_{SS} = 1$, $N_{ES} = 1$**

| MCS Index | Modulation | $R$ | $N_{BPSCS}(i_{SS})$ | $N_{SD}$ | $N_{SP}$ | $N_{CBPS}$ | $N_{DBPS}$ | Data rate (Mb/s) | |
|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | 800 ns GI | 400 ns GI (see NOTE) |
| 0 | BPSK | 1/2 | 1 | 52 | 4 | 52 | 26 | 6.5 | 7.2 |
| 1 | QPSK | 1/2 | 2 | 52 | 4 | 104 | 52 | 13.0 | 14.4 |
| 2 | QPSK | 3/4 | 2 | 52 | 4 | 104 | 78 | 19.5 | 21.7 |
| 3 | 16-QAM | 1/2 | 4 | 52 | 4 | 208 | 104 | 26.0 | 28.9 |
| 4 | 16-QAM | 3/4 | 4 | 52 | 4 | 208 | 156 | 39.0 | 43.3 |
| 5 | 64-QAM | 2/3 | 6 | 52 | 4 | 312 | 208 | 52.0 | 57.8 |
| 6 | 64-QAM | 3/4 | 6 | 52 | 4 | 312 | 234 | 58.5 | 65.0 |

# 20. Directional multi-gigabit (DMG) PHY specification

## 20.1 DMG PHY introduction

### 20.1.1 Scope of DMG PHY services

The DMG PHY supports two modulation methods:

— A control modulation using MCS 0 (the DMG control mode; see 20.4 (DMG control mode))

— A single carrier (SC) modulation using MCS 1 to MCS 12, MCS 9.1, 12.1, 12.2, 12.3, 12.4, 12.5, and 12.6 (the DMG SC mode; see 20.5 (DMG SC mode)) and MCS 25 to MCS 31 (the DMG low-power SC mode; see 20.6 (DMG low-power SC mode))

All DMG modulation methods share a similar preamble (see 20.3.6 (Common preamble)).

The services provided to the MAC by the DMG PHY consist of the following protocol functions:

a) A function that defines a method of mapping the PHY service data units (PSDU) into a framing format (PPDU) suitable for sending and receiving PSDUs between two or more STAs.

b) A function that defines the characteristics and method of transmitting and receiving data through a wireless medium between two or more STAs. Depending on the DMG MCSs, these STAs support a mixture of DMG SC mode, DMG low-power SC mode, and DMG control mode.

### 20.1.2 DMG PHY functions

The DMG PHY contains two functional entities: the PHY and the layer management function (PLME). Each of these functions is described in detail in 20.3 (Common parameters) to 20.11 (DMG PLME). The DMG PHY service is provided to the MAC through the PHY service primitives defined in Clause 8 (PHY service specification).

#### 20.1.2.1 PHY management entity (PLME)

The PLME performs management of the local PHY functions in conjunction with the MLME.

#### 20.1.2.2 Service specification method

The models represented by figures and state diagrams are intended to be illustrations of the functions provided. It is important to distinguish between a model and a real implementation. The models are optimized for simplicity and clarity of presentation, but do not necessarily reflect any particular implementation. The service of a layer or sublayer is the set of capabilities that it offers to a user in the next higher layer (or sublayer). Abstract services are specified here by describing the service primitives and parameters that characterize each service. This definition is independent of any particular implementation.

## 20.2 DMG PHY service interface

### 20.2.1 Introduction

The PHY interfaces to the MAC through the TXVECTOR, RXVECTOR, and the PHYCONFIG_VECTOR. Using the TXVECTOR, the MAC supplies the PHY with per-PPDU transmit parameters. Using the RXVECTOR, the PHY informs the MAC of the received (#14)PPDU's parameters. Using the PHYCONFIG_VECTOR, the MAC configures the PHY for operation, independent of (#14)PPDU transmission or reception.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

This interface is an extension of the generic PHY service interface defined in 8.3.4 (Basic service and options).

### 20.2.2 TXVECTOR and RXVECTOR parameters

The parameters in Table 20-1 (TXVECTOR and RXVECTOR parameters) are defined as part of the TXVECTOR parameter list in the PHY-TXSTART.request primitive and/or as part of the RXVECTOR parameter list in the PHY-RXSTART.indication primitive.

**Table 20-1—TXVECTOR and RXVECTOR parameters**

| Parameter | Value | TXVECTOR | RXVECTOR |
|---|---|---|---|
| MCS | The MCS parameter is an enumerated type that indicates the modulation and coding scheme used in the transmission of the (#14)PPDU. Values are integers in the range 0 to 31 and the values 9.1, 12.1, 12.2, 12.3, 12.4, 12.5 and 12.6.<br>— An MCS value of 0 indicates the use of DMG control mode.<br>— MCS values of 1 to 12 and 9.1, 12.1, 12.2, 12.3, 12.4, 12.5, 12.6 indicate use of single carrier modulations. The value is an index to Table 20-15 (DMG SC mode modulation and coding schemes).<br>— MCS values of 25 to 31 indicate use of DMG low-power SC mode. The value is an index to Table 20-21 (DMG low-power SC mode modulation and coding schemes). | Y | Y |
| LENGTH | Indicates the number of octets in the PSDU in the range 1 to 262 143. | Y | Y |
| ADD_PPDU | Enumerated Type:<br>— ADD-PPDU indicates that this PPDU is immediately followed by another PPDU with no IFS or preamble on the subsequent PPDU.<br>— NO-ADD-PPDU indicates no additional PPDU follows this PPDU. | Y | Y |
| PPDU_TYPE | Enumerated Type:<br>— TRN-R indicates either a PPDU whose Data field is followed by one or more TRN subfields, or a PPDU that is requesting TRN subfields to be appended to a future response PPDU.<br>— TRN-T indicates a PPDU whose Data field is followed by one or more TRN subfields. The transmitter may change AWV configuration at the beginning of each TRN subfield.<br>This parameter is reserved if TRN_LEN is 0. | Y | Y |
| TRN_LEN | TRN_LEN indicates the length of the training field. Values are in the range 0–16 (see 20.9.2.2.3 (BRP PPDU Header field(#6409))). | Y | Y |
| AGGREGATION | Indicates whether the PSDU contains an A-MPDU.<br>Enumerated Type:<br>— AGGREGATED indicates this is a PSDU with A-MPDU aggregation.<br>— NOT_AGGREGATED indicates this is a PSDU without A-MPDU aggregation. | Y | Y |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 20-1—TXVECTOR and RXVECTOR parameters *(continued)***

| Parameter | Value | TXVECTOR | RXVECTOR |
|---|---|---|---|
| RSSI | The allowed values for the RSSI parameter are in the range 0 to 255. This parameter is a (#1132)measurement by the PHY of the power observed at the input of the antennas plus the antenna gain, or equivalent antenna gain for a phased-array antenna, used to receive the current PPDU. RSSI shall be measured during the reception of the PHY preamble. RSSI is intended to be used in a relative manner, and it shall be a monotonically increasing function of the received power. | N | Y |
| SNR | This parameter indicates the SNR measured during the reception of a DMG control mode (#14)PPDU. Values are –13 dB to 50.75 dB in 0.25 dB steps. | N | Y |
| RCPI | Is a measure of the received RF power measured over the preamble (#3475)of the current (#14)PPDU. Refer to 20.3.10 (Received channel power indicator (RCPI) measurement) for the definition of RCPI. | N | Y |
| ANT_CONFIG | Indicates which antenna configuration(s) is to be used throughout the transmission of the (#14)PPDU, and when to switch between configurations.<br>Values are implementation dependent. | Y | N |
| CHAN_MEASUREMENT | Channel as measured during the reception of TRN subfields. Each measurement includes 63 complex numbers. | N | Y |
| TIME_OF_DEPARTURE_REQUESTED | Enumerated type:<br>— true indicates that the MAC entity requests that the PHY PHY entity measures and reports time of departure parameters corresponding to the time when the first (#14)PPDU energy is sent by the transmitting port.<br>— false indicates that the MAC entity requests that the PHY PHY entity neither measures nor reports time of departure parameters. | O | N |
| RX_START_OF_FRAME_OFFSET | 0 to $2^{32}$–1. An estimate of the offset (in 10 ns(#7198) units) from the point in time at which the start of the preamble (#14)of the PPDU arrived at the receive antenna connector to the point in time at which this primitive is issued to the MAC. | N | See NOTE |
| BEAM_TRACKING_REQUEST | This parameter indicates whether beam tracking is requested.<br>Enumerated type:<br>BEAM-TRACKING-REQUESTED or BEAM-TRACKING-NOT-REQUESTED | Y | Y |
| LAST_RSSI | In the TXVECTOR, LAST_RSSI indicates the received power level of the last (#14)PPDU with a valid PHY header that was received a SIFS before transmission of the current (#14)PPDU; otherwise, it is set to 0(#464) (10.3.2.3.3 (SIFS)).<br><br>In the RXVECTOR, LAST_RSSI indicates the value of the LAST_RSSI field from the (#14)header of the received PPDU. Valid values are integers in the range 0 to 15:<br>— Values of 2 to 14 represent power levels (–71+value×2) dBm.<br>— A value of 15 represents power greater than or equal to –42 dBm.<br>— A value of 1 represents power less than or equal to –68 dBm.<br>— A value of 0 indicates that the previous (#14)PPDU was not received a SIFS before the current transmission. | Y | Y |

**Table 20-1—TXVECTOR and RXVECTOR parameters *(continued)***

| Parameter | Value | TXVECTOR | RXVECTOR |
|---|---|---|---|
| TURNAROUND | Set to 1 or 0 as specified in 10.3.2.3.3 (SIFS). | Y | Y |
| PSK_APPLIED | Indicates if π/2-8-PSK is applied for MCS 10 or MCS 11. π/2-8-PSK cannot be applied for MCS other than 10 or 11.<br>Enumerated Type:<br>PSK_APPLIED: indicates that π/2-8-PSK is applied.<br>PSK_NOT_APPLIED: indicates that π/2-8-PSK is not applied. | Y | Y |
| (11ay)SCRAM-BLER_RESET | Indicates that the scrambler should be reset before the start of the PPDU.<br><br>Enumerated Type:<br>RESET_SCRAMBLER: The scrambler should be reset.<br>NO_SCRAMBLER_RESET: The scrambler should not be reset. | Y | N |
| NOTE— "Y" if dot11TimingMsmtActivated is true, otherwise "N". | | | |

### 20.2.3 PHYCONFIG_VECTOR parameters

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a DMG PHY contains an OPERATING_CHANNEL parameter, which identifies the operating 2.16 GHz channel. The PHY shall set the channel number to 1, 2, 3, 4, 5, 6, 7, or 8 using the value of OPERATING_CHANNEL parameter, which shall be set to 1, 3, 5, 7, 9, 11, 13, or 15 as defined in 20.3.1 (Channelization). (#4384)Additional PHYCONFIG_VECTOR parameters are defined in Table 8-4 (Vector descriptions(#4383)).

### 20.2.4 TXSTATUS parameters

The parameters listed in Table 20-2 (TXSTATUS parameters) are defined as part of the TXSTATUS parameter list in the PHY-TXSTART.confirm primitive.

**Table 20-2—TXSTATUS parameters**

| Parameter | Value |
|---|---|
| TIME_OF_DEPARTURE | When the first (#14)PPDU energy is sent by the transmitting port, in units equal to 1/TIME_OF_DEPARTURE_ClockRate.<br>This parameter is present only if TIME_OF_DEPARTURE_REQUESTED is true in the corresponding request. |
| TIME_OF_DEPARTURE_ClockRate | 0 to $2^{16}$–1. The clock rate, in units of MHz, is used to generate the TIME_OF_DEPARTURE value. This parameter is present only if TIME_OF_DEPARTURE_REQUESTED is true in the corresponding request. |
| TX_START_OF_FRAME_OFFSET | 0 to $2^{32}$–1. An estimate of the offset (in 10 ns(#7198) units) from the point in time at which the start of the preamble (#14)of the PPDU was transmitted at the transmit antenna connector to the point in time at which this primitive is issued to the MAC. |

## 20.3 Common parameters

### 20.3.1 Channelization

The DMG PHY operates in the channels defined in Annex E and shall support channel number 2 and may support the other channels.

The channel center frequency is defined as:

Channel center frequency = Channel starting frequency + Channel spacing × Channel number

where the channel starting frequency is equal to 56.16 GHz, and the channel spacing is defined in Annex E.

The OPERATING_CHANNEL parameter of PHYCONFIG_VECTOR is used to set up the operating channel number. The OPERATING_CHANNEL shall be set to 1, 3, 5, 7, 9, 11, 13, or 15. The relation between the channel number and OPERATING_CHANNEL is defined as follows:

*Channel number = ½ × (OPERATING_CHANNEL + 1)*

### 20.3.2 Transmit mask

The transmitted spectrum shall adhere to the transmit spectrum mask shown in (#6291)Figure 20-1 (Transmit mask). The transmit spectrum shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth not exceeding 1.88 GHz, –17 dBr at a 1.2 GHz offset, –22 dBr at a 2.7 GHz offset and –30 dBr at a 3.06 GHz offset and above, inside the channels allowed for the regulatory domain in which the device is transmitting. The measurement shall be made using a 1 MHz resolution bandwidth and a 300 kHz video bandwidth.

The transmit mask shall be measured on PPDUs longer than 10 μs without training fields.

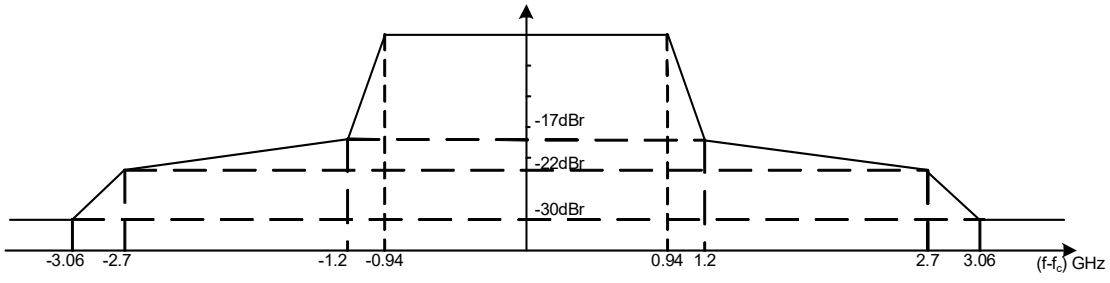

**Figure 20-1—Transmit mask**

### 20.3.3 Common requirements

#### 20.3.3.1 Introduction

This subclause describes the common requirement from all three DMG modes: control, SC, and low-power SC.

In all of the modes, all defined fields are transmitted bit 0 first in time.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

#### 20.3.3.2 Center frequency tolerance

##### 20.3.3.2.1 General

The transmitter center frequency tolerance shall be ± 20 ppm.

##### 20.3.3.2.2 Center frequency convergence

The transmitter center frequency shall converge to within 1 ppm of its final value within 0.9 μs from the start of the (#14)PPDU.

#### 20.3.3.3 Symbol clock tolerance

The symbol clock frequency tolerance shall be ± 20 ppm.

The transmit center frequency and the symbol clock frequency shall be derived from the same reference oscillator.

#### 20.3.3.4 Transmit center frequency leakage

The transmitter center frequency leakage shall not exceed –23 dB relative to the overall transmitted power.

#### 20.3.3.5 Transmit rampup and rampdown

The transmit power-on ramp is defined as the time it takes for a transmitter to rise from less than 10% to greater than 90% of the average power to be transmitted in the (#14)PPDU.

The transmit power-on ramp shall be less than 10 ns.

The transmit power-down ramp is defined as the time it takes the transmitter to fall from greater than 90% to less than 10% of the maximum power to be transmitted in the (#14)PPDU.

The transmit power-down ramp shall be less than 10 ns.

#### 20.3.3.6 Antenna setting

Antenna setting shall remain constant for the transmission of the entire (#14)PPDU except for the case of transmission of BRP-TX PPDUs (see 20.9.2.2 (Beam refinement)). During the transmission of BRP-TX PPDUs, it shall remain constant for the transmission of the STF, CE field, and Data field.

#### 20.3.3.7 Maximum input requirement

The receiver maximum input level is the maximum power level at the receive antenna(s) of the incoming signal, in dBm, present at the input of the receiver antenna for which the error rate criterion (defined in 20.3.3.8 (Receive minimum input level sensitivity(#256))) is met. A receiver shall have a receiver maximum input level at the receive antenna(s) of at least 10 $\mu W/cm^2$ for each of the modulation formats that the receiver supports.

#### 20.3.3.8 Receive minimum input level sensitivity(#256)

For MCS 0, the PER shall be less than 5% for a PSDU length of 256 octets with the MCS dependent input levels listed in Table 20-3 (Receiver minimum input level sensitivity) defined at the antenna connector. For

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

the other MCSs, the PER shall be less than 1% for a PSDU length of 4096 octets with the MCS dependent input levels listed in Table 20-3 (Receiver minimum input level sensitivity) defined at the antenna connector.

NOTE—For RF power measurements performed over the air, the input level shall be corrected to compensate for the antenna gain in the implementation. The gain of the antenna is the maximum estimated gain by the manufacturer. In the case of the phased-array antenna, the gain of the phased-array antenna is the maximum sum of estimated element gain minus 3 dB implementation loss.(#4045)

**Table 20-3—Receiver minimum input level sensitivity**

| MCS | Receive sensitivity (dBm) |
|---|---|

### 20.3.4 Timing-related parameters

Table 20-4 (Timing-related parameters) defines timing-related parameters.

**Table 20-4—Timing-related parameters**

| Parameter | Value |
|---|---|
| $N_{GI}$ | aSCGILength<br>NOTE—aSCGILength is defined in Table 20-30 (DMG PHY characteristics) |
| $N_{SPB}$ | 448 |
| $F_c$: chip rate | 1760 MHz |
| $T_c$: chip time | $1 / F_c$ (~0.57 ns) |
| $T_{seq}$ | $128 \times T_c$ (~72.7 ns) |
| $T_{STF}$: Detection sequence duration | $17 \times T_{seq}$ (~1236 ns) |
| $T_{CE}$: Channel Estimation sequence duration | $9 \times T_{seq}$ (~655 ns) |
| $T_{HEADER}$: header duration | $2 \times$ aSCBlockSize $\times T_c$ (~0.582 μs)<br>NOTE—aSCGIBlockSize is defined in Table 20-30 (DMG PHY characteristics) |
| $T_{STF\text{-}CM}$: control mode short training field duration | $50 \times T_{seq}$ (~3.636 μs) |
| $T_{CE\text{-}CM}$: control mode channel estimation field duration | $T_{CE}$ (~655 ns) |
| $T_{Data}$ | ($N_{BLKS} \times$ aSCBlockSize + aSCGILength) $\times T_c$<br>NOTE—$N_{BLKS}$ is defined in 20.5.3.2.3.3 (LDPC encoding process) and aSCBlockSize and aSCGILength are defined in Table 20-30 (DMG PHY characteristics). |

Table 20-5 (Frequently used parameters) defines parameters used frequently in Clause 20 (Directional multi-gigabit (DMG) PHY specification).

**Table 20-5—Frequently used parameters**

| Symbol | Explanation |
|---|---|
| $N_{CBPS}$ | Number of coded bits per symbol |
| $N_{DBPS}$ | Number of data bits per symbol |
| $R$ | Code rate |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 20.3.5 Mathematical conventions in the signal description

#### 20.3.5.1 General

The transmitted signal is described in complex baseband signal notation. The actual transmitted signal is related to the complex baseband signal $r(t)$ by the following relation:

$$r_{RF}(t) = \mathrm{Re}\{r(t)\exp(j2\pi f_c t)\}$$

where

$f_C$ is the center frequency of the carrier

The transmitted RF signal is generated by modulating the complex baseband signal, which consists of several fields. The fields and the timing boundaries for the various fields are shown in Figure 20-2 (PPDU structure).

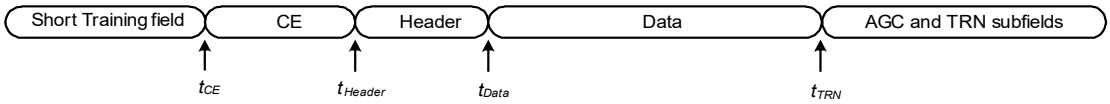

**Figure 20-2—PPDU structure**

The time offset, $t_{Field}$, determines the starting time of the corresponding field.

$$r_{PPDU}(t) = r_{STF}(t) + r_{CE}(t - t_{CE}) + r_{Header}(t - t_{Header}) + r_{Data}(t - t_{Data}) + r_{TRN}(t - t_{TRN})$$

where

$$t_{CE} = T_{STF}$$
$$t_{Header} = t_{CE} + T_{CE}$$
$$t_{Data} = t_{Header} + T_{Header}$$
$$t_{TRN} = t_{Data} + T_{Data}$$

The base band waveform for fields defined by time domain sequences or for single carrier transmission is

$$r_{Field}(nT_C) = x(n)$$

where

$x(n)$ is the constellation point $n$

Conversion from the sampled digital domain to the continuous time domain is beyond the scope of this document. Filtering for pulse shaping such as in GMSK is beyond the scope of this standard.

### 20.3.6 Common preamble

#### 20.3.6.1 General

The preamble is the part of the PPDU that is used for (#14)PPDU detection, AGC, frequency offset estimation, synchronization, and channel estimation. The format of the preamble consists of a Short

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Training field followed by a Channel Estimation field. Figure 20-3 (SC preamble) illustrates the SC (#14)PPDU preamble.

**Figure 20-3—SC preamble**

All numeric fields are transmitted in unsigned format, LSB first.

### 20.3.6.2 Short Training field

The Short Training field is composed of 16 repetitions of sequences $Ga_{128}(n)$ of length 128 defined in 20.10 (Golay sequences), followed by a single repetition of $-Ga_{128}(n)$.

The waveform for the Short Training field is

$$r_{STF}(nT_c) = \begin{cases} (Ga_{128}(n \bmod 128))\exp\left(j\pi\frac{n}{2}\right) & n = 0, 1, \ldots, 16 \times 128 - 1 \\ (-Ga_{128}(n \bmod 128))\exp\left(j\pi\frac{n}{2}\right) & n = 16 \times 128, \ldots, 17 \times 128 - 1 \end{cases}$$

where
*mod* is the modulus operation

### 20.3.6.3 Channel Estimation field

The Channel Estimation field is used for channel estimation, as well as indication of which modulation is going to be used for the (#14)PPDU. The Channel Estimation field is composed of a concatenation of two sequences $Gu_{512}(n)$ and $Gv_{512}(n)$, where the last 128 samples of $Gu_{512}(n)$ and $Gv_{512}(n)$ are equal to the last 128 samples used in the Short Training field. They are followed by a 128 samples sequence $Gv_{128}(n)$ equal to the first 128 samples of both $Gv_{512}(n)$ and $Gu_{512}(n)$.

The $Gu_{512}$ and $Gv_{512}$ sequences are defined as

$$G_{u_{512}} = \left[-Gb_{128} \quad -Ga_{128} \quad Gb_{128} \quad -Ga_{128}\right]$$

$$G_{v_{512}} = \left[-Gb_{128} \quad Ga_{128} \quad -Gb_{128} \quad -Ga_{128}\right]$$

where
$Ga_{128}$ and $Gb_{128}$ are as defined in 20.10 (Golay sequences)

When the (#404)Data field of the (#14)PPDU is modulated using single carrier, the $Gu_{512}$ and $Gv_{512}$ fields are concatenated in the order shown in Figure 20-4 (Channel Estimation field for SC PPDUs).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

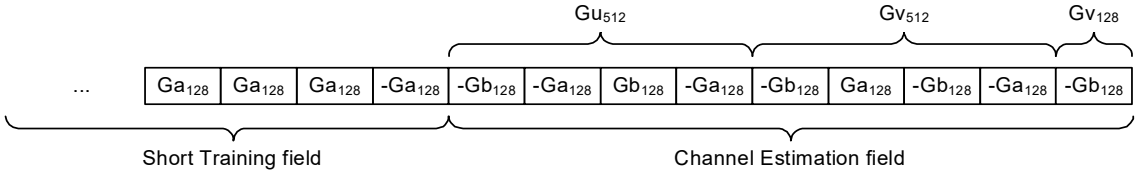

**Figure 20-4—Channel Estimation field for SC PPDUs**

The waveform for the channel estimation sequence is

$$r_{CE_{SC}}(nT_c) = (Gu_{512}(n) + Gv_{512}(n-512) + Gv_{128}(n-1024))\exp\left(j\pi\frac{n}{2}\right),\ n = 0, 1, \ldots, 1151$$

Note that sequences $Gu_{512}(n)$ and $Gv_{512}(n)$ are defined for $0 \le n \le 511$. For other values of $n$, $Gu_{512}(n)$ and $Gv_{512}(n)$ are set to 0.

### 20.3.7 HCS calculation for headers of DMG control mode and DMG SC mode

The header check sequence (HCS) is a CRC of the header bits. The header is considered to be a stream of bits $B_0, \ldots, B_{M-1}$. The CRC is based on CRC 16-CCITT. The value of the CRC field is the 1s complement of

$$CRC(D) = (M(D) \oplus I(D))D^{16} \bmod G(D)$$

where

$M(D) = B_0D^{M-1} + B_1D^{M-2} + \ldots + B_{M-1}$ is the header bits represented as polynomial (over the binary field) where $B_0$ is bit 0 of the header and $B_{M-1}$ is bit $M-1$ of the header

$I(D) = \sum_{k=M-16}^{M-1} D^k$ is an initialization polynomial added to the first 16 bits of the header (setting the shift register bits to 1)

$G(D) = D^{16} + D^{12} + D^5 + 1$ is the CRC generating polynomial

$CRC(D) = x_0D^{15} + x_1D^{14} + \ldots x_{14}D + x_{15}$

The CRC field is transmitted with $x_{15}$ first.

For a block diagram and an example of how to calculate the CRC, see 15.3.3.7 (PHY CRC field).

### 20.3.8 Common LDPC parity matrices

#### 20.3.8.1 General

Four low-density parity check (LDPC) codes are specified, each of a different rate but with a common codeword size of 672 bits.

Each of the parity-check matrices ***H*** is partitioned into square submatrices of size $Z \times Z$. The submatrices are either cyclic-permutations of the identity matrix, or null submatrices with all zero entries.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

(#577)A location with integer *i* denotes the cyclic-permutation submatrix $P_i$ obtained from the *Z x Z* identity matrix by cyclically shifting the columns to the right by *i* elements. The matrix $P_o$ is the *Z x Z* identity matrix. An empty location denotes a null submatrix of size *Z x Z*.

(#577)Examples with $Z = 4$:

$$P_0 = \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} \quad P_1 = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ 1 & 0 & 0 & 0 \end{bmatrix} \quad P_3 = \begin{bmatrix} 0 & 0 & 0 & 1 \\ 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \end{bmatrix}$$

### 20.3.9 Scrambler

(#404)(#6409)The Header field and Data field following the scrambler initialization field (including data padding bits) shall be scrambled by XORing each bit in turn with a length 127 periodic sequence generated by the polynomial $S(x) = x^7 + x^4 + 1$. The PHY header bits, with the exception of the first seven bits for SC and the first five bits for control mode, are placed one after the other, bit 7 first (bit 5 first for DMG control mode). The octets of the PSDU and the pad bits shall be placed into a bit stream with bit 0 (LSB) of each octet first and bit 7 of each octet (MSB) last. The generation of the sequence and the XOR operation are defined in Figure 20-5 (Data scrambler).

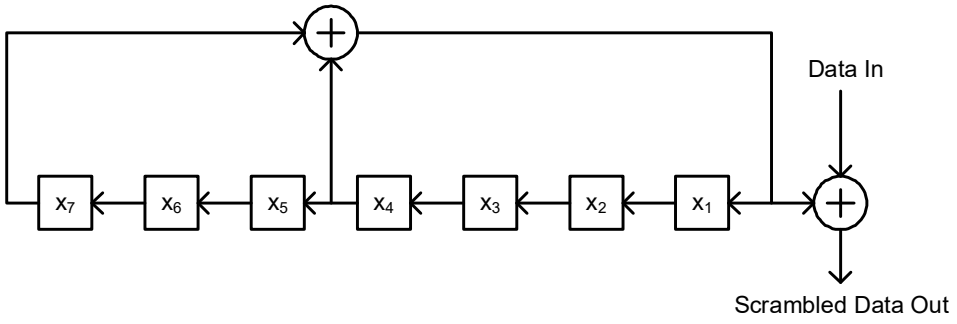

**Figure 20-5—Data scrambler**

For each PPDU, the transmitter shall select a nonzero seed value for the scrambler (bits $x_1$ to $x_7$). The seed value should be selected in a pseudorandom fashion. (11ay)If the SCRAMBLER_RESET parameter

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

is(M118) equal to RESET_SCRAMBLER, the seed value should be set to a nonzero random value not based on the scrambler value at the end of the last transmitted PPDU, before changes required to indicate MCSs in the set {9.1, 12.1, 12.2, 12.3, 12.4, 12.5, 12.6} are applied. The seed value is sent in the Scrambler Initialization field of the PHY header. Each data bit in the (#404)Data field of the PPDU is then XORed with the scrambler output ($x_4 \oplus x_7$) and then the scrambler content is shifted once.

### 20.3.10 Received channel power indicator (RCPI) measurement

The RCPI is a measure of the received RF power in the selected channel for a received (#14)PPDU. This parameter shall be a (#1132)measurement by the PHY of the received RF power in the channel measured over the preamble of the received (#14)PPDU.

(#2011)RCPI shall equal the received RF power in dBm with an accuracy of ± 5 dB with 95% confidence interval within the specified dynamic range of the receiver. The relative error between RF power measurements made within a (#1153)one second interval should be less than ± 1 dB.

## 20.4 DMG control mode

### 20.4.1 Introduction

Transmission and reception of control mode PPDUs is mandatory. DMG control mode uses the same chip rate as the DMG SC mode. DMG control mode is transmitted when the TXVECTOR indicates MCS 0.

The modulation and coding scheme for the DMG control mode is shown in Table 20-10 (DMG control mode modulation and coding scheme).

**Table 20-10—DMG control mode modulation and coding scheme**

| MCS index | Modulation | Code rate | Data rate |
|---|---|---|---|
| 0 | DBPSK | 1/2[a] | 27.5 Mb/s[a] |

[a] Code rate and data rate might be lower due to codeword shortening.

### 20.4.2 PPDU format

(#1916)The DMG control mode PPDU is shown in Figure 20-6 (DMG control mode PPDU format).

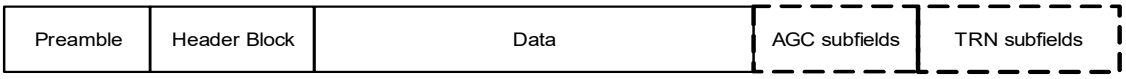

**Figure 20-6—DMG control mode PPDU format**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 20.4.3 Transmission

#### 20.4.3.1 Preamble

##### 20.4.3.1.1 General

The preamble is the part of the DMG control mode PPDU that is used for (#14)PPDU detection, AGC, frequency offset estimation, synchronization, indication of PPDU type and channel estimation.

The preamble is composed of two parts as shown in Figure 20-7 (DMG control mode preamble): the Short Training field and the Channel Estimation field.

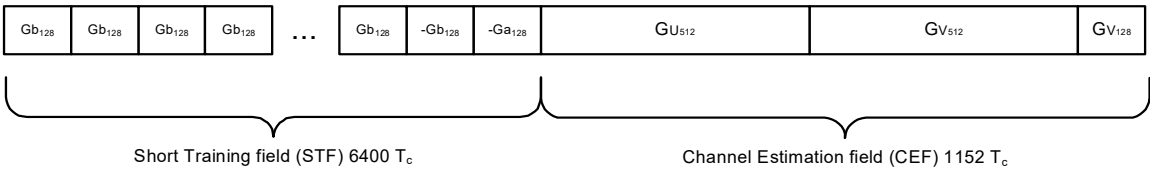

**Figure 20-7—DMG control mode preamble**

##### 20.4.3.1.2 Short Training field

The Short Training field is composed of 48 repetitions of the sequence $Gb_{128}(n)$ of length 128, followed by a single –Gb128(n) sequence (for synchronization) and then a single –Ga128(n) sequence. The sequences $Ga_{128}(n)$ and $Gb_{128}(n)$ are defined in 20.10 (Golay sequences).

The waveform for the Short Training field is

$$r_{STF}(nT_c) = \begin{cases} Gb_{128}(n \bmod 128)\exp\left(j\pi\frac{n}{2}\right) & n = 0, 1, \ldots, 48 \times 128 - 1 \\ -Gb_{128}(n \bmod 128)\exp\left(j\pi\frac{n}{2}\right) & n = 48 \times 128, \ldots, 49 \times 128 - 1 \\ -Ga_{128}(n \bmod 128)\exp\left(j\pi\frac{n}{2}\right) & n = 49 \times 128, \ldots, 50 \times 128 - 1 \end{cases}$$

where mod is the modulus operation. Note that sequences $Ga_{128}(n)$ and $Gb_{128}(n)$ are defined for $0 \le n \le 127$. For other $n$ they are set to 0.

##### 20.4.3.1.3 Channel Estimation field

The Channel Estimation field is the same as the Channel Estimation field of the DMG SC mode, as defined in Figure 20-4 (Channel Estimation field for SC PPDUs) of 20.3.6.3 (Channel Estimation field).

#### 20.4.3.2 Header

##### 20.4.3.2.1 General

In the DMG control mode, the preamble is followed by the header block. The header consists of several fields that define the details of the PPDU to be transmitted.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The header fields are described in Table 20-11 (DMG control mode header fields).

**Table 20-11—DMG control mode header fields**

| Field name | Bit | Description |
|---|---|---|
| Differential Encoder Initialization | B0 | Used to initialize the differential encoding *c(0)* in 20.4.3.3.4 (Modulation). May be set to any value. |
| Scrambler Initialization | B1–B4 | Bits X1–X4 of the initial scrambler state (see 20.4.3.3.2 (Scrambler)). |
| Length | B5–B14 | Number of data octets in the PSDU.<br>Range 14–1023. |
| PPDU Type | B15 | As defined in Table 20-13 (DMG SC mode header fields). |
| Training Length | B16–B20 | Length of the training field. The use of this field is defined in 20.9.2.2.3 (BRP PPDU Header field(#6409)). |
| Turnaround | B21 | Contains a copy of the parameter TURNAROUND from the TXVECTOR. |
| Reserved bits | B22–B23 | |
| HCS | B24–B39 | Header check sequence. Calculation of the header check sequence is defined in 20.3.7 (HCS calculation for headers of DMG control mode and DMG SC mode). |

Reserved bits are set to 0 by the transmitter and shall be ignored by the receiver.

#### 20.4.3.2.2 Generation of HCS bits

The header check sequence (HCS) is calculated over bits 0-23 and uses CRC 16-CCITT as described in 20.3.7 (HCS calculation for headers of DMG control mode and DMG SC mode).

#### 20.4.3.2.3 Header encoding and modulation

The header bits followed by the HCS bits are prepended to the (#404)Data field bits and passed into the (#14)Data field encoder per 20.4.3.3 (Data field). The minimal payload length is 14 octets.

### 20.4.3.3 Data field

#### 20.4.3.3.1 General

The Data field consists of the payload data of the PSDU. The PSDU is scrambled, encoded, modulated and spread as described in the following subclauses.

#### 20.4.3.3.2 Scrambler

The operation of the scrambler is defined in 20.3.9 (Scrambler). Bits x1, x2, x3, x4 of the scrambler shift register are initialized using the bits in the scrambler initialization bits from the header, bits x5, x6, x7 are set to 1. The header is scrambled starting from bit 5. The scrambling of the (#404)Data field continues the scrambling of the header with no reset.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

#### 20.4.3.3.3 Encoder

The DMG control mode header and data is encoded using an effective LDPC code rate less than or equal to 1/2, generated from the data PHY rate 3/4 LDPC parity check matrix, with shortening. The following steps are used for the encoding:

1) $L_{CWD} = 168$ is the maximal number of data bits in each LDPC codeword. $L_{HDR}$=5 is the length of the header (including HCS) in octets. $L_{FDCW}$=6 is the length of the additional data in the first LDPC codeword in octets.

2) The total (header and additional data) number of bits in the first LDPC codeword is $L_{DPFCW} = (L_{HDR} + L_{FDCW}) \times 8 = 88$.

3) The number of LDPC codewords is $N_{CW} = 1 + \left\lceil \frac{(Length - 6) \times 8}{L_{CWD}} \right\rceil$.

4) The number of bits in the second and any subsequent LDPC codeword (if present), except the last, is $L_{DPCW} = \left\lceil \frac{(Length - 6) \times 8}{N_{CW} - 1} \right\rceil$.

5) The number of bits in the last LDPC codeword is $L_{DPLCW} = (Length - 6) \times 8 - (N_{CW} - 2) \times L_{DPCW}$.

NOTE—For example, if $Length = 128$, then $N_{CW} = 1 + \left\lceil \frac{(128 - 6) \times 8}{L_{CWD}} \right\rceil = 7$, $L_{DPCW} = 163$, and $L_{DPLCW} = 161$. In the first LDPC block, the 88 bits of $L_{DPFCW}$ consist of 40 header+HCS bits along with 48 bits of the data.

#### 20.4.3.3.4 Modulation

The scrambled and coded bit stream $c(k)$, $k = 0, 1, 2, ...$, is converted into a stream of complex constellation points $d(k)$ using differential binary phase shift keying (DBPSK) as follows.

$c(k)$ is converted to the nondifferential stream $s(k) = 2c(k) - 1$. This is converted to the differential stream $d(k) = s(k) \times d(k-1)$, where $d(-1)$ is defined to be 1. $c(0)$ is the Differential Encoder Initialization field of the DMG control mode header.

NOTE—The scrambling process does not affect the Differential Encoder Initialization field of the DMG control mode header.

#### 20.4.3.3.5 Spreading

The constellation points are spread using the sequence $Ga_{32}(n)$, which is defined in 20.10 (Golay sequences).

The waveform for the modulated and spread (#404)Data field is

$$r_{DATA}(nT_c) = \left(Ga_{32}(n \bmod 32) \cdot d\left(\left\lfloor \frac{n}{32} \right\rfloor\right)\right) \exp\left(j\pi \frac{n}{2}\right), n = 0, 1, 2, \ldots$$

where $d(k)$ is the modulated constellation point $k$.

This is an unapproved IEEE Standards Draft, subject to change.

### 20.4.4 Performance requirements

#### 20.4.4.1 Transmit requirements

##### 20.4.4.1.1 Introduction

Transmitter performance requirements of the DMG control mode are defined in 20.4.4.1.2 (Transmit EVM).

##### 20.4.4.1.2 Transmit EVM

The transmit EVM accuracy test shall be performed by instrumentation capable of converting the transmitted signal into a stream of complex samples, with sufficient accuracy in terms of I/Q arm amplitude and phase balance, dc offsets, phase noise, etc. The instrumentation shall perform carrier lock, symbol timing recovery, and amplitude adjustment while making the measurements. The instrumentation shall incorporate a rake receiver or equalizer to minimize error resulting from multipath. If used, the equalizer shall be trained using information in the preamble (STF and/or CEF). For the DMG control mode EVM, the signal is first despread using $Ga_{32}$. The EVM is then calculated on the resulting symbols according to the formula below:(#315)(#2264)

$$EVM = 20\log 10\left(\sqrt{\left(\frac{1}{N_s P_{avg}}\sum_{i=1}^{N_s}[(I_i - I_i^* - I_0)^2 + (Q_i - Q_i^* - Q_0)^2]\right)}\right)$$

where

$N_S$ is the number of symbols to be measured

$N_S$ should be greater than 511

$P_{avg}$ is the average power of the constellation

$(I_i,Q_i)$ is the complex coordinates of the measured symbol $i$

$(I_i^*,Q_i^*)$ is the complex coordinates of the ideal constellation point for the measured symbol $i$

$(I_0,Q_0)$ is the complex DC term chosen to minimize EVM

The test equipment should use a root-raised cosine filter with roll-off factor of 0.25 for the pulse shaping filter when conducting EVM measurement.

The transmit pulse shaping used is left to the implementer.

The EVM shall not exceed a data-rate dependent value according to Table 20-12 (DMG control mode EVM requirements).

**Table 20-12—DMG control mode EVM requirements**

| MCS index | Description | EVM value [dB] |
|---|---|---|
| 0 | DMG control mode modulation | –6 |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

#### 20.4.4.2 Receive requirements

##### 20.4.4.2.1 Introduction

Subclause 20.4.4.2 (Receive requirements) describes the performance requirement from the DMG control mode receiver.

##### 20.4.4.2.2 CCA sensitivity

The start of a DMG control mode transmission at a receive level greater than –68 dBm shall cause CCA to indicate busy with a probability > 90% within 3 μs.

## 20.5 DMG SC mode

### 20.5.1 Introduction

Transmission and reception of DMG SC mode PPDUs is mandatory for selected MCSs.

### 20.5.2 PPDU format

(#3626)An(#1424) SC (#14)PPDU is shown in Figure 20-8 (SC PPDU format(#14)).

**Figure 20-8—SC PPDU format(#14)**

### 20.5.3 Transmission

#### 20.5.3.1 Header

##### 20.5.3.1.1 General

In the DMG SC mode, the preamble is followed by the header. The header consists of several fields that define the details of the PPDU to be transmitted. The encoding and modulation of the header is described in 20.5.3.1.4 (Header encoding and modulation).

The header fields are described in Table 20-13 (DMG SC mode header fields).

**Table 20-13—DMG SC mode header fields**

| Field name | Bit | Description |
|---|---|---|
| Scrambler Initialization | B0–B6 | Bits X1–X7 of the initial scrambler state (see 20.3.9 (Scrambler)). |
| Base MCS | B7–B11 | Modulation and Coding Scheme (see Table 20-15 (DMG SC mode modulation and coding schemes)) |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 20-13—DMG SC mode header fields *(continued)***

| Field name | Bit | Description |
|---|---|---|
| Length | B12–B29 | If the Extended SC MCS Indication field is 0, indicates the number of data octets in the PSDU; range 1–262 143.<br>If the Extended SC MCS Indication field is 1, the Length field value is set to $Base\_Length1 - \lfloor (Base\_Length2 - N)/4 \rfloor$, where $N$ is the number of data octets in the PSDU in the range 1 to 262 143, and *Base_Length1* and *Base_Length2* are computed according to Table 20-14 (Parameters for computing Length field value in SC header when Extended SC MCS Indication field is(M118) 1). |
| Additional PPDU | B30 | Contains a copy of the parameter ADD_PPDU from the TXVECTOR. A value of 1 indicates that this PPDU is immediately followed by another PPDU with no IFS or preamble on the subsequent PPDU. A value of 0 indicates that no additional PPDU follows this PPDU. |
| PPDU Type | B31 | Corresponds to the TXVECTOR parameter PPDU_TYPE.<br>— PPDU Type = 0 (BRP-RX PPDU, see 20.9.2.2.3 (BRP PPDU Header field(#6409))), indicates either a PPDU whose Data field is followed by one or more TRN subfields (when the Beam Tracking Request field is 0 or in DMG control mode), or a PPDU that contains a request for TRN subfields to be appended to a future response PPDU (when the Beam Tracking Request field is 1).<br>— PPDU Type = 1 (BRP-TX PPDU, see 20.9.2.2.3 (BRP PPDU Header field(#6409))), indicates a PPDU whose Data field is followed by one or more TRN subfields. The transmitter may change AWV at the beginning of each TRN subfield.<br>The field is reserved when the Training Length field is 0. |
| Training Length | B32–B36 | Corresponds to the TXVECTOR parameter TRN_LEN.<br>If the Beam Tracking Request field is 0, the Training Length field indicates the length of the training field. The use of this field is defined in 20.9.2.2.3 (BRP PPDU Header field(#6409)). A value of 0 indicates that no training field is present in this PPDU.<br>If the Beam Tracking Request field is 1 and the PPDU Type field is 1, the Training Length field indicates the length of the training field appended to this PPDU. If the PPDU Type field is 0, the Training Length field indicates the length of the training field requested for receive training. |
| Aggregation | B37 | Set to 1 to indicate that the (#14)PSDU contains an A-MPDU; otherwise, set to 0. |
| Beam Tracking Request | B38 | Corresponds to the TXVECTOR parameter BEAM_TRACKING_REQUEST.<br>Set to 1 to indicate the need for beam tracking (10.41.7 (Beam tracking)); otherwise, set to 0.<br>The Beam Tracking Request field is reserved when the Training Length field is 0. |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 20-13—DMG SC mode header fields *(continued)***

| Field name | Bit | Description |
|---|---|---|
| Last RSSI | B39–B42 | Contains a copy of the parameter LAST_RSSI from the TXVECTOR. The value is an unsigned integer:<br>Values 2 to 14 represent power levels (–71+value×2) dBm.<br>A value of 15 represents a power greater than or equal to –42 dBm.<br>A value of 1 represents a power less than or equal to –68 dBm.<br>A value of 0 indicates that the previous (#14)PPDU was not received a SIFS before the current transmission. |
| Turnaround | B43 | Contains a copy of the parameter TURNAROUND from the TXVECTOR. |
| Extended SC MCS Indication | B44 | The Extended SC MCS Indication field combined with the Base MCS field indicates the MCS.<br>The Extended SC MCS Indication field indicates whether the Length field shall be calculated according to Table 20-14 (Parameters for computing Length field value in SC header when Extended SC MCS Indication field is(M118) 1). |
| π/2-8-PSK Applied | B45 | Corresponds to TXVECTOR parameter PSK_APPLIED. If this field is(M118) 1, π/2-8-PSK with corresponding LDPC shortening code with rates 2/3 or 5/6 is applied at the transmitter for MCS 10 or 11, respectively. If set to 0, π/2-16-QAM with LDPC code with rates 1/2 or 5/8 is applied at the transmitter for MCS 10 or 11, respectively. |
| Reserved | B46–B47 | |
| HCS | B48–B63 | Header check sequence |

Reserved bits are set to 0 by the transmitter and shall be ignored by the receiver.

If the Additional PPDU field is equal to 1, the Training Length field shall be set to 0.

When the MCS belongs to the set {9.1, 12.1, 12.2, 12.3, 12.4, 12.5, 12.6}, bits X6, X7 of the initial scrambler state are set so that X6+X7×2 = (*Base_Length2* – *N*) mod 4, where *N* is the number of data octets in the PSDU, and *Base_Length2* is computed according to Table 20-14 (Parameters for computing Length field value in SC header when Extended SC MCS Indication field is(M118) 1). Bits X1–X5 are selected in a pseudorandom fashion making sure that at least one bit in X1–X7 is nonzero.

NOTE—The combination of the values of the X6 and X7 in the Scrambler Initialization field and the Length field is unique for different PSDU lengths, i.e., there is a one-to-one mapping between a combination (X6, X7, Length) and a PSDU length, so the receiver can recover the actual PSDU length from the header fields. See 20.5.3.1.5 (Length recovery for extended SC MCSs at receiver) for an example algorithm for the length recovery.

X1–X7 are sent in the Scrambler Initialization field, as defined in 20.5.3.1.4 (Header encoding and modulation) and 20.5.3.2.2 (Scrambler).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 20-14—Parameters for computing Length field value in SC header when Extended SC MCS Indication field is(M118) 1**

| MCS | *Base_Length1* (See NOTEs 1 and 2) | *Base_Length2* (See NOTEs 1 and 3) |
|---|---|---|
| 9.1 | $\left\lfloor \frac{N_{BLKS} \times 4}{3} \right\rfloor \times 42$ | $\left\lfloor \left\lfloor \frac{N_{BLKS} \times 56}{39} \right\rfloor \times 68.25 \right\rfloor$ |
| 12.1 | $\left\lfloor \left\lfloor \frac{N_{BLKS} \times 4}{3} \right\rfloor \times 52.5 \right\rfloor$ | $\left\lfloor \left\lfloor \frac{N_{BLKS} \times 8}{3} \right\rfloor \times 68.25 \right\rfloor$ |
| 12.2 | $\left\lfloor \frac{N_{BLKS} \times 4}{3} \right\rfloor \times 63$ | $\left\lfloor \left\lfloor \frac{N_{BLKS} \times 112}{39} \right\rfloor \times 68.25 \right\rfloor$ |
| 12.3 | $\left\lfloor \left\lfloor \frac{N_{BLKS} \times 4}{3} \right\rfloor \times 68.25 \right\rfloor$ | $N_{BLKS} \times 210$ |
| 12.4 | $\left\lfloor \frac{N_{BLKS} \times 8}{3} \right\rfloor \times 42$ | $N_{BLKS} \times 252$ |
| 12.5 | $\left\lfloor \left\lfloor \frac{N_{BLKS} \times 8}{3} \right\rfloor \times 52.5 \right\rfloor$ | $N_{BLKS} \times 273$ |
| 12.6 | $\left\lfloor \frac{N_{BLKS} \times 8}{3} \right\rfloor \times 63$ | $\left\lfloor \left\lfloor \frac{N_{BLKS} \times 56}{13} \right\rfloor \times 68.25 \right\rfloor$ |

NOTE 1—$N_{BLKS}$ is the number of symbol blocks defined in 20.5.3.2.3.3 (LDPC encoding process).

NOTE 2—*Base_Length1* is the maximum Length value such that the (#14)PPDU with the base MCS specified in SC header has the given $N_{BLKS}$.

NOTE 3—*Base_Length2* is the maximum number of data octets in PSDU such that the (#14)PPDU with the extended MCS has the given $N_{BLKS}$.

### 20.5.3.1.2 Modulation and coding scheme

The modulation and coding scheme defines the modulation and code rate that is used in the PPDU. The modulation and coding schemes for SC are defined in Table 20-15 (DMG SC mode modulation and coding schemes) and Table 20-16 (DMG SC mode modulation and coding schemes when π/2-8-PSK Applied field is 1). PPDUs that have the π/2-8-PSK Applied field set to 0 in Table 20-13 (DMG SC mode header fields) follow Table 20-15 (DMG SC mode modulation and coding schemes). PPDUs that have the π/2-8-PSK Applied field set to 1 in Table 20-13 (DMG SC mode header fields) follow Table 20-15 (DMG SC mode modulation and coding schemes), except that MCS 10 and MCS 11 in this table shall be replaced by those in Table 20-16 (DMG SC mode modulation and coding schemes when π/2-8-PSK Applied field is 1).

NOTE—The LDPC code with rate 2/3 is generated by employing the LDPC code with rate 3/4 and applying the codeword shortening procedure to achieve the effective code rate. The LDPC code with rate 5/6 is generated by employing the LDPC code with rate 13/16 and applying the codeword shortening and puncturing procedure. See 20.5.3.2.3.3 (LDPC encoding process).

Transmit and receive support for MCS 4 and below is mandatory. Other MCSs are optional. For STAs that support MCS 10, the support for π/2-16-QAM for MCS 10 is mandatory and the support for π/2-8-PSK (#4037)for MCS 10 is optional. For STAs that support MCS 11, the support for (#4038)π/2-16-QAM for MCS 11 is mandatory and the support for π/2-8-PSK for MCS 11 is optional.

#### 20.5.3.1.3 Generation of the HCS bits

Calculation of the HCS for bits 0–47 of the header is defined in 20.3.7 (HCS calculation for headers of DMG control mode and DMG SC mode).

#### 20.5.3.1.4 Header encoding and modulation

The header is encoded using a two SC block of $N_{SPB}$ symbols with $N_{GI}$ guard symbols. The bits are scrambled and encoded as follows:

1) The input header bits ($B_1$, $B_2$, …, $B_{LH}$), where LH = 64, are scrambled as described in 20.3.9 (Scrambler), starting from the eighth bit. to create $\mathbf{d_{1s}}=(q_1,q_2,\ldots,q_{LH})$
2) The LDPC codeword $\mathbf{c} = (q_1,q_2,\ldots,q_{LH},0_1,0_2,\ldots,0_{504\text{-}LH},p_1,p_2,\ldots,p_{168})$ is created by concatenating 504-LH 0s(M118) to the LH bits of $\mathbf{d_{1s}}$ and then generating the parity bits $p_1,p_2,\ldots,p_{168}$ such that $\mathbf{Hc}^T = \mathbf{0}$, where **H** is the parity check matrix for the rate 3/4 LDPC code specified in 20.5.3.2.3.2 (Parity check matrices).
3) Remove bits LH+1 to 504 and bits 665 to 672 of the codeword **c** to create the sequence $\mathbf{cs1}=(q_1,q_2,\ldots,q_{LH},p_1,p_2,\ldots,p_{160})$.
4) Remove bits LH+1 to 504 and bits 657 to 664 of the codeword **c** to create the sequence **cs2** = $(q_1,q_2,\ldots,q_{LH},p_1,p_2,\ldots,p_{152},p_{161},p_{162},\ldots,p_{168})$ and then XOR with a PN sequence that is generated from the LFSR used for data scramblings defined in 20.3.9 (Scrambler). The LFSR is initialized to the all 1s vector.
5) **cs1** and **cs2** are concatenated to form the sequence (**cs1**, **cs2**). The resulting 448 bits are then mapped as $\pi/2$-BPSK as described in 20.5.3.2.4.2 (π/2-BPSK modulation). The $N_{GI}$ guard symbols are then prepended to the resulting $N_{CBPB}$ symbols as described in 20.5.3.2.5 (Symbol blocking and guard insertion).

The same resulting $N_{CBPB}$ symbols are multiplied by –1 and repeated, and then prepended with $N_{GI}$ guard symbols as described in 20.5.3.2.5 (Symbol blocking and guard insertion). The resulting sequence is then appended after the sequence created in step 5).

#### 20.5.3.1.5 Length recovery for extended SC MCSs at receiver

This subclause describes an example steps to calculate the PSDU length *N* at the receiver when the Extended SC MCS Indication field of the received PPDU is set to 1.

1) Compute $N_{BLKS}$ using the values of the Base MCS and Length fields in the PHY header as if the Extended SC MCS Indication field is set to 0.
2) Compute *Base_Length1* and *Base_Length2* using $N_{BLKS}$ computed in step 1) as defined in Table 20-14 (Parameters for computing Length field value in SC header when Extended SC MCS Indication field is(M118) 1)
3) Compute the PSDU length *N* using the following equation:

$$N = Base\_Length2 - (4 \cdot (Base\_Length1 - Length) + (X6 + 2 \cdot X7))$$

where

*Length* is the value of the Length field in the PHY header

*X6* and *X7* are the 6th and 7th bits of the Scrambler Initialization field in the PHY header

NOTE—The equation is derived by the following equations a) to c).

a) The equation that defines the Length field value in the PHY header (see Table 20-13 (DMG SC mode header fields)),

$$Length = Base\_Length1 - \lfloor (Base\_Length2 - N)/4 \rfloor$$

where

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$N$ is the PSDU length.

b) The equation that defines the two MSBs of the Scrambler Initialization field, X6 and X7 (see 20.5.3.1.1 (General)),

$$X6 + 2 \cdot X7 = (Base\_Length2 - N) \bmod 4$$

c) The equations a) and b) mean that ($Base\_Length1 - Length$) and ($X6 + 2 \cdot X7$) are respectively the quotient and remainder of dividing ($Base\_Length2 - N$) by 4. Thus, the following equation is obtained,

$$Base\_Length2 - N = 4 \cdot (Base\_Length1 - Length) + (X6 + 2 \cdot X7)$$

and the equation in step 3) of this subclause is obtained after applying simple rearrangement.

Table 20-17 (Examples of length recovery) shows several examples of length recovery.

**Table 20-17—Examples of length recovery**

| PHY header values | | | Recovered values at receiver | | | | |
|---|---|---|---|---|---|---|---|
| Base MCS | Length (Octets) | X6, X7 of Scramble Initialization | MCS | $N_{BLKS}$ | Base_Length1 (Octets) | Base_Length2 (Octets) | PSDU Length, $N$ (Octets) |
| 6 | 150 | 1, 0 | 9.1 | 3 | 168 | 273 | 200 |
| 7 | 95 | 1, 0 | 12.1 | 2 | 105 | 341 | 300 |
| 8 | 464 | 0, 0 | 12.2 | 6 | 504 | 1160 | 1000 |
| 9 | 403 | 0, 1 | 12.3 | 5 | 409 | 1050 | 1024 |
| 10 | 838 | 0, 1 | 12.4 | 8 | 840 | 2016 | 2006 |
| 11 | 1323 | 0, 1 | 12.5 | 10 | 1365 | 2730 | 2560 |
| 12 | 1713 | 1, 1 | 12.6 | 11 | 1764 | 3207 | 3000 |

### 20.5.3.2 Data field

#### 20.5.3.2.1 General

The (#404)Data field consists of the payload data of the PSDU and possible padding. The data are padded with 0s(M118), scrambled, encoded and modulated as described in the following subclauses. The amount of padding is defined in 20.5.3.2.3 (Encoding).

#### 20.5.3.2.2 Scrambler

The operation of the scrambler is defined in 20.3.9 (Scrambler). The scrambling of the PSDU continues the scrambling of the header with no reset of the scrambler.

#### 20.5.3.2.3 Encoding

##### 20.5.3.2.3.1 General

The data are encoded by a systematic LDPC encoder. The LDPC is a block code. Each block of information bits $(B_1, B_2, ..., B_k)$ is concatenated with a block of parity bits $(p_1, p_2, ..., p_{n-k})$(#515) to create a codeword $\boldsymbol{c}=(B_1, B_2, ..., B_k, p_1, p_2, ..., p_{n-k})$(#515) such that $\mathbf{Hc}^{\mathbf{T}}=\mathbf{0}$, where $\mathbf{H}$ is the $(n-k)\times n$ parity check matrix. The block size $n$ is 672 bits. The code rate, R, is equal to $k/n$. The set of code rates is defined in Table 20-18

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

(LDPC code rates). The parity check matrices are defined in 20.5.3.2.3.2 (Parity check matrices). The encoding process is defined in 20.5.3.2.3.3 (LDPC encoding process).

**Table 20-18—LDPC code rates**

| Code rate | Codeword size | Number of data bits |
|---|---|---|
| 1/2 | 672 | 336 |
| 5/8 | 672 | 420 |
| 2/3 | 504 | 336 |
| 3/4 | 672 | 504 |
| 13/16 | 672 | 546 |
| 5/6 | 468 | 390 |
| 7/8 | 624 | 546 |

#### 20.5.3.2.3.2 Parity check matrices

See 20.3.8 (Common LDPC parity matrices).

#### 20.5.3.2.3.3 LDPC encoding process

The LDPC encoding process is composed of several steps that includes deciding the number of shortening/ repetition bits in every codeword, the shortening itself, the coding of each word and then any repetition of bits.

a) First the total number of data pad bits $N_{DATA\_PAD}$ is calculated, using the number of LDPC codewords $N_{CW}$(#14):

$$N_{CW} = \left\lceil \frac{Length \cdot 8}{\frac{L_{CW}}{\rho} \cdot R} \right\rceil$$

if BRP PPDU and $N_{CW} < N_{CWmin}$; $N_{CW} = N_{CWmin}$

$$N_{DATA\_PAD} = N_{CW} \cdot \frac{L_{CW}}{\rho} \cdot R - Length \cdot 8$$

where

$L_{CW}$ is the LDPC codeword length , which is 624 for code rate R=7/8, 504 for code rate R=2/3, 468 for code rate R=5/6, or 672 for all other code rates

$Length$ is the length of the PSDU indicated by the TXVECTOR parameter LENGTH (in octets)

$\rho$ is the repetition factor (1 or 2)

$R$ is the code rate

$N_{CWmin}$ is defined for BRP PPDUs in Table 20-22 (Zero filling for DMG SC mode BRP PPDUs).

The scrambled PSDU is concatenated with $N_{DATA\_PAD}$ 0s(M118). They are scrambled using the continuation of the scrambler sequence that scrambled the PSDU input bits.

b) The procedure for converting the scrambled PSDU data to LDPC codewords depends on the repetition factor.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

1) If ρ = 1 and the code rate is not one of 2/3, 5/6, 7/8,
   i) The output stream of the scrambler is broken into blocks of $L_{CWD} = L_{CW} \times R$ bits such that the $m^{\text{th}}$ data word is $(b_1^{(m)}, b_2^{(m)}, \ldots b_{L_{CWD}}^{(m)})$, $m \le N_{CW}$.
   ii) To each data word, $n\text{-}k = L_{CW} - R \times L_{CW}$ parity bits $(p_1^{(m)}, p_2^{(m)}, \ldots, p_{n-k}^{(m)})$ are added to create the codeword $\mathrm{c}^{(m)} = (b_1^{(m)}, b_2^{(m)}, \ldots, b_{L_{CWD}}^{(m)}, p_1^{(m)}, \ldots p_{n-k}^{(m)})$ such that $\mathbf{H}\boldsymbol{c}^{(m)^{\mathrm{T}}} = 0$
2) If ρ = 1 and the code rate is 7/8, 48 bits are punctured from the parity bits of the rate 13/16 parity bits:
   i) The output stream of the scrambler is broken into blocks of 546 bits such that the $m^{\text{th}}$ data word is $(b_1^{(m)}, b_2^{(m)}, \ldots, b_{546}^{(m)})$, $m \le N_{CW}$.
   ii) To each data word, 126 parity bits $(p_1^{(m)}, p_2^{(m)}, \ldots, p_{126}^{(m)})$ are added to create the code word $\tilde{\boldsymbol{c}}^{(m)} = (b_1^{(m)}, b_2^{(m)}, \ldots, b_{546}^{(m)}, p_1^{(m)}, \ldots p_{126}^{(m)})$ such that $\boldsymbol{H}\tilde{\boldsymbol{c}}^{(m)^{\mathrm{T}}} = \mathbf{0}$. The code word $\boldsymbol{c}^{(m)}$ is generated from $\tilde{\boldsymbol{c}}^{(m)}$ by removing the first 48 parity bits so that $\boldsymbol{c}^{(m)} = (b_1^{(m)}, b_2^{(m)}, \ldots, b_{546}^{(m)}, p_{49}^{(m)}, p_{50}^{(m)}, \ldots p_{126}^{(m)})$
3) If ρ = 1 and the code rate is 2/3,
   i) The output stream of the scrambler is broken into blocks of $L_{CWD} = 336$ bits such that (#3245)the $m^{\text{th}}$ data word is $(b_1^{(m)}, b_2^{(m)}, \ldots b_{L_{CWD}}^{(m)})$, $m \le N_{CW}$.
   ii) To each data word, 168 zero bits $\mathbf{0}^{(m)} = (0_1, 0_2, \ldots 0_{168})$ and parity bits $\mathbf{p}^{(m)} = (p_1, p_2, \ldots p_{168})$ are added to create the codeword $\mathbf{c}^{(m)} = (\mathbf{b}^{(m)}, \mathbf{0}^{(m)}, \mathbf{p}^{(m)})$ such that $\boldsymbol{H}\boldsymbol{c}^{(m)^{\mathrm{T}}} = \mathbf{0}$, applying the rate 3/4 LDPC code matrix.
   iii) Finally, the zero bits are discarded to create the output codeword $\boldsymbol{c}^{(m)} = (b_1^{(m)}, b_2^{(m)}, \ldots, b_{LWD}^{(m)}, p_1^{(m)}, \ldots p_{n-k}^{(m)})$.
4) If ρ = 1 and the code rate is 5/6,
   i) The output stream of the scrambler is broken into blocks of $L_{CWD} = 390$ bits such that (#3245)the $m^{\text{th}}$ data word is $(b_1^{(m)}, b_2^{(m)}, \ldots b_{L_{CWD}}^{(m)})$, $m \le N_{CW}$.
   ii) To each data word, 156 zero bits $\mathbf{0}^{(m)} = (0_1, 0_2, \ldots 0_{156})$ and parity bits parity bits $\mathbf{p}^{(m)} = (p_1, p_2, \ldots p_{126})$ are added to create the codeword $\tilde{\boldsymbol{c}}^{(m)} = (\mathbf{b}^{(m)}, \mathbf{0}^{(m)}, \mathbf{p}^{(m)})$ such that $\boldsymbol{H}\tilde{\boldsymbol{c}}^{(m)^{\mathrm{T}}} = \mathbf{0}$, applying the rate 13/16 LDPC code matrix.
   iii) Finally, the zero bits are discarded to create the output codeword $\boldsymbol{c}^{(m)} = (b_1^{(m)}, b_2^{(m)}, \ldots, b_{390}^{(m)}, p_{49}^{(m)}, \ldots p_{126}^{(m)})$.
5) If ρ = 2,
   i) The data bits in each codeword $(b_1, b_2, \ldots, b_{L_Z})$ where $L_Z = L_{CW}/2\rho$ are concatenated with $L_{CW}/2\rho$ 0s(M118) to produce a sequence of length of $2L_Z$ $(b_1, b_2, \ldots, b_{L_Z}, 0_1, 0_2, \ldots, 0_{L_Z})$.
   ii) The LDPC codeword $\mathbf{c} = (b_1, b_2, \ldots, b_{L_Z}, 0_1, 0_2, \ldots, 0_{L_Z}, p_1, p_2, \ldots, p_{336})$ is created by generating the parity bits $p_1, p_2, \ldots, p_{336}$ such that $\mathbf{H}\mathbf{c}^{\boldsymbol{T}} = \mathbf{0}$, where $\mathbf{H}$ is the parity matrix for rate 1/2 LDPC coding specified in 20.3.8 (Common LDPC parity matrices).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

iii) Replace bits $L_Z + 1$ to 336 of the codeword **c** with bits from the sequence $b_1, b_2, \ldots, b_{L_Z}$ XORed by a PN sequence that is generated from the LFSR used for data scrambling as defined in 20.3.9 (Scrambler). The LFSR is initialized to the all 1s vector and reinitialized to the same vector after every codeword.

c) The codewords are then concatenated one after the other to create the coded bits stream $(c_1, c_2, \ldots, c_{L_{CW} \cdot N_{CW}})$.

d) The number of symbol blocks, $N_{BLKS}$, and the number of symbol block padding bits, $N_{BLK\_PAD}$, are calculated:

$$N_{BLKS} = \left\lceil \frac{N_{CW} \cdot L_{CW}}{N_{CBPB}} \right\rceil$$

$$N_{BLK\_PAD} = N_{BLKS} \cdot N_{CBPB} - N_{CW} \cdot L_{CW}$$

where $N_{CBPB}$ is the number of coded bits per symbol block, per Table 20-19 (Values of NCBPB) in 20.5.3.2.5 (Symbol blocking and guard insertion).

e) The coded bit stream is concatenated with $N_{BLK\_PAD}$ 0s(M118). They are scrambled using the continuation of the scrambler sequence that scrambled the PSDU input bits.

#### 20.5.3.2.4 Modulation mapping

##### 20.5.3.2.4.1 General

The coded and padded bit stream is converted into a stream of complex constellation points according to the modulation specified in the MCS table.

##### 20.5.3.2.4.2 π/2-BPSK modulation

In π/2-BPSK modulation, the input bit stream is mapped according to the following equation: $\tilde{s}_k = 2 \cdot c_k - 1$, where $c_k$ is the $k^{th}$ input coded (or scrambled pad) bit. Each output symbol is then rotated according to the following equation: $s_k = \tilde{s}_k \cdot e^{j\pi k/2}$. The constellation bit encoding for BPSK is shown in Figure 20-9 (BPSK constellation bit encoding).

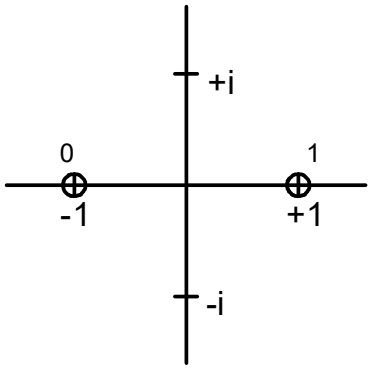

**Figure 20-9—BPSK constellation bit encoding**

NOTE—With appropriate choice of transmit filtering, π/2-BPSK is equivalent to a precoded pulse-shaped MSK (e.g., GMSK). The precoder is simply $b_{out,k} = b_{in,k} \oplus b_{in,k-1}, k = 0, 1, \ldots$, where $b_{in,k}$ is the scrambled input stream, $b_{in,-1}$ is 0, $b_{out,k}$ is the input to the (G)MSK modulator.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

#### 20.5.3.2.4.3 π/2-QPSK modulation

In π/2-QPSK modulation, the input bit stream is grouped into sets of 2 bits and mapped according to the following equation: $\tilde{s}_k = \frac{1}{\sqrt{2}}((2c_{2k}-1)+j(2c_{2k+1}-1))\exp\left(-j\frac{\pi}{4}\right)$, where k is the output symbol index, k = 0, 1, …. Each output symbol is then rotated according to the following equation: $s_k = \tilde{s}_k \cdot e^{j\pi k/2}$. The constellation bit encoding for QPSK is shown in Figure 20-10 (QPSK constellation bit encoding).

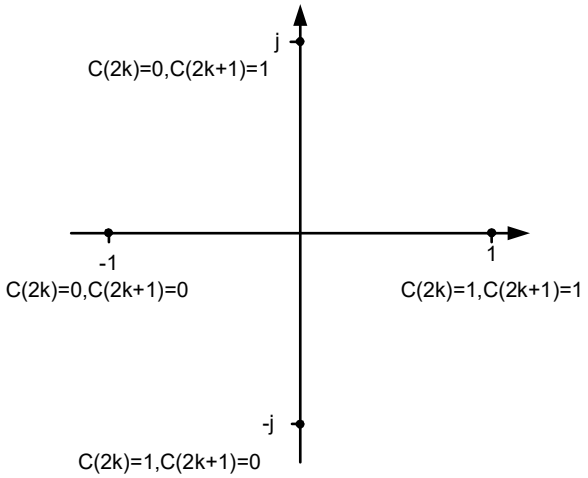

**Figure 20-10—QPSK constellation bit encoding**

#### 20.5.3.2.4.4 π/2-8-PSK modulation

A DMG STA shall only apply π/2-8-PSK modulation to a PPDU transmitted to a peer STA if the π/2-8-PSK Supported field in the peer STA's DMG Capabilities element is equal to 1.

In π/2-8-PSK modulation, the input stream is grouped into sets of 3 bits and mapped according to the following equation:

$$\tilde{s}_k = \exp\left(j\frac{\pi}{4}(c_{3k}-3c_{3k+1}-c_{3k+2}-2c_{3k}c_{3k+1}+2c_{3k+1}c_{3k+2}+2c_{3k}c_{3k+2}+4c_{3k}c_{3k+1}c_{3k+2}+4)\right)$$

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

where $k$ is the symbol output index, $k$ = 0, 1, …. Each output symbol is then rotated according to the following equation: $s_k = \tilde{s}_k \cdot e^{j\pi k/2}$. The constellation bit encoding for 8-PSK before π/2 rotation is in Figure 20-11 (8-PSK constellation bit encoding (before π/2 rotation)).

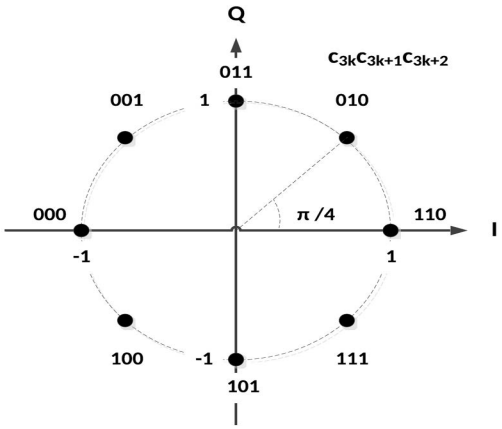

**Figure 20-11—8-PSK constellation bit encoding (before π/2 rotation)**

### 20.5.3.2.4.5 π/2-16-QAM modulation

In π/2-16-QAM modulation, the input bit stream is grouped into sets of 4 bits and mapped according to the following equation:

$$\tilde{s}_k = \frac{1}{\sqrt{10}}\{(4c_{4k}-2)-(2c_{4k}-1)(2c_{4k+1}-1)+j(4c_{4k+2}-2)-j(2c_{4k+2}-1)(2c_{4k+3}-1)\}$$

where k is the output symbol index, k =0, 1, …. Each output symbol is then rotated according to the following equation: $s_k = \tilde{s}_k \cdot e^{j\cdot\pi\cdot k/2}$. The constellation bit encoding for 16-QAM is shown in Figure 20-12 (16-QAM constellation bit encoding).

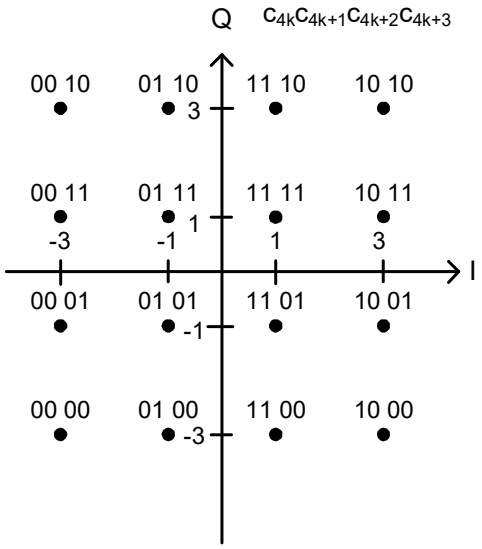

**Figure 20-12—16-QAM constellation bit encoding**

#### 20.5.3.2.4.6 π/2-64-QAM modulation

In π/2-64-QAM modulation, the input bit stream is grouped in sets of 6 bits and mapped according to the following equation:

$$\tilde{s}_k =$$

$$\frac{1}{\sqrt{42}}((8c_{6k}-4)-(2c_{6k}-1)(4c_{6k+1}-2)+(2c_{6k}-1)(2c_{6k+1}-1)(2c_{6k+2}-1))+$$

$$\frac{j}{\sqrt{42}}((8c_{6k+3}-4)-(2c_{6k+3}-1)(4c_{6k+4}-2)+(2c_{6k+3}-1)(2c_{6k+4}-1)(2c_{6k+5}-1))$$

where k is the output symbol index, k=0,1, …. Each output symbol is then rotated according to the following equation $s_k = \tilde{s}_k \cdot e^{\frac{j\pi k}{2}}$. The constellation bit encoding for 64-QAM is shown in Figure 20-13 (64-QAM constellation bit encoding).

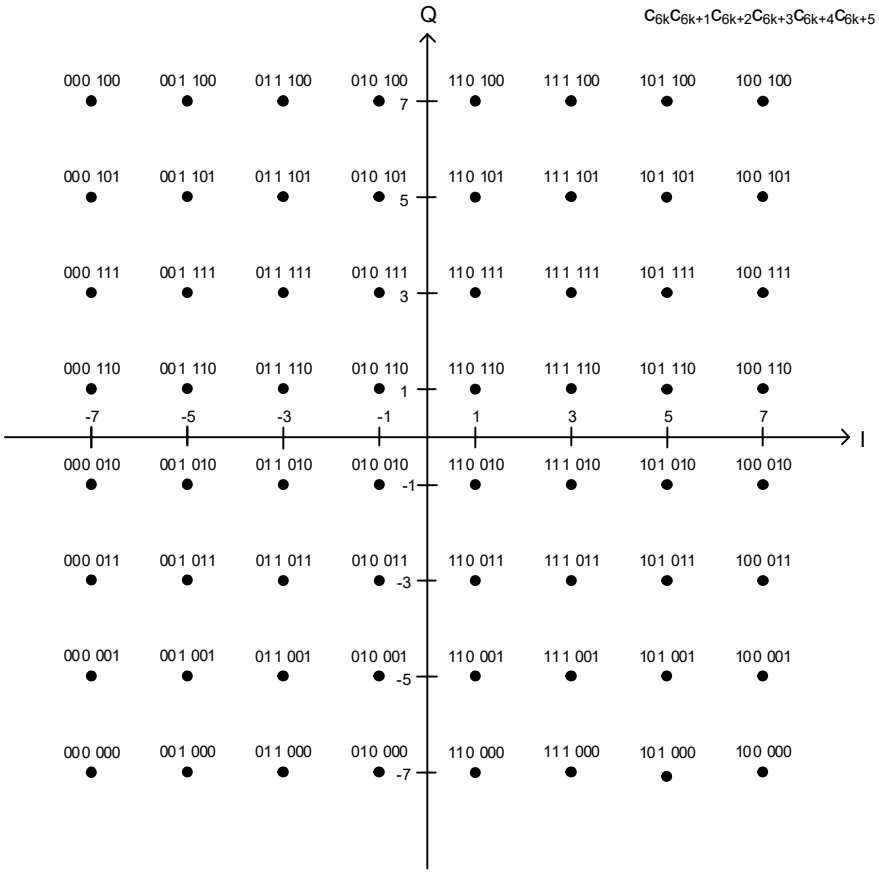

**Figure 20-13—64-QAM constellation bit encoding**

This is an unapproved IEEE Standards Draft, subject to change.

#### 20.5.3.2.5 Symbol blocking and guard insertion

Each group of $N_{CBPB}$ bits is prepended by π/2-BPSK symbols generated by the 64 point Golay sequence $Ga_{64}$ defined in 20.10 (Golay sequences). $N_{CBPB}$ values are shown in Table 20-19 (Values of NCBPB). The starting index for the first symbol for π/2 rotation is 0.

**Table 20-19—Values of $N_{CBPB}$**

| Symbol mapping | $N_{CBPB}$ |
|---|---|
| π/2-BPSK | 448 |
| π/2-QPSK | 896 |
| π/2-16-QAM | 1792 |
| π/2-64-QAM | 2688 |

If the Additional PPDU field within the PHY header is equal to 0, the final block transmitted is followed by the same Golay sequence guard interval. See Figure 20-14 (Block transmission). If the Additional PPDU field within the PHY header is equal to 1, the final block transmitted of the last PPDU in an A-PPDU is followed by the same Golay sequence guard interval.

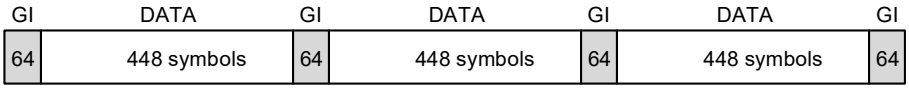

**Figure 20-14—Block transmission**

### 20.5.4 Performance requirements

#### 20.5.4.1 Transmit requirements

##### 20.5.4.1.1 Transmit EVM

The transmit EVM accuracy test shall be performed by instrumentation capable of converting the transmitted signal into a stream of complex samples, with sufficient accuracy in terms of I/Q arm amplitude and phase balance, dc offsets, phase noise, etc.

The instrumentation shall perform carrier lock, symbol timing recovery and amplitude adjustment and equalization while making the measurements. The equalizer shall be trained using information in the SC preamble (STF and/or CEF). For the DMG SC mode EVM, measuring Ns samples at the sample rate, the measured symbols should not contain the first and the last hundred symbols of a given (#14)PPDU (ramp up/down). The EVM is calculated according to the formula below:(#315)

$$EVM = 20\log 10\left(\sqrt{\left(\frac{1}{N_s P_{avg}}\sum_{i=1}^{N_s}[(I_i - I_i^* - I_0)^2 + (Q_i - Q_i^* - Q_0)^2]\right)}\right)$$

where $N_s$ is the number of samples to be measured and $N_s$ shall be 1000, $P_{avg}$ is the average power of the constellation, $(I_i, Q_i)$ is the complex coordinates of the measured symbol $i$, $(I_i^*, Q_i^*)$ is the complex coordinates of the ideal constellation point for the measured symbol $i$, and $(I_o, Q_o)$ is the complex DC term chosen to minimize EVM.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The test equipment should use a root-raised cosine filter with roll-off factor of 0.25 for the pulse shaping filter when conducting EVM measurement.

The transmit pulse shaping used is left to the implementer.

The relative constellation error (EVM) shall not exceed an MCS dependent value according to Table 20-20 (DMG SC mode EVM requirements).

**Table 20-20—DMG SC mode EVM requirements**

| MCS | Modulation | Coding rate | EVM value [dB] |
|---|---|---|---|
| 1 | π/2-BPSK | 1/2 with repetition | –6 |
| 2 | π/2-BPSK | 1/2 | –7 |
| 3 | π/2-BPSK | 5/8 | –9 |
| 4 | π/2-BPSK | 3/4 | –10 |
| 5 | π/2-BPSK | 13/16 | –12 |
| 6 | π/2-QPSK | 1/2 | –11 |
| 7 | π/2-QPSK | 5/8 | –12 |
| 8 | π/2-QPSK | 3/4 | –13 |
| 9 | π/2-QPSK | 13/16 | –15 |
| 9.1 | π/2-QPSK | 7/8 | –16 |
| 10 | π/2-16-QAM | 1/2 | –19 |
| 11 | π/2-16-QAM | 5/8 | –20 |
| 12 | π/2-16-QAM | 3/4 | –21 |
| 12.1 | π/2-16-QAM | 13/16 | –22 |
| 12.2 | π/2-16-QAM | 7/8 | –23 |
| 12.3 | π/2-64-QAM | 5/8 | –26 |
| 12.4 | π/2-64-QAM | 3/4 | –27 |
| 12.5 | π/2-64-QAM | 13/16 | –29 |
| 12.6 | π/2-64-QAM | 7/8 | –31 |

#### 20.5.4.1.2 Time of Departure accuracy

(#8050)The RMS accuracy of the time of departure provided in TIME_OF_DEPARTURE shall be less than or equal to 80 ns.

The Time of Departure accuracy test evaluates TIME_OF_DEPARTURE against aTxPHYTxStartRMS and aTxPHYTxStartRMS against TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH as defined in Annex P with the following test parameters:

— MULTICHANNEL_SAMPLING_RATE is $1760 \times 10^6$ sample/s

— FIRST_TRANSITION_FIELD is Short Training field

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

— SECOND_TRANSITION_FIELD is Channel Estimation field
— TRAINING_FIELD is Channel Estimation field
— TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH is 80 ns

NOTE—The indicated windowing applies to the time of departure accuracy test equipment, and not the transmitter or receiver.

#### 20.5.4.2 Receive requirements

##### 20.5.4.2.1 Introduction

This subclause describes the receiver requirements of the DMG SC mode.

##### 20.5.4.2.2 CCA sensitivity

The start of a DMG SC mode transmission at a receive level greater than the minimum sensitivity for MCS 1 (–68 dBm) shall cause CCA to indicate busy with a probability > 90% within 1 μs. The receiver shall hold the carrier sense signal busy for any signal 20 dB above the minimum sensitivity for MCS 1.

## 20.6 DMG low-power SC mode

### 20.6.1 Introduction

The DMG low-power SC mode is obsolete, and support for this mode might be subject to removal in a future revision of the standard.

The DMG low-power SC mode is an optional SC mode that can provide lower processing power requirements for DMG transceivers.

### 20.6.2 Transmission

#### 20.6.2.1 Preamble

The DMG low-power SC mode uses the same preamble as the DMG SC mode.

#### 20.6.2.2 Header

##### 20.6.2.2.1 General

The DMG low-power SC mode header fields are the same fields as in the DMG SC mode (see Table 20-13 (DMG SC mode header fields) in 20.5.3.1 (Header)).

The DMG low-power SC mode modulation and coding schemes are listed in Table 20-21 (DMG low-power SC mode modulation and coding schemes).

##### 20.6.2.2.2 Header encoding and modulation

The DMG low-power SC mode header is encoded and modulated as defined in 20.5.3.1.4 (Header encoding and modulation).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 20-21—DMG low-power SC mode modulation and coding schemes**

| MCS | Modulation | Effective code rate | Coding scheme | $N_{CPB}$ | Rate (Mb/s) |
|---|---|---|---|---|---|
| 25 | π/2-BPSK | 13/28 | RS(224,208)+Block-Code(16,8) | 392 | 626 |
| 26 | π/2-BPSK | 13/21 | RS(224,208)+Block-Code(12,8) | 392 | 834 |
| 27 | π/2-BPSK | 52/63 | RS(224,208)+SPC(9,8) | 392 | 1112 |
| 28 | π/2-QPSK | 13/28 | RS(224,208)+Block-Code(16,8) | 392 | 1251 |
| 29 | π/2-QPSK | 13/21 | RS(224,208)+Block-Code(12,8) | 392 | 1668 |
| 30 | π/2-QPSK | 52/63 | RS(224,208)+SPC(9,8) | 392 | 2224 |
| 31 | π/2-QPSK | 13/14 | RS(224,208)+Block-Code(8,8) | 392 | 2503 |

### 20.6.2.3 Data field

#### 20.6.2.3.1 General

The (#404)Data field consists of the payload data of the PSDU and possible padding. The data are padded with 0s(M118), scrambled, encoded and modulated as described in the following subclauses.

#### 20.6.2.3.2 Scrambler

The operation of the scrambler is defined in 20.3.9 (Scrambler). The scrambling of the PSDU continues the scrambling of the header with no reset of the scrambler. The padding bits are also scrambled.

#### 20.6.2.3.3 Encoding

##### 20.6.2.3.3.1 General

Data is encoded using an outer RS(224,208) block code and a short inner code. The inner code is a (16,8) block code for MCSs 25 and 28, a (12,8) block code for MCSs 26 and 29, and a (9,8) single parity check (SPC) block code for MCSs 27 and 30 and the identity block-code for MCS 31. The encoding is further detailed in the following steps:

1) First, the number of block padding bits is calculated:
   a) The total number of Reed Solomon codewords is $N_{RS} = \lceil (Length)/208 \rceil$ and the total number of RS encoded symbols is given by $Length + N_{RS} \times 16$;
   b) After Reed Solomon encoding, the data is encoded with a short block code ($N$,8) where $N$ can take one of the following values 8, 9, 12, or 16 depending on the MCS as shown in Table 20-21 (DMG low-power SC mode modulation and coding schemes). Therefore:
      i) The total number of encoded bits is $N_{EB} = N \times (Length + N_{RS} \times 16)$;
      ii) The total number of 512 (in length) blocks (each containing 392 data symbols) is $N_{BLKS} = \lceil N_{EB}/(N_{CBPS} \times 392) \rceil$. If BRP PPDU and $N_{BLKS} < N_{BLKS\_MIN}$; $N_{BLKS} = N_{BLKS\_MIN}$, where $N_{BLKS\_MIN} = 18$. The total number of zero block padding bits is $N_{BLK\_PAD} = N_{BLKS} \times N_{CBPS} \times 392 - N_{EB}$.
2) The data is broken into blocks of length 208×8 bits (except for possibly the last block).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

3) Each block is encoded using the RS(224,208) block code as described in 20.6.2.3.3.2 (RS encoding), except perhaps the last block, which is encoded by a shortened version of the code (i.e., if the last block length is K, the shortened block code is RS(16+K,K).
4) The Reed Solomon encoded (#2056)bit stream is further encoded using the block code(N,8) as described in 20.6.2.3.3.3 ((N,8) Block-coding).
5) The coded bit stream is concatenated with $N_{BLK\_PAD}$ 0s(M118). They are scrambled with the continuation of the scrambler sequence that scrambled the PSDU input bits.
6) Each set of 7 octets is interleaved using a uniform interleaver of 7 rows and 8 columns. The 7 octets are written row wise and read column wise, i.e., the index *i* of a bit after interleaving is related to the index *k* of a bit before interleaving by the following rule:

   $i = 8 \times (k \bmod 7) + \lfloor k/7 \rfloor$, $k = 0, 1, \ldots, 55$

7) The resulting bit stream is modulated and then blocked as described in 20.6.2.3.4 (Modulation) and 20.6.2.3.5 (Blocking).

#### 20.6.2.3.3.2 RS encoding

The RS block code is based on the polynomial

$$g(x) = \prod_{k=1}^{16} (x + a^k)$$

where $a = 0x02$ is a root of the primitive polynomial $p(x) = 1 + x^2 + x^3 + x^4 + x^8$. Assume that an octet $b_0 b_1 b_2 b_3 b_4 b_5 b_6 b_7$ ($b_0$ is the LSB) represented by the polynomial

$$M = b_7 x^7 + b_6 x^6 + b_5 x^5 + b_4 x^4 + b_3 x^3 + b_2 x^2 + b_1 x + b_0 .$$

The RS is a systematic block code. Given a block of octets $\mathbf{m} = (m_{M-1}, m_{M-2}, \ldots m_0)$, the additional parity octets $\mathbf{r} = (r_{15}, r_{14}, \ldots r_0)$ are calculated by setting $r = x^{16}\mathbf{m}(x) \bmod g(x)$, where $\mathbf{r}(x) = \sum_{k=0}^{15} r_k x^k$ and $\mathbf{m}(x) = \sum_{k=0}^{M-1} m_k x^k$ and where the calculation is performed over $GF(2^8)$. The parity octets $\mathbf{r}$ are appended to the uncoded block $\mathbf{m}$ to generate the encoded RS block $m_{M-1}, m_{M-2}, \ldots m_0, r_{15}, r_{14}, \ldots, r_0$.

#### 20.6.2.3.3.3 (N,8) Block-coding

Every octet $\mathbf{b}_{1\times 8} = [b_0 b_1 b_2 b_3 b_4 b_5 b_6 b_7]$ is encoded into an *N*-bit codeword $\mathbf{c}_{1\times N} = \left[ \mathbf{b}_{1\times 8} \; \mathbf{p}_{1\times(N-8)} \right]$ such that $\mathbf{c}_{1\times N} = \mathbf{b}_{1\times 8}\mathbf{G}_{8\times N}$, where the generator matrix $\mathbf{G}_{8\times N}$ is given by the following expressions for $N = 8, 9, 12,$ *and* 16, respectively: $G_{8x8}$ is the identity matrix.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$\mathbf{G}_{8\times 9} = \begin{bmatrix} 1&0&0&0&0&0&0&0&1 \\ 0&1&0&0&0&0&0&0&1 \\ 0&0&1&0&0&0&0&0&1 \\ 0&0&0&1&0&0&0&0&1 \\ 0&0&0&0&1&0&0&0&1 \\ 0&0&0&0&0&1&0&0&1 \\ 0&0&0&0&0&0&1&0&1 \\ 0&0&0&0&0&0&0&1&1 \end{bmatrix}$$

$$\mathbf{G}_{8\times 12} = \begin{bmatrix} 1&0&0&0&0&0&0&0&1&1&0&0 \\ 0&1&0&0&0&0&0&0&1&0&1&0 \\ 0&0&1&0&0&0&0&0&0&1&0&1 \\ 0&0&0&1&0&0&0&0&0&0&1&1 \\ 0&0&0&0&1&0&0&0&1&0&1&1 \\ 0&0&0&0&0&1&0&0&1&1&0&1 \\ 0&0&0&0&0&0&1&0&1&1&1&0 \\ 0&0&0&0&0&0&0&1&0&1&1&1 \end{bmatrix}$$

$$\mathbf{G}_{8\times 16} = \begin{bmatrix} 1&0&0&0&0&0&0&0&0&1&1&0&1&0&1&0 \\ 0&1&0&0&0&0&0&0&0&0&1&1&0&1&0&1 \\ 0&0&1&0&0&0&0&0&1&0&0&1&1&0&1&0 \\ 0&0&0&1&0&0&0&0&0&1&0&0&1&1&0&1 \\ 0&0&0&0&1&0&0&0&1&0&1&0&0&1&1&0 \\ 0&0&0&0&0&1&0&0&0&1&0&1&0&0&1&1 \\ 0&0&0&0&0&0&1&0&1&0&1&0&1&0&0&1 \\ 0&0&0&0&0&0&0&1&1&1&0&1&0&1&0&0 \end{bmatrix}$$

#### 20.6.2.3.4 Modulation

The same π/2-BPSK described in 20.5.3.2.4.2 (π/2-BPSK modulation) and π/2-QPSK described in 20.5.3.2.4.2 (π/2-BPSK modulation) are used in the DMG low-power SC mode.

#### 20.6.2.3.5 Blocking

The blocking for the low-power SC is illustrated in Figure 20-15 (Blocking for DMG low-power SC mode). The data is partitioned into blocks of length 512 wherein each 512-block is constructed from 8 subblocks. Each subblock is of length 64. The first subblock is a $G_{64}$, which is the π/2-BPSK symbols sequence generated by the 64 point Golay sequence $Ga_{64}$ defined in 20.10 (Golay sequences). The starting index for the first symbol π/2 rotation is 0, and subblocks 2 to 8 are constructed in the same way, i.e., a data portion of 56 symbols followed by a guard interval of 8 symbols. Note that each 512-block carries 392 symbols of data and 120 symbols of guard.

If the Additional PPDU field within the PHY header is equal to 0, the final block transmitted is followed by $Ga_{64}$. If the Additional PPDU field within the PHY header is equal to 1, the final block transmitted of the last PPDU in an A-PPDU is followed by $Ga_{64}$.

The $G_8$ guard interval is a copy of the last 8 samples of $Ga_{64}$.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

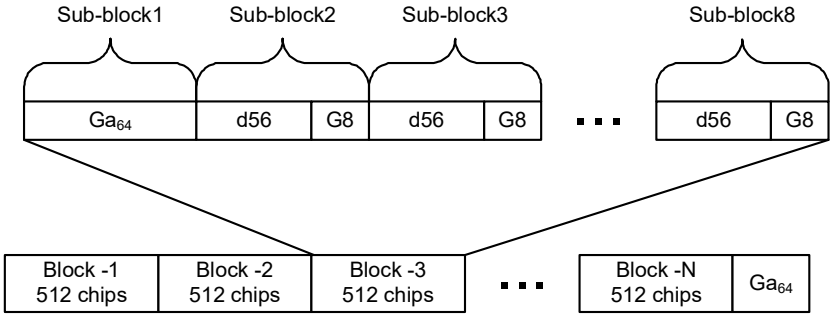

**Figure 20-15—Blocking for DMG low-power SC mode**

NOTE—A STA might estimate the channel impulse response from the CEF, and decides whether to equalize using the 512-block or the short 64-subblock. For example, if the channel impulse response energy is almost concentrated in 8 taps, a 64-equalizer can be used; otherwise, a 512-equalizer is used.

## 20.7 PHY transmit procedure

The PHY transmit procedure is shown in Figure 20-16 (PHY transmit procedure). In order to transmit data, a PHY-TXSTART.request primitive shall be enabled so that the PHY entity shall be in the transmit state. Further, the PHY shall be set to operate at the appropriate frequency through station management via the PLME, as specified in 20.11 (DMG PLME). Other transmit parameters, such as MCS and transmit power, are set via the PHY SAP with the PHY-TXSTART.request(TXVECTOR) primitive, as described in 20.2.2 (TXVECTOR and RXVECTOR parameters).

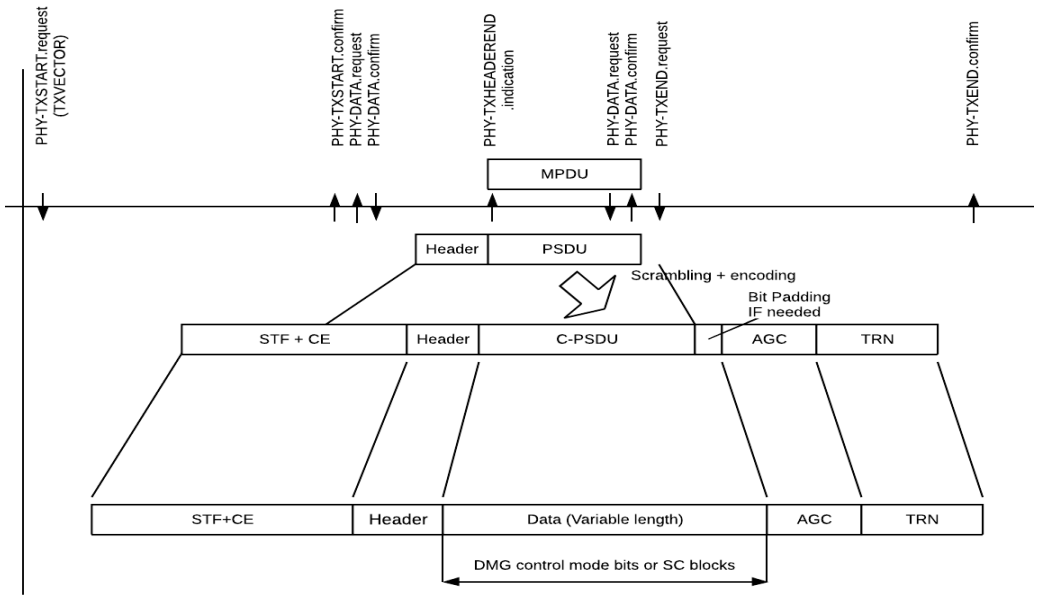

**Figure 20-16—PHY transmit procedure**

Transmission of the PHY preamble may start if TIME_OF_DEPARTURE_REQUESTED is false, and shall start immediately if TIME_OF_DEPARTURE_REQUESTED is true, based on the parameters passed in the PHY-TXSTART.request primitive.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The preamble format (control or SC mode) depend on the MCS in the PHY-TXSTART.request primitive. The PHY shall calculate the length of the (#14)PPDU according the MCS and the length specified in the PHY-TXSTART.request primitive, adding padding bits if necessary.

The PHY continues with the encoding and transmission of the header according to the parameters of the PHY-TXSTART.request(TXVECTOR) primitive. The PHY proceeds with PSDU transmission through a series of data octet transfers from the MAC. The data are encoded as described in 20.4.3.2.3 (Header encoding and modulation) and 20.5.3.2.3 (Encoding). The encoded data are then modulated as described in 20.4 (DMG control mode), 20.5 (DMG SC mode), and 20.6 (DMG low-power SC mode), depending on the MCS requested in the PHY-TXSTART.request primitive. Transmission can be prematurely terminated by the MAC through the PHY-TXEND.request primitive.

Transmission of the PSDU is completed with the transmission of the last bits of the (encoded) PSDU. If no TRN-T/R fields are specified in the PHY-TXSTART.request primitive, the PHY shall issue a PHY-TXEND.confirm primitive after the transmission of the last bits. If TRN units are requested in the PHY-TXSTART.request primitive, the transmission continues with the transmission of AGC subfields and TRN units. The PHY issues the PHY-TXEND.confirm primitive to the MAC after the transmission of the last TRN unit. The (#14)PPDU transmission shall be completed, and the PHY entity shall enter the receive state. Each PHY-TXEND.request primitive is acknowledged with a PHY-TXEND.confirm primitive from the PHY.

A typical transmit state machine is shown in Figure 20-17 (Typical Tx state machine (Training Length = 0 is assumed; some optional features such as DMG SC low-power mode are not shown)(#410)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

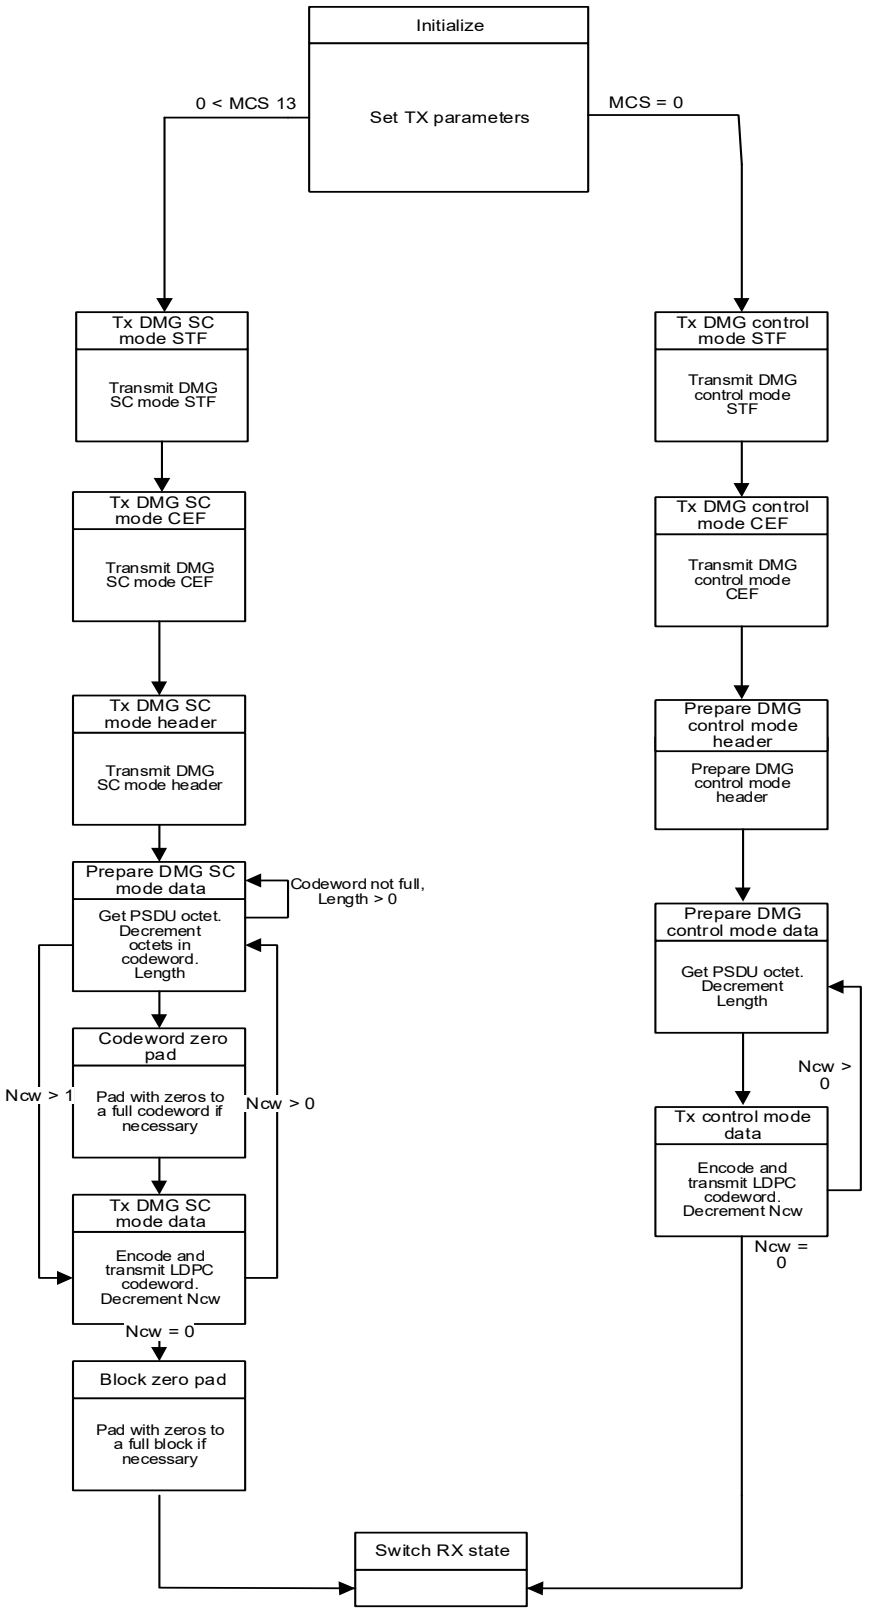

**Figure 20-17—Typical Tx state machine (Training Length = 0 is assumed; some optional features such as DMG SC low-power mode are not shown)(#410)**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

## 20.8 PHY receive procedure

A typical PHY receive procedure is shown in Figure 20-18 (PHY receive procedure(#1058)(#3480)).

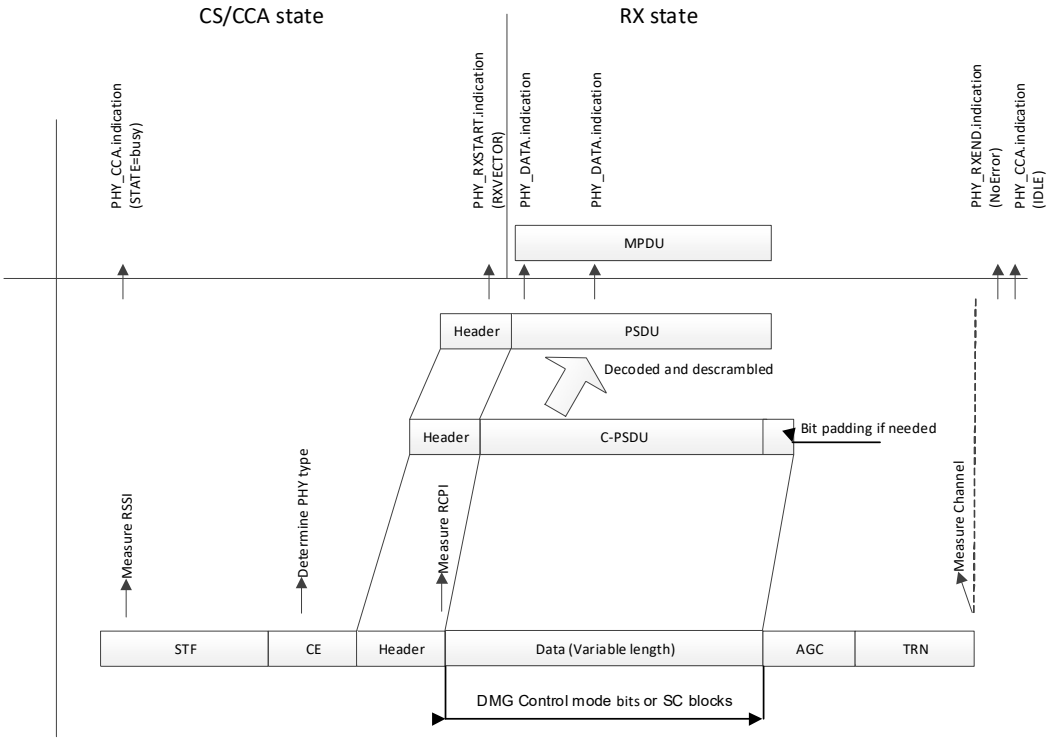

**Figure 20-18—PHY receive procedure(#1058)(#3480)**

Upon receiving the STF, the PHY measures signal strength. This activity is indicated by the PHY to the MAC by issuing a PHY-CCA.indication(BUSY) primitive.

After the PHY-CCA.indication(BUSY) primitive is issued, the PHY entity shall search for the CE field and begin receiving the CE field. The PHY demodulates the header following the reception of the CE field. If the receiver is capable of receiving low-power SC mode, and dot11LowPowerSCPHYActivated is true, then the PHY shall attempt to demodulate both an(#1424) SC header and an SC low-power header. The PHY shall decode the header and determine the MCS, length and other parameters needed for the demodulation of (#14)the remainder of the PPDU.

Subsequently, if dot11TimingMsmtActivated is true, a PHY-RXSTART.indication(RXVECTOR) primitive shall be issued and RX_START_OF_FRAME_OFFSET parameter within the RXVECTOR shall be forwarded (see 20.2.2 (TXVECTOR and RXVECTOR parameters)).

NOTE—The RX_START_OF_FRAME_OFFSET value is used (#3049)to estimate when the start of the preamble for the incoming (#14)PPDU was detected on the medium at the receive antenna connector.

(#14)At the end of the Data field that has the Training Length field in the PHY header equal to 0, the PHY shall issue a PHY-RXEND.indication(No_Error) primitive to the MAC. If the Training Length field in the PHY header is greater than 0, the PHY shall continue to receive these training fields after the data portion of

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

the packet and measure the channel. After the end of the training fields, the PHY shall generate a PHY-CCA.indication(IDLE) primitive and the PHY-RXEND.indication(NoError) primitive.

In the case of signal loss before the decoding of the header or in the case of an invalid header, the PHY shall not generate a PHY-CCA.indication(IDLE) primitive until the received level drops below a value that is 20 dB higher than the receive sensitivity of MCS 1. In the case of signal loss after decoding of a valid header, the PHY shall not generate a PHY-CCA.indication(IDLE) primitive until the expected end of the (#14)PPDU, including AGC and TRN fields.

A typical receive state machine is shown in Figure 20-19 (Typical Rx state machine (some optional features such as DMG low-power SC mode are not shown)).

## 20.9 Beamforming

### 20.9.1 Beamforming concept

Beamforming enables a pair of STAs to train their transmit and receive antennas for subsequent communication. A beamformed link is established following the successful completion of BF training, which is described in 10.41 (DMG beamforming).

(11ay)DMG STAs use a quasi-omni antenna pattern. For a STA that is not operating in a TDD SP (see 10.39.6.2.2 (SP with TDD channel access)), the antenna gain of the main beam of a quasi-omni antenna pattern should be at most 15 dB lower than the antenna gain in the main beam for a directional pattern, unless the STA is an EDMG STA that supports beamforming for asymmetric links (see 10.42.10.3 (Beamforming for asymmetric links)). In this case, the difference in antenna gain may be greater than 15 dB.

### 20.9.2 Beamforming PPDU format(#14)

#### 20.9.2.1 Sector-level sweep

PPDUs transmitted during transmit sector sweep are DMG control mode PPDUs. PPDUs transmitted during receive sector sweep are DMG control mode or DMG SC mode PPDUs.

#### 20.9.2.2 Beam refinement

##### 20.9.2.2.1 General

Beam refinement is a process where a STA can improve its antenna configuration (or antenna weight vectors) both for transmission and reception. If the SLS beamforming training did not include an RSS, as in the case where both devices have more than one transmit sector per antenna, beam refinement can serve as the first receive antenna configuration training. The procedure of beam refinement is described in 10.41.6.4 (BRP phase execution).

In the beam refinement procedure, BRP PPDUs are used to train the receiver and transmitter antenna. There are two types of BRP PPDUs: BRP-RX PPDUs and BRP-TX PPDUs:

— BRP-RX PPDUs are PPDUs that have an AGC field and a TRN field following the Data field. These PPDUs enable receiver antenna weight vector training. A BRP-RX PPDU has the (#6409)Header field Training Length greater than zero, PPDU Type equal to zero and Beam Tracking Request (if present) equal to 0.

— BRP-TX PPDUs are PPDUs that have an AGC field and a TRN field following the Data field. The transmitting STA may change antenna configuration at the beginning of each subfield. The receiving STA performs measurements on these subfields and sends feedback to the STA that

This is an unapproved IEEE Standards Draft, subject to change.

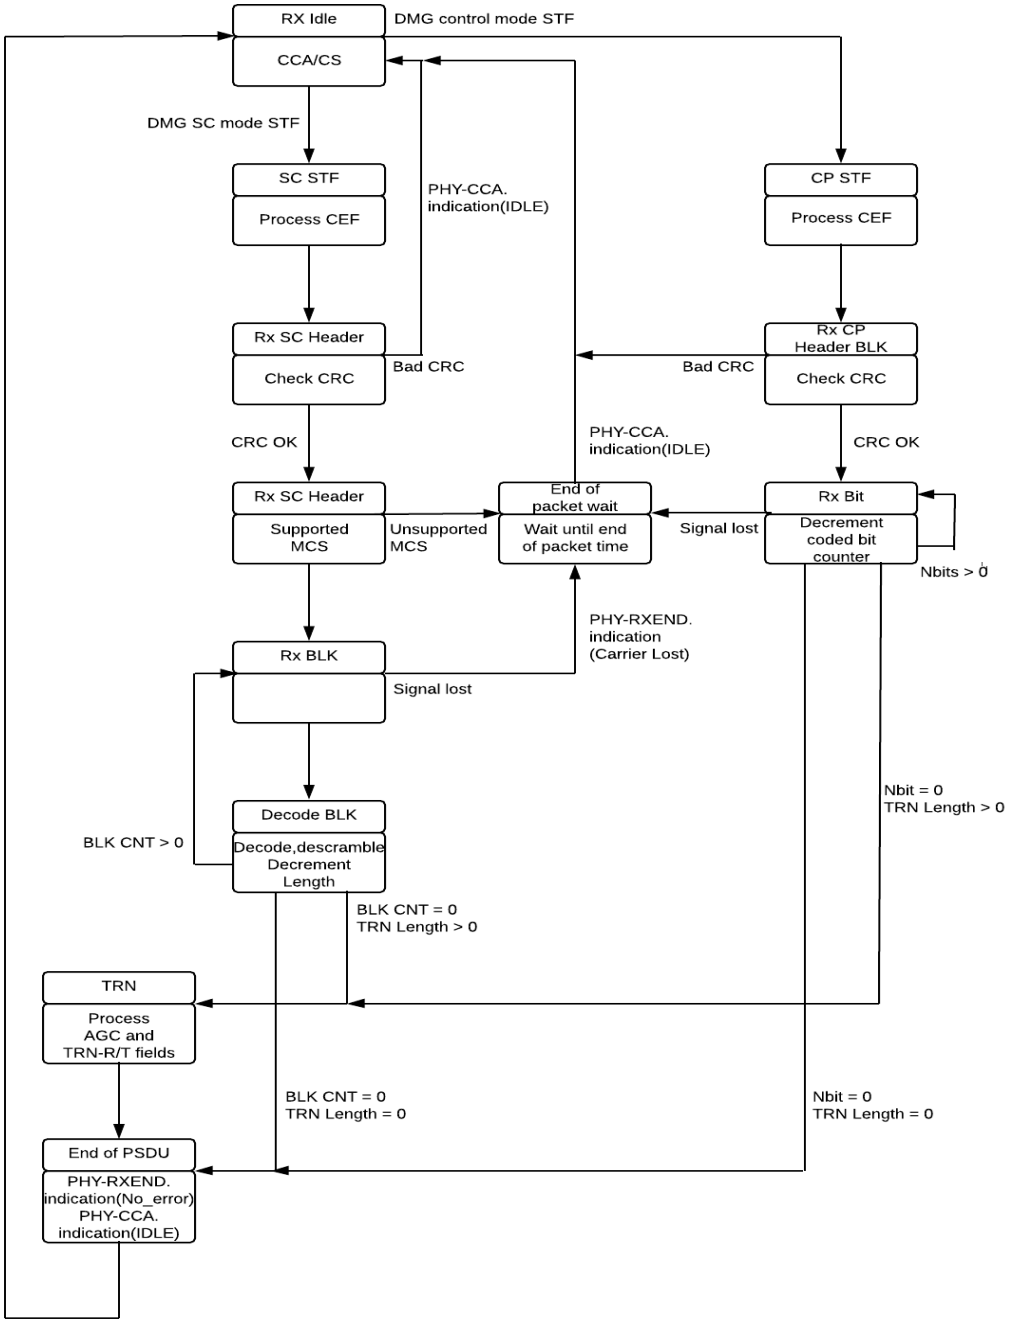

**Figure 20-19—Typical Rx state machine**
**(some optional features such as DMG low-power SC mode are not shown)**

transmits the BRP-TX PPDU. A BRP-RX PPDU has the (#6409)Header field Training Length greater than zero and PPDU Type equal to 1.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

#### 20.9.2.2.2 BRP PPDU structure

(#3626)Each BRP PPDU is shown in Figure 20-20 (BRP PPDU structure).

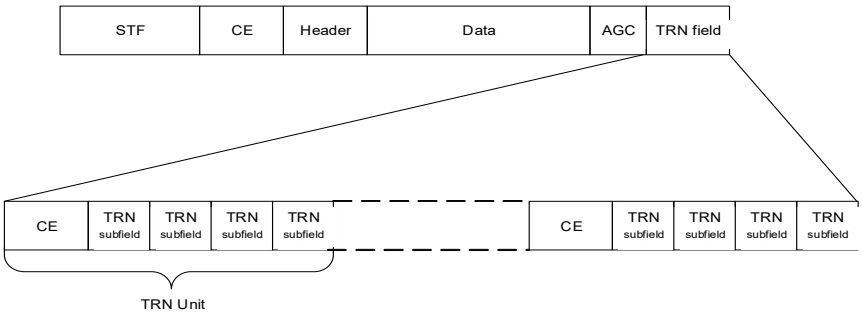

**Figure 20-20—BRP PPDU structure**

#### 20.9.2.2.3 BRP PPDU Header field(#6409)

The PPDU Type and Training Length fields present within the SC mode header, control mode header and LP SC mode header are used to indicate that a (#14)PPDU is BRP PPDU and the length of the training fields, respectively.

A value of 0 in both the PPDU Type field and the Beam Tracking Request field indicates a BRP-RX PPDU.

A value of 1 in the PPDU Type field indicates a BRP-TX PPDU.

A value of *N* in the Training Length field indicates 4×*N* AGC subfields and that the TRN-R/T field has *N* TRN Units.

The value *N* in the Training Length field of a BRP-RX PPDU is equal to the value of the L-RX field requested by the intended receiver of the BRP-RX PPDU at a previously received BRP Request field (see 9.5.4 (BRP Request field)).

#### 20.9.2.2.4 BRP PPDU duration

The minimum duration of the (#404)Data field of a BRP PPDU when sent in an SC mode is aBRPminSCblocks SC blocks (see 20.5.3.2.5 (Symbol blocking and guard insertion)) and, if needed, the (#404)Data field of the (#14)PPDU shall be extended by extra zero padding to generate the required number of SC blocks. Table 20-22 (Zero filling for DMG SC mode BRP PPDUs) contains the values of $N_{CWmin}$ for each MCS necessary to compute the padding described in 20.5.3.2.3.3 (LDPC encoding process).

The minimum duration of the (#404)Data field of a BRP PPDU when sent with the low-power SC mode is $N_{BLKS\_MIN}$ low-power SC blocks (see 20.6.2.3.3 (Encoding)).

**Table 20-22—Zero filling for DMG SC mode BRP PPDUs**

| MCS index | Modulation | $N_{CBPS}$ | Repetition | Code rate | Data rate (Mb/s) | $N_{CWmin}$ |
|---|---|---|---|---|---|---|
| 1 | π/2-BPSK | 1 | 2 | 1/2 | 385 | 12 |
| 2 | π/2-BPSK | 1 | 1 | 1/2 | 770 | 12 |
| 3 | π/2-BPSK | 1 | 1 | 5/8 | 962.5 | 12 |
| 4 | π/2-BPSK | 1 | 1 | 3/4 | 1155 | 12 |
| 5 | π/2-BPSK | 1 | 1 | 13/16 | 1251.25 | 12 |
| 6 | π/2-QPSK | 2 | 1 | 1/2 | 1540 | 23 |
| 7 | π/2-QPSK | 2 | 1 | 5/8 | 1925 | 23 |
| 8 | π/2-QPSK | 2 | 1 | 3/4 | 2310 | 23 |
| 9 | π/2-QPSK | 2 | 1 | 13/16 | 2502.5 | 23 |
| 9.1 | π/2-QPSK | 2 | 1 | 7/8 | 2695 | 25 |
| 10 | π/2-16-QAM | 4 | 1 | 1/2 | 3080 | 46 |
| 11 | π/2-16-QAM | 4 | 1 | 5/8 | 3850 | 46 |
| 12 | π/2-16-QAM | 4 | 1 | 3/4 | 4620 | 46 |
| 12.1 | π/2-16-QAM | 4 | 1 | 13/16 | 5005 | 46 |
| 12.2 | π/2-16-QAM | 4 | 1 | 7/8 | 5390 | 49 |
| 12.3 | π/2-64-QAM | 6 | 1 | 5/8 | 5775 | 69 |
| 12.4 | π/2-64-QAM | 6 | 1 | 3/4 | 6930 | 69 |
| 12.5 | π/2-64-QAM | 6 | 1 | 13/16 | 7507.5 | 69 |
| 12.6 | π/2-64-QAM | 6 | 1 | 7/8 | 8085 | 74 |

### 20.9.2.2.5 AGC field

(#14)The AGC field in the BRP PPDU is composed of 4*N* AGC subfields. Each AGC subfield consists of the sequence [$Ga_{64}$ $Ga_{64}$ $Ga_{64}$ $Ga_{64}$ $Ga_{64}$] when the PPDU is transmitted using the SC mode and [$Gb_{64}$ $Gb_{64}$ $Gb_{64}$ $Gb_{64}$ $Gb_{64}$] when the PPDU is transmitted using the control mode. The sequences $Ga_{64}$ and $Gb_{64}$ are defined in 20.10 (Golay sequences). The sequences are transmitted using rotated π/2-BPSK modulation.

In a BRP-TX PPDU, the transmitter may change the TX AWV configuration at the beginning of each AGC subfield. Any transmit signal transients that occur due to this TX AWV configuration change shall completely settle by the end of the first Ga64 or Gb64 subsequence. The set of AWVs used for the AGC subfields should be the same as that used for the TRN-T subfields. In a BRP-RX PPDU, the transmitter shall use the same TX AWV as in the preamble and (#404)Data fields of the PPDU.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

#### 20.9.2.2.6 TRN field

The TRN field enables transmitter and receiver AWV training. The TRN field has the form shown in Figure 20-21 (TRN field definition).

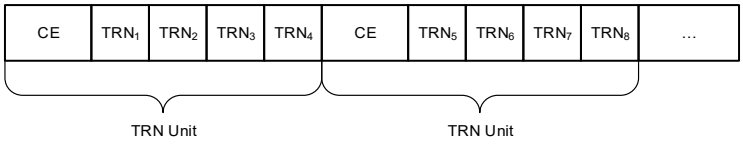

**Figure 20-21—TRN field definition**

The TRN field is composed of *N* TRN Units. Each TRN Unit is composed of a CE subfield and 4 TRN subfields. Each subfield CE matches the Channel Estimation field defined in 20.3.6.3 (Channel Estimation field). The 4N subfields $TRN_1$ to $TRN_{4N}$ each consist of the sequence $[Ga_{128}\ -Gb_{128}\ Ga_{128}\ Gb_{128}\ Ga_{128}]$. The sequences $Ga_{128}$ and $Gb_{128}$ are defined in Table 20-23 (The sequence Ga128(n)) and Table 20-24 (The sequence Gb128(n)), respectively, in 20.10 (Golay sequences). The sequences are transmitted using rotated π/2-BPSK modulation.

In a BRP-RX PPDU, all of the TRN and CE subfields are transmitted using the same AWV as the preamble and (#404)Data field of the (#14)PPDU. In a BRP-TX PPDU, the CE subfield shall be transmitted using the same AWV as the preamble and (#404)Data field of the (#14)PPDU. In a BRP-TX PPDU, the transmitter may change AWV at the beginning of each TRN subfield. Any transmit signal transients that occur due to TX AWV configuration changes at the beginning of TRN subfields shall settle by the end of the first 64 samples of the subfield.

#### 20.9.2.2.7 Channel measurement

The good autocorrelation properties of the Golay sequence enable reconstructing part of the impulse response of the channel between the transmitter and the receiver. The receiver should find the tap with largest amplitude in the channel during the CE field of the BRP-RX. It selects thereafter the set of taps that is measured around the tap with the largest amplitude, according to dot11ChanMeasFBCKNtaps. It can select a contiguous set of taps or select a noncontiguous set of taps, and include the tap delays subfield as part of the subfield measurement. It then measures the phase and amplitude of the corresponding channel taps in each of the TRN-T subfields (except for those using the CE AWV configuration). The beam refinement feedback subfield k-1 is the relative amplitude and phase of this tap in the k'th repetition compared to this tap in the first TRN-T subfield.

## 20.10 Golay sequences

The following Golay sequences are used in the preamble, in the single carrier guard interval and in beam refinement TRN-R/T and AGC fields: $Ga_{128}(n)$, $Gb_{128}(n)$, $Ga_{64}(n)$, $Gb_{64}(n)$, $Ga_{32}(n)$, $Gb_{32}(n)$. These are 3 pairs of complementary sequences. The subscript denotes the length of the sequences. These sequences are generated using the following recursive procedure:

$$A_0(n) = \delta(n)$$
$$B_0(n) = \delta(n)$$
$$A_k(n) = W_k A_{k-1}(n) + B_{k-1}(n - D_k)$$
$$B_k(n) = W_k A_{k-1}(n) - B_{k-1}(n - D_k)$$

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

where

$$\delta(n) = \begin{cases} 1 & n=0 \\ 0 & \text{otherwise} \end{cases}$$

Note that $A_k(n), B_k(n)$ are zero for n < 0 and for $n \geq 2^k$.

$Ga_{128}(n)=A_7(127-n)$, $Gb_{128}(n)=B_7(127-n)$ when the procedure uses $D_k$ = [1 8 2 4 16 32 64] (k=1,2,…,7) and $W_k$ = [–1 –1 –1 –1 +1 –1 –1].

$Ga_{64}(n)=A_6(63-n)$, $Gb_{64}(n)=B_6(63-n)$ when the procedure uses $D_k$= [2 1 4 8 16 32] and $W_k$ =[1 1 -1 -1 1 -1].

$Ga_{32}(n)=A_5(31-n)$, $Gb_{32}(n)=B_5(31-n)$ when the procedure uses $D_k$=[1 4 8 2 16] and $W_k$ =[-1 1 -1 1 -1].

The sequences are defined in Table 20-23 (The sequence Ga128(n)) through Table 20-28 (The sequence Gb32(n)).

## 20.11 DMG PLME

### 20.11.1 PLME SAP layer management primitives(#6320)

Table 20-29 (DMG PHY MIB attribute default values) lists the MIB attributes that may be accessed by the PHY entities and the intra-layer of higher level LMEs. These attributes are accessed via the PLME-GET, PLME-SET, PLME-RESET, and PLME-CHARACTERISTICS primitives defined in 6.7 (PLME SAP interface).

### 20.11.2 DMG PHY MIB

All DMG PHY MIB attributes are defined in Annex C, with specific values defined in Table 20-29 (DMG PHY MIB attribute default values). The column titled “Operational semantics” in Table 20-29 (DMG PHY MIB attribute default values) contains two types: static and dynamic. Static MIB attributes are fixed and cannot be modified for a given PHY implementation. Dynamic MIB attributes can be modified by some management entity.

**Table 20-29—DMG PHY MIB attribute default values**

| Managed object | Default value/range | Operational semantics |
|---|---|---|
| **dot11PHYOperationTable** | | |
| dot11PHYType | DMG | Static |
| **dot11PHYDMGTable** | | |
| dot11LowPowerSCPHYImplemented | Boolean | Static |
| dot11LowPowerSCPHYActivated | Boolean | Dynamic |

When MAX-ACCESS is read-only, the MIB attribute value may be updated by the PLME and read from the MIB attribute by management entities. When MAX-ACCESS is read-write, the MIB attribute may be read and written by management entities but shall not be updated by the PLME.

### 20.11.3 TXTIME calculation

The value of the TXTIME parameter returned by the PLME-TXTIME.confirm primitive shall be calculated according to the following equations.

For the DMG SC mode ($N_{TRN}$ is Training Length field defined in the header):

$$TXTIME = \begin{cases} T_{STF} + T_{CE} + T_{header} + T_{Data} & N_{TRN} = 0 \\ T_{STF} + T_{CE} + T_{header} + \max\{T_{Data}, (\alpha \times \beta + \gamma) \times T_C\} + N_{TRN} \times T_{TRN-Unit} & N_{TRN} > 0 \text{ and SC} \end{cases}$$

where

$\alpha$ = aBRPminSCblocks
$\beta$ = aSCBlockSize
$\gamma$ = aSCGILength
$T_{TRN-Unit}$ = aBRPTRNBlock $\times$ $T_C$

For the DMG control mode:

$$TXTIME = T_{STF-CM} + T_{CE-CM} + (11 \times 8 + (Length - 6) \times 8 + N_{CW} \times 168) \times T_C \times 32 + N_{TRN} \times T_{TRN-Unit}$$

where $N_{CW}$ calculation is defined in 20.4.3.3.3 (Encoder).

### 20.11.4 DMG PHY

(#2123)The DMG PHY characteristics, provided through the PLME-CHARACTERISTICS service primitive, are shown in Table 20-30 (DMG PHY characteristics). The definitions for these characteristics are given in 6.7.4 (PLME-CHARACTERISTICS.confirm).

**Table 20-30—DMG PHY characteristics**

| PHY parameter | Value |
|---|---|
| aRIFSTime | 1 μs |
| aSIFSTime | 3 μs |
| aRxPHYDelay | Implementation dependent, see 10.3.7 (DCF timing relations). |

# 21. Very high throughput (VHT) PHY specification

## 21.1 Introduction

### 21.1.1 Introduction to the VHT PHY

Clause 21 (Very high throughput (VHT) PHY specification) specifies the PHY entity for a very high throughput (VHT) orthogonal frequency division multiplexing (OFDM) system operating in the 5 GHz band.

In addition to the requirements in Clause 21 (Very high throughput (VHT) PHY specification), a VHT STA shall support(#546) transmitting and receiving PPDUs that are compliant with the mandatory PHY specifications defined in Clause 19 (High Throughput (HT) PHY specification(#2297)) in the 5 GHz band.

The VHT PHY is based on the HT PHY defined in Clause 19 (High Throughput (HT) PHY specification(#2297)), which in turn is based on the OFDM PHY defined in Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification). The VHT PHY extends the maximum number of space-time streams supported to eight and provides support for downlink multi-user (MU) transmissions. A downlink MU transmission supports up to four users with up to four space-time streams per user with the total number of space-time streams not exceeding eight.

NOTE—MU transmission is different from VHT SU group addressed transmission.

The VHT PHY provides support for 20 MHz, 40 MHz, 80 MHz, and 160 MHz contiguous channel widths and support for 80+80 MHz noncontiguous channel width.

The VHT PHY data subcarriers are modulated using binary phase shift keying (BPSK), quadrature phase shift keying (QPSK), 16-quadrature amplitude modulation (16-QAM), 64-QAM, and 256-QAM. Forward error correction (FEC) coding (convolutional or LDPC coding) is used with coding rates of 1/2, 2/3, 3/4, and 5/6.

A VHT STA shall support the following features:

- Non-HT and non-HT duplicate formats (transmit and receive) for all channel widths supported by the VHT STA
- HT-mixed format (transmit and receive)
- VHT format (transmit and receive)
- 20 MHz, 40 MHz, and 80 MHz channel widths
- Single spatial stream VHT-MCSs 0 to 7 (transmit and receive) in all supported channel widths
- BCC coding

A VHT STA may support the following features:

- HT-greenfield format (transmit and receive)
- 2 or more spatial streams (transmit and receive)
- 400 ns short guard interval (transmit and receive)
- Beamforming sounding (by sending a VHT NDP)
- Responding to transmit beamforming sounding (by providing compressed beamforming feedback)
- STBC (transmit and receive)
- LDPC (transmit and receive)
- VHT MU PPDUs (transmit and receive)

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

- Support for 160 MHz channel width
- Support for 80+80 MHz channel width
- VHT-MCSs 8 and 9 (transmit and receive)

### 21.1.2 Scope of VHT PHY services

The services provided to the MAC by the VHT PHY consist of the following protocol functions:

a) A function that defines a method of mapping the PSDUs into (#14)a PPDU format suitable for sending and receiving PSDUs between two or more STAs.

b) A function that defines the characteristics and method of transmitting and receiving data through a wireless medium between two or more STAs. Depending on the PPDU format, these STAs support a mixture of VHT, Clause 19 (High Throughput (HT) PHY specification(#2297)) and Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) PHYs.

### 21.1.3 VHT PHY functions

#### 21.1.3.1 General

The VHT PHY contains two functional entities: the PHY function and the physical layer management function (i.e., the PLME). Both of these functions are described in detail in 21.3 (VHT PHY) and 21.4 (VHT PLME).

The VHT PHY service is provided to the MAC through the PHY service primitives defined in Clause 8 (PHY service specification). The VHT PHY service interface is described in 21.2 (VHT PHY service interface).

#### 21.1.3.2 PHY management entity (PLME)

The PLME performs management of the local PHY functions in conjunction with the MLME.

#### 21.1.3.3 Service specification method

The models represented by figures and state diagrams are intended to be illustrations of the functions provided. It is important to distinguish between a model and a real implementation. The models are optimized for simplicity and clarity of presentation, but do not necessarily reflect any particular implementation.

The service of a layer is the set of capabilities that it offers to a user in the next higher layer. Abstract services are specified here by describing the service primitives and parameters that characterize each service. This definition is independent of any particular implementation.

### 21.1.4 PPDU formats

The structure of the PPDU transmitted by a VHT STA is determined by the TXVECTOR parameters as defined in Table 21-1 (TXVECTOR and RXVECTOR parameters(#12)).

In a VHT STA the FORMAT parameter determines the overall structure of the PPDU and can take one of the following values:

- Non-HT format (NON_HT), based on Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) and including non-HT duplicate format.
- HT-mixed format (HT_MF) as specified in Clause 19 (High Throughput (HT) PHY specification(#2297)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

- HT-greenfield format (HT_GF) as specified in Clause 19 (High Throughput (HT) PHY specification(#2297)).
- VHT format (VHT). PPDUs of this format contain a preamble compatible with Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) and Clause 19 (High Throughput (HT) PHY specification(#2297)) STAs. The non-VHT portion of the VHT format preamble (the parts of VHT preamble preceding the VHT-SIG-A field) is defined so that it can be decoded by these STAs.

NOTE—Required support for these formats is defined in 11.38 (VHT BSS operation), 19.1.1 (Introduction to the HT PHY), and 21.1.1 (Introduction to the VHT PHY).

A VHT PPDU can be further categorized as a VHT SU PPDU or a VHT MU PPDU. A VHT PPDU using a group ID value of 0 or 63 is a VHT SU PPDU and either carries only one PSDU or no PSDU. A VHT PPDU using a group ID value in the range 1 to 62 is a VHT MU PPDU and carries one or more PSDUs to one or more users.

## 21.2 VHT PHY service interface

### 21.2.1 Introduction

The PHY provides an interface to the MAC through an extension of the generic PHY service interface defined in 8.3.4 (Basic service and options). The interface includes TXVECTOR, RXVECTOR, and PHYCONFIG_VECTOR.

Using the TXVECTOR, the MAC supplies the PHY with per-PPDU transmit parameters. Using the RXVECTOR, the PHY informs the MAC of the received (#14)PPDU's parameters. Using the PHYCONFIG_VECTOR, the MAC configures the PHY for operation, independent of (#14)PPDU transmission or reception.

### 21.2.2 TXVECTOR and RXVECTOR parameters

The parameters in Table 21-1 (TXVECTOR and RXVECTOR parameters(#12)) are defined as part of the TXVECTOR parameter list in the PHY-TXSTART.request primitive and/or as part of the RXVECTOR parameter list in the PHY-RXSTART.indication primitive. (#12)TXVECTOR and RXVECTOR parameters for transmitting or receiving a DSSS, HR/DSSS, OFDM, ERP or HT PPDU are defined in:

- DSSS PPDU: Table 15-1 (TXVECTOR parameters) and Table 15-2 (RXVECTOR parameters)
- HR/DSSS PPDU: Table 16-5 (Parameter vectors)
- OFDM PPDU: Table 17-1 (TXVECTOR parameters) and Table 17-2 (RXVECTOR parameters)
- ERP PPDU: Table 18-1 (TXVECTOR parameters) and Table 18-3 (RXVECTOR parameters)

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

— HT PPDU: Table 19-1 (TXVECTOR and RXVECTOR parameters).

**Table 21-1—TXVECTOR and RXVECTOR parameters(#12)**

| Parameter | Condition | Value | TXVECTOR | RXVECTOR |
|---|---|---|---|---|
| FORMAT | | Determines the format of the PPDU.<br>Enumerated type:<br>NON_HT indicates OFDM or non-HT duplicate PPDU format. In this case, the modulation is determined by the NON_HT_MODULATION parameter.<br>HT_MF indicates HT-mixed format.<br>HT_GF indicates HT-greenfield format.<br>VHT indicates VHT format. | Y | Y |
| NON_HT_MDULATION | FORMAT is NON_HT | In TXVECTOR, indicates the format type of the transmitted non-HT PPDU.<br>In RXVECTOR, indicates the estimated format type of the received non-HT PPDU.<br>Enumerated type:<br>OFDM indicates OFDM format. NON_HT_DUP_OFDM indicates non-HT duplicate format | Y | Y |
| | Otherwise | Not present | N | N |
| L_LENGTH(#3291) | FORMAT is VHT | Not present<br><br>NOTE—The Length field of the L-SIG field(#4145) in VHT PPDUs is defined in Equation (21-24) using the TXTIME value defined byEquation (21-109) and Equation (21-110), which in turn depend on other parameters including the TXVECTOR parameter APEP_LENGTH. | N | N |
| | Otherwise | See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters) | | |
| L_DATARATE(#3291) | FORMAT is VHT | Not present<br><br>NOTE—The RATE field in the L-SIG field in a VHT PPDU is set to the value representing 6 Mb/s in the 20 MHz channel spacing column of Table 17-6 (Contents of the SIGNAL field). | N | N |

**Table 21-1—TXVECTOR and RXVECTOR parameters(#12) *(continued)***

| Parameter | Condition | Value | TXVECTOR | RXVECTOR |
|---|---|---|---|---|
| EXPANSION_MAT_TYPE | FORMAT is VHT and EXPANSION_MAT is present. | Set to COMPRESSED_SV | Y | N |
| | Otherwise | See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters) | | |
| EXPANSION_MAT | FORMAT is VHT | Contains a vector in the number of selected subcarriers containing feedback matrices as defined in 21.3.11.2 (Beamforming Feedback Matrix V) based on the channel measured during the training symbols of a previous VHT NDP. | M<br>U | N |
| | Otherwise | See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters) | | |
| CHAN_MAT_TYPE | FORMAT is VHT and PSDU_LENGTH equals 0 | Set to COMPRESSED_SV | N | Y |
| | FORMAT is VHT and PSDU_LENGTH is greater than 0 | Not present | N | N |
| | Otherwise | See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters) | | |
| CHAN_MAT | FORMAT is VHT and PSDU_LENGTH equals 0 | Contains a set of compressed beamforming feedback matrices as defined in 21.3.11.2 (Beamforming Feedback Matrix V) based on the channel measured during the training symbols of the received VHT NDP. | N | Y |
| | FORMAT is VHT and PSDU_LENGTH is greater than 0 | Not present | N | N |
| | Otherwise | See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters) | | |
| DELTA_SNR | FORMAT is VHT | Contains an array of delta SNR values as defined in 9.4.1.49 (MU Exclusive Beamforming Report field) based on the channel measured during the training symbols of the received VHT NDP.<br><br>NOTE—In the RXVECTOR this parameter is present only for VHT NDPs for MU sounding. | M<br>U | Y |
| | Otherwise | Not present | N | N |

**Table 21-1—TXVECTOR and RXVECTOR parameters(#12) *(continued)***

| Parameter | Condition | Value | TXVECTOR | RXVECTOR |
|---|---|---|---|---|
| SNR | FORMAT is VHT | Contains an array of received SNR measurements for each spatial stream. SNR indications of 8 bits are supported. SNR shall be the sum of the decibel values of SNR per tone divided by the number of tones represented in each stream as described in 9.4.1.47 (VHT Compressed Beamforming Report field) | N | Y |
| | Otherwise | See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters) | | |
| FEC_CODING | FORMAT is VHT | Indicates which FEC encoding is used.<br>Enumerated type:<br>BCC_CODING indicates binary convolutional code.<br>LDPC_CODING indicates low-density parity check code. | M<br>U | Y |
| | Otherwise | See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters) | | |
| STBC | FORMAT is VHT | Indicates whether STBC is used.<br>0 indicates no STBC ($N_{STS}=N_{SS}$ in the Data field).<br>1 indicates STBC is used ($N_{STS}=2N_{SS}$ in the Data field).<br>This parameter is 0 for a VHT MU PPDU. | Y | Y |
| | Otherwise | See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters) | | |
| GI_TYPE | FORMAT is VHT | Indicates whether a short guard interval is used in the transmission of the Data field of the PPDU.<br>Enumerated type:<br>LONG_GI indicates short GI is not used in the Data field of the PPDU.<br>SHORT_GI indicates short GI is used in the Data field of the PPDU. | Y | Y |
| | Otherwise | See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters) | | |
| TXPWR_LEVEL_INDEX | FORMAT is VHT | The allowed values for the TXPWR_LEVEL_INDEX parameter are in the range 1 to $N/2$, where $N$ is the number of octets in dot11TxPowerLevelExtended. This parameter is used to indicate which of the available transmit output power levels defined in dot11TxPowerLevelExtended shall be used for the current transmission. | Y | N |
| | Otherwise | See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters) | | |
| RSSI | FORMAT is VHT | The allowed values for the RSSI parameter are in the range 0 to 255. This parameter is a (#1132)measurement by the PHY of the power observed at the antenna connector used to receive the current PPDU measured during the reception of the VHT-LTF field. RSSI is intended to be used in a relative manner, and it is a monotonically increasing function of the received power. | N | Y |
| | Otherwise | See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters) | | |

**Table 21-1—TXVECTOR and RXVECTOR parameters(#12) *(continued)***

| Parameter | Condition | Value | TXVECTOR | RXVECTOR |
|---|---|---|---|---|
| PSDU_LENGTH | FORMAT is VHT | Indicates the number of octets in the VHT PSDU in the range 0 to aPSDUMaxLength octets (see Table 21-28 (VHT PHY characteristics)). A value of 0 indicates a VHT NDP. | N | Y |
| | Otherwise | Not present | N | N |
| USER_POSITION | FORMAT is VHT and 1 ≤ GROUP_ID ≤ 62 | User position in MU transmission using the group ID GROUP_ID. Integer range: 0-3.<br><br>NOTE—The entries in the USER_POSITION array are in ascending order. | M<br>U | O |
| | Otherwise | Not present | N | N |
| NUM_STS | FORMAT is VHT | Indicates the number of space-time streams.<br>Integer: range 1-8 for SU, 1-4 per user in the TXVECTOR and 0-4 in the RXVECTOR for MU.<br>NUM_STS summed over all users is in the range 1 to 8. | M<br>U | Y |
| | Otherwise | Not present | N | N |
| GROUP_ID | FORMAT is VHT | Indicates the group ID.<br>Integer: range 0-63 (see Table 21-12 (Fields in the VHT-SIG-A field))<br>A value of 0 or 63 indicates a VHT SU PPDU. A value in the range 1 to 62 indicates a VHT MU PPDU. | Y | Y |
| | Otherwise | Not present | N | N |
| PARTIAL_AID | FORMAT is VHT and GROUP_ID is 0 or 63 | Provides an abbreviated indication of the intended recipient(s) of the PSDU (see 10.19 (Group ID and partial AID in VHT and CMMG PPDUs)).<br>Integer: range 0-511. | Y | Y |
| | Otherwise | Not present | N | N |
| NUM_USERS | FORMAT is VHT | Indicates the number of users with nonzero space-time streams.<br>Integer: range 1 to 4. | Y | N |
| | Otherwise | Not present | N | N |
| BEAMFORMED | FORMAT is VHT and GROUP_ID is 0 or 63 | Set to 1 if a beamforming steering matrix is applied to the waveform in an SU transmission. Set to 0 otherwise.<br><br>NOTE—When BEAMFORMED is(M118) 1, frequency domain smoothing as part of channel estimation is not recommended. | Y | O |
| | Otherwise | Not present | N | N |

**Table 21-1—TXVECTOR and RXVECTOR parameters(#12) *(continued)***

| Parameter | Condition | Value | TXVECTOR | RXVECTOR |
|---|---|---|---|---|
| (#602)SCRAMBLER_INITIAL_VALUE | FORMAT is VHT, GROUP_ID is neither 0 nor 63, and STA is an HE STA | The first 7 bits of the scrambling sequence (the first 7 bits in the SERVICE field prior to descrambling), with the first bit of the scrambling sequence being the LSB of SCRAMBLER_INITIAL_VALUE. | N | Y |
| | FORMAT is VHT and GROUP_ID is 0 or 63 | Not present | N | N |
| | FORMAT is VHT and STA is not an HE STA | Not present | N | N |
| | Otherwise | See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters) | | |

NOTE—In the TXVECTOR and RXVECTOR columns, the following apply:
Y indicates that the parameter is always present in that vector;
N indicates that the parameter is never present in that vector;
O indicates that the parameter's presence is an implementation option;
MU indicates that the parameter is present once for a VHT SU PPDU and present per user for a VHT MU PPDU. Parameters specified to be present per user are conceptually supplied as an array of values indexed by *u*, where *u* takes values 0 to NUM_USERS-1.

### 21.2.3 PHYCONFIG_VECTOR parameters

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a VHT PHY contains an OPERATING_CHANNEL parameter, which identifies the operating or primary channel. The PHY shall set dot11CurrentPrimaryChannel to the value of this parameter.

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a VHT PHY contains a CHANNEL_WIDTH parameter, which identifies the operating channel width and takes one of the values 20 MHz, 40 MHz, 80 MHz, 160 MHz, and 80+80 MHz. The PHY shall set dot11CurrentChannelWidth to the value of this parameter.

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a VHT PHY contains a CENTER_FREQUENCY_SEGMENT_0 parameter, which identifies the center frequency of the channel (or of segment 0 if the CHANNEL_WIDTH parameter indicates 80+80 MHz) and takes a value between 1 and 200. The PHY shall set dot11CurrentChannelCenterFrequencyIndex0 to the value of this parameter.

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a VHT PHY contains a CENTER_FREQUENCY_SEGMENT_1 parameter, which takes the value 0 if the CHANNEL_WIDTH parameter does not indicate 80+80 MHz, and otherwise identifies the center frequency of segment 1 and takes a value between 1 and 200. The PHY shall set dot11CurrentChannelCenterFrequencyIndex1 to the value of this parameter.

(#4383)The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a VHT PHY contains a GROUP_ID_MANAGEMENT parameter, which specifies membership status and STA position for each of the group IDs as described in 9.6.22.3 (Group ID Management frame format).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

(#4383)The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a VHT PHY contains a PARTIAL_AID_LIST_GID00 parameter, which includes the list of partial AIDs, of which the STA is an intended recipient, associated with group ID 0. The settings of the PARTIAL_AID are specified in 10.19 (Group ID and partial AID in VHT and CMMG PPDUs).

(#4383)The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a VHT PHY contains a PARTIAL_AID_LIST_GID63 parameter, which includes the list of partial AIDs, of which the STA is an intended recipient, associated with group ID 63. The settings of the PARTIAL_AID are specified in 10.19 (Group ID and partial AID in VHT and CMMG PPDUs).

(#4383)The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a VHT PHY contains a LISTEN_TO_GID00 parameter, which, when true, indicates to the PHY not to filter out PPDUs with GROUP_ID field equal to 0.

(#4383)The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a VHT PHY contains a LISTEN_TO_GID63 parameter, which, when true, indicates to the PHY not to filter out PPDUs with GROUP_ID field equal to 63.

(#4384)Additional PHYCONFIG_VECTOR parameters are defined in Table 8-4 (Vector descriptions(#4383)).

### 21.2.4 Effects of CH_BANDWIDTH parameter on PPDU format

Table 21-2 (Interpretation of FORMAT, NON_HT_MODULATION, CH_BANDWIDTH, and CH_OFFSET parameters) shows the valid combinations of the FORMAT, NON_HT_MODULATION, and CH_BANDWIDTH parameters and the corresponding PPDU format and value of CH_OFFSET (if applicable). Other combinations are reserved.

**Table 21-2—Interpretation of FORMAT, NON_HT_MODULATION, CH_BANDWIDTH, and CH_OFFSET parameters**

| FORMAT | NON_HT_ MODULATION | CH_BANDWIDTH | CH_OFFSET | PPDU format |
|---|---|---|---|---|
| VHT | N/A | CBW20 | N/A | The STA transmits a VHT PPDU (when FORMAT is VHT) of 20 MHz bandwidth. If the BSS bandwidth is wider than 20 MHz, then the transmission shall use the primary 20 MHz channel. |
| VHT | N/A | CBW40 | N/A | The STA transmits a VHT PPDU (when FORMAT is VHT) of 40 MHz bandwidth. If the BSS bandwidth is wider than 40 MHz, then the transmission shall use the primary 40 MHz channel. |
| HT_MF or HT_GF | N/A | HT_CBW20 and CHANNEL_WIDTH in PHYCONFIG_VECTOR > 20 MHz and $f_{S20,\,idx} < f_{P20,\,idx}$ | CH_OFF_20U | The STA transmits an (#2095)(#1366)HT-mixed format PPDU (when FORMAT is HT_MF) or (#1367)HT-greenfield format PPDU (when FORMAT is HT_GF) of 20 MHz bandwidth. The transmission shall use the primary 20 MHz channel. |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 21-2—Interpretation of FORMAT, NON_HT_MODULATION, CH_BANDWIDTH, and CH_OFFSET parameters *(continued)***

| FORMAT | NON_HT_ MODULATION | CH_BANDWIDTH | CH_OFFSET | PPDU format |
|---|---|---|---|---|
| HT_MF or HT_GF | N/A | HT_CBW20 and CHANNEL_WIDTH in PHYCONFIG_VECTOR > 20 MHz and $f_{S20,\,idx} > f_{P20,\,idx}$ | CH_OFF_20L | The STA transmits an (#2095)(#1366)HT-mixed format PPDU (when FORMAT is HT_MF) or (#1367)HT-greenfield format PPDU (when FORMAT is HT_GF) of 20 MHz bandwidth. The transmission shall use the primary 20 MHz channel. |
| HT_MF or HT_GF | N/A | HT_CBW20 and CHANNEL_WIDTH in PHYCONFIG_VECTOR = 20 MHz | CH_OFF_20 | The STA transmits an (#2095)(#1366)HT-mixed format PPDU (when FORMAT is HT_MF) or (#1367)HT-greenfield format PPDU (when FORMAT is HT_GF) of 20 MHz bandwidth. |
| HT_MF or HT_GF | N/A | HT_CBW40 | CH_OFF_40 | The STA transmits an (#2095)(#1366)HT-mixed format PPDU (when FORMAT is HT_MF) or (#1367)HT-greenfield format PPDU (when FORMAT is HT_GF) of 40 MHz bandwidth. If the BSS bandwidth is wider than 40 MHz, then the transmission shall use the primary 40 MHz channel. |
| VHT | N/A | CBW80 | | The STA transmits a VHT PPDU of 80 MHz bandwidth. If the BSS bandwidth is 160 MHz or 80+80 MHz, then the transmission shall use the primary 80 MHz channel. |
| VHT | N/A | CBW160 | | The STA transmits a VHT PPDU of 160 MHz bandwidth. |
| VHT | N/A | CBW80+80 | | The STA transmits a VHT PPDU of 80+80 MHz bandwidth. |
| NON_HT | OFDM | CBW20 | | The STA transmits a non-HT PPDU(#238) with NON_HT_MODULATION set to OFDM using the primary 20 MHz channel as defined in Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification). |

**Table 21-2—Interpretation of FORMAT, NON_HT_MODULATION, CH_BANDWIDTH, and CH_OFFSET parameters *(continued)***

| FORMAT | NON_HT_ MODULATION | CH_BANDWIDTH | CH_OFFSET | PPDU format |
|---|---|---|---|---|
| NON_HT | NON_HT_DUP_ OFDM | CBW40 | | The STA transmits a non-HT PPDU(#238) with NON_HT_MODULATION set to NON_HT_DUP_OFDM using two adjacent 20 MHz channels as defined in 21.3.10.12 (Non-HT duplicate transmission). If the BSS bandwidth is wider than 40 MHz, then the transmission shall use the primary 40 MHz channel. The one 20 MHz channel higher in frequency is rotated +90º relative to the 20 MHz channel lowest in frequency as defined in Equation (21-15). |
| NON_HT | NON_HT_DUP_ OFDM | CBW80 | | The STA transmits a non-HT PPDU(#238) with NON_HT_MODULATION set to NON_HT_DUP_OFDM using four adjacent 20 MHz channels as defined in 21.3.10.12 (Non-HT duplicate transmission). If the BSS bandwidth is 160 MHz or 80+80 MHz, then the transmission shall use the primary 80 MHz channel. The three 20 MHz channels higher in frequency are rotated +180º relative to the 20 MHz channel lowest in frequency as defined in Equation (21-16). |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 21-2—Interpretation of FORMAT, NON_HT_MODULATION, CH_BANDWIDTH, and CH_OFFSET parameters *(continued)***

| FORMAT | NON_HT_ MODULATION | CH_BANDWIDTH | CH_OFFSET | PPDU format |
|---|---|---|---|---|
| NON_HT | NON_HT_DUP_ OFDM | CBW160 | | The STA transmits a non-HT PPDU(#238) with NON_HT_MODULATION set to NON_HT_DUP_OFDM using eight adjacent 20 MHz channels as defined in 21.3.10.12 (Non-HT duplicate transmission). The second, third, fourth, sixth, seventh, and eighth 20 MHz channels in the order of increasing frequency are rotated +180º relative to the 20 MHz channel lowest in frequency as defined in Equation (21-17). |
| NON_HT | NON_HT_DUP_ OFDM | CBW80+80 | | The STA transmits a non-HT PPDU(#238) with NON_HT_MODULATION set to NON_HT_DUP_OFDM using two nonadjacent frequency segments, with each frequency segment consisting of four adjacent 20 MHz channels as defined in 21.3.10.12 (Non-HT duplicate transmission). In each frequency segment, the three 20 MHz channels higher in frequency are rotated +180º relative to the 20 MHz channel lowest in frequency as defined in Equation (21-16). |

### 21.2.5 Support for NON_HT and HT formats

#### 21.2.5.1 General

A VHT STA logically contains Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification), Clause 19 (High Throughput (HT) PHY specification(#2297)), and Clause 21 (Very high throughput (VHT) PHY specification) PHYs. The MAC interfaces to the PHYs via the Clause 21 (Very high throughput (VHT) PHY specification) PHY service interface, which in turn interacts with the Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) and Clause 19 (High Throughput (HT) PHY specification(#2297)) PHY service interfaces as shown in Figure 21-1 (PHY interaction on transmit for various PPDU formats), Figure 21-2 (PHY interaction on receive for various PPDU formats), and Figure 21-3 (PHY-CONFIG and CCA interaction with Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification), Clause 19 (High Throughput (HT) PHY specification(#2297)), and Clause 21 (Very high throughput (VHT) PHY specification) PHYs).

#### 21.2.5.2 Support for NON_HT format when NON_HT_MODULATION is OFDM

When a PHY-TXSTART.request(TXVECTOR) primitive with the FORMAT parameter equal to NON_HT and the NON_HT_MODULATION parameter equal to OFDM is issued, the behavior of the VHT PHY is defined in Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) with additional requirements described in the following subclauses:

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

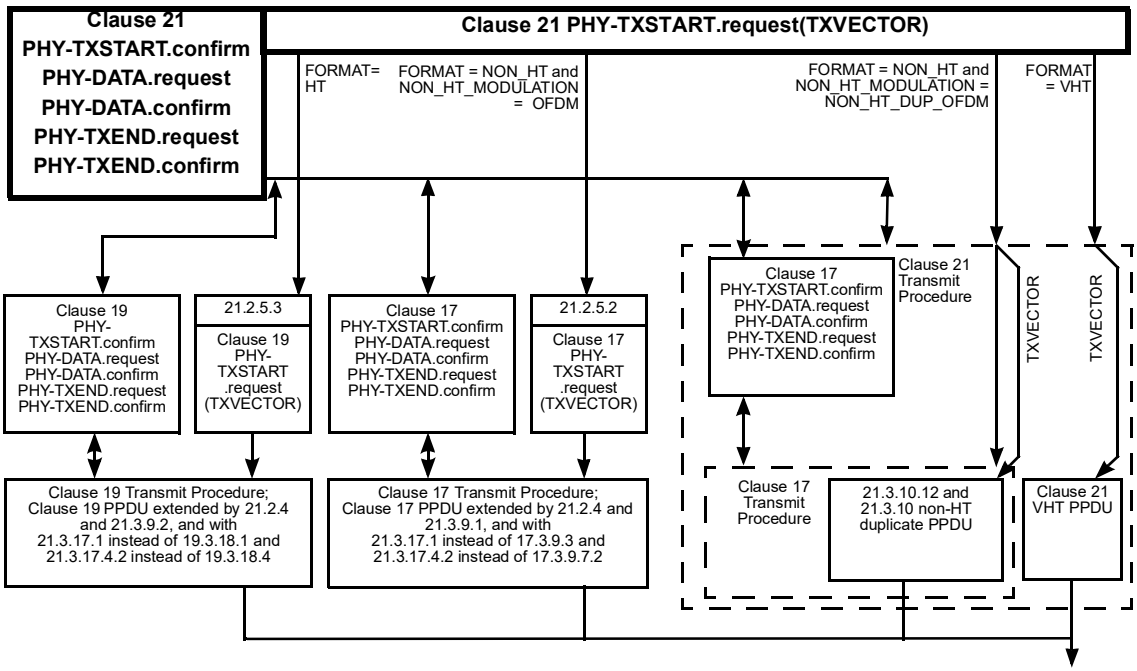

**Figure 21-1—PHY interaction on transmit for various PPDU formats**

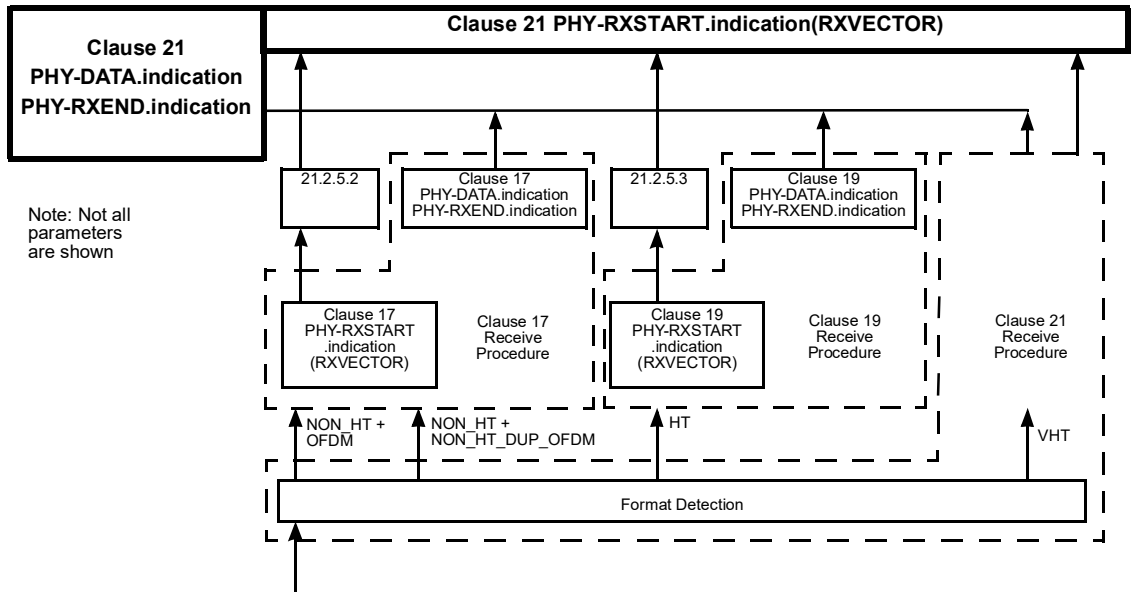

**Figure 21-2—PHY interaction on receive for various PPDU formats**

— 21.3.9.1 (Transmission of 20 MHz non-HT PPDUs(#238) with more than one transmit chain)

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

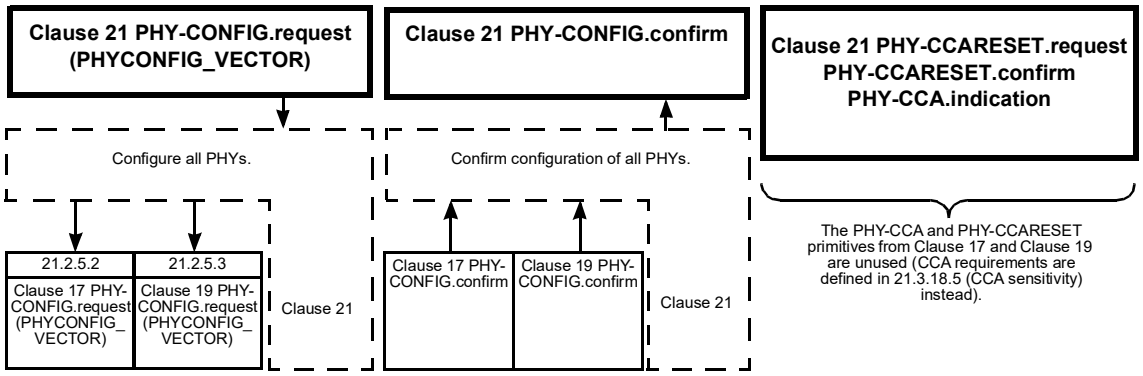

**Figure 21-3—PHY-CONFIG and CCA interaction with Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification), Clause 19 (High Throughput (HT) PHY specification(#2297)), and Clause 21 (Very high throughput (VHT) PHY specification) PHYs**

— 21.3.17.1 (Transmit spectrum mask) instead of 17.3.9.3 (Transmit spectrum mask)

— 21.3.17.4.2 (Transmit center frequency leakage) instead of 17.3.9.7.2 (Transmitter center frequency leakage)

where the Clause 21 (Very high throughput (VHT) PHY specification) TXVECTOR parameters in Table 21-1 (TXVECTOR and RXVECTOR parameters(#12)) are mapped to Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) TXVECTOR parameters in Table 17-1 (TXVECTOR parameters) according to Table 21-3 (Mapping of VHT PHY parameters for NON_HT operation).

NOTE—When the FORMAT parameter is (M118)equal to NON_HT and the NON_HT_MODULATION parameter is (M118)equal to NON_HT_DUP_OFDM in a PHY-TXSTART.request(TXVECTOR) primitive, the behavior of the VHT PHY is defined in Clause 21 (Very high throughput (VHT) PHY specification).

When the VHT PHY receives a Clause 21 (Very high throughput (VHT) PHY specification) PHY-CONFIG.request(PHYCONFIG_VECTOR) primitive, the VHT PHY shall, for the purposes of OFDM PPDU transmission and reception, behave as if it were a Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) PHY that had received a PHY-CONFIG.request(PHYCONFIG_VECTOR) primitive but with the CHANNEL_WIDTH, CENTER_FREQUENCY_SEGMENT_0, and CENTER_FREQUENCY_SEGMENT_1 parameters discarded from PHYCONFIG_VECTOR.

As defined in 21.3.20 (PHY receive procedure), once a PPDU is received and detected as a non-HT PPDU(#238), the behavior of the VHT PHY is defined in Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification). The RXVECTOR parameters from the Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) PHY-RXSTART.indication primitive are mapped to the Clause 21 (Very high throughput (VHT) PHY specification) RXVECTOR parameters as defined in Table 21-3 (Mapping of VHT PHY parameters for NON_HT operation). VHT PHY parameters not listed in the table are not present.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 21-3—Mapping of VHT PHY parameters for NON_HT operation**

| VHT PHY Parameter | 5 GHz operation defined by Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) | Parameter List |
|---|---|---|
| L_LENGTH | LENGTH | TXVECTOR/RXVECTOR |
| L_DATARATE | DATARATE | TXVECTOR/RXVECTOR |
| TXPWR_LEVEL_INDEX | TXPWR_LEVEL_INDEX | TXVECTOR |
| RSSI | RSSI | RXVECTOR |
| SERVICE | SERVICE | TXVECTOR/RXVECTOR |
| CH_BANDWIDTH_IN_NON_HT | CH_BANDWIDTH_IN_NON_HT | TXVECTOR/RXVECTOR |
| DYN_BANDWIDTH_IN_NON_HT | DYN_BANDWIDTH_IN_NON_HT | TXVECTOR/RXVECTOR |
| OPERATING_CHANNEL | OPERATING_CHANNEL | PHYCONFIG_VECTOR |
| CHANNEL_WIDTH | discarded | PHYCONFIG_VECTOR |
| CENTER_FREQUENCY_SEGMENT_0 | discarded | PHYCONFIG_VECTOR |
| CENTER_FREQUENCY_SEGMENT_1 | discarded | PHYCONFIG_VECTOR |

#### 21.2.5.3 Support for HT formats

When a PHY-TXSTART.request(TXVECTOR) primitive is received with the TXVECTOR parameter FORMAT equal to HT_MF or HT_GF, the behavior of the PHY is defined by Clause 19 (High Throughput (HT) PHY specification(#2297)) with additional requirements defined in the following subclauses:

— 21.3.9.2 (Transmission of HT PPDUs with more than four transmit chains)

— 21.3.17.1 (Transmit spectrum mask) instead of 19.3.18.1 (Transmit spectrum mask)

— 21.3.17.4.2 (Transmit center frequency leakage) instead of 19.3.18.4 (Transmit center frequency tolerance)

The Clause 21 (Very high throughput (VHT) PHY specification) TXVECTOR parameters in Table 21-1 (TXVECTOR and RXVECTOR parameters(#12)) are mapped directly to Clause 19 (High Throughput (HT) PHY specification(#2297)) TXVECTOR parameters in Table 19-1 (TXVECTOR and RXVECTOR parameters) and the Clause 19 (High Throughput (HT) PHY specification(#2297)) PHY-TXSTART.request(TXVECTOR) primitive is issued. The PHY shall use a value of CH_OFFSET in the Clause 19 (High Throughput (HT) PHY specification(#2297)) TXVECTOR that is consistent with Table 21-2 (Interpretation of FORMAT, NON_HT_MODULATION, CH_BANDWIDTH, and CH_OFFSET parameters).

When the VHT PHY receives a Clause 21 (Very high throughput (VHT) PHY specification) PHY-CONFIG.request(PHYCONFIG_VECTOR) primitive, the VHT PHY shall, for the purposes of HT PPDU transmission and reception, behave as if it were a Clause 19 (High Throughput (HT) PHY specification(#2297)) PHY that had received PHY-CONFIG.request(PHYCONFIG_VECTOR) primitive but with the CHANNEL_WIDTH, CENTER_FREQUENCY_SEGMENT_0, and CENTER_FREQUENCY_SEGMENT_1 parameters discarded from the PHYCONFIG_VECTOR and the SECONDARY_CHANNEL_OFFSET parameter set to SECONDARY_CHANNEL_NONE if

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

dot11CurrentChannelWidth indicates 20 MHz, to SECONDARY_CHANNEL_ABOVE if $f_{\text{P20, idx}} < f_{\text{S20, idx}}$, or to SECONDARY_CHANNEL_BELOW otherwise.

As defined in 21.3.20 (PHY receive procedure), once a PPDU is received and detected as an HT PPDU, the behavior of the VHT PHY is defined in Clause 19 (High Throughput (HT) PHY specification(#2297)). The RXVECTOR parameters in Table 19-1 (TXVECTOR and RXVECTOR parameters) from the Clause 19 (High Throughput (HT) PHY specification(#2297)) PHY-RXSTART.indication primitive are mapped directly to the RXVECTOR parameters in Table 21-1 (TXVECTOR and RXVECTOR parameters(#12)) and a Clause 21 (Very high throughput (VHT) PHY specification) PHY-RXSTART.indication primitive is issued.

### 21.2.6 TXSTATUS parameters

The parameters listed in Table 19-4 (TXSTATUS parameters) are defined as part of the TXSTATUS parameter list in the PHY-TXSTART.confirm primitive.

## 21.3 VHT PHY

### 21.3.1 Introduction

This subclause provides the procedure by which PSDUs are converted to and from transmissions on the wireless medium.

During transmission, a PSDU (in the SU case) or one or more PSDUs (in the MU case) are processed (i.e., scrambled and coded) and appended to the PHY preamble to create the PPDU. At the receiver, the PHY preamble is processed to aid in the detection, demodulation, and delivery of the PSDU.

Pre-VHT modulated fields refer to the L-STF, L-LTF, L-SIG, and VHT-SIG-A fields, while VHT modulated fields refer to the VHT-STF, VHT-LTF, VHT-SIG-B, and Data fields (see Figure 21-17 (Timing boundaries for VHT PPDU fields)).

### 21.3.2 VHT PPDU format

A single PPDU format is defined for this PHY: the VHT PPDU format. Figure 21-4 (VHT PPDU format) shows the VHT PPDU format.

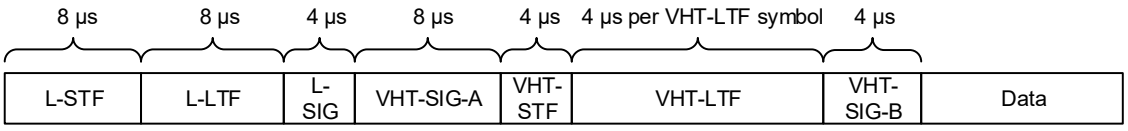

**Figure 21-4—VHT PPDU format**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The fields of the VHT PPDU format are summarized in Table 21-4 (Fields of the VHT PPDU).

**Table 21-4—Fields of the VHT PPDU**

| Field | Description |
|---|---|
| L-STF | Non-HT Short Training field |
| L-LTF | Non-HT Long Training field |
| L-SIG | Non-HT SIGNAL field |
| VHT-SIG-A | VHT Signal A field |
| VHT-STF | VHT Short Training field |
| VHT-LTF | VHT Long Training field |
| VHT-SIG-B | VHT Signal B field |
| Data | The Data field carrying the PSDU(s) |

The VHT-SIG-A, VHT-STF, VHT-LTF, and VHT-SIG-B fields exist only in VHT PPDUs. In a VHT NDP the Data field is not present. The number of symbols in the VHT-LTF field, $N_{VHT\text{-}LTF}$, can be either 1, 2, 4, 6, or 8 and is determined by the total number of space-time streams across all users being transmitted in the VHT PPDU (see Table 21-13 (Number of VHT-LTFs required for different numbers of space-time streams)).

### 21.3.3 Transmitter block diagram

The generation of each field in a VHT PPDU uses many of the following blocks:

a) PHY padding
b) Scrambler
c) BCC encoder parser
d) FEC (BCC or LDPC) encoders
e) Stream parser
f) Segment parser (for 160 MHz and 80+80 MHz transmissions)
g) BCC interleaver
h) Constellation mapper
i) Pilot insertion
j) Replicate over multiple 20 MHz (if BW > 20 MHz)
k) Multiply by first column of $P_{VHT\text{-}LTF}$
l) LDPC tone mapper
m) Segment deparser
n) Space time block code (STBC) encoder
o) Cyclic shift diversity (CSD) per STS insertion
p) Spatial mapper
q) Inverse discrete Fourier transform (IDFT)
r) Cyclic shift diversity (CSD) per chain insertion
s) Guard interval (GI) insertion

t) Windowing

Figure 21-5 (Transmitter block diagram for the L-SIG and VHT-SIG-A fields) to Figure 21-16 (Transmitter block diagram for the Data field of an 80+80 MHz VHT SU PPDU with LDPC encoding) show example transmitter block diagrams. The actual structure of the transmitter is implementation dependent. In particular, Figure 21-5 (Transmitter block diagram for the L-SIG and VHT-SIG-A fields) shows the transmit process for the L-SIG and VHT-SIG-A fields of a VHT PPDU using one frequency segment. These transmit blocks are also used to generate L-STF and L-LTF fields, except that the BCC encoder and interleaver are not used for these fields.

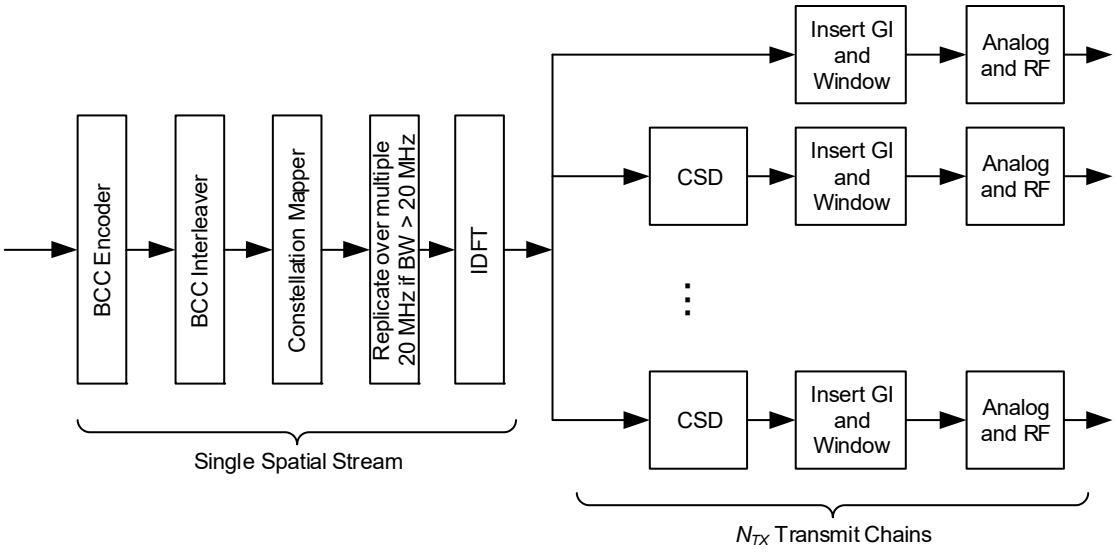

**Figure 21-5—Transmitter block diagram for the L-SIG and VHT-SIG-A fields**

Figure 21-6 (Transmitter block diagram for the VHT-SIG-B field of a 20 MHz, 40 MHz, and 80 MHz VHT SU PPDU) and Figure 21-7 (Transmitter block diagram for the VHT-SIG-B field of a 20 MHz, 40 MHz, and 80 MHz VHT MU PPDU(#2259)(#7214)) show the transmit process for generating the VHT-SIG-B field of a VHT SU PPDU and VHT MU PPDU, respectively, in 20 MHz, 40 MHz, and 80 MHz channel widths. Figure 21-8 (Transmitter block diagram for the VHT-SIG-B field of a 160 MHz VHT SU PPDU(#7214)) and Figure 21-9 (Transmitter block diagram for the VHT-SIG-B field of an 80+80 MHz VHT SU PPDU) show the transmit process for generating the VHT_SIG-B field of a 160 MHz and 80+80 MHz VHT SU PPDU, respectively.

Figure 21-10 (Transmitter block diagram for the Data field of a 20 MHz, 40 MHz, or 80 MHz VHT SU PPDU with BCC encoding) shows the transmitter blocks used to generate the Data field of a 20 MHz, 40 MHz, and 80 MHz VHT SU PPDU with BCC encoding. A subset of these transmitter blocks consisting of the constellation mapper and CSD blocks, as well as the blocks to the right of, and including, the spatial mapping block, are also used to generate the VHT-LTF fields. This is illustrated in Figure 21-21 (Generation of VHT-LTF symbols per frequency segment). A subset of these transmitter blocks consisting of the constellation mapper and CSD blocks, as well as the blocks to the right of, and including, the spatial mapping block, are also used to generate the VHT-STF field but without the multiplication by $A^k_{VHT\text{-}LTF}$ [defined in Equation (21-40)].

### 21.3.4 Overview of the PPDU encoding process

#### 21.3.4.1 General

This subclause provides an overview of the VHT PPDU encoding process.

#### 21.3.4.2 Construction of L-STF

Construct the L-STF field as defined in 21.3.8.2.2 (L-STF definition) with the following highlights:

a) Determine the CH_BANDWIDTH from the TXVECTOR.

b) Sequence generation: Generate the L-STF sequence over the CH_BANDWIDTH as described in 21.3.8.2.2 (L-STF definition).

c) Phase rotation: Apply appropriate phase rotation for each 20 MHz subchannel as described in 21.3.7.4 (Transmitted signal) and 21.3.7.5 (Definition of tone rotation).

d) IDFT: Compute the inverse discrete Fourier transform.

e) CSD: Apply CSD for each transmit chain and frequency segment as described in 21.3.8.2.1 (Cyclic shift for pre-VHT modulated fields).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

f) Insert GI and apply windowing: Prepend a GI (LONG_GI) and apply windowing as described in 21.3.7.4 (Transmitted signal).

g) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 21.3.7.4 (Transmitted signal) and 21.3.8 (VHT preamble) for details.

#### 21.3.4.3 Construction of the L-LTF

Construct the L-LTF field as defined in 21.3.8.2.3 (L-LTF definition) with the following highlights:

a) Determine the CH_BANDWIDTH from the TXVECTOR.

b) Sequence generation: Generate the L-LTF sequence over the CH_BANDWIDTH as described in 21.3.8.2.3 (L-LTF definition).

c) Phase rotation: Apply appropriate phase rotation for each 20 MHz subchannel as described in 21.3.7.4 (Transmitted signal) and 21.3.7.5 (Definition of tone rotation).

d) IDFT: Compute the inverse discrete Fourier transform.

e) CSD: Apply CSD for each transmit chain and frequency segment as described in 21.3.8.2.1 (Cyclic shift for pre-VHT modulated fields).

f) Insert GI and apply windowing: Prepend a GI ($2 \times$ LONG_GI ) and apply windowing as described in 21.3.7.4 (Transmitted signal).

g) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 21.3.7.4 (Transmitted signal) and 21.3.8 (VHT preamble) for details.

#### 21.3.4.4 Construction of L-SIG

Construct the L-SIG field as the SIGNAL field defined by 21.3.8.2.4 (L-SIG definition) with the following highlights:

a) In a VHT PPDU set the RATE subfield in the SIGNAL field to 6 Mb/s. Set the Length, Parity, and Tail bits in the SIGNAL field as described in 21.3.8.2.4 (L-SIG definition).

b) BCC encoder: Encode the SIGNAL field by a convolutional encoder at the rate of R=1/2 as described in 21.3.10.5.3 (BCC coding and puncturing).

c) BCC interleaver: Interleave as described in 21.3.10.8 (BCC interleaver).

d) Constellation Mapper: BPSK modulate as described in 21.3.10.9 (Constellation mapping).

e) Pilot insertion: Insert pilots as described in 21.3.10.11 (OFDM modulation).

f) Duplication and phase rotation: Duplicate the L-SIG field over each 20 MHz of the CH_BANDWIDTH. Apply appropriate phase rotation for each 20 MHz subchannel as described in 21.3.7.4 (Transmitted signal) and 21.3.7.5 (Definition of tone rotation).

g) IDFT: Compute the inverse discrete Fourier transform.

h) CSD: Apply CSD for each transmit chain and frequency segment as described in 21.3.8.2.1 (Cyclic shift for pre-VHT modulated fields).

i) Insert GI and apply windowing: Prepend a GI (LONG_GI) and apply windowing as described in 21.3.7.4 (Transmitted signal).

j) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 21.3.7.4 (Transmitted signal) and 21.3.8 (VHT preamble) for details.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

#### 21.3.4.5 Construction of VHT-SIG-A

The VHT-SIG-A field consists of two symbols, VHT-SIG-A1 and VHT-SIG-A2, as defined in 21.3.8.3.3 (VHT-SIG-A definition) and is constructed as follows:

a) Obtain the CH_BANDWIDTH, STBC, GROUP_ID, PARTIAL_AID (SU only), NUM_STS, GI_TYPE, FEC_CODING, MCS (SU only), BEAMFORMED (SU only), NUM_USERS, and TXOP_PS_NOT_ALLOWED from the TXVECTOR. Add the reserved bits, append the calculated CRC, then append the $N_{tail}$ tail bits as shown in 21.3.8.3.3 (VHT-SIG-A definition). This results in 48 uncoded bits.

b) BCC encoder: Encode the data by a convolutional encoder at the rate of R=1/2 as described in 17.3.5.6 (Convolutional encoder)

c) BCC interleaver: Interleave as described in 17.3.5.7 (Data interleaving).

d) Constellation mapper: BPSK modulate the first 48 interleaved bits as described in 17.3.5.8 (Subcarrier modulation mapping) to form the first symbol of VHT-SIG-A. BPSK modulate the second 48 interleaved bits and rotate by 90° counter-clockwise relative to the first symbol to form the second symbol of VHT-SIG-A.

e) Pilot insertion: Insert pilots as described in 17.3.5.9 (Pilot subcarriers).

f) Duplication and phase rotation: Duplicate VHT-SIG-A1 and VHT-SIG-A2 over each 20 MHz of the CH_BANDWIDTH. Apply the appropriate phase rotation for each 20 MHz subchannel as described in 21.3.7.4 (Transmitted signal) and 21.3.7.5 (Definition of tone rotation).

g) IDFT: Compute the inverse discrete Fourier transform.

h) CSD: Apply CSD for each transmit chain and frequency segment as described in 21.3.8.2.1 (Cyclic shift for pre-VHT modulated fields).

i) Insert GI and apply windowing: Prepend a GI (LONG_GI) and apply windowing as described in 21.3.7.4 (Transmitted signal).

j) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 21.3.7.4 (Transmitted signal) and 21.3.8 (VHT preamble) for details.

#### 21.3.4.6 Construction of VHT-STF

The VHT-STF field is defined in 21.3.8.3.4 (VHT-STF definition) and is constructed as follows:

a) Sequence generation: Generate the VHT-STF in the frequency domain over the bandwidth indicated by CH_BANDWIDTH as described in 21.3.8.3.4 (VHT-STF definition).

b) Phase rotation: Apply appropriate phase rotation for each 20 MHz subchannel as described in 21.3.7.4 (Transmitted signal) and 21.3.7.5 (Definition of tone rotation).

c) CSD: Apply CSD for each space-time stream and frequency segment as described in 21.3.8.3.2 (Cyclic shift for VHT modulated fields).

d) Spatial mapping: Apply the $Q$ matrix as described in 21.3.10.11.1 (Transmission in VHT format).

e) IDFT: Compute the inverse discrete Fourier transform.

f) Insert GI and apply windowing: Prepend a GI (LONG_GI) and apply windowing as described in 21.3.7.4 (Transmitted signal).

g) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 21.3.7.4 (Transmitted signal) and 21.3.8 (VHT preamble) for details.

#### 21.3.4.7 Construction of VHT-LTF

The VHT-LTF field is defined in 21.3.8.3.5 (VHT-LTF definition) and constructed as follows:

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

a) Sequence generation: Generate the VHT-LTF sequence in the frequency domain over the bandwidth indicated by CH_BANDWIDTH as described in 21.3.8.3.5 (VHT-LTF definition).

b) Phase rotation: Apply appropriate phase rotation for each 20 MHz subchannel as described in 21.3.7.4 (Transmitted signal) and 21.3.7.5 (Definition of tone rotation).

c) $A_{VHT\text{-}LTF}$ matrix mapping: Apply the $P_{VHT\text{-}LTF}$ matrix to the data tones of the VHT-LTF sequence and apply the $R_{VHT\text{-}LTF}$ matrix to the pilot tones as described in 21.3.8.3.5 (VHT-LTF definition).

d) CSD: Apply CSD for each space-time stream and frequency segment as described in 21.3.8.3.2 (Cyclic shift for VHT modulated fields).

e) Spatial mapping: Apply the $Q$ matrix as described in 21.3.10.11.1 (Transmission in VHT format).

f) IDFT: Compute the inverse discrete Fourier transform.

g) Insert GI and apply windowing: Prepend a GI (LONG_GI) and apply windowing as described in 21.3.7.4 (Transmitted signal).

h) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 21.3.7.4 (Transmitted signal) and 21.3.8 (VHT preamble) for details.

#### 21.3.4.8 Construction of VHT-SIG-B

The VHT-SIG-B field is constructed per-user as follows:

a) Obtain the VHT-MCS (for MU only) and APEP_LENGTH from the TXVECTOR.

b) VHT-SIG-B bits: Set the VHT-MCS (for MU only) and VHT-SIG-B Length field as described in 21.3.8.3.6 (VHT-SIG-B definition). Add the reserved bits (for SU only) and $N_{tail}$ bits of tail. In an NDP set VHT-SIG-B to the fixed bit pattern for the bandwidth used as described in 21.3.8.3.6 (VHT-SIG-B definition).

c) VHT-SIG-B Bit Repetition: Repeat the VHT-SIG-B bits as a function of CH_BANDWIDTH as defined in 21.3.8.3.6 (VHT-SIG-B definition).

d) BCC encoder: Encode the VHT-SIG-B field using BCC at rate R=1/2 as described in 17.3.5.6 (Convolutional encoder).

e) Segment parser (if needed): In a 160 MHz or 80+80 MHz transmission, divide the output bits of the BCC encoder into two frequency subblocks as described in 21.3.10.7 (Segment parser). This block is bypassed for 20 MHz, 40 MHz, and 80 MHz VHT PPDU transmissions.

f) BCC interleaver: Interleave as described in 21.3.10.8 (BCC interleaver).

g) Constellation mapper: Map to a BPSK constellation as defined in 17.3.5.8 (Subcarrier modulation mapping).

h) Segment deparser (if needed): In a 160 MHz transmission, merge the two frequency subblocks into one frequency segment as described in 21.3.10.9.3 (Segment deparser). This block is bypassed for 20 MHz, 40 MHz, 80 MHz, and 80+80 MHz VHT PPDU transmissions.

i) Pilot insertion: Insert pilots following the steps described in 21.3.10.10 (Pilot subcarriers).

j) $P_{VHT\text{-}LTF}$ matrix mapping: Apply the mapping of the first column of the $P_{VHT\text{-}LTF}$ matrix to the data subcarriers as described in 21.3.8.3.6 (VHT-SIG-B definition). The total number of data and pilot subcarriers is the same as in the Data field.

k) CSD: Apply CSD for each space-time stream and frequency segment as described in 21.3.8.3.2 (Cyclic shift for VHT modulated fields).

l) Spatial mapping: Apply the $Q$ matrix as described in 21.3.10.11.1 (Transmission in VHT format).

m) Phase rotation: Apply the appropriate phase rotations for each 20 MHz subchannel as described in 21.3.7.4 (Transmitted signal) and 21.3.7.5 (Definition of tone rotation).

n) IDFT: Compute the inverse discrete Fourier transform.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

o) Insert GI and apply windowing: Prepend a GI (LONG_GI) and apply windowing as described in 21.3.7.4 (Transmitted signal).

p) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 21.3.7.4 (Transmitted signal) and 21.3.8 (VHT preamble) for details.

#### 21.3.4.9 Construction of the Data field in a VHT SU PPDU

##### 21.3.4.9.1 Using BCC

The construction of the Data field in a VHT SU PPDU with BCC encoding proceeds as follows:

a) Insert the CRC calculated for VHT-SIG-B in the SERVICE field as described in 21.3.10.2 (SERVICE field) and append the PSDU to the SERVICE field.

b) PHY padding: Append the PHY pad bits and tail bits to the PSDU.

c) Scrambler: Scramble the PHY padded data.

d) BCC encoder: Divide the scrambled bits between the encoders by sending bits to different encoders in a round robin manner. The number of encoders is determined by rate-dependent parameters described in 21.5 (Parameters for VHT-MCSs). BCC encode as described in 21.3.10.5.2 (BCC encoder parsing operation) and 21.3.10.5.3 (BCC coding and puncturing).

e) Stream parser: Rearrange the output of the BCC encoders into blocks as described in 21.3.10.6 (Stream parser).

f) Segment parser (if needed): In a 160 MHz or 80+80 MHz transmission, divide the output bits of each stream parser into two frequency subblocks as described in 21.3.10.7 (Segment parser). This block is bypassed for 20 MHz, 40 MHz, and 80 MHz VHT PPDU transmissions.

g) BCC interleaver: Interleave as described in 21.3.10.8 (BCC interleaver).

h) Constellation mapper: Map to BPSK, QPSK, 16-QAM, 64-QAM, or 256-QAM constellation points as described in 21.3.10.9 (Constellation mapping).

i) Segment deparser (if needed): In a 160 MHz transmission, merge the two frequency subblocks into one frequency segment as described in 21.3.10.9.3 (Segment deparser). This block is bypassed for 20 MHz, 40 MHz, 80 MHz, and 80+80 MHz VHT PPDU transmissions.

j) STBC: Apply STBC as described in 21.3.10.9.4 (Space-time block coding).

k) Pilot insertion: Insert pilots following the steps described in 21.3.10.10 (Pilot subcarriers).

l) CSD: Apply CSD for each space-time stream and frequency segment as described in 21.3.8.3.2 (Cyclic shift for VHT modulated fields).

m) Spatial mapping: Apply the $Q$ matrix as described in 21.3.10.11.1 (Transmission in VHT format).

n) Phase rotation: Apply the appropriate phase rotations for each 20 MHz subchannel as described in 21.3.7.4 (Transmitted signal) and 21.3.7.5 (Definition of tone rotation).

o) IDFT: In an 80+80 MHz transmission, map each frequency subblock to a separate IDFT. Compute the inverse discrete Fourier transform.

p) Insert GI and apply windowing: Prepend a GI (SHORT_GI or LONG_GI) and apply windowing as described in 21.3.7.4 (Transmitted signal).

q) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 21.3.7.4 (Transmitted signal) and 21.3.8 (VHT preamble) for details.

##### 21.3.4.9.2 Using LDPC

The construction of the Data field in a VHT SU PPDU with LDPC encoding proceeds as follows:

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

a) Insert the CRC calculated for VHT-SIG-B in the SERVICE field as described in 21.3.10.2 (SERVICE field) and append the PSDU to the SERVICE field.

b) PHY padding: Append the PHY pad bits to the PSDU. There are no tail bits.

c) Scrambler: Scramble the PHY padded data.

d) LDPC encoder: The scrambled bits are encoded using the LDPC code with the APEP_LENGTH in the TXVECTOR as described in 21.3.10.5.4 (LDPC coding).

e) Stream parser: The output of the LDPC encoder is rearranged into blocks as described in 21.3.10.6 (Stream parser).

f) Segment parser (if needed): In a 160 MHz or 80+80 MHz transmission, divide the output bits of each stream parser into two frequency subblocks as described in 21.3.10.7 (Segment parser). This block is bypassed for 20 MHz, 40 MHz, and 80 MHz VHT PPDU transmissions.

g) Constellation mapper: Map to BPSK, QPSK, 16-QAM, 64-QAM or 256-QAM constellation points as described in 21.3.10.9 (Constellation mapping).

h) LDPC tone mapper: The LDPC tone mapping shall be performed on all LDPC encoded streams as described in 21.3.10.9.2 (LDPC tone mapping).

i) Segment deparser (if needed): In a 160 MHz transmission, merge the two frequency subblocks into one frequency segment as described in 21.3.10.9.3 (Segment deparser). This block is bypassed for 20 MHz, 40 MHz, 80 MHz, and 80+80 MHz VHT PPDU transmissions.

j) STBC: Apply STBC as described in 21.3.10.9.4 (Space-time block coding).

k) Pilot insertion: Insert pilots following the steps described in 21.3.10.10 (Pilot subcarriers).

l) CSD: Apply CSD for each space-time stream and frequency segment as described in 21.3.8.3.2 (Cyclic shift for VHT modulated fields).

m) Spatial mapping: Apply the $Q$ matrix as described in 21.3.10.11.1 (Transmission in VHT format).

n) Phase rotation: Apply the appropriate phase rotations for each 20 MHz subchannel as described in 21.3.7.4 (Transmitted signal) and 21.3.7.5 (Definition of tone rotation).

o) IDFT: In an 80+80 MHz transmission, map each frequency subblock to a separate IDFT. Compute the inverse discrete Fourier transform.

p) Insert GI and apply windowing: Prepend a GI (SHORT_GI or LONG_GI) and apply windowing as described in 21.3.7.4 (Transmitted signal).

q) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 21.3.7.4 (Transmitted signal) and 21.3.8 (VHT preamble) for details.

#### 21.3.4.10 Construction of the Data field in a VHT MU PPDU

##### 21.3.4.10.1 General

In an MU transmission, the PPDU encoding process is performed independently on a per-user basis up to the input of the Spatial Mapping block, except that CSD is performed with a knowledge of the space time stream starting index for that user. All user data is combined and mapped to the transmit chains in the Spatial Mapping block.

##### 21.3.4.10.2 Using BCC

A Data field with BCC encoding is constructed using steps a) to k) in 21.3.4.9.1 (Using BCC), then applying CSD for a VHT MU PPDU (as described in 21.3.8.3.2 (Cyclic shift for VHT modulated fields)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

#### 21.3.4.10.3 Using LDPC

A Data field with LDPC encoding is constructed using steps a) to k) in 21.3.4.9.2 (Using LDPC), then applying CSD as for a VHT MU PPDU (as described in 21.3.8.3.2 (Cyclic shift for VHT modulated fields)).

#### 21.3.4.10.4 Combining to form a VHT MU PPDU

The per-user data is combined as follows:

a) Spatial Mapping: The $Q$ matrix is applied as described in 21.3.10.11.1 (Transmission in VHT format). The combining of all user data is done in this block.

b) Phase rotation: Apply the appropriate phase rotations for each 20 MHz subchannel as described in 21.3.7.4 (Transmitted signal) and 21.3.7.5 (Definition of tone rotation).

c) IDFT: Compute the inverse discrete Fourier transform.

d) Insert GI and apply windowing: Prepend a GI (SHORT_GI or LONG_GI) and apply windowing as described in 21.3.7.4 (Transmitted signal).

e) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 21.3.7.4 (Transmitted signal) and 21.3.8 (VHT preamble) for details.

### 21.3.5 VHT modulation and coding scheme (VHT-MCS)

The VHT-MCS is a value that determines the modulation and coding used in the Data field of the PPDU. It is a compact representation that is carried in the VHT-SIG-A field for VHT SU PPDUs and in the VHT-SIG-B field for VHT MU PPDUs. Rate-dependent parameters for the full set of VHT-MCSs are shown in Table 21-29 (VHT-MCSs for mandatory 20 MHz, NSS = 1) to Table 21-60 (VHT-MCSs for optional 160 MHz and 80+80 MHz, NSS = 8) (in 21.5 (Parameters for VHT-MCSs)). These tables give rate-dependent parameters for VHT-MCSs with indices 0 to 9, with number of spatial streams from 1 to 8 and bandwidth options of 20 MHz, 40 MHz, 80 MHz, and either 160 MHz or 80+80 MHz. Equal modulation (EQM) is applied to all streams for a particular user.

### 21.3.6 Timing-related parameters

Refer to Table 19-6 (Timing-related constants) for timing-related parameters for non-VHT formats.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Table 21-5 (Timing-related constants) defines the timing-related parameters for VHT format.

**Table 21-5—Timing-related constants**

| Parameter | CBW20 | CBW40 | CBW80 | CBW80+80 | CBW160 | Description |
|---|---|---|---|---|---|---|
| $N_{SD}$ | 52 | 108 | 234 | 234 | 468 | Number of complex data numbers per frequency segment |
| $N_{SP}$ | 4 | 6 | 8 | 8 | 16 | Number of pilot values per frequency segment |
| $N_{ST}$ | 56 | 114 | 242 | 242 | 484 | Total number of subcarriers per frequency segment. See NOTE. |
| $N_{SR}$ | 28 | 58 | 122 | 122 | 250 | Highest data subcarrier index per frequency segment |
| $N_{Seg}$ | 1 | 1 | 1 | 2 | 1 | Number of frequency segments |
| $\Delta_F$ | 312.5 kHz | | | | | Subcarrier frequency spacing |
| $T_{DFT}$ | 3.2 μs | | | | | IDFT/DFT period |
| $T_{GI}$ | 0.8 μs = $T_{DFT}$/4 | | | | | Guard interval duration |
| $T_{GI2}$ | 1.6 μs | | | | | Double guard interval |
| $T_{GIS}$ | 0.4 μs = $T_{DFT}$/8 | | | | | Short guard interval duration |
| $T_{SYML}$ | 4 μs = $T_{DFT}$ + $T_{GI}$ = 1.25 × $T_{DFT}$ | | | | | Long GI symbol interval |
| $T_{SYMS}$ | 3.6 μs = $T_{DFT}$ + $T_{GIS}$ = 1.125 × $T_{DFT}$ | | | | | Short GI symbol interval |
| $T_{SYM}$ | $T_{SYML}$ or $T_{SYMS}$ depending on the GI used (see Table 21-8 (Tone scaling factor and guard interval duration values for PHY fields)) | | | | | Symbol interval |
| $T_{L\text{-}STF}$ | 8 μs = 10 x $T_{DFT}$/4 | | | | | Non-HT Short Training field duration |
| $T_{L\text{-}LTF}$ | 8 μs = 2 x $T_{DFT}$ + $T_{GI2}$ | | | | | Non-HT Long Training field duration |
| $T_{L\text{-}SIG}$ | 4 μs = $T_{SYML}$ | | | | | Non-HT SIGNAL field duration |
| $T_{VHT\text{-}SIG\text{-}A}$ | 8 μs = 2$T_{SYML}$ | | | | | VHT Signal A field duration |
| $T_{VHT\text{-}STF}$ | 4 μs = $T_{SYML}$ | | | | | VHT Short Training field duration |
| $T_{VHT\text{-}LTF}$ | 4 μs = $T_{SYML}$ | | | | | Duration of each VHT-LTF symbol |

**Table 21-6—Frequently used parameters *(continued)***

| Symbol | Explanation |
|---|---|
| $M_u$ | For pre-VHT modulated fields, $M_u = 0$. For VHT modulated fields, $M_0 = 0$ for $u = 0$ and $M_u = \sum_{u'=0}^{u-1} N_{STS,u'}$ for $u = 1, \ldots N_{user}-1$. |
| NOTE—For pre-VHT modulated fields, $u$ is 0 only since $N_{user} = 1$. | |

### 21.3.7 Mathematical description of signals

#### 21.3.7.1 Notation

For a description of the conventions used for the mathematical description of the signals, see 17.3.2.5 (Mathematical conventions in the signal descriptions). In addition, the following notational conventions are used in Clause 21 (Very high throughput (VHT) PHY specification):

$[Q]_{m,n}$ indicates the element in row $m$ and column $n$ of matrix $Q$, where $1 \le m \le N_{row}$ and $1 \le n \le N_{col}$

$N_{row}$ and $N_{col}$ are the number of rows and columns, respectively, of the matrix $Q$

$[Q]_{M:N}$ indicates a matrix consisting of columns $M$ to $N$ of matrix $Q$

#### 21.3.7.2 Subcarrier indices in use

For description on subcarrier indices over which the signal is transmitted for non-HT and HT PPDUs, see 19.3.7 (Mathematical description of signals).

For a 20 MHz VHT PPDU transmission, the 20 MHz is divided into 64 subcarriers. The signal is transmitted on subcarriers –28 to –1 and 1 to 28, with 0 being the center (DC) subcarrier.

For a 40 MHz VHT PPDU transmission, the 40 MHz is divided into 128 subcarriers. The signal is transmitted on subcarriers –58 to –2 and 2 to 58.

For an 80 MHz VHT PPDU transmission, the 80 MHz is divided into 256 subcarriers. The signal is transmitted on subcarriers –122 to –2 and 2 to 122.

For a 160 MHz VHT PPDU transmission, the 160 MHz is divided into 512 subcarriers. The signal is transmitted on subcarriers –250 to –130, –126 to –6, 6 to 126, and 130 to 250.

For an 80+80 MHz VHT PPDU transmission, each 80 MHz frequency segment is divided into 256 subcarriers. In each frequency segment, the signal is transmitted on subcarriers –122 to –2 and 2 to 122.

#### 21.3.7.3 Channel frequencies

Let

$$f_{c,\,\mathrm{idx0}} = \mathrm{dot11CurrentChannelCenterFrequencyIndex0} \quad (21\text{-}1)$$

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$f_{c,\,\mathrm{idx1}} = \mathrm{dot11CurrentChannelCenterFrequencyIndex1} \tag{21-2}$$

$$f_{\mathrm{P20,\,idx}} = \mathrm{dot11CurrentPrimaryChannel} \tag{21-3}$$

$$f_{\mathrm{CH,\,start}} = \mathrm{dot11ChannelStartingFactor} \times 500\ \mathrm{kHz} \tag{21-4}$$

where

dot11CurrentChannelCenterFrequencyIndex0, dot11CurrentChannelCenterFrequencyIndex1, and dot11CurrentPrimaryChannel are defined in Table 21-22 (Fields to specify VHT channels).

When dot11CurrentChannelWidth (see Table 21-22 (Fields to specify VHT channels)) is 20 MHz, $f_{\mathrm{P20,\,idx}} = f_{c,\,\mathrm{idx0}}$. For dot11CurrentChannelWidth greater than 20 MHz, $f_{\mathrm{P20,\,idx}}$ and $f_{c,\,\mathrm{idx0}}$ shall have the relationship specified in Equation (21-5).

$$f_{\mathrm{P20,\,idx}} = f_{c,\,\mathrm{idx0}} - 4 \cdot \left( \frac{N_{\mathrm{20MHz}}}{2} - n_{\mathrm{P20}} \right) + 2 \tag{21-5}$$

where

$$N_{\mathrm{20MHz}} = \begin{cases} 2, \text{ if dot11CurrentChannelWidth indicates 40 MHz} \\ 4, \text{ if dot11CurrentChannelWidth indicates 80 MHz and 80+80 MHz} \\ 8, \text{ if dot11CurrentChannelWidth indicates 160 MHz} \end{cases}$$

$n_{\mathrm{P20}}$ is an integer with possible range $0 \le n_{\mathrm{P20}} \le N_{\mathrm{20MHz}} - 1$

When dot11CurrentChannelWidth is 40 MHz, 80 MHz, 160 MHz, or 80+80 MHz,

— The primary 20 MHz channel is the channel with 20 MHz bandwidth centered at $f_{\mathrm{CH,\,start}} + 5 \times f_{\mathrm{P20,\,idx}}$ MHz.

— The secondary 20 MHz channel is the channel with 20 MHz bandwidth centered at $f_{\mathrm{CH,\,start}} + 5 \times f_{S20,\,\mathrm{idx}}$, where $f_{S20,\,\mathrm{idx}}$ is given in Equation (21-6).

$$f_{\mathrm{S20,\,idx}} = \begin{cases} f_{\mathrm{P20,\,idx}} + 4, & \text{if } n_{\mathrm{P20}} \text{ is even} \\ f_{\mathrm{P20,\,idx}} - 4, & \text{if } n_{\mathrm{P20}} \text{ is odd} \end{cases} \tag{21-6}$$

When dot11CurrentChannelWidth is 80 MHz, 160 MHz, or 80+80 MHz,

— The primary 40 MHz channel is the channel with 40 MHz bandwidth centered at $f_{\mathrm{CH,\,start}} + 5 \times f_{\mathrm{P40,\,idx}}$ MHz, where $f_{\mathrm{P40,\,idx}}$ is given in Equation (21-7).

— The secondary 40 MHz channel is the channel with 40 MHz bandwidth centered at $f_{\mathrm{CH,\,start}} + 5 \times f_{S40,\,\mathrm{idx}}$ MHz, where $f_{S40,\,\mathrm{idx}}$ is given in Equation (21-8).

$$f_{\mathrm{P40,\,idx}} = f_{c,\,\mathrm{idx0}} - 8 \cdot \left( \frac{N_{\mathrm{20MHz}}}{4} - n_{\mathrm{P40}} \right) + 4 \tag{21-7}$$

$$f_{\mathrm{S40,\,idx}} = \begin{cases} f_{\mathrm{P40,\,idx}} + 8, & \text{if } n_{\mathrm{P40}} \text{ is even} \\ f_{\mathrm{P40,\,idx}} - 8, & \text{if } n_{\mathrm{P40}} \text{ is odd} \end{cases} \tag{21-8}$$

where $n_{\mathrm{P40}} = \lfloor n_{\mathrm{P20}} / 2 \rfloor$.

When dot11CurrentChannelWidth is 160 MHz,

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

— The primary 80 MHz channel is the channel with 80 MHz bandwidth centered at $f_{\text{CH, start}} + 5 \times f_{\text{P80, idx}}$ MHz, where $f_{\text{P80, idx}}$ is given in Equation (21-9).
— The secondary 80 MHz channel is the channel with 80 MHz bandwidth centered at $f_{\text{CH, start}} + 5 \times f_{\text{S80, idx}}$ MHz where $f_{\text{S80, idx}}$ is given in Equation (21-10).

$$f_{\text{P80, idx}} = f_{c,\text{ idx0}} - 16 \cdot \left( \frac{N_{\text{20MHz}}}{8} - n_{\text{P80}} \right) + 8 \tag{21-9}$$

$$f_{\text{S80, idx}} = \begin{cases} f_{\text{P80, idx}} + 16, & \text{if } n_{\text{P80}} \text{ is even} \\ f_{\text{P80, idx}} - 16, & \text{if } n_{\text{P80}} \text{ is odd} \end{cases} \tag{21-10}$$

where $n_{\text{P80}} = \lfloor n_{\text{P20}} / 4 \rfloor$.

When dot11CurrentChannelWidth is 80+80 MHz,

— The primary 80 MHz channel is the channel with 80 MHz bandwidth centered at $f_{\text{CH, start}} + 5 \times f_{\text{P80, idx}}$ MHz, where $f_{\text{P80, idx}} = f_{c,\text{ idx0}}$.
— The secondary 80 MHz channel is the channel with 80 MHz bandwidth centered at $f_{\text{CH, start}} + 5 \times f_{\text{S80, idx}}$ MHz where $f_{\text{S80, idx}} = f_{c,\text{ idx1}}$.

### 21.3.7.4 Transmitted signal

The transmitted signal is described in complex baseband signal notation. The actual transmitted signal is related to the complex baseband signal by the relation shown in Equation (21-11).

$$r_{RF}^{(i_{Seg}, i_{TX})}(t) = \text{Re}\left\{ \frac{1}{\sqrt{N_{Seg}}} r_{\text{PPDU}}^{(i_{Seg}, i_{TX})}(t) \exp(j2\pi f_c^{(i_{Seg})} t) \right\}, \quad i_{Seg} = 0, \ldots, N_{Seg} - 1; \quad i_{TX} = 1, \ldots, N_{TX} \tag{21-11}$$

where

$N_{Seg}$ represents the number of frequency segments in the transmit signal, as defined in Table 21-5 (Timing-related constants)

$r_{\text{PPDU}}^{(i_{Seg}, i_{TX})}(t)$ represents the complex baseband signal of frequency segment $i_{Seg}$ and transmit chain $i_{TX}$

$f_c^{(i_{Seg})}$ represents the center frequency of the portion of the PPDU transmitted in frequency segment $i_{Seg}$. Table 21-7 (Center frequency of the portion of the PPDU transmitted in frequency segment iSeg) shows $f_c^{(i_{Seg})}$ as a function of the channel starting frequency and dot11CurrentChannelWidth (see Table 21-22 (Fields to specify VHT channels)) where $f_{\text{P20, idx}}$, $f_{\text{P40, idx}}$, and $f_{\text{P80, idx}}$ are given in Equation (21-4), Equation (21-5), Equation (21-7), and Equation (21-9), respectively.

NOTE—Transmitted signals might have different impairments such as phase offset or phase noise between the two frequency segments, which is not shown in Equation (21-11) for simplicity. See 21.3.17.3 (Transmit center frequency and symbol clock frequency tolerance).

The transmitted RF signal is derived by upconverting the complex baseband signal, which consists of several fields. The timing boundaries for the various fields are shown in Figure 21-17 (Timing boundaries

for VHT PPDU fields) where $N_{VHT\text{-}LTF}$ is the number of VHT-LTF symbols and is defined in Table 21-13 (Number of VHT-LTFs required for different numbers of space-time streams).

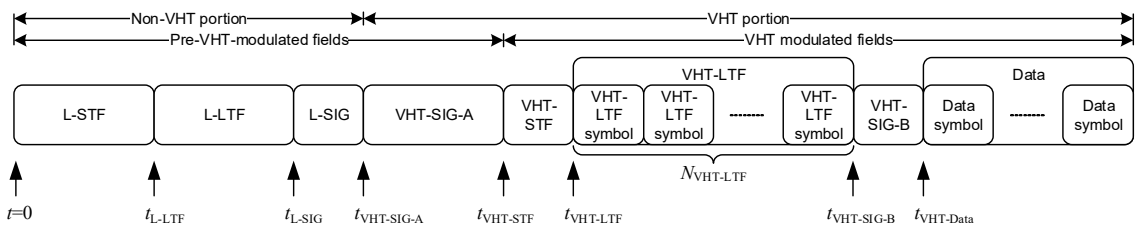

**Figure 21-17—Timing boundaries for VHT PPDU fields**

The time offset, $t_{Field}$, determines the starting time of the corresponding field relative to the start of L-STF ($t$ = 0).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The signal transmitted on frequency segment $i_{Seg}$ and transmit chain $i_{TX}$ shall be as shown in Equation (21-12).

$$\begin{aligned} r_{\text{PPDU}}^{(i_{Seg}, i_{TX})}(t) = {} & r_{\text{L-STF}}^{(i_{Seg}, i_{TX})}(t) + r_{\text{L-LTF}}^{(i_{Seg}, i_{TX})}(t - t_{\text{L-LTF}}) \\ & + r_{\text{L-SIG}}^{(i_{Seg}, i_{TX})}(t - t_{\text{L-SIG}}) + r_{\text{VHT-SIG-A}}^{(i_{Seg}, i_{TX})}(t - t_{\text{VHT-SIG-A}}) \\ & + r_{\text{VHT-STF}}^{(i_{Seg}, i_{TX})}(t - t_{\text{VHT-STF}}) + r_{\text{VHT-LTF}}^{(i_{Seg}, i_{TX})}(t - t_{\text{VHT-LTF}}) \\ & + r_{\text{VHT-SIG-B}}^{(i_{Seg}, i_{TX})}(t - t_{\text{VHT-SIG-B}}) + r_{\text{VHT-Data}}^{(i_{Seg}, i_{TX})}(t - t_{\text{VHT-Data}}) \end{aligned} \tag{21-12}$$

where

$0 \le i_{Seg} \le N_{Seg} - 1$

$1 \le i_{TX} \le N_{TX}$

$t_{\text{L-LTF}} = T_{\text{L-STF}}$

$t_{\text{L-SIG}} = t_{\text{L-LTF}} + T_{\text{L-LTF}}$

$t_{\text{VHT-SIG-A}} = t_{\text{L-SIG}} + T_{\text{L-SIG}}$

$t_{\text{VHT-STF}} = t_{\text{VHT-SIG-A}} + T_{\text{VHT-SIG-A}}$

$t_{\text{VHT-LTF}} = t_{\text{VHT-STF}} + T_{\text{VHT-STF}}$

$t_{\text{VHT-SIG-B}} = t_{\text{VHT-LTF}} + N_{VHT\text{-}LTF} T_{\text{VHT-LTF}}$

$t_{\text{VHT-Data}} = t_{\text{VHT-SIG-B}} + T_{\text{VHT-SIG-B}}$

Each field, $r_{Field}^{(i_{Seg}, i_{TX})}(t)$, is defined as the summation of one or more subfields, where each subfield is defined to be an inverse discrete Fourier transform as specified in Equation (21-13).

$$\begin{aligned} r_{\text{Subfield}}^{(i_{Seg}, i_{TX})}(t) = {} & \frac{1}{\sqrt{N_{\text{Field}}^{\text{Tone}} N_{\text{Norm}}}} w_{T_{\text{Subfield}}}(t) \sum_{k=-N_{SR}}^{N_{SR}} \sum_{u=0}^{N_{user}-1} \sum_{m=1}^{N_{STS,u}} \left[ Q_k^{(i_{Seg})} \right]_{i_{TX}, (M_u + m)} \Upsilon_{k, BW} X_{k,u}^{(i_{Seg}, m)} \\ & \exp(j 2\pi k \Delta_F (t - T_{\text{GI, Field}} - T_{\text{CS, VHT}}(M_u + m))) \end{aligned} \tag{21-13}$$

This general representation holds for all subfields. The total power of the time domain VHT modulated field signals summed over all transmit chains should not exceed the total power of the time domain pre-VHT modulated field signals summed over all transmit chains. For notational simplicity, the parameter BW is omitted from some bandwidth dependent terms.

In Equation (21-13) the following notions are used:

$N_{\text{Field}}^{\text{Tone}}$ Table 21-8 (Tone scaling factor and guard interval duration values for PHY fields) summarizes the various values of $N_{\text{Field}}^{\text{Tone}}$ as a function of bandwidth per frequency segment.

**Table 21-8—Tone scaling factor and guard interval duration values for PHY fields**

| Field | $N_{\text{Field}}^{\text{Tone}}$ as a function of bandwidth per frequency segment | | | | Guard interval duration |
|---|---|---|---|---|---|
| | 20 MHz | 40 MHz | 80 MHz | 160 MHz | |
| L-STF | 12 | 24 | 48 | 96 | — |
| L-LTF | 52 | 104 | 208 | 416 | $T_{GI2}$ |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 21-8—Tone scaling factor and guard interval duration values for PHY fields**

| | | | | | |
|---|---|---|---|---|---|
| L-SIG | 52 | 104 | 208 | 416 | $T_{GI}$ |
| VHT-SIG-A | 52 | 104 | 208 | 416 | $T_{GI}$ |
| VHT-STF | 12 | 24 | 48 | 96 | — |
| VHT-LTF | 56 | 114 | 242 | 484 | $T_{GI}$ |
| VHT-SIG-B | 56 | 114 | 242 | 484 | $T_{GI}$ |
| VHT-Data | 56 | 114 | 242 | 484 | $T_{GI}$ or $T_{GIS}$ (see NOTE 2) |
| NON_HT_DUP_OFDM-Data (see NOTE 1) | — | 104 | 208 | 416 | $T_{GI}$ |

NOTE 1—For notational convenience, NON_HT_DUP_OFDM-Data is used as a label for the Data field of a non-HT PPDU(#238) with format type NON_HT_DUP_OFDM.

NOTE 2—$T_{GI}$ denotes guard interval duration when TXVECTOR parameter GI_TYPE equals LONG_GI, $T_{GIS}$ denotes short guard interval duration when TXVECTOR parameter GI_TYPE equals SHORT_GI.

$N_{\text{Norm}}$ For pre-VHT modulated fields, $N_{\text{Norm}} = N_{TX}$. For VHT modulated fields, $N_{\text{Norm}} = N_{STS,\,total}$ where $N_{STS,\,total}$ is given in Table 21-6 (Frequently used parameters).

$w_{T_{\text{Subfield}}}(t)$ is a windowing function. An example function, $w_{T_{\text{Subfield}}}(t)$, is given in 17.3.2.5 (Mathematical conventions in the signal descriptions). $T_{\text{Subfield}}$ is $T_{L\text{-}STF}$ for L-STF, $T_{L\text{-}LTF}$ for L-LTF, $T_{L\text{-}SIG}$ for L-SIG, $T_{SYML}$ for VHT-SIG-A, $T_{VHT\text{-}STF}$ for VHT-STF, $T_{VHT\text{-}LTF}$ for VHT-LTF and $T_{VHT\text{-}SIG\text{-}B}$ for VHT-SIG-B. $T_{\text{Subfield}}$ is $T_{SYM}$ for VHT-Data, that is $T_{SYML}$ when not using the short guard interval (Short GI field of VHT-SIG-A is 0) and $T_{SYMS}$ when using the short guard interval (Short GI field of VHT-SIG-A is 1).

$Q_k^{(i_{Seg})}$ is the spatial mapping matrix for the subcarrier $k$ in frequency segment $i_{Seg}$. For pre-VHT modulated fields, $Q_k^{(i_{Seg})}$ is a column vector with $N_{TX}$ elements with element $i_{TX}$ being $\exp(-j2\pi k\Delta_F T_{CS}^{i_{TX}})$, where $T_{CS}^{i_{TX}}$ represents the cyclic shift for transmitter chain $i_{TX}$ whose values are given in Table 21-10 (Cyclic shift values for L-STF, L-LTF, L-SIG, and VHT-SIG-A fields of the PPDU). For VHT modulated fields, $Q_k^{(i_{Seg})}$ is a matrix with $N_{TX}$ rows and $N_{STS,\,total}$ columns.

$\Upsilon_{k,\,\text{BW}}$ is defined in 21.3.7.5 (Definition of tone rotation)

$\Delta_F$ is the subcarrier frequency spacing given in Table 21-5 (Timing-related constants).

$X_{k,\,u}^{(i_{Seg},\,m)}$ is the frequency domain symbol in subcarrier $k$ of user $u$ for frequency segment $i_{Seg}$ of space-time stream $m$. Some of the $X_{k,\,u}^{(i_{Seg},\,m)}$ within $-N_{SR} \le k \le N_{SR}$ have a value of 0. Examples of such cases include the DC tones, guard tones on each side of the transmit spectrum, as well as the unmodulated tones of L-STF and VHT-STF fields. Note that the multiplication matrices $A_{VHT\text{-}LTF}^{k}$ and $P_{VHT\text{-}LTF}$ are included in the calculation of $X_{k,\,u}^{(i_{Seg},\,m)}$ for the VHT-LTF and VHT-SIG-B fields, respectively.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$T_{\text{GI, Field}}$ is the guard interval duration used for each OFDM symbol in the field. For L-STF and VHT-STF, $T_{\text{GI, Field}} = T_{\text{GI}}$ but it can be omitted from Equation (21-13) due to the periodic property of L-STF and VHT-STF over every 0.8 μs. For the L-SIG, VHT-SIG-A, VHT-LTF, and VHT-SIG-B fields, $T_{\text{GI, Field}}$ is defined in the (#4177)Guard interval duration column of Table 21-8 (Tone scaling factor and guard interval duration values for PHY fields).

$T_{\text{CS, VHT}}(l)$ For pre-VHT modulated fields, $T_{\text{CS, VHT}}(l) = 0$. For VHT modulated fields, $T_{\text{CS, VHT}}(l)$ represents the cyclic shift per space-time stream, whose value is defined in Table 21-11 (Cyclic shift values for the VHT modulated fields of a PPDU).

$M_u$ is defined in Table 21-6 (Frequently used parameters).

### 21.3.7.5 Definition of tone rotation

The function $\Upsilon_{k, \text{BW}}$ is used to represent a rotation of the tones. BW in $\Upsilon_{k, \text{BW}}$ is determined by the TXVECTOR parameter CH_BANDWIDTH as defined in Table 21-9 (CH_BANDWIDTH and).

**Table 21-9—CH_BANDWIDTH and $\Upsilon_{k, \text{BW}}$**

| CH_BANDWIDTH | $\Upsilon_{k, \text{BW}}$ |
|---|---|
| CBW20 | $\Upsilon_{k, 20}$ |
| CBW40 | $\Upsilon_{k, 40}$ |
| CBW80 | $\Upsilon_{k, 80}$ |
| CBW160 | $\Upsilon_{k, 160}$ |
| CBW80+80 | $\Upsilon_{k, 80}$ per frequency segment |

For a 20 MHz PPDU transmission,

$$\Upsilon_{k, 20} = 1 \tag{21-14}$$

For a 40 MHz PPDU transmission,

$$\Upsilon_{k, 40} = \begin{cases} 1, & k < 0 \\ j, & k \geq 0 \end{cases} \tag{21-15}$$

For an 80 MHz PPDU transmission,

$$\Upsilon_{k, 80} = \begin{cases} 1, & k < -64 \\ -1, & k \geq -64 \end{cases} \tag{21-16}$$

For an 80+80 MHz PPDU transmission, each 80 MHz frequency segment shall use the phase rotation for 80 MHz PPDU transmissions as defined in Equation (21-16).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

For a 160 MHz PPDU transmission,

$$\Upsilon_{k,160} = \begin{cases} 1, & k < -192 \\ -1, & -192 \le k < 0 \\ 1, & 0 \le k < 64 \\ -1, & k \ge 64 \end{cases} \quad (21\text{-}17)$$

### 21.3.8 VHT preamble

#### 21.3.8.1 Introduction

A VHT preamble is defined to carry the required information to operate in either single user or multi-user mode. To maintain compatibility with non-VHT STAs, specific non-VHT fields are defined that can be received by non-VHT STAs compliant with Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) or Clause 19 (High Throughput (HT) PHY specification(#2297)). The non-VHT fields are followed by VHT fields specific to VHT STAs.

#### 21.3.8.2 Non-VHT portion of VHT format preamble

##### 21.3.8.2.1 Cyclic shift for pre-VHT modulated fields

The cyclic shift value $T_{CS}^{i_{TX}}$ for the L-STF, L-LTF, L-SIG, and VHT-SIG-A fields of the PPDU for transmit chain $i_{TX}$ out of a total of $N_{TX}$ are defined in Table 21-10 (Cyclic shift values for L-STF, L-LTF, L-SIG, and VHT-SIG-A fields of the PPDU).

**Table 21-10—Cyclic shift values for L-STF, L-LTF, L-SIG, and VHT-SIG-A fields of the PPDU**

| $T_{CS}^{i_{TX}}$ values for L-STF, L-LTF, L-SIG, and VHT-SIG-A fields of the PPDU | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| **Total number of transmit chains ($N_{TX}$) per frequency segment** | **Cyclic shift for transmit chain $i_{TX}$ (in units of ns)** | | | | | | | | |

#### 21.3.8.2.2 L-STF definition

The L-STF field for a 20 MHz or 40 MHz transmission is defined by Equation (19-8) and Equation (19-9), respectively, in 19.3.9.3.3 (L-STF definition). For 80 MHz, the L-STF field is defined by Equation (21-18). Note that these equations do not include the phase rotation per 20 MHz subchannel.

$$S_{-122,\,122} = \{S_{-58,\,58}, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, S_{-58,\,58}\} \tag{21-18}$$

where

$S_{-58,\,58}$ is defined in Equation (19-9)

For 160 MHz, the L-STF is defined by Equation (21-19).

$$S_{-250,\,250} = \{S_{-122,\,122}, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, S_{-122,\,122}\} \tag{21-19}$$

For an 80+80 MHz transmission, each 80 MHz frequency segment shall use the L-STF pattern for the 80 MHz ($S_{-122,\,122}$) defined in Equation (21-18).

The time domain representation of the signal on frequency segment $i_{Seg}$ and transmit chain $i_{TX}$ shall be as specified in Equation (21-20).

$$r_{\text{L-STF}}^{(i_{Seg},\,i_{TX})}(t) = \frac{1}{\sqrt{N_{\text{L-STF}}^{\text{Tone}} N_{\text{TX}}}} w_{T_{\text{L-STF}}}(t) \sum_{k=-26}^{26} \Upsilon_{k,\,\text{BW}} S_k \exp(j2\pi k \Delta_F (t - T_{CS}^{i_{TX}})) \tag{21-20}$$

where

$T_{CS}^{i_{TX}}$ represents the cyclic shift for transmit chain $i_{TX}$ with a value given in Table 21-10 (Cyclic shift values for L-STF, L-LTF, L-SIG, and VHT-SIG-A fields of the PPDU)

$\Upsilon_{k,\,\text{BW}}$ is defined by Equation (21-14), Equation (21-15), Equation (21-16). and Equation (21-17)

$N_{\text{L-STF}}^{\text{Tone}}$ has the value given in Table 21-8 (Tone scaling factor and guard interval duration values for PHY fields)

#### 21.3.8.2.3 L-LTF definition

For a 20 MHz or 40 MHz transmission, the L-LTF pattern in the VHT preamble is defined by Equation (19-11) and Equation (19-12) in 19.3.9.3.4 (L-LTF definition), respectively. For an 80 MHz transmission, the L-LTF pattern is defined by Equation (21-21). Note that these equations do not include the phase rotation per 20 MHz subchannel.

$$L_{-122,\,122} = \{L_{-58,\,58}, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, L_{-58,\,58}\} \tag{21-21}$$

where

$L_{-58,\,58}$ is defined in Equation (19-12)

For a 160 MHz transmission, the L-LTF is defined by Equation (21-22). Note that this equation does not include the phase rotations per 20 MHz subchannel.

$$L_{-250,\,250} = \{L_{-122,\,122}, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, L_{-122,\,122}\} \tag{21-22}$$

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

For an 80+80 MHz transmission, each 80 MHz frequency segment shall use the L-LTF pattern for the 80 MHz L-LTF pattern ($L_{-122,\,122}$) defined in Equation (21-21).

The time domain representation of the signal on frequency segment $i_{Seg}$ and transmit chain $i_{TX}$ shall be as defined in Equation (21-23).

$$r_{\text{L-LTF}}^{(i_{Seg},\,i_{TX})}(t) = \frac{1}{\sqrt{N_{\text{L-LTF}}^{\text{Tone}} N_{\text{TX}}}} w_{T_{\text{L-LTF}}}(t) \sum_{k=-N_{SR}}^{N_{SR}} \Upsilon_{k,\,\text{BW}} L_k \exp(j2\pi k \Delta_F (t - T_{\text{GI2}} - T_{CS}^{i_{TX}})) \quad (21\text{-}23)$$

where

$T_{CS}^{i_{TX}}$ represents the cyclic shift for transmitter chain $i_{TX}$ with a value given in Table 21-10 (Cyclic shift values for L-STF, L-LTF, L-SIG, and VHT-SIG-A fields of the PPDU)

$\Upsilon_{k,\,\text{BW}}$ is defined by Equation (21-14), Equation (21-15), Equation (21-16). and Equation (21-17)

$N_{\text{L-LTF}}^{\text{Tone}}$ has the value given in Table 21-8 (Tone scaling factor and guard interval duration values for PHY fields)

#### 21.3.8.2.4 L-SIG definition

The L-SIG field is used to communicate rate and length information. The structure of the L-SIG field is defined in Figure 17-5 (SIGNAL field bit assignment).

In a VHT PPDU, the RATE field shall be set to the value representing 6 Mb/s in the 20 MHz channel spacing column of Table 17-6 (Contents of the SIGNAL field). In a non-HT duplicate PPDU, the RATE field is defined in 17.3.4.2 (RATE field) using the L_DATARATE parameter in the TXVECTOR.

The LENGTH field shall be set to the value given by Equation (21-24).

$$\text{Length} = \frac{\text{TXTIME} - 20}{4} \times 3 - 3 \quad (21\text{-}24)$$

where

TXTIME (in μs) is defined in 21.4.3 (TXTIME and PSDU_LENGTH calculation)

The LSB of the binary expression of the Length value shall be mapped to B5. In a non-HT duplicate PPDU, the LENGTH field is defined in 17.3.4.3 (PHY LENGTH field) using the L_LENGTH parameter in the TXVECTOR.

The Reserved (R) field shall be set to 0 (#455)on transmit and ignored on receive.

The Parity (P) field has the even parity of bits 0-16.

The SIGNAL TAIL field shall be set to 0.

The L-SIG field shall be encoded, interleaved, and mapped following the steps described in 17.3.5.6 (Convolutional encoder), 17.3.5.7 (Data interleaving), and 17.3.5.8 (Subcarrier modulation mapping). The stream of 48 complex numbers generated by these steps is denoted by $d_k, k = 0, \ldots, 47$. Pilots shall be inserted as described in 17.3.5.9 (Pilot subcarriers). The time domain waveform of the L-SIG field shall be as given by Equation (21-25).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$r_{\text{L-SIG}}^{(i_{Seg}, i_{TX})}(t) = \frac{1}{\sqrt{N_{\text{L-SIG}}^{\text{Tone}} N_{TX}}} w_{T_{\text{L-SIG}}}(t) \cdot \sum_{i_{\text{BW}}=0}^{N_{20\text{MHz}}-1} \sum_{k=-26}^{26} \left( \Upsilon_{(k-K_{\text{Shift}}(i_{\text{BW}})),\,\text{BW}}(D_{k,20} + p_0 P_k) \cdot \exp(j2\pi(k - K_{\text{Shift}}(i_{\text{BW}}))\Delta_F(t - T_{GI} - T_{CS}^{i_{TX}})) \right) \quad (21\text{-}25)$$

where

$N_{20\text{MHz}}$ is defined in 21.3.7.3 (Channel frequencies)

$K_{\text{Shift}}(i) = (N_{20\text{MHz}} - 1 - 2i) \cdot 32$

$$D_{k,20} = \begin{cases} 0, k = 0, \pm 7, \pm 21 \\ d_{M_{20}^r(k)}, \text{otherwise} \end{cases} \quad (21\text{-}26)$$

$$M_{20}^r(k) = \begin{cases} k + 26, -26 \le k \le -22 \\ k + 25, -20 \le k \le -8 \\ k + 24, -6 \le k \le -1 \\ k + 23, 1 \le k \le 6 \\ k + 22, 8 \le k \le 20 \\ k + 21, 22 \le k \le 26 \end{cases} \quad (21\text{-}27)$$

$P_k$ is defined in 17.3.5.10 (OFDM modulation)

$p_0$ is the first pilot value in the sequence defined in 17.3.5.10 (OFDM modulation)

$N_{\text{L-SIG}}^{\text{Tone}}$ has the value given in Table 21-8 (Tone scaling factor and guard interval duration values for PHY fields)

$\Upsilon_{k,\text{BW}}$ is defined in Equation (21-14), Equation (21-15), Equation (21-16). and Equation (21-17)

$T_{CS}^{i_{TX}}$ represents the cyclic shift for transmitter chain $i_{TX}$ with a value given in Table 21-10 (Cyclic shift values for L-STF, L-LTF, L-SIG, and VHT-SIG-A fields of the PPDU)

NOTE—$M_{20}^r(k)$ is a "reverse" function of the function $M(k)$ defined in 17.3.5.10 (OFDM modulation).

### 21.3.8.3 VHT portion of VHT format preamble

#### 21.3.8.3.1 Introduction

The VHT portion of the VHT format preamble consists of the VHT-SIG-A, VHT-STF, VHT-LTF, and VHT-SIG-B fields.

All numeric fields are transmitted in unsigned format, LSB first.

#### 21.3.8.3.2 Cyclic shift for VHT modulated fields

The cyclic shift values defined in this subclause apply to the VHT-STF, VHT-LTF, VHT-SIG-B, and Data fields of the VHT PPDU. The cyclic shift values defined in 21.3.8.2.1 (Cyclic shift for pre-VHT modulated fields) apply to VHT-SIG-A field in the VHT format preamble.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Throughout the VHT modulated fields of the preamble, cyclic shifts are applied to prevent unintended beamforming when correlated signals are transmitted in multiple space-time streams. The same cyclic shift is also applied to these streams during the transmission of the Data field of the VHT PPDU. The cyclic shift value $T_{CS,VHT}(n)$ for the VHT modulated fields for space-time stream $n$ out of $N_{STS,total}$ total space-time streams is shown in Table 21-11 (Cyclic shift values for the VHT modulated fields of a PPDU).

**Table 21-11—Cyclic shift values for the VHT modulated fields of a PPDU**

| $T_{CS,VHT}(n)$ values for the VHT modulated fields of a PPDU | | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| Total number of space-time streams ($N_{STS,total}$) | Cyclic shift for space-time stream $n$ (ns) | | | | | | | |
| | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| 1 | 0 | – | – | – | – | – | – | – |
| 2 | 0 | –400 | – | – | – | – | – | – |
| 3 | 0 | –400 | –200 | – | – | – | – | – |
| 4 | 0 | –400 | –200 | –600 | – | – | – | – |
| 5 | 0 | –400 | –200 | –600 | –350 | – | – | – |
| 6 | 0 | –400 | –200 | –600 | –350 | –650 | – | – |
| 7 | 0 | –400 | –200 | –600 | –350 | –650 | –100 | – |
| 8 | 0 | –400 | –200 | –600 | –350 | –650 | –100 | –750 |

In a VHT MU PPDU, the cyclic shifts are applied sequentially across the space-time streams as follows: the cyclic shift of the space-time stream number $m$ of user $u$ is given by $T_{CS,VHT}(M_u + m)$ of the row corresponding to $N_{STS,total}$ in Table 21-11 (Cyclic shift values for the VHT modulated fields of a PPDU).

### 21.3.8.3.3 VHT-SIG-A definition

The VHT-SIG-A field carries information required to interpret VHT PPDUs. The structure of the VHT-SIG-A field for the first part (VHT-SIG-A1) is shown in Figure 21-18 (VHT-SIG-A1 structure) and for the second part (VHT-SIG-A2) is shown in Figure 21-19 (VHT-SIG-A2 structure).

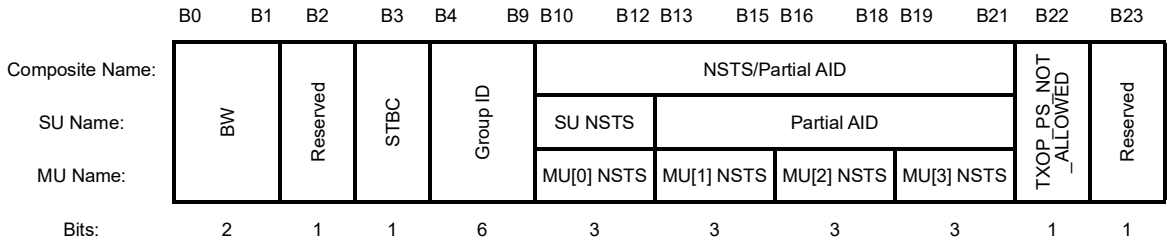

**Figure 21-18—VHT-SIG-A1 structure**

The VHT-SIG-A field contains the fields listed in Table 21-12 (Fields in the VHT-SIG-A field). The mapping of the fields is also described in Table 21-12 (Fields in the VHT-SIG-A field). Note that the mapping of the STBC field, the NSTS/Partial AID field, the SU/MU[0] Coding field, the SU VHT-MCS/MU[1-3] Coding field, and the Beamformed field is different for VHT SU and MU PPDUs.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

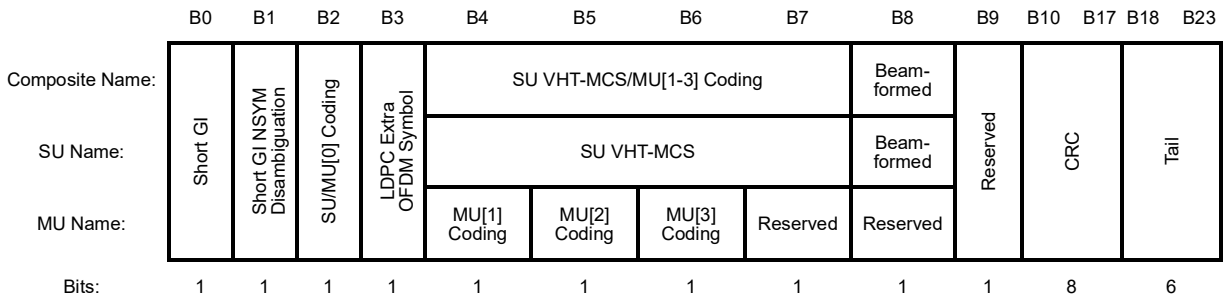

**Figure 21-19—VHT-SIG-A2 structure**

The VHT-SIG-A field is composed of two parts, VHT-SIG-A1 and VHT-SIG-A2, each containing 24 data bits, as shown in Table 21-12 (Fields in the VHT-SIG-A field). VHT-SIG-A1 is transmitted before VHT-SIG-A2. The VHT-SIG-A symbols shall be BCC encoded at rate, R = 1/2, be interleaved, be mapped to a BPSK constellation, and have pilots inserted following the steps described in 17.3.5.6 (Convolutional encoder), 17.3.5.7 (Data interleaving), 17.3.5.8 (Subcarrier modulation mapping), and 17.3.5.9 (Pilot subcarriers), respectively. The first and second half of the stream of 96 complex numbers generated by these steps (before pilot insertion) is divided into two groups of 48 complex numbers $d_{k,n}, k = 0 \ldots 47$, where $n = 0, 1$, respectively. The first 48 complex numbers form the first symbol of VHT-SIG-A and the second 48 complex numbers form the second symbol of VHT-SIG-A after rotating by 90° counter-clockwise relative to the first symbol. The first symbol of VHT-SIG-A, which does not have the 90° rotation, is used to differentiate VHT PPDUs from HT PPDUs, while the second symbol of VHT-SIG-A, which has the 90° rotation, is used to differentiate VHT PPDUs from non-HT PPDUs.

The time domain waveform for the VHT-SIG-A field in a VHT PPDU shall be as specified in Equation (21-28).

$$r_{\text{VHT-SIG-A}}^{(i_{Seg}, i_{TX})}(t) = \frac{1}{\sqrt{N_{\text{VHT-SIG-A}}^{\text{Tone}} N_{\text{TX}}}} \sum_{n=0}^{1} w_{T_{SYML}}(t - nT_{SYML}) \cdot \sum_{i_{\text{BW}}=0}^{N_{20\text{MHz}}-1} \left( \sum_{k=-26}^{26} \Upsilon_{(k-K_{\text{Shift}}(i_{\text{BW}})),\,\text{BW}} (j^n D_{k,n,20} + p_{n+1} P_k) \cdot \exp(j2\pi(k - K_{\text{Shift}}(i_{\text{BW}}))\Delta_F(t - nT_{SYML} - T_{\text{GI}} - T_{CS}^{j_{TX}})) \right) \quad (21\text{-}28)$$

where

$N_{20\text{MHz}}$ and $K_{\text{Shift}}(i)$ are defined in 21.3.8.2.4 (L-SIG definition)

$$D_{k,n,20} = \begin{cases} 0, k = 0, \pm 7, \pm 21 \\ d_{M_{20}^r(k),n}, \text{otherwise} \end{cases}$$

$M_{20}^r(k)$ is defined in Equation (21-27)

$P_k$ and $p_n$ are defined in 17.3.5.10 (OFDM modulation)

$N_{\text{VHT-SIG-A}}^{\text{Tone}}$ has the value given in Table 21-8 (Tone scaling factor and guard interval duration values for PHY fields)

**Table 21-12—Fields in the VHT-SIG-A field**

| Two parts of VHT-SIG-A | Bit | Field | Description |
|---|---|---|---|
| VHT-SIG-A1 | B0-B1 | BW | Set to 0 for 20 MHz, 1 for 40 MHz, 2 for 80 MHz, and 3 for 160 MHz and 80+80 MHz |
| | B2 | Reserved | Reserved. Set to 1(#455) on transmit. See 21.3.20 (PHY receive procedure) for behavior on receive. |
| | B3 | STBC | For a VHT SU PPDU:<br>Set to 1 if space-time block coding (see 21.3.10.9.4 (Space-time block coding)) is used and set to 0 otherwise.<br>For a VHT MU PPDU:<br>Set to 0. |
| | B4-B9 | Group ID | A value of 0 or 63 indicates a VHT SU PPDU; otherwise, indicates a VHT MU PPDU.<br>(See TXVECTOR parameter GROUP_ID.) |
| | B10-B21 | NSTS/Partial AID | For a VHT MU PPDU: NSTS is divided into 4 user positions of 3 bits each. User position $p$, where $0 \le p \le 3$, uses bits B($10 + 3p$) to B($12 + 3p$). The number of space-time streams for user $u$ are indicated at user position $p$ = USER_POSITION[$u$] where $u$ = 0, 1, …, NUM_USERS – 1 and the notation A[$b$] denotes the value of array A at index $b$. Zero space-time streams are indicated at positions not listed in the USER_POSITION array. Each user position is set as follows:<br>Set to 0 for 0 space-time streams<br>Set to 1 for 1 space-time stream<br>Set to 2 for 2 space-time streams<br>Set to 3 for 3 space-time streams<br>Set to 4 for 4 space-time streams<br>Values 5-7 are reserved<br>For a VHT SU PPDU:<br>B10-B12<br>Set to 0 for 1 space-time stream<br>Set to 1 for 2 space-time streams<br>Set to 2 for 3 space-time streams<br>Set to 3 for 4 space-time streams<br>Set to 4 for 5 space-time streams<br>Set to 5 for 6 space-time streams<br>Set to 6 for 7 space-time streams<br>Set to 7 for 8 space-time streams<br>B13-B21<br>Partial AID: Partial AID provides an abbreviated indication of the intended recipient(s) of the PSDU (see TXVECTOR parameter PARTIAL_AID and 10.19 (Group ID and partial AID in VHT and CMMG PPDUs)). |
| | B22 | TXOP_PS_NOT_ALLOWED | Set to 0 by VHT AP if it allows non-AP VHT STAs in TXOP power save mode to enter doze state during a TXOP. Set to 1 otherwise.<br><br>The bit is reserved and set to 1 in VHT PPDUs transmitted by a non-AP VHT STA. |
| | B23 | Reserved | (#455)Reserved. Set to 1 on transmit. See 21.3.20 (PHY receive procedure) for behavior on receive. |

**Table 21-12—Fields in the VHT-SIG-A field *(continued)***

| Two parts of VHT-SIG-A | Bit | Field | Description |
|---|---|---|---|
| VHT-SIG-A2 | B0 | Short GI | Set to 0 if short guard interval is not used in the Data field. Set to 1 if short guard interval is used in the Data field. |
| | B1 | Short GI $N_{SYM}$ Disambiguation | Set to 1 if short guard interval is used and $N_{SYM}$ mod 10 = 9; otherwise, set to 0. $N_{SYM}$ is defined in 21.4.3 (TXTIME and PSDU_LENGTH calculation). |
| | B2 | SU/MU[0] Coding | For a VHT SU PPDU, B2 is set to 0 for BCC, 1 for LDPC<br>For a VHT MU PPDU, if the MU[0] NSTS field is nonzero, then B2 indicates the coding used for user $u$ with USER_POSITION[$u$] = 0; set to 0 for BCC and 1 for LDPC. If the MU[0] NSTS field is 0, then this field is reserved and set to 1. |
| | B3 | LDPC Extra OFDM Symbol | Set to 1 if the LDPC PPDU encoding process (if an SU PPDU), or at least one LDPC user's PPDU encoding process (if a VHT MU PPDU), results in an extra OFDM symbol (or symbols) as described in 21.3.10.5.4 (LDPC coding) and 21.3.10.5.5 (Encoding process for VHT MU PPDUs). Set to 0 otherwise. |
| | B4-B7 | SU VHT-MCS/MU[1-3] Coding | For a VHT SU PPDU:<br>VHT-MCS index<br>For a VHT MU PPDU:<br>If the MU[1] NSTS field is nonzero, then B4 indicates coding for user $u$ with USER_POSITION[$u$] = 1: set to 0 for BCC, 1 for LDPC. If the MU[1] NSTS field is 0, then B4 is reserved and set to 1.<br>If the MU[2] NSTS field is nonzero, then B5 indicates coding for user $u$ with USER_POSITION[$u$] = 2: set to 0 for BCC, 1 for LDPC. If the MU[2] NSTS field is 0, then B5 is reserved and set to 1.<br>If the MU[3] NSTS field is nonzero, then B6 indicates coding for user $u$ with USER_POSITION[$u$] = 3: set to 0 for BCC, 1 for LDPC. If the MU[3] NSTS field is 0, then B6 is reserved and set to 1.<br>B7 is reserved and set to 1 |
| | B8 | Beamformed | For a VHT SU PPDU:<br>Set to 1 if a beamforming steering matrix is applied to the waveform in an SU transmission, set to 0 otherwise.<br>For a VHT MU PPDU:<br>Reserved and set to 1<br><br>NOTE—If equal to 1 smoothing is not recommended. |
| | B9 | Reserved | (#455)Reserved. Set to 1 on transmit. See 21.3.20 (PHY receive procedure) for behavior on receive. |
| | B10-B17 | CRC | CRC calculated as in 19.3.9.4.4 (CRC calculation for HT-SIG) with c7 in B10. Bits 0-23 of HT-SIG1 and bits 0-9 of HT-SIG2 are replaced by bits 0-23 of VHT-SIG-A1 and bits 0-9 of VHT-SIG-A2, respectively. |
| | B18-B23 | Tail | Used to terminate the trellis of the convolutional decoder. Set to 0. |

This is an unapproved IEEE Standards Draft, subject to change.

$\Upsilon_{k,\mathrm{BW}}$ is defined in Equation (21-14), Equation (21-15), Equation (21-16). and Equation (21-17)

$T_{CS}^{i_{TX}}$ represents the cyclic shift for transmitter chain $i_{TX}$ with a value given in Table 21-10 (Cyclic shift values for L-STF, L-LTF, L-SIG, and VHT-SIG-A fields of the PPDU)

NOTE—This definition results in a QBPSK modulation on the second symbol of VHT-SIG-A where the constellation of the data tones is rotated by 90º counter-clockwise relative to the first symbol of VHT-SIG-A and relative to the (#3815)L-SIG in VHT PPDUs (Figure 21-20 (Data tone constellation in the VHT PPDU pre-VHT modulated fields)). In VHT PPDUs, the VHT-SIG-A is transmitted with the same number of subcarriers and the same cyclic shifts as the preceding non-HT portion of the preamble.

For an 80+80 MHz transmission, each frequency segment shall use the time domain waveform for 80 MHz transmissions.

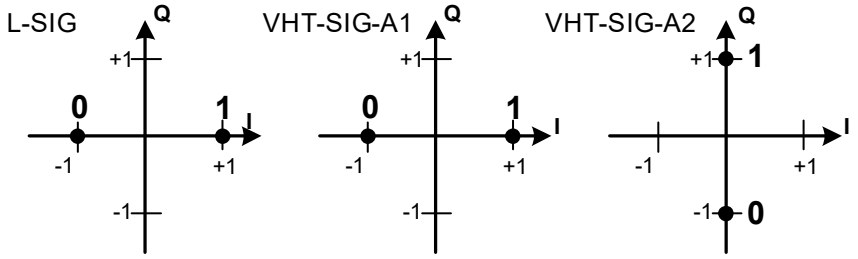

**Figure 21-20—Data tone constellation in the VHT PPDU pre-VHT modulated fields**

### 21.3.8.3.4 VHT-STF definition

The main purpose of the VHT-STF field is to improve automatic gain control estimation in a MIMO transmission. The duration of the VHT-STF field is $T_{VHT\text{-}STF}$ regardless of the Short GI field setting in VHT-SIG-A. The frequency domain sequence used to construct the VHT-STF field in a 20 MHz transmission is identical to the HT-STF field. In a 40 MHz and an 80 MHz transmission, the VHT-STF field is constructed from the 20 MHz version by frequency shifting a duplicate of it to each 20 MHz subchannel and applying appropriate phase rotations per 20 MHz subchannel.

For a 20 MHz transmission, the frequency domain sequence is given by Equation (21-29).

$$VHTS_{-28,28} = HTS_{-28,28} \tag{21-29}$$

where

$HTS_{-28,28}$ is defined in Equation (19-19)

For a 40 MHz transmission, the frequency domain sequence is given by Equation (21-30).

$$VHTS_{-58,58} = HTS_{-58,58} \tag{21-30}$$

where

$HTS_{-58,58}$ is defined in Equation (19-20)

For an 80 MHz transmission, the frequency domain sequence is given by Equation (21-31).

$$VHTS_{-122,122} = \{VHTS_{-58,58}, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, VHTS_{-58,58}\} \tag{21-31}$$

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

For a 160 MHz transmission, the frequency domain sequence is given by Equation (21-32).

$$VHTS_{-250,250} = \{VHTS_{-122,122}, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, VHTS_{-122,122}\} \quad (21\text{-}32)$$

NOTE—Equation (21-29), Equation (21-30), Equation (21-31), and Equation (21-32) do not show the phase rotation per 20 MHz subchannel.

For an 80+80 MHz transmission, each 80 MHz frequency segment shall use the VHT-STF pattern for the 80 MHz ($VHTS_{-122,122}$) defined in Equation (21-31).

The time domain representation of the signal on frequency segment $i_{Seg}$ and transmit chain $i_{TX}$ shall be as specified in Equation (21-33).

$$r_{\text{VHT-STF}}^{(i_{Seg}, i_{TX})}(t) = \frac{1}{\sqrt{N_{\text{VHT-STF}}^{\text{Tone}} N_{STS,total}}} w_{T_{\text{VHT-STF}}}(t) \cdot \sum_{k=-N_{SR}}^{N_{SR}} \sum_{u=0}^{N_{user}-1} \sum_{m=1}^{N_{STS,u}} \left( \left[ Q_k^{(i_{Seg})} \right]_{i_{TX},(M_u+m)} \Upsilon_{k,\text{BW}} VHTS_k \cdot \exp(j2\pi k \Delta_F (t - T_{\text{CS,VHT}}(M_u+m))) \right) \quad (21\text{-}33)$$

where

$N_{\text{VHT-STF}}^{\text{Tone}}$ has the value given in Table 21-8 (Tone scaling factor and guard interval duration values for PHY fields)

$T_{\text{CS,VHT}}(n)$ is given in Table 21-11 (Cyclic shift values for the VHT modulated fields of a PPDU)

$Q_k^{(i_{Seg})}$ is defined in 21.3.10.11.1 (Transmission in VHT format)

$\Upsilon_{k,\text{BW}}$ is defined in Equation (21-14), Equation (21-15), Equation (21-16). and Equation (21-17)

### 21.3.8.3.5 VHT-LTF definition

The VHT Long Training field (VHT-LTF) field provides a means for the receiver to estimate the MIMO channel between the set of constellation mapper outputs (or, if STBC is applied, the STBC encoder outputs) and the receive chains. The transmitter provides training for $N_{STS,total}$ space-time streams (spatial mapper inputs) used for the transmission of the PSDU(s). For each tone, the MIMO channel that can be estimated is an $N_{RX} \times N_{STS,total}$ matrix. A VHT transmission has a preamble that contains VHT-LTF symbols, where the data tones of each VHT-LTF symbol are multiplied by entries belonging to a matrix $P_{VHT\text{-}LTF}$, to enable channel estimation at the receiver. The pilot tones of each VHT-LTF symbol are multiplied by the entries of a matrix $R_{VHT\text{-}LTF}$ defined in the following text. The multiplication of the pilot tones in the VHT-LTF symbol by the $R_{VHT\text{-}LTF}$ matrix instead of the $P_{VHT\text{-}LTF}$ matrix allows receivers to track phase and frequency offset during MIMO channel estimation using the VHT-LTF. The number of VHT-LTF symbols, $N_{VHT\text{-}LTF}$, is a function of the total number of space-time streams $N_{STS,total}$ as shown in Table 21-13 (Number of VHT-

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

LTFs required for different numbers of space-time streams). As a result the VHT-LTF field consists of one, two, four, six or eight symbols.

**Table 21-13—Number of VHT-LTFs required for different numbers of space-time streams**

| $N_{STS,total}$ | $N_{VHT\text{-}LTF}$ |
|---|---|
| 1 | 1 |
| 2 | 2 |
| 3 | 4 |
| 4 | 4 |
| 5 | 6 |
| 6 | 6 |
| 7 | 8 |
| 8 | 8 |

Let $LTF_{\text{left}}$ and $LTF_{\text{right}}$ be the sequences defined in Equation (21-34) and Equation (21-35), respectively.

$$LTF_{\text{left}} = \{1, 1, -1, -1, 1, 1, -1, 1, -1, 1, 1, 1, 1, 1, 1, -1, -1, 1, 1, -1, 1, -1, 1, 1, 1, 1\} \quad (21\text{-}34)$$

$$LTF_{\text{right}} = \{1, -1, -1, 1, 1, -1, 1, -1, 1, -1, -1, -1, -1, -1, -1, 1, 1, -1, -1, 1, -1, 1, -1, 1, 1, 1, 1, 1\} \quad (21\text{-}35)$$

NOTE 1—$LTF_{\text{left}}$ is identical to the leftmost 26 elements of Equation (17-8), and $LTF_{\text{right}}$ is identical to the rightmost 26 elements of Equation (17-8).

In a 20 MHz transmission, the VHT-LTF sequence transmitted is given by Equation (21-36).

$$\begin{aligned} VHT\text{-}LTF_{-28,28} &= \{1, 1, LTF_{\text{left}}, 0, LTF_{\text{right}}, -1, -1\} \\ &= HT\text{-}LTF_{-28,28} \end{aligned} \quad (21\text{-}36)$$

where

$HT\text{-}LTF_{-28,28}$ is defined in Equation (19-23)

In a 40 MHz transmission, the VHT-LTF sequence transmitted is given by Equation (21-37).

$$\begin{aligned} VHT\text{-}LTF_{-58,58} &= \{LTF_{\text{left}}, 1, LTF_{\text{right}}, -1, -1, -1, 1, 0, 0, 0, -1, 1, 1, -1, LTF_{\text{left}}, 1, LTF_{\text{right}}\} \\ &= HT\text{-}LTF_{-58,58} \end{aligned} \quad (21\text{-}37)$$

where

$HT\text{-}LTF_{-58,58}$ is defined in Equation (19-24)

In an 80 MHz transmission, the VHT-LTF sequence transmitted is given by Equation (21-38).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$VHT\text{-}LTF_{-122,\,122} = \{LTF_{\text{left}}, 1, LTF_{\text{right}}, -1, -1, -1, 1, 1, -1, 1, -1, 1, 1, -1, LTF_{\text{left}}, 1, LTF_{\text{right}}, 1, -1, 1, -1, 0, 0, 0, 1, -1, -1, 1, LTF_{\text{left}}, 1, LTF_{\text{right}}, -1, -1, -1, 1, 1, -1, 1, -1, 1, 1, -1, LTF_{\text{left}}, 1, LTF_{\text{right}}\} \quad (21\text{-}38)$$

In a 160 MHz transmission, the VHT-LTF sequence transmitted is given by Equation (21-39).

$$VHT\text{-}LTF_{-250,\,250} = \{VHT\text{-}LTF_{-122,\,122}, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, VHT\text{-}LTF_{-122,\,122}\} \quad (21\text{-}39)$$

where

$VHT\text{-}LTF_{-122,\,122}$ is given in Equation (21-38)

NOTE 2—Equation (21-36), Equation (21-37), Equation (21-38), and Equation (21-39) do not show the phase rotation per 20 MHz subchannel.

For a 80+80 MHz transmission, each 80 MHz frequency segment shall use the 80 MHz VHT-LTF sequence, $VHT\text{-}LTF_{-122,\,122}$, defined in Equation (21-38).

The generation of the time domain VHT-LTF symbols per frequency segment is shown in Figure 21-21 (Generation of VHT-LTF symbols per frequency segment) where $A^{k}_{VHT\text{-}LTF}$ is given in Equation (21-40).

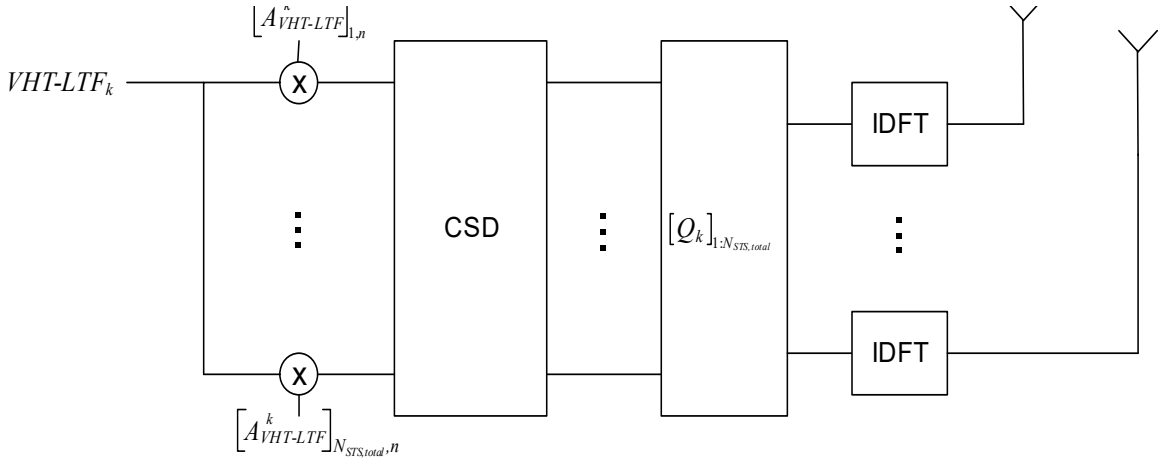

**Figure 21-21—Generation of VHT-LTF symbols per frequency segment**

$$A^{k}_{VHT\text{-}LTF} = \begin{cases} R_{VHT\text{-}LTF}, \text{ if } k \in K_{\text{Pilot}} \\ P_{VHT\text{-}LTF}, \text{ otherwise} \end{cases} \quad (21\text{-}40)$$

where

$K_{\text{Pilot}}$ is the set of subcarrier indices for the pilot tones:

For a 20 MHz transmission, $K_{\text{Pilot}} = \{\pm 7, \pm 21\}$.

For a 40 MHz transmission, $K_{\text{Pilot}} = \{\pm 11, \pm 25, \pm 53\}$.

For an 80 MHz transmission, $K_{\text{Pilot}} = \{\pm 11, \pm 39, \pm 75, \pm 103\}$.

For a 160 MHz transmission,
$K_{\text{Pilot}} = \{\pm 25, \pm 53, \pm 89, \pm 117, \pm 139, \pm 167, \pm 203, \pm 231\}$.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

For an 80+80 MHz transmission, $K_{\text{Pilot}}$ for each 80 MHz frequency segment is identical to $K_{\text{Pilot}}$ for an 80 MHz transmission.

$R_{VHT\text{-}LTF}$ is a $N_{VHT\text{-}LTF} \times N_{VHT\text{-}LTF}$ matrix whose elements are defined in Equation (21-41).

$$\left[R_{VHT\text{-}LTF}\right]_{m,\,n} = \left[P_{VHT\text{-}LTF}\right]_{1,\,n},\ 1 \le m, n \le N_{VHT\text{-}LTF} \tag{21-41}$$

$P_{VHT\text{-}LTF}$ is defined in (#8068)Equation (21-43)

The time domain representation of the waveform transmitted on frequency segment $i_{Seg}$ of transmit chain $i_{TX}$ shall be as described by Equation (21-42).

$$r^{(i_{Seg},\,i_{TX})}_{\text{VHT-LTF}}(t) = \frac{1}{\sqrt{N^{\text{Tone}}_{\text{VHT-LTF}} N_{STS,\,total}}} \sum_{n=0}^{N_{VHT\text{-}LTF}-1} w_{T_{\text{VHT-LTF}}}(t - nT_{\text{VHT-LTF}}) \cdot \sum_{k=-N_{SR}}^{N_{SR}} \sum_{u=0}^{N_{user}-1} \sum_{m=1}^{N_{STS,u}} \left( \begin{array}{l} \left[Q_k^{(i_{Seg})}\right]_{i_{TX},\,(M_u+m)} \Upsilon_{k,\,\text{BW}} \left[A^k_{VHT\text{-}LTF}\right]_{(M_u+m),\,(n+1)} VHT\text{-}LTF_k \\ \quad \cdot \exp(j2\pi k\Delta_F(t - nT_{\text{VHT-LTF}} - T_{\text{GI}} - T_{\text{CS,VHT}}(M_u+m))) \end{array} \right) \tag{21-42}$$

where

$N^{\text{Tone}}_{\text{VHT-LTF}}$ has the value given in Table 21-8 (Tone scaling factor and guard interval duration values for PHY fields)

$T_{\text{CS,VHT}}(n)$ is given in Table 21-11 (Cyclic shift values for the VHT modulated fields of a PPDU)

$Q_k^{(i_{Seg})}$ is defined in 21.3.10.11.1 (Transmission in VHT format)

$\Upsilon_{k,\,\text{BW}}$ is defined in Equation (21-14), Equation (21-15), Equation (21-16). and Equation (21-17)

$A^k_{VHT\text{-}LTF}$ is defined in Equation (21-40)

$$P_{VHT\text{-}LTF} = \begin{cases} P_{4\times 4},\ N_{STS,\,total} \le 4 \\ P_{6\times 6},\ N_{STS,\,total} = 5, 6 \\ P_{8\times 8},\ N_{STS,\,total} = 7, 8 \end{cases} \tag{21-43}$$

where

$P_{4\times 4}$ is defined in Equation (19-27)

The VHT-LTF mapping matrix for six VHT-LTF symbols, $P_{6\times 6}$, is defined in Equation (21-44).

$$P_{6\times 6} = \begin{bmatrix} 1 & -1 & 1 & 1 & 1 & -1 \\ 1 & -w^1 & w^2 & w^3 & w^4 & -w^5 \\ 1 & -w^2 & w^4 & w^6 & w^8 & -w^{10} \\ 1 & -w^3 & w^6 & w^9 & w^{12} & -w^{15} \\ 1 & -w^4 & w^8 & w^{12} & w^{16} & -w^{20} \\ 1 & -w^5 & w^{10} & w^{15} & w^{20} & -w^{25} \end{bmatrix} \tag{21-44}$$

where

$w = \exp(-j2\pi/6)$

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The VHT-LTF mapping matrix for eight VHT-LTF symbols, $P_{8\times 8}$, is defined in Equation (21-45).

$$P_{8\times 8} = \begin{bmatrix} P_{4\times 4} & P_{4\times 4} \\ P_{4\times 4} & -P_{4\times 4} \end{bmatrix} \quad (21\text{-}45)$$

where

$P_{4\times 4}$ is defined in Equation (19-27)

As defined in Table 21-5 (Timing-related constants), the duration of each VHT-LTF symbol is $T_{\text{VHT-LTF}}$ regardless of the Short GI field setting in VHT-SIG-A.

#### 21.3.8.3.6 VHT-SIG-B definition

The VHT-SIG-B field is one symbol and contains 26 bits in a 20 MHz PPDU, 27 bits in a 40 MHz PPDU, and 29 bits in 80 MHz, 160 MHz, and 80+80 MHz PPDUs for each user. The fields in the VHT-SIG-B field are listed in Table 21-14 (Fields in the VHT-SIG-B field). For example, for an MU transmission using VHT-MCS 5 (0101 in binary) in 20 MHz bandwidth, the VHT-SIG-B field bits are set as follows: B16=1, B17=0, B18=1, and B19=0.

**Table 21-14—Fields in the VHT-SIG-B field**

| Field | VHT MU PPDU Allocation (bits) | | | VHT SU PPDU Allocation (bits) | | | Description |
|---|---|---|---|---|---|---|---|
| | 20 MHz | 40 MHz | 80 MHz, 160 MHz, 80+80 MHz | 20 MHz | 40 MHz | 80 MHz, 160 MHz, 80+80 MHz | |
| VHT-SIG-B Length | B0-B15 (16) | B0-B16 (17) | B0-B18 (19) | B0-B16 (17) | B0-B18 (19) | B0-B20 (21) | Length of A-MPDU pre-EOF padding in units of four octets |
| VHT-MCS | B16-B19 (4) | B17-B20 (4) | B19-B22 (4) | N/A | N/A | N/A | |
| Reserved | N/A | N/A | N/A | B17-B19 (3) | B19-B20 (2) | B21-B22 (2) | (#455)Set to all 1s on transmit and ignored on receive. |

NOTE—Due to the limitations in the maximum A-MPDU length, B19-20 are always 0 for an 80 MHz, 160 MHz, and 80+80 MHz VHT SU PPDU.

The VHT-SIG-B Length field for user $u$ shall be set using Equation (21-46).

$$\text{VHT-SIG-B Length (for user } u \text{ in units of 4 octets)} = \left\lceil \frac{\text{APEP\_LENGTH}_u}{4} \right\rceil \quad (21\text{-}46)$$

where

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

APEP_LENGTH$_u$ is the TXVECTOR parameter APEP_LENGTH for user $u$ (in octets)

The VHT-SIG-B bits for an NDP transmission in various channel widths shall be set as defined in Table 21-15 (VHT-SIG-B bits (before Tail field) in NDP for various channel widths).

**Table 21-15—VHT-SIG-B bits (before Tail field) in NDP for various channel widths**

| Channel width | B0 | B1 | B2 | B3 | B4 | B5 | B6 | B7 | B8 | B9 | B10 | B11 | B12 | B13 | B14 | B15 | B16 | B17 | B18 | B19 | B20 | B21 | B22 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| 20 MHz | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 0 | 1 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 1 | 0 | – | – | – |
| 40 MHz | 1 | 0 | 1 | 0 | 0 | 1 | 0 | 1 | 1 | 0 | 1 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 1 | 1 | — | – |
| 80 MHz, 160 MHz, or 80+80 MHz | 0 | 1 | 0 | 1 | 0 | 0 | 1 | 1 | 0 | 0 | 1 | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 0 | 0 | 1 | 0 |

For a 40 MHz transmission, the VHT-SIG-B bits are repeated twice. For an 80 MHz transmission, the VHT-SIG-B bits are repeated four times and a pad bit appended that is set to 0. For a 160 MHz and 80+80 MHz transmission, the VHT-SIG-B bits are first repeated four times and a pad bit appended that is set to 0 as in the 80 MHz transmission. Then, the resulting 117 bits are repeated again to fill the 234 available bits. The repetition of the VHT-SIG-B bits for various channel width PPDUs is shown in Figure 21-22 (VHT-SIG-B bits in 20 MHz, 40 MHz, 80 MHz, 160 MHz, and 80+80 MHz transmissions).

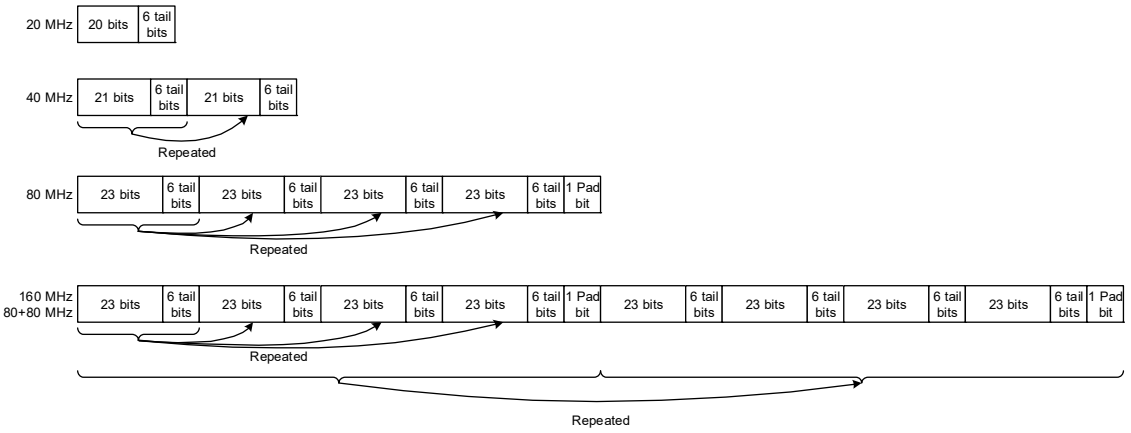

**Figure 21-22—VHT-SIG-B bits in 20 MHz, 40 MHz, 80 MHz, 160 MHz, and 80+80 MHz transmissions**

For each user $u$, the VHT-SIG-B field shall be BCC encoded at rate R = 1/2 as defined in 17.3.5.6 (Convolutional encoder), be segment parsed as defined in 21.3.10.7 (Segment parser), be interleaved as defined in 21.3.10.8 (BCC interleaver), be mapped to a BPSK constellation as defined in 17.3.5.8 (Subcarrier modulation mapping), be segment deparsed as defined in 21.3.10.9.3 (Segment deparser), and (#20)have pilots inserted following the steps described in 21.3.10.10 (Pilot subcarriers). The data subcarriers of the VHT-SIG-B field constellation points are mapped to $N_{STS,u}$ space-time streams by the user-specific elements of the first column of the $P_{VHT\text{-}LTF}$ matrix, which is defined in 21.3.8.3.5 (VHT-LTF definition). The total number of data subcarriers and pilot subcarriers are the same as in the Data field. The space-time streams per each frequency segment are input into the CSD block, which is defined in Table 21-11 (Cyclic shift values for the VHT modulated fields of a PPDU) and follow the same transmission flow as the Data field from there on. The duration of the VHT-SIG-B field is $T_{VHT\text{-}SIG\text{-}B}$, regardless of the value of the

TXVECTOR parameter GI_TYPE. The time domain waveform for the VHT-SIG-B field in a VHT PPDU is specified by Equation (21-47).

$$r_{\text{VHT-SIG-B}}^{(i_{Seg},\, i_{TX})}(t) = \frac{1}{\sqrt{N_{\text{VHT-SIG-B}}^{\text{Tone}} N_{STS,\,total}}} w_{T_{\text{VHT-SIG-B}}}(t) \cdot \sum_{k=-N_{SR}}^{N_{SR}} \sum_{u=0}^{N_{user}-1} \sum_{m=1}^{N_{STS,\,u}} \left( \begin{array}{l} \left[ Q_k^{(i_{Seg})} \right]_{i_{TX},\,(M_u+m)} \Upsilon_{k,\,\text{BW}} \left( \left[ P_{VHT\text{-}LTF} \right]_{(M_u+m),\,1} D_{k,\,BW}^{(i_{Seg},\,u)} + p_3 P_0^k \right) \\ \cdot \exp(j2\pi k \Delta_F (t - T_{\text{GI}} - T_{\text{CS,VHT}}(M_u+m))) \end{array} \right) \tag{21-47}$$

where

$N_{\text{VHT-SIG-B}}^{\text{Tone}}$ has the value given in Table 21-8 (Tone scaling factor and guard interval duration values for PHY fields)

$T_{\text{CS,VHT}}(n)$ is given in Table 21-11 (Cyclic shift values for the VHT modulated fields of a PPDU)

$Q_k^{(i_{Seg})}$ is defined in 21.3.10.11.1 (Transmission in VHT format)

$p_n$ is defined in 17.3.5.10 (OFDM modulation)

$P_n^k$ is defined in 21.3.10.10 (Pilot subcarriers)

$\Upsilon_{k,\,\text{BW}}$ is defined in Equation (21-14), Equation (21-15), Equation (21-16). and Equation (21-17)

$P_{VHT\text{-}LTF}$ is given in Equation (21-43)

Let $d_k^{(i_{Seg},\,u)}$ be the stream of complex numbers generated for VHT-SIG-B for user $u$ at subcarrier $k$ (logical index, starting with 0) on frequency segment $i_{Seg}$ (prior to multiplication by $P_{VHT\text{-}LTF}$). For a 20 MHz VHT transmission,

$$D_{k,\,20}^{(i_{Seg},\,u)} = \begin{cases} 0, k = 0, \pm 7, \pm 21 \\ d_{M_{20}^r(k)}^{(i_{Seg},\,u)}, \text{otherwise} \end{cases} \tag{21-48}$$

$$M_{20}^r(k) = \begin{cases} k + 28, -28 \le k \le -22 \\ k + 27, -20 \le k \le -8 \\ k + 26, -6 \le k \le -1 \\ k + 25, 1 \le k \le 6 \\ k + 24, 8 \le k \le 20 \\ k + 23, 22 \le k \le 28 \end{cases} \tag{21-49}$$

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

For a 40 MHz VHT transmission,

$$D_{k,40}^{(i_{Seg},u)} = \begin{cases} 0, k = 0, \pm 1, \pm 11, \pm 25, \pm 53 \\ d_{M_{40}^r(k)}^{(i_{Seg},u)}, \text{otherwise} \end{cases} \quad (21\text{-}50)$$

$$M_{40}^r(k) = \begin{cases} k+58, -58 \le k \le -54 \\ k+57, -52 \le k \le -26 \\ k+56, -24 \le k \le -12 \\ k+55, -10 \le k \le -2 \\ k+52, 2 \le k \le 10 \\ k+51, 12 \le k \le 24 \\ k+50, 26 \le k \le 52 \\ k+49, 54 \le k \le 58 \end{cases} \quad (21\text{-}51)$$

For an 80 MHz VHT transmission,

$$D_{k,80}^{(i_{Seg},u)} = \begin{cases} 0, k = 0, \pm 1, \pm 11, \pm 39, \pm 75, \pm 103 \\ d_{M_{80}^r(k)}^{(i_{Seg},u)}, \text{otherwise} \end{cases} \quad (21\text{-}52)$$

$$M_{80}^r(k) = \begin{cases} k+122, -122 \le k \le -104 \\ k+121, -102 \le k \le -76 \\ k+120, -74 \le k \le -40 \\ k+119, -38 \le k \le -12 \\ k+118, -10 \le k \le -2 \\ k+115, 2 \le k \le 10 \\ k+114, 12 \le k \le 38 \\ k+113, 40 \le k \le 74 \\ k+112, 76 \le k \le 102 \\ k+111, 104 \le k \le 122 \end{cases} \quad (21\text{-}53)$$

For a 160 MHz VHT transmission,

$$D_{k,160}^{(i_{Seg},u)} = \begin{cases} 0, k = 0, \pm 1, \pm 2, \pm 3, \pm 4, \pm 5, \pm 25, \pm 53, \pm 89, \pm 117, \pm 127, \pm 128, \pm 129, \pm 139, \pm 167, \pm 203, \pm 231 \\ d_{M_{160}^r(k)}^{(i_{Seg},u)}, \text{otherwise} \end{cases} \quad (21\text{-}54)$$

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$M^{r}_{160}(k) = \begin{cases} k+250, -250 \le k \le -232 \\ k+249, -230 \le k \le -204 \\ k+248, -202 \le k \le -168 \\ k+247, -166 \le k \le -140 \\ k+246, -138 \le k \le -130 \\ k+243, -126 \le k \le -118 \\ k+242, -116 \le k \le -90 \\ k+241, -88 \le k \le -54 \\ k+240, -52 \le k \le -26 \\ k+239, -24 \le k \le -6 \\ k+228, 6 \le k \le 24 \\ k+227, 26 \le k \le 52 \\ k+226, 54 \le k \le 88 \\ k+225, 90 \le k \le 116 \\ k+224, 118 \le k \le 126 \\ k+221, 130 \le k \le 138 \\ k+220, 140 \le k \le 166 \\ k+219, 168 \le k \le 202 \\ k+218, 204 \le k \le 230 \\ k+217, 232 \le k \le 250 \end{cases} \quad (21\text{-}55)$$

For an 80+80 MHz VHT transmission, each frequency segment shall follow the 80 MHz VHT transmission format as specified in Equation (21-52) and Equation (21-53).

### 21.3.9 Transmission of NON_HT and HT PPDUs with multiple transmit chains

#### 21.3.9.1 Transmission of 20 MHz non-HT PPDUs(#238) with more than one transmit chain

A VHT STA that transmits a non-HT PPDU(#238) shall apply the cyclic shifts defined in Table 21-10 (Cyclic shift values for L-STF, L-LTF, L-SIG, and VHT-SIG-A fields of the PPDU) to the preamble and Data field.

#### 21.3.9.2 Transmission of HT PPDUs with more than four transmit chains

A VHT STA that transmits an HT PPDU with FORMAT equal to HT_MF shall apply the cyclic shifts defined in Table 21-10 (Cyclic shift values for L-STF, L-LTF, L-SIG, and VHT-SIG-A fields of the PPDU) for the non-HT portion of the PPDU, including the HT-SIG field.

### 21.3.10 Data field

#### 21.3.10.1 General

The number of OFDM symbols in the Data field is determined by the Length field in L-SIG (#4181)(see Equation (21-24)), the preamble duration and the setting of the Short GI field in VHT-SIG-A (see 21.3.8.3.3 (VHT-SIG-A definition)).

When BCC encoding is used, the Data field shall consist of the SERVICE field, the PSDU, the PHY pad bits, and the tail bits ($N_{tail}N_{ES}$ bits for SU and $N_{tail}N_{ES,u}$ bits for each user $u$ in MU). When LDPC

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

encoding is used, the Data field shall consist of the SERVICE field, the PSDU, and the PHY pad bits. No tail bits are present when LDPC encoding is used.

The padding flow is as follows. The MAC delivers a PSDU that fills the available octets in the Data field of the PPDU for each user *u*. The PHY determines the number of pad bits to add and appends them to the PSDU. The number of pad bits added is(M118) 0 to 7 per user. When user *u* of a VHT MU PPDU uses BCC encoding, the number of pad bits is calculated using Equation (21-56). In the case of SU ignore *u* in Equation (21-56).

$$N_{PAD,u} = N_{SYM}N_{DBPS,u} - 8 \cdot \text{PSDU\_LENGTH}_u - N_{service} - N_{tail}N_{ES,u} \quad (21\text{-}56)$$

where

| | |
|---|---|
| $\text{PSDU\_LENGTH}_u$ | is defined in 21.4.3 (TXTIME and PSDU_LENGTH calculation) |
| $N_{SYM}$ | is the number of symbols in the Data field and is given by Equation (21-111) for a VHT SU PPDU and by Equation (21-67) for a VHT MU PPDU |

For an SU PPDU, if LDPC encoding is used then the PHY padding bits are calculated using Equation (21-57).

$$N_{PAD} = N_{SYM,init}N_{DBPS} - 8 \cdot \text{PSDU\_LENGTH} - N_{service} \quad (21\text{-}57)$$

where

| | |
|---|---|
| PSDU_LENGTH | is defined in 21.4.3 (TXTIME and PSDU_LENGTH calculation) |
| $N_{SYM,init}$ | is given by Equation (21-62) |

For a VHT MU PPDU, if LDPC encoding is used for user *u* then the PHY padding bits are calculated using Equation (21-58).

$$N_{PAD,u} = N_{\text{SYM\_max\_init}}N_{DBPS,u} - 8 \cdot \text{PSDU\_LENGTH}_u - N_{service} \quad (21\text{-}58)$$

where

| | |
|---|---|
| $\text{PSDU\_LENGTH}_u$ | is defined in 21.4.3 (TXTIME and PSDU_LENGTH calculation) |
| $N_{\text{SYM\_max\_init}}$ | is given by Equation (21-65) |

The Data field of the VHT PPDU contains data for one or more users. For a VHT MU PPDU, the data processing, from scrambling to constellation mapping shall happen on a per-user basis. In the following subclauses, this process is described from a single user's point of view.

### 21.3.10.2 SERVICE field

The SERVICE field is as shown in Table 21-16 (SERVICE field).

**Table 21-16—SERVICE field**

| Bits | Field | Description |
|---|---|---|
| B0-B6 | Scrambler Initialization | Set to 0 |
| B7 | Reserved | (#455)Set to 0 on transmit and ignored on receive |
| B8-B15 | CRC | CRC calculated over VHT-SIG-B (excluding tail bits) |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 21.3.10.3 CRC calculation for VHT-SIG-B

The CRC calculation and insertion is illustrated in Figure 21-23 (VHT-SIG-B and SERVICE field relationship).

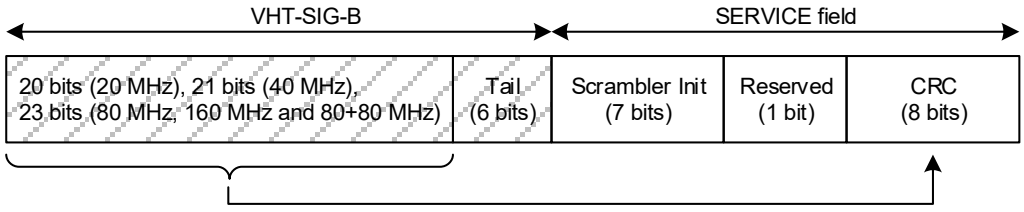

**Figure 21-23—VHT-SIG-B and SERVICE field relationship**

The value of the CRC field shall be the 1s complement of Equation (21-59).

$$crc(D) = (M(D) \oplus I(D))D^8 \bmod G(D) \quad (21\text{-}59)$$

where

$M(D) = m_0 D^{N-1} + m_1 D^{N-2} + \ldots + m_{N-2} D + m_{N-1}$

$N$ is the number of bits over which the CRC is generated; 20 for 20 MHz, 21 for 40 MHz, and 23 for 80 MHz/160 MHz/80+80 MHz

$m_i$ is bit $i$ of VHT-SIG-B

$I(D) = \sum_{i=N-8}^{N-1} D^i$ are initialized values that are added modulo 2 to the first 8 bits of VHT-SIG-B

$G(D) = D^8 + D^2 + D + 1$ is the CRC generating polynomial

$crc(D) = c_0 D^7 + c_1 D^6 + \ldots + c_6 D + c_7$

Figure 19-8 (HT-SIG CRC calculation) shows the operation of the CRC. First, the shift register is reset to all 1s. The bits are then passed through the XOR operation at the input. When the last bit has entered, the output is generated by shifting the bits out of the shift register, $c_7$ first, through an inverter.

As an example, if bits $\{m_0, \ldots m_{22}\}$ are given by {1 0 0 1 1 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 1 1}, the CRC bits $\{c_7, \ldots c_0\}$ are {0 0 0 1 1 1 0 0}.

The CRC field is transmitted with $c_7$ first. Hence, $c_7$ is mapped to B8 of the SERVICE field, $c_6$ is mapped to B9, …, and $c_0$ is mapped to B15 of the SERVICE field.

### 21.3.10.4 Scrambler

The SERVICE, PSDU, and PHY pad parts of the Data field shall be scrambled by the scrambler defined in 17.3.5.5 (PHY DATA scrambler and descrambler). The Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) (#602)TXVECTOR parameters CH_BANDWIDTH_IN_NON_HT, DYN_BANDWIDTH_IN_NON_HT, and SCRAMBLER_INITIAL_VALUE are not present; therefore, the first 7 bits of the scrambling sequence are set to a 7-bit pseudorandom nonzero integer. Different users in a VHT MU PPDU may use different pseudorandom nonzero seeds.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 21.3.10.5 Coding

#### 21.3.10.5.1 General

The Data field shall be encoded using either the binary convolutional code (BCC) defined in 21.3.10.5.2 (BCC encoder parsing operation) and 21.3.10.5.3 (BCC coding and puncturing) or the low-density parity check (LDPC) code defined in 21.3.10.5.4 (LDPC coding). The encoder is selected by the SU/MU[0] Coding, MU[1] Coding, MU[2] Coding, or MU[3] Coding fields in VHT-SIG-A, as defined in 21.3.8.3.3 (VHT-SIG-A definition). When BCC FEC encoding is used, the number of encoders is determined by rate-dependent parameters as defined in 21.5 (Parameters for VHT-MCSs). The operation of the BCC FEC is described in 21.3.10.5.2 (BCC encoder parsing operation) and 21.3.10.5.3 (BCC coding and puncturing). The operation of the LDPC coder is described in 21.3.10.5.4 (LDPC coding). Support for the reception of a BCC encoded Data field is mandatory.

#### 21.3.10.5.2 BCC encoder parsing operation

If multiple encoders are used, the scrambled SERVICE, PSDU, and PHY pad bits are divided between the encoders by sending bits to different encoders in a round robin manner. Bit $i$ to encoder $j$ of user $u$, denoted $x_{i,u}^{(j)}$, is as specified in Equation (21-60).

$$x_{i,u}^{(j)} = \begin{cases} b_{N_{ES}\cdot i+j,u}; & 0 \le i < N_{SYM}\dfrac{N_{DBPS,u}}{N_{ES,u}} - N_{tail}, \quad 0 \le j \le N_{ES,u} - 1 \\ 0; & N_{SYM}\dfrac{N_{DBPS,u}}{N_{ES,u}} - N_{tail} \le i < N_{SYM}\dfrac{N_{DBPS,u}}{N_{ES,u}}, \quad 0 \le j \le N_{ES,u} - 1 \end{cases} \tag{21-60}$$

where

$b_{k,u}$ is bit k of the scrambled SERVICE, PSDU, and pad bits of user u

$N_{SYM}$ is the number of symbols in the Data field and is given by Equation (21-111) for a VHT SU PPDU and by Equation (21-67) for a VHT MU PPDU

NOTE—Tail bits with value 0 are being appended to each BCC encoder parser output sequence in Equation (21-60).

#### 21.3.10.5.3 BCC coding and puncturing

The BCC encoder parser output sequences of user $u$ $\{x_{i,u}^{(j)}\}$, $0 \le i < N_{SYM}N_{DBPS,u}/N_{ES,u}$, $0 \le j \le N_{ES,u} - 1$ each of which is separately encoded by a rate R = ½ convolutional encoder defined in 17.3.5.6 (Convolutional encoder). After encoding, the encoded data is punctured by the method defined in 17.3.5.6 (Convolutional encoder) (except for rate 5/6), to achieve the rate selected by the modulation and coding scheme. In the case that rate 5/6 coding is selected, the puncturing scheme is(M118) the same as described in 19.3.11.6 (BCC coding and puncturing).

#### 21.3.10.5.4 LDPC coding

For a VHT SU PPDU using LDPC coding to encode the Data field, the LDPC code and encoding process described in 19.3.11.7 (LDPC codes) shall be used with the following modifications. First, all bits in the Data field including the scrambled SERVICE, PSDU, and pad bits are encoded. Thus, $N_{pld}$ for VHT PPDUs shall be computed using Equation (21-61) instead of Equation (19-35).

$$N_{pld} = N_{SYM,init}N_{DBPS} \tag{21-61}$$

where

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$N_{SYM,init}$ is given by Equation (21-62)

$$N_{SYM,init} = m_{STBC} \times \left\lceil \frac{8 \cdot \text{APEP\_LENGTH} + N_{service}}{m_{STBC} \cdot N_{DBPS}} \right\rceil \quad (21\text{-}62)$$

where

$m_{STBC}$ is equal to 2 when STBC is used, and 1 otherwise

APEP_LENGTH is the TXVECTOR parameter APEP_LENGTH

Following the calculation of $N_{pld}$, $N_{avbits}$ shall be computed using Equation (21-63) instead of Equation (19-36).

$$N_{avbits} = N_{SYM,init} N_{CBPS} \quad (21\text{-}63)$$

In addition, if $N_{SYM}$ computed in Equation (19-41) in step d) of 19.3.11.7.5 (LDPC PPDU encoding process) is greater than $N_{SYM,init}$, then the LDPC Extra OFDM Symbol field of VHT-SIG-A shall be set to 1. Otherwise, the LDPC Extra OFDM Symbol field of VHT-SIG-A shall be set to 0.

LDPC codes used in VHT MU PPDUs shall also follow the definitions in 19.3.11.7 (LDPC codes). Refer to 21.3.10.5.5 (Encoding process for VHT MU PPDUs) for a description of the LDPC encoding process for VHT MU PPDUs.

### 21.3.10.5.5 Encoding process for VHT MU PPDUs

For a VHT MU PPDU, first compute the initial number of OFDM symbols for each user using Equation (21-64).

$$N_{\text{SYM\_init},u} = \begin{cases} \left\lceil \dfrac{8 \cdot \text{APEP\_LENGTH}_u + N_{service} + N_{tail} \cdot N_{ES,u}}{N_{DBPS,u}} \right\rceil & \text{when user } u \text{ uses BCC} \\ \left\lceil \dfrac{8 \cdot \text{APEP\_LENGTH}_u + N_{service}}{N_{DBPS,u}} \right\rceil & \text{when user } u \text{ uses LDPC} \end{cases} \quad (21\text{-}64)$$

where

$\text{APEP\_LENGTH}_u$ is the TXVECTOR parameter APEP_LENGTH for user $u$

Based on the above equation, compute the largest initial number of symbols over all users using Equation (21-65).

$$N_{\text{SYM\_max\_init}} = \max\{N_{\text{SYM\_init},u}\}_{u=0}^{N_{user}-1} \quad (21\text{-}65)$$

Then, for each user $u$ that uses LDPC in the VHT MU PPDU, the final number of symbols in the Data field ($N_{SYM,u}$) shall be computed as follows. First, perform step a) in 19.3.11.7.5 (LDPC PPDU encoding process) with the exception that $N_{pld}$ is computed using Equation (21-66) instead of Equation (19-35).

$$N_{pld} = N_{\text{SYM\_max\_init}} N_{DBPS,u} \quad (21\text{-}66)$$

Then, perform steps b) to d) in 19.3.11.7.5 (LDPC PPDU encoding process) with $N_{CBPS}$ and $R$ replaced with $N_{CBPS,u}$ and $R_u$, respectively. $N_{SYM,u}$ for user $u$ shall then be equal to the value of $N_{SYM}$ obtained at the end of step d) using Equation (19-41).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The purpose of going through steps a) to d) in 19.3.11.7.5 (LDPC PPDU encoding process) in the above paragraph is to compute $N_{SYM,u}$. Thus, at this stage $N_{SYM,u}$ for each user may be calculated without actually encoding the data using LDPC.

For BCC users, $N_{SYM,\,u} = N_{\mathrm{SYM\_init},\,u}$.

Then, compute the number of symbols in the Data field using Equation (21-67).

$$N_{SYM} = \max\{N_{SYM,\,u}\}_{u=0}^{N_{user}-1} \tag{21-67}$$

When constructing the Data field for user $u$ encoded using LDPC code, the MAC follows the padding procedure described in 10.12.6 (A-MPDU padding for VHT, HE(11ax) or S1G PPDU) and delivers a PSDU that contains $\mathrm{PSDU\_LENGTH}_u$ octets (see 21.4.3 (TXTIME and PSDU_LENGTH calculation)). The PHY follows the padding procedure described in 21.3.10.1 (General) to fill $N_{\mathrm{SYM\_max\_init}}$ symbols, where $N_{\mathrm{SYM\_max\_init}}$ is defined in Equation (21-65). Then, for each user, all bits in the Data field including the scrambled SERVICE, PSDU, and pad bits shall be encoded using the LDPC encoding process specified in 19.3.11.7.5 (LDPC PPDU encoding process) with the following modifications. First, $N_{pld}$ shall be computed using Equation (21-66) instead of Equation (19-35). Also, replace $N_{CBPS}$ and $R$ with $N_{CBPS,u}$ and $R_u$, respectively. Next, step d) in 19.3.11.7.5 (LDPC PPDU encoding process) is replaced with step d) below:

d) If $N_{SYM}$ computed in Equation (21-67) is equal to $N_{\mathrm{SYM\_max\_init}}$, then the number of bits to be punctured, $N_{punc}$, from the codewords after encoding is computed as shown in Equation (19-38).

If $N_{SYM}$ computed in Equation (21-67) is greater than $N_{\mathrm{SYM\_max\_init}}$, then the number of bits to be punctured, $N_{punc}$, from the codewords after encoding is computed using Equation (19-39) and Equation (19-40). Note also that $N_{avbits}$ has now been updated in Equation (19-39) in this case.

The punctured bits shall be equally distributed over all $N_{CW}$ codewords with the first $\mathrm{rem}(N_{punc}, N_{CW})$ codewords punctured 1 bit more than the remaining codewords. Define $N_{ppcw} = \lfloor N_{punc}/N_{CW} \rfloor$. When $N_{ppcw} > 0$, the puncturing is performed by discarding parity bits $p_{n-k-N_{ppcw}-1}, \ldots, p_{n-k-1}$ of the first $\mathrm{rem}(N_{punc}, N_{CW})$ codewords and discarding parity bits $p_{n-k-N_{ppcw}}, \ldots, p_{n-k-1}$ of the remaining codewords after encoding.

When constructing the Data field for users encoded using BCC, the MAC follows the padding procedure described in 10.12.6 (A-MPDU padding for VHT, HE(11ax) or S1G PPDU) and delivers a PSDU that contains $\mathrm{PSDU\_LENGTH}_u$ octets. The PHY follows the padding procedure described in 21.3.10.1 (General) to fill up $N_{SYM}$ symbols computed in Equation (21-67). Then, for each user, all bits in the Data field including the scrambled SERVICE, PSDU, and pad bits shall be encoded using the BCC encoding process specified in 21.3.10.5.2 (BCC encoder parsing operation) and 21.3.10.5.3 (BCC coding and puncturing). Note that this process results in the BCC tail bits being placed at the very end of the PPDU.

In addition, if $N_{SYM}$ computed in Equation (21-67) is greater than $N_{\mathrm{SYM\_max\_init}}$ computed in Equation (21-65), then the LDPC Extra OFDM Symbol field of VHT-SIG-A2 shall be set to 1. Otherwise, the LDPC Extra OFDM Symbol field of VHT-SIG-A2 shall be set to 0.

### 21.3.10.6 Stream parser

After coding and puncturing, the data bit streams at the output of the FEC encoders are processed in groups of $N_{CBPS}$ bits. Each of these groups is rearranged into $N_{SS}$ blocks of $N_{CBPSS}$ bits ($N_{SS,u}$ blocks of $N_{CBPSS,u}$ bits in the case of an MU transmission). This operation is referred to as *stream parsing* and is described in this subclause.

The description is given in terms of an SU transmission. For MU transmissions, the rearrangements are carried out in the same way per user.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The number of bits assigned to a single axis (real or imaginary) of a constellation point in a spatial stream is denoted by Equation (21-68).

$$s = \max\left\{1, \frac{N_{BPSCS}}{2}\right\} \tag{21-68}$$

The sum of these over all streams is $S = N_{SS} \cdot s$

Consecutive blocks of $s$ bits are assigned to different spatial streams in a round robin fashion.

Let

$$N_{\text{Block}} = \left\lfloor \frac{N_{CBPS}}{N_{ES} \cdot S} \right\rfloor \tag{21-69}$$

and

$$M = \frac{N_{CBPS} - N_{\text{Block}} \cdot N_{ES} \cdot S}{s \cdot N_{ES}} \tag{21-70}$$

For the first $N_{\text{Block}} \cdot N_{ES} \cdot S$ bits of each OFDM symbol, $S$ bits from the output of first encoder are divided among all spatial streams, $s$ bits per stream. Then, $S$ bits from the output of next encoder are used, and so on. If $N_{CBPS}$ is greater than $N_{\text{Block}} \cdot N_{ES} \cdot S$, then for the last $N_{CBPS} - N_{\text{Block}} \cdot N_{ES} \cdot S$ bits of each OFDM symbol, $M \cdot s$ bits from the output of the first encoder are fed into spatial streams 1 to $M$ ($s$ bits per spatial stream), and then $M \cdot s$ bits from the output of the next encoder are used for spatial stream $M + 1$ to $[(2M - 1) \bmod N_{SS}] + 1$, and so on, where $z \bmod t$ is the remainder resulting from the division of integer $z$ by integer $t$.

The following equations are an equivalent description to the above procedure. Bit $i$ at the output of encoder $j$ is assigned to input bit $k$ of spatial stream $i_{SS}$ where

$$j = \begin{cases} \left\lfloor \frac{k}{s} \right\rfloor \bmod N_{ES}, & k = 0, 1, \ldots, N_{\text{Block}} \cdot N_{ES} \cdot s - 1 \\ \left\lfloor \frac{L}{M} \right\rfloor, & k = N_{\text{Block}} \cdot N_{ES} \cdot s, \ldots, N_{CBPSS} - 1 \end{cases} \tag{21-71}$$

and

$$i = \begin{cases} (i_{SS} - 1)s + S \cdot \left\lfloor \frac{k}{N_{ES} \cdot s} \right\rfloor + k \bmod s, & k = 0, 1, \ldots, N_{\text{Block}} \cdot N_{ES} \cdot s - 1 \\ (L \bmod M) \cdot s + N_{\text{Block}} \cdot S + k \bmod s, & k = N_{\text{Block}} \cdot N_{ES} \cdot s, \ldots, N_{CBPSS} - 1 \end{cases} \tag{21-72}$$

where

$i_{SS} = 1, 2, \ldots, N_{SS}$

$i = 0, 1, \ldots, N_{CBPS}/N_{ES} - 1$

$j = 0, 1, \ldots, N_{ES} - 1$

$k = 0, 1, \ldots, N_{CBPSS} - 1$

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$L = \left\lfloor \frac{k'}{s} \right\rfloor N_{SS} + (i_{SS} - 1)$$

$$k' = k - N_{\text{Block}} \cdot N_{ES} \cdot s$$

NOTE—$N_{CBPS}$ is greater than $N_{\text{Block}} \cdot N_{ES} \cdot S$ in only the following cases:

a) 160 MHz and 80+80 MHz, $N_{SS}$ = 5, VHT-MCS = 5
b) 160 MHz and 80+80 MHz, $N_{SS}$ = 5, VHT-MCS = 6
c) 160 MHz and 80+80 MHz, $N_{SS}$ = 7, VHT-MCS = 5
d) 160 MHz and 80+80 MHz, $N_{SS}$ = 7, VHT-MCS = 6

### 21.3.10.7 Segment parser

NOTE —The output of the operation described in this subclause is named a frequency subblock rather than a segment because it applies to both 80+80 and 160 MHz PPDUs, where the 160 MHz PPDU has two parser outputs yet one frequency segment (see Table 21-5 (Timing-related constants)). A more precise name for this operation would be frequency subblock deparser.(#19)

The description in this subclause is given in terms of an SU transmission. For MU transmissions, the rearrangements are carried out in the same way per user.

For a 160 MHz or an 80+80 MHz transmission, the output bits of each stream parser are first divided into blocks of $N_{CBPSS}$ bits ($N_{CBPSS,u}$ bits in the case of an MU transmission). Then, each block is further divided into two frequency subblocks of $N_{CBPSS}/2$ bits as shown in Equation (21-73).

$$y_{k,l} = x_{2s \cdot N_{ES}\left\lfloor \frac{k}{s \cdot N_{ES}} \right\rfloor + l \cdot s \cdot N_{ES} + k \bmod (s \cdot N_{ES})}, \qquad k = 0, 1, \ldots, \frac{N_{CBPSS}}{2} - 1 \tag{21-73}$$

where

$x_m$ is the $m$ th bit of a block of $N_{CBPSS}$ bits, $m$= 0 to $N_{CBPSS} - 1$
$l$ is the frequency subblock index, $l = 0, 1$
$y_{k,l}$ is bit $k$ of the frequency subblock $l$
$s$ is defined in Equation (21-68)

If $N_{CBPSS}$ is not divisible by $2s \cdot N_{ES}$, then apply the segment parsing method described in Equation (21-73) for $\lfloor N_{CBPSS}/(2s \cdot N_{ES}) \rfloor$ sets of $2s \cdot N_{ES}$ segment parser input bits. At this point, each stream parser output has $2s \cdot N_{res}$ ($N_{res} = \frac{N_{CBPSS} \bmod (2s \cdot N_{ES})}{2s} < N_{ES}$, integer ) residue bits. Then, the residue bits are divided into subsets of $s$ bits, with each subset being assigned to different subblock ($l = 0, 1$ ) in a round robin fashion. The first $s$ bits are assigned to the subblock with index $l = 0$. Repeat $N_{res}$ times (until all bits are distributed to the two subblocks). That is, if $N_{CBPSS}$ is not divisible by $2s \cdot N_{ES}$, each block is further divided into two subblocks of $N_{CBPSS}/2$ bits as shown in Equation (21-74).

$$y_{k,l} = \begin{cases} x_{2s \cdot N_{ES}\left\lfloor \frac{k}{s \cdot N_{ES}} \right\rfloor + l \cdot s \cdot N_{ES} + k \bmod (s \cdot N_{ES})}, & k = 0, 1, \ldots, \lfloor N_{CBPSS}/(2s \cdot N_{ES}) \rfloor \cdot s \cdot N_{ES} - 1 \\ x_{2s \cdot N_{ES}\left\lfloor \frac{k}{s \cdot N_{ES}} \right\rfloor + 2s \cdot \left\lfloor \frac{k \bmod (s \cdot N_{ES})}{s} \right\rfloor + l \cdot s + k \bmod s}, & k = \lfloor N_{CBPSS}/(2s \cdot N_{ES}) \rfloor \cdot s \cdot N_{ES}, \ldots, \frac{N_{CBPSS}}{2} - 1 \end{cases} \tag{21-74}$$

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Segment parser is bypassed for a 20 MHz, 40 MHz, or 80 MHz VHT PPDU transmission, i.e., as specified in Equation (21-75).

$$y_{k,l} = x_k, \quad k = 0, 1, \ldots, N_{CBPSS} - 1 \tag{21-75}$$

where

$l$ is the frequency subblock index. $l = 0$ for a 20, 40 or 80 MHz VHT PPDU transmission.

$y_{k,l}$ is bit $k$ of the frequency subblock $l$

$x_m$ is bit $m$ of a block of $N_{CBPSS}$ bits, $m = 0$ to $N_{CBPSS} - 1$

### 21.3.10.8 BCC interleaver

For ease of explanation, the operation of the interleaver is described for the SU case. For user $u$ of an MU transmission, the interleaver operates in the same way on the output bits for the user from the stream parser by replacing $N_{SS}$, $N_{CBPSS}$, $N_{CBPSSI}$, and $N_{BPSCS}$ with $N_{SS,u}$, $N_{CBPSS,u}$, $N_{CBPSSI,u}$, and $N_{BPSCS,u}$, respectively. That is, the operation of the interleaver is the same as if the transmission were an SU one, consisting of bits from only that user.

This subclause describes the interleaver used in the case of BCC encoding. The interleaver described in this subclause shall be bypassed in the case of LDPC encoding.

In a 20 MHz, 40 MHz, or 80 MHz VHT PPDU transmission, the bits at the output of the stream parser are processed in groups of $N_{CBPS}$ bits. Each of these groups is divided into $N_{SS}$ blocks of $N_{CBPSS}$ bits, and each block shall be interleaved by an interleaver based on the Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) interleaver. In a 160 MHz or an 80+80 MHz VHT PPDU transmission, each frequency subblock of $N_{CBPSS}/2$ output bits from the segment parser is interleaved by the interleaver for 80 MHz defined in this subclause. This interleaver, which is based on entering the data in rows, and reading it out in columns, has a different number of columns $N_{COL}$ and rows $N_{ROW}$ for different bandwidths. The values of $N_{COL}$ and $N_{ROW}$ are given in Table 21-17 (Number of rows and columns in the interleaver).

**Table 21-17—Number of rows and columns in the interleaver**

| Parameter | 20 MHz | 40 MHz | 80 MHz |
|---|---|---|---|
| $N_{COL}$ | 13 | 18 | 26 |
| $N_{ROW}$ | $4 \times N_{BPSCS}$ | $6 \times N_{BPSCS}$ | $9 \times N_{BPSCS}$ |
| $N_{ROT}$ ($N_{SS} \leq 4$) | 11 | 29 | 58 |
| $N_{ROT}$ ($N_{SS} > 4$) | 6 | 13 | 28 |

After the operations based on the Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) interleaver have been applied and if more than one spatial stream exists, a third operation called *frequency rotation* is applied to the additional spatial streams. The parameter for the frequency rotation is $N_{ROT}$. The values of $N_{ROT}$ are given in Table 21-17 (Number of rows and columns in the interleaver).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

An additional parameter is the spatial stream index $i_{SS} = 1, 2, \ldots, N_{SS}$. The output of the third operation is a function of the spatial stream index.

The interleaving is defined using three permutations. The first permutation is given by the rule shown in Equation (21-76).

$$i = N_{ROW}(k \bmod N_{COL}) + \left\lfloor \frac{k}{N_{COL}} \right\rfloor, k = 0, 1, \ldots, N_{CBPSSI} - 1 \quad (21\text{-}76)$$

The second permutation is defined by the rule shown in Equation (21-77).

$$j = s\left\lfloor \frac{i}{s} \right\rfloor + \left(i + N_{CBPSSI} - \left\lfloor \frac{N_{COL} \cdot i}{N_{CBPSSI}} \right\rfloor\right) \bmod s, \quad i = 0, 1, \ldots, N_{CBPSSI} - 1 \quad (21\text{-}77)$$

where

$s$ is defined in Equation (21-68)

If $2 \le N_{SS} \le 4$, a frequency rotation is applied to the output of the second permutation as shown in Equation (21-78).

$$r = \left\{ j - \left[ (2(i_{SS} - 1)) \bmod 3 + 3\left\lfloor \frac{i_{SS} - 1}{3} \right\rfloor \right] \cdot N_{ROT} \cdot N_{BPSCS} \right\} \bmod N_{CBPSSI}, \quad (21\text{-}78)$$

$$j = 0, 1, \ldots, N_{CBPSSI} - 1$$

where

$i_{SS} = 1, 2, \ldots, N_{SS}$ is the spatial steam index on which this interleaver is operating

If $N_{SS} > 4$, a frequency rotation is applied to the output of the second permutation as shown in Equation (21-79).

$$r = \{j - J(i_{SS}) \cdot N_{ROT} \cdot N_{BPSCS}\} \bmod N_{CBPSSI}, j = 0, 1, \ldots, N_{CBPSSI} - 1 \quad (21\text{-}79)$$

where

$i_{SS} = 1, 2, \ldots, N_{SS}$ is the spatial steam index on which this interleaver is operating, and $J(i_{SS})$ is an integer as defined in Table 21-18 (J(iSS) values).

**Table 21-18—$J(i_{SS})$ values**

| $i_{SS}$ | $J(i_{SS})$ |
|---|---|
| 1 | 0 |
| 2 | 5 |
| 3 | 2 |
| 4 | 7 |
| 5 | 3 |
| 6 | 6 |
| 7 | 1 |
| 8 | 4 |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The deinterleaver uses the following three operations to perform the inverse permutations. Let $r$ denote the index of the bit in the received block (per spatial stream). The first operation reverses the third (frequency rotation) permutation of the interleaver. When $N_{SS} = 1$, this reversal is performed by $j = r$ ($r = 0, 1, \ldots, N_{CBPSSI} - 1$). When $2 \le N_{SS} \le 4$, this reversal is performed by as shown in Equation (21-80).

$$j = \left\{ r + \left[ (2(i_{SS} - 1)) \bmod 3 + 3 \left\lfloor \frac{i_{SS} - 1}{3} \right\rfloor \right] \cdot N_{ROT} \cdot N_{BPSCS} \right\} \bmod N_{CBPSSI}, \quad r = 0, 1, \ldots, N_{CBPSSI} - 1 \tag{21-80}$$

When $N_{SS} > 4$, this reversal is performed by Equation (21-81).

$$j = \{ r + J(i_{SS}) \cdot N_{ROT} \cdot N_{BPSCS} \} \bmod N_{CBPSSI}, \quad r = 0, 1, \ldots, N_{CBPSSI} - 1 \tag{21-81}$$

where

$J(i_{SS})$ is defined in Table 21-18 (J(iSS) values)

The second operation defined by Equation (21-82) reverses the second permutation in the interleaver.

$$i = s \left\lfloor \frac{j}{s} \right\rfloor + \left( j + \left\lfloor \frac{N_{COL} \cdot j}{N_{CBPSSI}} \right\rfloor \right) \bmod s, \quad j = 0, 1, \ldots, N_{CBPSSI} - 1 \tag{21-82}$$

where

$s$ is defined in Equation (21-68)

The third operation defined in Equation (21-83) reverses the first permutation of the interleaver.

$$k = N_{COL} \cdot i - (N_{CBPSSI} - 1) \left\lfloor \frac{i}{N_{ROW}} \right\rfloor, \quad i = 0, 1, \ldots, N_{CBPSSI} - 1 \tag{21-83}$$

### 21.3.10.9 Constellation mapping

#### 21.3.10.9.1 General

The mapping between bits at the output of the interleaver and complex constellation points for BPSK, QPSK, 16-QAM, and 64-QAM follows the rules defined in 17.3.5.8 (Subcarrier modulation mapping). For 256-QAM, the mapping is shown in Figure 21-24 (Constellation bit encoding for 256-QAM (1st quadrant)) through Figure 21-27 (Constellation bit encoding for 256-QAM (4th quadrant)).

The bit string convention in Figure 21-24 (Constellation bit encoding for 256-QAM (1st quadrant)) through Figure 21-27 (Constellation bit encoding for 256-QAM (4th quadrant)) follows the bit string convention outlined in 17.3.5.8 (Subcarrier modulation mapping).

The streams of complex numbers in frequency subblock $l$ for user $u$ are denoted as follows:

$d''_{k,i,n,l,u}$; $k = 0, 1, \ldots, N_{SD} - 1$ for 20 MHz, 40 MHz, 80 MHz, and 80+80 MHz; (21-84)

$k = 0, 1, \ldots, \frac{N_{SD}}{2} - 1$ for 160 MHz;

$i = 1, \ldots, N_{SS,u}$;

$n = 0, 1, \ldots, N_{SYM} - 1$;

$l = 0$ for 20 MHz, 40 MHz, and 80 MHz;

$l = 0, 1$ for 160 MHz and 80+80 MHz;

$u = 0, \ldots, N_{user} - 1$

The normalization factor, $K_{MOD}$, for 256-QAM is $1/\sqrt{170}$.

### 21.3.10.9.2 LDPC tone mapping

The LDPC tone mapping shall be performed on all LDPC encoded streams as described in this subclause and using an LDPC tone-mapping distance parameter $D_{TM}$. $D_{TM}$ is constant for each bandwidth and its value for different bandwidths is given in Table 21-19 (LDPC tone mapping distance for each bandwidth). LDPC tone mapping shall not be performed on streams that are encoded using BCC.

**Table 21-19—LDPC tone mapping distance for each bandwidth**

| Parameter | 20 MHz | 40 MHz | 80 MHz | 160 MHz, 80+80 MHz |
|---|---|---|---|---|
| $D_{TM}$ | 4 | 6 | 9 | 9 |

For a VHT PPDU transmission, the LDPC tone mapping for LDPC-coded streams corresponding to user $u$ is done by permuting the stream of complex numbers generated by the constellation mappers (#4181)(see Equation (21-84)) to obtain

$d''_{t(k),i,n,l,u} = d''_{k,i,n,l,u}$; $k = 0, 1, \ldots, N_{SD} - 1$ for 20 MHz, 40 MHz, 80 MHz and 80+80 MHz; (21-85)

$k = 0, 1, \ldots, \frac{N_{SD}}{2} - 1$ for 160 MHz;

$i = 1, \ldots, N_{SS,u}$;

$n = 0, 1, \ldots, N_{SYM} - 1$;

$l = 0$ for 20 MHz, 40 MHz, and 80 MHz;

$l = 0, 1$ for 160 MHz and 80+80 MHz;

$u = 0, \ldots, N_{user} - 1$

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

where

$$t(k) = \begin{cases} D_{TM}\left(k \bmod \frac{N_{SD}}{D_{TM}}\right) + \left\lfloor \frac{k \cdot D_{TM}}{N_{SD}} \right\rfloor, & \text{for 20 MHz, 40 MHz, 80 MHz, and 80+80 MHz} \\ D_{TM}\left(k \bmod \frac{N_{SD}/2}{D_{TM}}\right) + \left\lfloor \frac{k \cdot D_{TM}}{N_{SD}/2} \right\rfloor, & \text{for 160 MHz} \end{cases} \quad (21\text{-}86)$$

As a result of the LDPC tone mapping operation above, each two consecutively generated complex constellation numbers $d'_{k,i,n,l,u}$ and $d'_{k+1,i,n,l,u}$ are(M118) transmitted on two data tones that are separated by at least $D_{TM} - 1$ other data tones. Note that the operation above is equivalent to block-interleaving the complex numbers $d'_{0,i,n,l,u}, \ldots, d'_{N_{SD}-1,i,n,l,u}$ for each $i$, $n$, and $u$ using a matrix with $D_{TM}$ rows and $N_{SD}/D_{TM}$ (for 20 MHz, 40 MHz, 80 MHz, or 80+80 MHz) or $\frac{N_{SD}}{2 \cdot D_{TM}}$ (for 160 MHz) columns, where $d'_{0,i,n,l,u}, \ldots, d'_{N_{SD}-1,i,n,l,u}$ are written row-wise into the matrix, and $d''_{0,i,n,l,u}, \ldots, d''_{N_{SD}-1,i,n,l,u}$ are read column-wise from the matrix.

NOTE—LDPC tone mapping is performed separately for the upper and lower 80 MHz frequency subblocks of a 160 MHz or 80+80 MHz transmission as indicated by the frequency subblock index $l$ in Equation (21-85) and Equation (21-86).

Since LDPC tone mapping is not performed on BCC-coded streams, for BCC-coded streams, the following applies:

$$d''_{k,i,n,l,u} = d'_{k,i,n,l,u}; \quad k = 0, 1, \ldots, N_{SD} - 1 \text{ for 20 MHz, 40 MHz, 80 MHz and 80+80 MHz;} \quad (21\text{-}87)$$

$$k = 0, 1, \ldots, \frac{N_{SD}}{2} - 1 \text{ for 160 MHz;}$$

$$i = 1, \ldots, N_{SS,u};$$

$$n = 0, 1, \ldots, N_{SYM} - 1;$$

$$l = 0 \text{ for 20 MHz, 40 MHz, and 80 MHz;}$$

$$l = 0, 1 \text{ for 160 MHz and 80+80 MHz;}$$

$$u = 0, \ldots, N_{user} - 1$$

### 21.3.10.9.3 Segment deparser

NOTE 1—The input of the operation described in this subclause is named a frequency subblock rather than a segment because it applies to 160 MHz PPDUs which has two deparser inputs yet one frequency segment (see Table 21-5 (Timing-related constants)). A more precise name for this operation would be frequency subblock deparser.(#19)

In a 160 MHz VHT PPDU transmission, the two frequency subblocks at the output of the LDPC tone mapper for LDPC or constellation mapper for BCC are combined into one frequency segment as shown in Equation (21-88).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$d_{k,i,n,u}^{(i_{Seg})} = \begin{cases} d''_{k,i,n,0,u}, & \text{if } 0 \le k \le \frac{N_{SD}}{2} - 1 \\ d''_{k-N_{SD}/2,i,n,1,u}, & \text{if } \frac{N_{SD}}{2} \le k \le N_{SD} - 1 \end{cases}, \quad i_{Seg} = 0 \tag{21-88}$$

In a 20 MHz, 40 MHz, or 80 MHz VHT PPDU transmission, the segment deparsing is not performed. Hence,

$$d_{k,i,n,u}^{(i_{Seg})} = d''_{k,i,n,0,u}, \quad 0 \le k \le N_{SD} - 1, \quad i_{Seg} = 0 \tag{21-89}$$

In an 80+80 MHz VHT PPDU transmission, the segment deparsing is not performed. Hence,

$$d_{k,i,n,u}^{(i_{Seg})} = d''_{k,i,n,i_{Seg},u}, \quad 0 \le k \le N_{SD} - 1, \quad i_{Seg} = 0, 1 \tag{21-90}$$

NOTE 2—As per Table 21-7 (Center frequency of the portion of the PPDU transmitted in frequency segment iSeg), $f_c^{(0)}$ (center frequency for frequency segment $i_{Seg}$=0) is always less than $f_c^{(1)}$ in case of 80+80 MHz VHT PPDU transmissions. Hence, $d''_{k,i,n,0,u}$ (frequency subblock 0) is always transmitted in the frequency segment lower in frequency, while $d''_{k,i,n,1,u}$ (frequency subblock 1) is always transmitted in the frequency segment higher in frequency.

### 21.3.10.9.4 Space-time block coding

This subclause defines a set of optional robust transmission techniques that are applicable only when using STBC coding for VHT SU PPDUs. In this case, $N_{SS,0}$ spatial streams are mapped to $N_{STS,0}$ space-time streams. These techniques are based on STBC. When the VHT-SIG-A STBC field is 1, a symbol operation shall occur between the constellation mapper and the spatial mapper as defined in this subclause. STBC shall not be applied in a VHT MU PPDU. Hence, the user subscript $u$ is 0 in this subclause.

If STBC is applied, the stream of complex numbers, $d_{k,i,n,0}^{(i_{Seg})}$; $k = 0, \ldots, N_{SD} - 1$; $i = 1, \ldots, N_{SS,0}$; $n = 0, \ldots, N_{SYM} - 1$, generated by the segment deparser, is the input to the STBC encoder, which produces as output the stream of complex numbers $\tilde{d}_{k,i_{STS},n,0}^{(i_{Seg})}$; $k = 0, \ldots, N_{SD} - 1$; $i_{STS} = 1, \ldots, N_{STS,0}$; $n = 0, \ldots, N_{SYM} - 1$. For given values of $k$ and $i$, STBC processing operates on the complex modulation symbols in sequential pairs of OFDM symbols so that the value of $\tilde{d}_{k,2i-1,2m,0}^{(i_{Seg})}$ and $\tilde{d}_{k,2i,2m,0}^{(i_{Seg})}$ depend on $d_{k,i,2m,0}^{(i_{Seg})}$ and $d_{k,i,2m+1,0}^{(i_{Seg})}$. Also, $\tilde{d}_{k,2i-1,2m+1,0}^{(i_{Seg})}$ and $\tilde{d}_{k,2i,2m+1,0}^{(i_{Seg})}$ depend on $d_{k,i,2m,0}^{(i_{Seg})}$ and $d_{k,i,2m+1,0}^{(i_{Seg})}$. This is defined in Table 21-20 (Constellation mapper output to spatial mapper input for STBC). Note that the segment index $i_{Seg}$ is omitted in Table 21-20 (Constellation mapper output to spatial mapper input for STBC) for simplicity.

**Table 21-20—Constellation mapper output to spatial mapper input for STBC**

| $N_{STS}$ | $N_{SS}$ | $i_{STS}$ | $\tilde{d}_{k,i_{STS},2m,0}$ | $\tilde{d}_{k,i_{STS},2m+1,0}$ |
|---|---|---|---|---|
| 2 | 1 | 1 | $d_{k,1,2m,0}$ | $d_{k,1,2m+1,0}$ |
| | | 2 | $-d^*_{k,1,2m+1,0}$ | $d^*_{k,1,2m,0}$ |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 21-20—Constellation mapper output to spatial mapper input for STBC *(continued)***

| $N_{STS}$ | $N_{SS}$ | $i_{STS}$ | $\tilde{d}_{k, i_{STS}, 2m, 0}$ | $\tilde{d}_{k, i_{STS}, 2m+1, 0}$ |
|---|---|---|---|---|
| 4 | 2 | 1 | $d_{k, 1, 2m, 0}$ | $d_{k, 1, 2m+1, 0}$ |
| | | 2 | $-d^*_{k, 1, 2m+1, 0}$ | $d^*_{k, 1, 2m, 0}$ |
| | | 3 | $d_{k, 2, 2m, 0}$ | $d_{k, 2, 2m+1, 0}$ |
| | | 4 | $-d^*_{k, 2, 2m+1, 0}$ | $d^*_{k, 2, 2m, 0}$ |
| 6 | 3 | 1 | $d_{k, 1, 2m, 0}$ | $d_{k, 1, 2m+1, 0}$ |
| | | 2 | $-d^*_{k, 1, 2m+1, 0}$ | $d^*_{k, 1, 2m, 0}$ |
| | | 3 | $d_{k, 2, 2m, 0}$ | $d_{k, 2, 2m+1, 0}$ |
| | | 4 | $-d^*_{k, 2, 2m+1, 0}$ | $d^*_{k, 2, 2m, 0}$ |
| | | 5 | $d_{k, 3, 2m, 0}$ | $d_{k, 3, 2m+1, 0}$ |
| | | 6 | $-d^*_{k, 3, 2m+1, 0}$ | $d^*_{k, 3, 2m, 0}$ |
| 8 | 4 | 1 | $d_{k, 1, 2m, 0}$ | $d_{k, 1, 2m+1, 0}$ |
| | | 2 | $-d^*_{k, 1, 2m+1, 0}$ | $d^*_{k, 1, 2m, 0}$ |
| | | 3 | $d_{k, 2, 2m, 0}$ | $d_{k, 2, 2m+1, 0}$ |
| | | 4 | $-d^*_{k, 2, 2m+1, 0}$ | $d^*_{k, 2, 2m, 0}$ |
| | | 5 | $d_{k, 3, 2m, 0}$ | $d_{k, 3, 2m+1, 0}$ |
| | | 6 | $-d^*_{k, 3, 2m+1, 0}$ | $d^*_{k, 3, 2m, 0}$ |
| | | 7 | $d_{k, 4, 2m, 0}$ | $d_{k, 4, 2m+1, 0}$ |
| | | 8 | $-d^*_{k, 4, 2m+1, 0}$ | $d^*_{k, 4, 2m, 0}$ |

If STBC is not applied, $\tilde{d}^{(i_{Seg})}_{k, i, n, 0} = d^{(i_{Seg})}_{k, i, n, 0}$ and $N_{STS, 0} = N_{SS, 0}$.

NOTE—When STBC is applied, an odd number of space-time streams is not allowed, and $N_{STS, 0} = 2N_{SS, 0}$.

### 21.3.10.10 Pilot subcarriers

In a 20 MHz transmission, four pilot tones shall be inserted in subcarriers $k \in \{-21, -7, 7, 21\}$. The pilot mapping $P^k_n$ for subcarrier *k* for symbol *n* shall be as specified in Equation (21-91).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$P_n^{\{-21,-7,7,21\}} = \{\Psi^{(1)}_{1,n \bmod 4}, \Psi^{(1)}_{1,(n+1) \bmod 4}, \Psi^{(1)}_{1,(n+2) \bmod 4}, \Psi^{(1)}_{1,(n+3) \bmod 4}\}$$
$$P_n^{k \notin \{-21,-7,7,21\}} = 0 \quad (21\text{-}91)$$

where

$\Psi^{(1)}_{1,m}$ is given by the $N_{STS} = 1$ row of Table 19-19 (Pilot values for 20 MHz transmission)

In a 40 MHz transmission, six pilot tones shall be inserted in subcarriers –53, –25, –11, 11, 25, and 53. The pilot mapping $P_n^k$ for subcarrier *k* for symbol *n* shall be as specified in Equation (21-92).

$$P_n^{\{-53,-25,-11,11,25,53\}} = \{\Psi^{(1)}_{1,n \bmod 6}, \Psi^{(1)}_{1,(n+1) \bmod 6}, \ldots, \Psi^{(1)}_{1,(n+5) \bmod 6}\}$$
$$P_n^{k \notin \{-53,-25,-11,11,25,53\}} = 0 \quad (21\text{-}92)$$

where

$\Psi^{(1)}_{1,m}$ is given by the $N_{STS} = 1$ row of Table 19-20 (Pilots values for 40 MHz transmission (excluding MCS 32))

In an 80 MHz transmission, eight pilot tones shall be inserted in subcarriers –103, –75, –39, –11, 11, 39, 75, and 103. The pilot mapping $P_n^k$ for subcarrier *k* for symbol *n* shall be as specified in Equation (21-93).

$$P_n^{\{-103,-75,-39,-11,11,39,75,103\}} = \{\Psi_{n \bmod 8}, \Psi_{(n+1) \bmod 8}, \ldots, \Psi_{(n+7) \bmod 8}\}$$
$$P_n^{k \notin \{-103,-75,-39,-11,11,39,75,103\}} = 0 \quad (21\text{-}93)$$

where

$\Psi_m$ is defined in Table 21-21 (Pilot values for 80 MHz transmission)

**Table 21-21—Pilot values for 80 MHz transmission**

| $\Psi_0$ | $\Psi_1$ | $\Psi_2$ | $\Psi_3$ | $\Psi_4$ | $\Psi_5$ | $\Psi_6$ | $\Psi_7$ |
|---|---|---|---|---|---|---|---|
| 1 | 1 | 1 | –1 | –1 | 1 | 1 | 1 |

In a 160 MHz transmission, the 80 MHz pilot mapping is replicated in the two 80 MHz subchannels of the 160 MHz transmission. Specifically, 16 pilot tones shall be inserted in subcarriers –231, –203, –167, –139, –117, –89, –53, –25, 25, 53, 89, 117, 139, 167, 203, and 231. The pilot mapping $P_n^k$ for subcarrier *k* for symbol *n* shall be as specified in Equation (21-94).

$$P_n^{\{-231,-203,-167,-139,-117,-89,-53,-25,25,53,89,117,139,167,203,231\}}$$
$$= \{\Psi_{n \bmod 8}, \Psi_{(n+1) \bmod 8}, \Psi_{(n+2) \bmod 8}, \Psi_{(n+3) \bmod 8}, \Psi_{(n+4) \bmod 8}, \Psi_{(n+5) \bmod 8}, \Psi_{(n+6) \bmod 8}, \Psi_{(n+7) \bmod 8},$$
$$\Psi_{n \bmod 8}, \Psi_{(n+1) \bmod 8}, \Psi_{(n+2) \bmod 8}, \Psi_{(n+3) \bmod 8}, \Psi_{(n+4) \bmod 8}, \Psi_{(n+5) \bmod 8}, \Psi_{(n+6) \bmod 8}, \Psi_{(n+7) \bmod 8}\} \quad (21\text{-}94)$$
$$P_n^{k \notin \{-231,-203,-167,-139,-117,-89,-53,-25,25,53,89,117,139,167,203,231\}} = 0$$

where

$\Psi_m$ is given in Table 21-21 (Pilot values for 80 MHz transmission)

In an 80+80 MHz transmission, each frequency segment shall follow the 80 MHz pilot tone allocation and values defined for 80 MHz transmission as specified in Equation (21-93) and Table 21-21 (Pilot values for 80 MHz transmission).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The above pilot mapping shall be copied to all space-time streams before the space-time stream cyclic shifts are applied.

### 21.3.10.11 OFDM modulation

#### 21.3.10.11.1 Transmission in VHT format

The time domain waveform of the Data field of a VHT PPDU from frequency segment $i_{Seg}$ and transmit chain $i_{TX}$, $1 \le i_{TX} \le N_{TX}$ shall be as defined in Equation (21-95).

$$r_{\text{VHT-Data}}^{(i_{Seg}, i_{TX})}(t) = \frac{1}{\sqrt{N_{\text{VHT-Data}}^{\text{Tone}} N_{STS,\,total}}} \sum_{n=0}^{N_{SYM}-1} w_{T_{\text{SYM}}}(t - nT_{SYM}) \cdot \sum_{k=-N_{SR}}^{N_{SR}} \sum_{u=0}^{N_{user}-1} \sum_{m=1}^{N_{STS,\,u}} \left( \left[ Q_k^{(i_{Seg})} \right]_{i_{TX},\,(M_u+m)} \Upsilon_{k,\,\text{BW}} (\tilde{D}_{k,\,m,\,n,\,BW}^{(i_{Seg},\,u)} + p_{n+4} P_n^k) \cdot \exp(j2\pi k \Delta_F (t - nT_{SYM} - T_{\text{GI, Data}} - T_{\text{CS,VHT}}(M_u + m))) \right) \quad (21\text{-}95)$$

where

$p_n$ is defined in 17.3.5.10 (OFDM modulation)

$P_n^k$ is defined in 21.3.10.10 (Pilot subcarriers)

$\Upsilon_{k,\,\text{BW}}$ is defined in Equation (21-14), Equation (21-15), Equation (21-16). and Equation (21-17)

$\tilde{D}_{k,\,m,\,n,\,BW}^{(i_{Seg},\,u)}$ is the transmitted constellation for user $u$ at subcarrier $k$, space-time stream $m$, and Data field OFDM symbol $n$ and is defined in Equation (21-96) to Equation (21-99)

$N_{\text{VHT-Data}}^{\text{Tone}}$ has the value given in Table 21-8 (Tone scaling factor and guard interval duration values for PHY fields)

$T_{\text{CS,VHT}}(n)$ is given in Table 21-11 (Cyclic shift values for the VHT modulated fields of a PPDU)

$T_{\text{GI, Data}}$ is the guard interval duration. $T_{\text{GI, Data}} = T_{\text{GI}}$ when not using the short guard interval (Short GI field of VHT-SIG-A2 is 0) and $T_{\text{GI, Data}} = T_{\text{GIS}}$ when using the short guard interval (Short GI field of VHT-SIG-A2 is 1). $T_{\text{GI}}$ and $T_{\text{GIS}}$ are given in Table 21-5 (Timing-related constants)

In a 20 MHz VHT transmission,

$$\tilde{D}_{k,\,m,\,n,\,20}^{(i_{Seg},\,u)} = \begin{cases} 0, k = 0, \pm 7, \pm 21 \\ \tilde{d}_{M_{20}^r(k),\,m,\,n,\,u}^{(i_{Seg})}, \text{otherwise} \end{cases} \quad (21\text{-}96)$$

where

$M_{20}^r(k)$ is defined in Equation (21-49)

In a 40 MHz VHT transmission,

$$\tilde{D}_{k,\,m,\,n,\,40}^{(i_{Seg},\,u)} = \begin{cases} 0, k = 0, \pm 1, \pm 11, \pm 25, \pm 53 \\ \tilde{d}_{M_{40}^r(k),\,m,\,n,\,u}^{(i_{Seg})}, \text{otherwise} \end{cases} \quad (21\text{-}97)$$

where

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$M^r_{40}(k)$ is defined in Equation (21-51)

In an 80 MHz transmission,

$$\tilde{D}^{(i_{Seg},u)}_{k,m,n,80} = \begin{cases} 0, k = 0, \pm1, \pm11, \pm39, \pm75, \pm103 \\ \tilde{d}^{(i_{Seg})}_{M^r_{80}(k),m,n,u}, \text{otherwise} \end{cases} \quad (21\text{-}98)$$

where

$M^r_{80}(k)$ is defined in Equation (21-53)

In a 160 MHz transmission,

$$\tilde{D}^{(i_{Seg},u)}_{k,m,n,160} = \begin{cases} 0, k = 0, \pm1, \pm2, \pm3, \pm4, \pm5, \pm25, \pm53, \pm89, \pm117, \pm127, \pm128, \pm129, \pm139, \pm167, \pm203, \pm231 \\ \tilde{d}^{(i_{Seg})}_{M^r_{160}(k),m,n,u}, \text{otherwise} \end{cases} \quad (21\text{-}99)$$

where

$M^r_{160}(k)$ is defined in Equation (21-55)

In an 80+80 MHz transmission, each frequency segment shall follow the 80 MHz VHT subcarrier mapping as specified in Equation (21-98) and Equation (21-53).

$Q^{(i_{Seg})}_k$ is a spatial mapping/steering matrix with $N_{TX}$ rows and $N_{STS,total}$ columns for subcarrier $k$ in frequency segment $i_{Seg}$. $Q^{(i_{Seg})}_k$ may be frequency dependent. Refer to the examples of $Q_k$ listed in 19.3.11.11.2 (Spatial mapping) for examples of $Q^{(i_{Seg})}_k$ that could be used for VHT SU PPDUs. Note that implementations are not restricted to the spatial mapping matrix examples listed in 19.3.11.11.2 (Spatial mapping) and the number of transmit chains $N_{TX}$ could be greater than 4. For VHT SU PPDUs to which beamforming is applied, $Q^{(i_{Seg})}_k$ is a beamforming steering matrix and is derived from the TXVECTOR parameter EXPANSION_MAT. For VHT MU PPDUs, $Q^{(i_{Seg})}_k$ is the (#3367)DL MU-MIMO steering matrix and is derived from the TXVECTOR parameter EXPANSION_MAT. The beamforming steering matrices and (#3367)DL MU-MIMO steering matrices are implementation specific.

### 21.3.10.12 Non-HT duplicate transmission

When the TXVECTOR parameter FORMAT is NON_HT and the TXVECTOR parameter NON_HT_MODULATION is NON_HT_DUP_OFDM, the transmitted PPDU is a non-HT duplicate. Non-HT duplicate transmission is used to transmit to non-HT OFDM STAs, HT STAs, or VHT STAs that may be present in a part of a 40 MHz, 80 MHz, or 160 MHz channel (see Table 21-2 (Interpretation of FORMAT, NON_HT_MODULATION, CH_BANDWIDTH, and CH_OFFSET parameters)). The VHT-SIG-A, VHT-STF, VHT-LTF, and VHT-SIG-B fields are not transmitted. The L-STF, L-LTF, and L-SIG fields shall be transmitted in the same way as in the VHT transmission, with the exceptions for the Rate and Length fields which shall follow 17.3.4 (SIGNAL field).

In a 40 MHz non-HT duplicate transmission, the Data field shall be as defined by Equation (19-61).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

For 80 MHz and 160 MHz non-HT duplicate transmissions, the Data field shall be as defined by Equation (21-100).(#567)

$$r^{i_{TX}}_{\text{non-HT},\,BW}(t) = \frac{1}{\sqrt{N_{TX} N^{\text{Tone}}_{\text{NON\_HT\_DUP\_OFDM-Data}}}} \sum_{n=0}^{N_{SYM}-1} w_{T_{SYM}}(t - nT_{SYM}) \cdot \sum_{i_{BW}=0}^{N_{20\text{MHz}}-1} \left( \sum_{k=-26}^{26} \Upsilon_{(k - K_{\text{Shift}}(i_{BW})),\,BW}(D_{k,\,n} + p_{n+1}P_k) \cdot \exp(j2\pi(k - K_{\text{Shift}}(i_{BW}))\Delta_F(t - nT_{SYM} - T_{GI} - T^{i_{TX}}_{\text{CS}})) \right) \quad (21\text{-}100)$$

where

| | |
|---|---|
| $N_{20\text{MHz}}$ and $K_{\text{Shift}}(i)$ | are defined in 21.3.8.2.4 (L-SIG definition) |
| $P_k$ and $p_n$ | are defined in 17.3.5.10 (OFDM modulation) |
| $D_{k,n}$ | is defined in Equation (21-26) |
| $\Upsilon_{k,\,BW}$ | is defined in Equation (21-16) and Equation (21-17) |
| $T^{i_{TX}}_{\text{CS}}$ | represents the cyclic shift for transmitter chain $i_{TX}$ with a value given in Table 21-10 (Cyclic shift values for L-STF, L-LTF, L-SIG, and VHT-SIG-A fields of the PPDU) |
| $N^{\text{Tone}}_{\text{NON\_HT\_DUP\_OFDM-Data}}$ | has the value given in Table 21-8 (Tone scaling factor and guard interval duration values for PHY fields) |

In an 80+80 MHz non-HT duplicate transmission, data transmission in each frequency segment shall be as defined for an 80 MHz non-HT duplicate transmission in Equation (21-100).

### 21.3.11 SU-MIMO and (#3367)DL MU-MIMO Beamforming

#### 21.3.11.1 General

SU-MIMO and (#3367)DL MU-MIMO beamforming are techniques used by a STA with multiple antennas (the beamformer) to steer signals using knowledge of the channel to improve throughput. With SU-MIMO beamforming all space-time streams in the transmitted signal are intended for reception at a single STA. With (#3367)DL MU-MIMO beamforming, disjoint subsets of the space-time streams are intended for reception at different STAs.

For SU-MIMO beamforming, the steering matrix $Q_k$ can be determined from the beamforming feedback matrix $V_k$ that is sent back to the beamformer by the beamformee using the compressed beamforming feedback matrix format as defined in 19.3.12.3.6 (Compressed beamforming feedback matrix). The feedback report format is described in 9.4.1.47 (VHT Compressed Beamforming Report field).

For (#3367)DL MU-MIMO beamforming, the receive signal vector in subcarrier $k$ at beamformee $u$, $\boldsymbol{y}_{k,\,u} = [y_{k,\,0}, y_{k,\,1}, \ldots, y_{k,\,N_{RX_u}-1}]^T$, is shown in Equation (21-101), where $\boldsymbol{x}_k = [\boldsymbol{x}^T_{k,\,0}, \boldsymbol{x}^T_{k,\,1}, \ldots, \boldsymbol{x}^T_{k,\,N_{user}-1}]^T$ denotes the transmit signal vector in subcarrier $k$ for all $N_{user}$ beamformees, with $\boldsymbol{x}_{k,\,u} = [x_{k,\,0}, x_{k,\,1}, \ldots, x_{k,\,N_{STS,\,u}-1}]^T$ being the transmit signal for beamformee $u$.

$$\boldsymbol{y}_{k,\,u} = \boldsymbol{H}_{k,\,u} \times [Q_{k,\,0}, Q_{k,\,1}, \ldots, Q_{k,\,N_{user}-1}] \times \boldsymbol{x}_k + \boldsymbol{n} \quad (21\text{-}101)$$

where

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$\boldsymbol{H}_{k,u}$ is the channel matrix from the beamformer to beamformee $u$ in subcarrier $k$ with dimensions $N_{RX_u} \times N_{TX}$

$N_{RX_u}$ is the number of receive antennas at beamformee $u$

$Q_{k,u}$ is a steering matrix for beamformee $u$ in subcarrier $k$ with dimensions $N_{TX} \times N_{STS_u}$

$N_{user}$ is the number of VHT MU PPDU recipients (see Table 21-6 (Frequently used parameters))

$\boldsymbol{n}$ is a vector of additive noise and may include interference

The (#3367)DL MU-MIMO steering matrix $Q_k = [Q_{k,0}, Q_{k,1}, \ldots, Q_{k,N_{user}-1}]$ can be determined by the beamformer using the beamforming feedback matrices for subcarrier $k$ from beamformee $u$, $V_{k,u,}$ and SNR information for subcarrier $k$ from beamformee $u$, $SNR_{k,u}$, where $u = 0, 1, \ldots, N_{user} - 1$ . The steering matrix that is computed (or updated) using new beamforming feedback matrices and new SNR information from some or all of participating beamformees might replace the existing steering matrix $Q_k$ for the next (#3367)DL MU-MIMO data transmission. The beamformee group for the MU transmission is signaled using the Group ID field in VHT-SIG-A (see 21.3.8.3.3 (VHT-SIG-A definition) and 21.3.11.4 (Group ID)).

### 21.3.11.2 Beamforming Feedback Matrix *V*

Upon receipt of a VHT NDP sounding PPDU, the beamformee shall remove the space-time stream CSD in Table 21-11 (Cyclic shift values for the VHT modulated fields of a PPDU) from the measured channel before computing a set of matrices for feedback to the beamformer. The beamforming feedback matrix, $V_{k,u}$, found by the beamformee $u$ for subcarrier $k$ shall be compressed in the form of angles using the method described in 19.3.12.3.6 (Compressed beamforming feedback matrix). The angles, $\phi(k,u)$ and $\psi(k,u)$, are quantized according to Table 9-104 (Quantization of angles). The number of bits for quantization is chosen by the beamformee, based on the indication from the beamformer as to whether the feedback is requested for SU-MIMO beamforming or (#3367)DL MU-MIMO beamforming. The compressed beamforming feedback using 19.3.12.3.6 (Compressed beamforming feedback matrix) is the only Clause 21 (Very high throughput (VHT) PHY specification) beamforming feedback format defined.

The beamformee shall generate the beamforming feedback matrices with the number of rows ($Nr$) equal to the $N_{STS}$ of the NDP.

After receiving the angle information, $\phi(k,u)$ and $\psi(k,u)$, the beamformer reconstructs $V_{k,u}$ using Equation (19-79). For SU-MIMO beamforming, the beamformer can use this $V_{k,0}$ matrix to determine the steering matrix $Q_k$. For (#3367)DL MU-MIMO beamforming, the beamformer may calculate a steering matrix $Q_k = [Q_{k,0}, Q_{k,1}, \ldots, Q_{k,N_{user}-1}]$ using $V_{k,u}$ and $SNR_{k,u}$ $(0 \le u \le N_{user} - 1)$ in order to suppress crosstalk between participating beamformees. The method used by the beamformer to calculate the steering matrix $Q_k$ is implementation specific.

The beamformee decides the tone grouping and codebook size to be used in the beamforming feedback matrix $V$. A beamformer shall support all tone groups and codebook sizes.

### 21.3.11.3 Maximum Number of Total Spatial Streams in VHT MU PPDUs

An MU beamformee capable STA shall support reception of VHT MU PPDUs with the total number of space-time streams across the N_user users being less than or equal to the value indicated in the Maximum NSTS, total subfield of the Supported VHT-MCS and NSS Set field of the VHT Capabilities element.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

#### 21.3.11.4 Group ID

A value in the Group ID field in VHT-SIG-A (see 21.3.8.3.3 (VHT-SIG-A definition)) in the range 1 to 62 indicates a VHT MU PPDU. Prior to transmitting a VHT MU PPDU, group assignments have been established by the AP for (#3367)DL MU-MIMO capable STAs using the Group ID Management frame as defined in 9.6.22.3 (Group ID Management frame format).

After the PHY is configured using the PHYCONFIG_VECTOR parameter GROUP_ID_MANAGEMENT, the following lookup tables are populated:

a) Group ID to Membership Status, denoted by MembershipStatusInGroupID[$g$] for $1 \le g \le 62$

b) Group ID to User Position, denoted by UserPositionInGroupID[$g$] for $1 \le g \le 62$

When a STA receives a VHT MU PPDU where the Group ID field in VHT-SIG-A has the value $k$ and where MembershipStatusInGroupID[$k$] is equal to 1, then the number of space-time streams for that STA is indicated in the MU[UserPositionInGroupID[$k$]] NSTS field in VHT-SIG-A. The space-time streams of different users are ordered in accordance to user position values, i.e., the space-time streams for the user in user position 0 come first, followed by the space-time streams for the user in position 1, followed by the space-time streams for the user in position 2, and followed by the space-time streams for the user in position 3.

A STA is also able to identify the space-time streams intended for other STAs that act as interference. VHT-LTF symbols in the VHT MU PPDU are used to measure the channel for the space-time streams intended for the STA and can also be used to measure the channel for the interfering space-time streams. To successfully demodulate the space-time streams intended for the STA, the STA may use the channel state information for all space-time streams to reduce the effect of interfering space-time streams.

If a STA finds that it is not a member of the group, or the STA is a member of the group but the corresponding MU NSTS field in VHT-SIG-A indicates that there are zero space-time streams for the STA in the PPDU, then the STA may elect to not process the remainder of the PPDU.

### 21.3.12 VHT preamble format for sounding PPDUs

NDP is the only VHT sounding format.

The format of a VHT NDP is shown in Figure 21-28 (VHT NDP format).

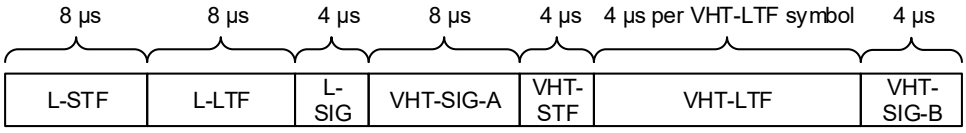

**Figure 21-28—VHT NDP format**

NOTE—The number of VHT-LTF symbols in the NDP is determined by the SU NSTS field in VHT-SIG-A.

The VHT NDP has the following properties:

— Uses the VHT PPDU format but without the Data field.

— Is a VHT SU PPDU as indicated by the VHT-SIG-A field.

— Has the data bits of the VHT-SIG-B field set to a fixed bit pattern (see 21.3.8.3.6 (VHT-SIG-B definition)).

This is an unapproved IEEE Standards Draft, subject to change.

### 21.3.13 Regulatory requirements

Wireless LANs (WLANs) implemented in accordance with this standard are subject to equipment certification and operating requirements established by regional and national regulatory administrations. The PHY specification establishes minimum technical requirements for interoperability, based upon established regulations at the time this standard was issued. These regulations are subject to revision or may be superseded. Requirements that are subject to local geographic regulations are annotated within the PHY specification. Regulatory requirements that do not affect interoperability are not addressed in this standard. Implementers are referred to the regulatory sources in Annex D for further information. Operation in countries within defined regulatory domains might be subject to additional or alternative national regulations.

### 21.3.14 Channelization

A VHT channel is specified by the four PLME MIB fields specified in Table 21-22 (Fields to specify VHT channels).

**Table 21-22—Fields to specify VHT channels**

| Field | Meaning |
|---|---|
| dot11CurrentChannelWidth | Channel width. Possible values represent 20 MHz, 40 MHz, 80 MHz, 160 MHz, and 80+80 MHz channels. |
| dot11CurrentChannelCenterFrequencyIndex0 | For a 20 MHz, 40 MHz, 80 MHz, or 160 MHz channel, denotes the channel center frequency.<br>For an 80+80 MHz channel, denotes the center frequency of the frequency segment 0, which is the frequency segment containing the primary channel.<br>Valid range is 1 to 200.<br>See Equation (21-102). |
| dot11CurrentChannelCenterFrequencyIndex1 | For an 80+80 MHz channel, denotes the center frequency of the frequency segment 1, which is the frequency segment that does not contain the primary channel.<br>Valid range is 1 to 200.<br>See Equation (21-102).<br>For a 20 MHz, 40 MHz, 80 MHz, or 160 MHz channel, set to 0. |
| dot11CurrentPrimaryChannel | Denotes the location of the primary 20 MHz channel.<br>Valid range is 1 to 200.<br>See Equation (21-103). |

Given dot11CurrentChannelCenterFrequencyIndex0 and dot11CurrentChannelCenterFrequencyIndex1, the respective channel center frequency is given by Equation (21-102).

$$\text{Channel center frequency [MHz]} = \text{Channel starting frequency} + 5 \times \text{dot11CurrentChannelCenterFrequencyIndex} \quad (21\text{-}102)$$

where

Channel starting frequency is given by the operating class (Annex E)

dot11CurrentChannelCenterFrequencyIndex is either dot11CurrentChannelCenterFrequencyIndex0 or dot11CurrentChannelCenterFrequencyIndex1

The center frequency of the primary 20 MHz channel is given by Equation (21-103).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Primary 20 MHz channel center frequency [MHz] = Channel starting frequency + 5 × dot11CurrentPrimaryChannel (21-103)

where

Channel starting frequency is defined as dot11ChannelStartingFactor × 500 kHz.

A channel center frequency of 5 GHz shall be indicated by dot11ChannelStartingFactor = 8000 and dot11CurrentPrimaryChannel = 200.

For an 80+80 MHz channel, any two channels that would each be allowed as 80 MHz channels and whose center frequencies are separated by greater than 80 MHz (difference between dot11CurrentChannelCenterFrequencyIndex0 and dot11CurrentChannelCenterFrequencyIndex1 corresponds to a frequency difference greater than 80 MHz) may be used.

For example, a channel specified by

Channel starting frequency = 5000 MHz
dot11CurrentChannelWidth = 80 MHz
dot11CurrentChannelCenterFrequencyIndex0 = 42
dot11CurrentPrimaryChannel = 36

is an 80 MHz channel with a center frequency of 5210 MHz and the primary 20 MHz channel centered at 5180 MHz.

A channel specified by

Channel starting frequency = 5000 MHz
dot11CurrentChannelWidth = 160 MHz
dot11CurrentChannelCenterFrequencyIndex0 = 50
dot11CurrentPrimaryChannel = 56

is a 160 MHz channel with a center frequency of 5250 MHz and the primary 20 MHz channel centered at 5280 MHz.

A channel specified by

Channel starting frequency = 5000 MHz
dot11CurrentChannelWidth = 80+80 MHz
dot11CurrentChannelCenterFrequencyIndex0 =155
dot11CurrentChannelCenterFrequencyIndex1 = 106
dot11CurrentPrimaryChannel = 161

is an 80+80 MHz channel in which frequency segment 0 has 80 MHz bandwidth and center frequency of 5775 MHz. Frequency segment 1 also has 80 MHz bandwidth and center frequency of 5530 MHz. The primary 20 MHz channel is centered at 5805 MHz.

### 21.3.15 Slot time

The slot time for the VHT PHY shall be 9 μs for 20 MHz, 40 MHz, 80 MHz, 160 MHz, and 80+80 MHz channel spacing.

### 21.3.16 Transmit and receive port impedance

(#1247)The impedance of exposed transmit and receive antenna connectors are defined in 17.3.8.7 (Transmit and receive impedance at the antenna connector).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

## 21.3.17 VHT transmit specification

### 21.3.17.1 Transmit spectrum mask

NOTE 1—In the presence of additional regulatory restrictions, the device has to meet both the regulatory requirements and the mask defined in this subclause.

NOTE 2—Transmit spectral mask figures in this subclause are not drawn to scale.

NOTE 3—For rules regarding TX center frequency leakage levels, see 21.3.17.4.2 (Transmit center frequency leakage). The spectral mask requirements in this subclause do not apply to the RF LO.

(#1471)The overall transmit spectral mask is constructed using two components. First, an interim spectral mask is constructed whose mask level is determined relative to the maximum spectral density of the signal. Second, an absolute transmit spectral limit is computed based on the mask bandwidth. The overall transmit spectral mask is then constructed by taking the higher of the interim transmit spectral mask and the absolute transmit spectral limit at each frequency offset.

For a 20 MHz mask PPDU of non-HT, HT or VHT format, the interim transmit spectral mask shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth of 18 MHz, –20 dBr at 11 MHz frequency offset, –28 dBr at 20 MHz frequency offset, and –40 dBr at 30 MHz frequency offset and above. The interim transmit spectral mask for frequency offsets in between 9 and 11 MHz, 11 and 20 MHz, and 20 and 30 MHz shall be linearly interpolated in dB domain from the requirements for 9 MHz, 11 MHz, 20 MHz, and 30 MHz frequency offsets. The transmit spectrum shall not exceed the maximum of the interim transmit spectral mask and –39 dBm/MHz(M25) at any frequency offset. Figure 21-29 (Example transmit spectral mask for 20 MHz mask PPDU) shows an example of the resulting overall spectral mask when the –40 dBr spectrum level is above –39 dBm/MHz.(M25)

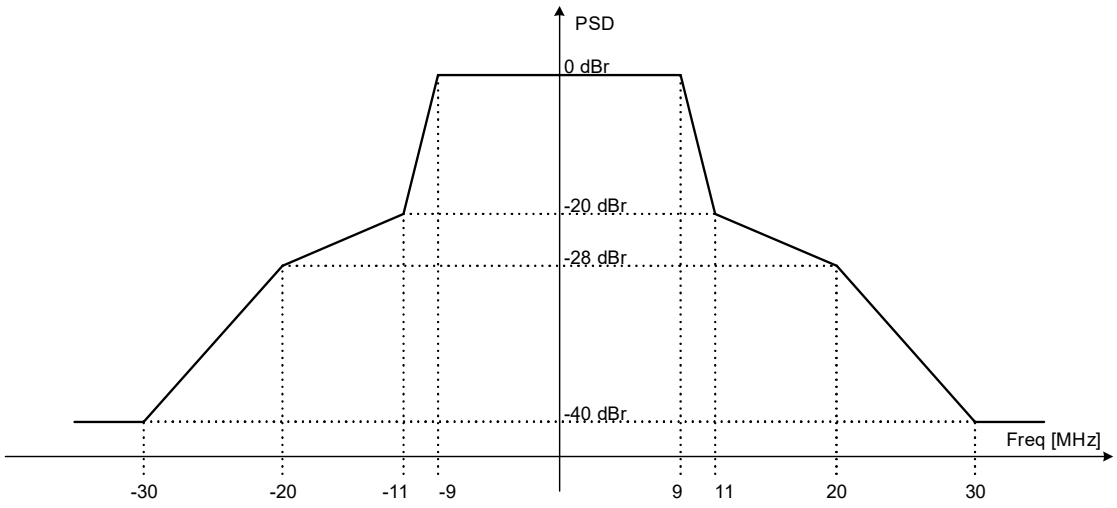

**Figure 21-29—Example transmit spectral mask for 20 MHz mask PPDU**

For a 40 MHz mask PPDU of non-HT, non-HT duplicate, HT or VHT format, the interim transmit spectral mask shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth of 38 MHz, –20 dBr at 21 MHz frequency offset, –28 dBr at 40 MHz frequency offset, and –40 dBr at 60 MHz frequency offset and above. The interim transmit spectral mask for frequency offsets in between 19 and 21 MHz, 21 and 40 MHz, and 40 and 60 MHz shall be linearly interpolated in dB domain from the requirements for 19 MHz, 21 MHz, 40 MHz, and 60 MHz frequency offsets. The transmit

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

spectrum shall not exceed the maximum of the interim transmit spectral mask and –39 dBm/MHz(M25) at any frequency offset greater than 19 MHz. Figure 21-30 (Example transmit spectral mask for 40 MHz mask PPDU) shows an example of the resulting overall spectral mask when the –40 dBr spectrum level is above –39 dBm/MHz.(M25)

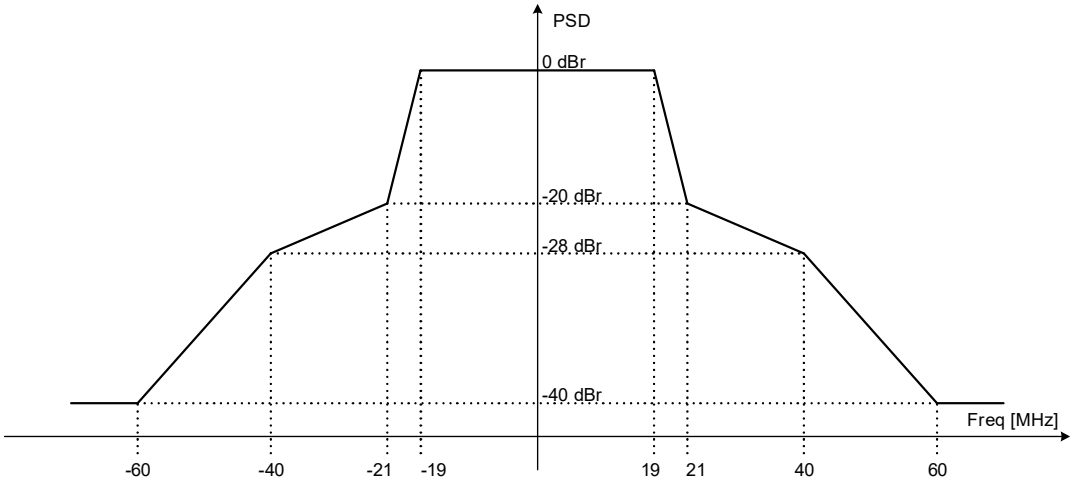

**Figure 21-30—Example transmit spectral mask for 40 MHz mask PPDU**

For an 80 MHz mask PPDU of non-HT, non-HT duplicate, HT or VHT format, the interim transmit spectral mask shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth of 78 MHz, –20 dBr at 41 MHz frequency offset, –28 dBr at 80 MHz frequency offset, and –40 dBr at 120 MHz frequency offset and above. The interim transmit spectral mask for frequency offsets in between 39 and 41 MHz, 41 and 80 MHz, and 80 and 120 MHz shall be linearly interpolated in dB domain from the requirements for 39 MHz, 41 MHz, 80 MHz, and 120 MHz frequency offsets. The transmit spectrum shall not exceed the maximum of the interim transmit spectrum mask and –39 dBm/MHz(M25) at any frequency offset. Figure 21-31 (Example transmit spectral mask for 80 MHz mask PPDU) shows an example of the resulting overall spectral mask when the –40 dBr spectrum level is above –39 dBm/MHz.(M25)

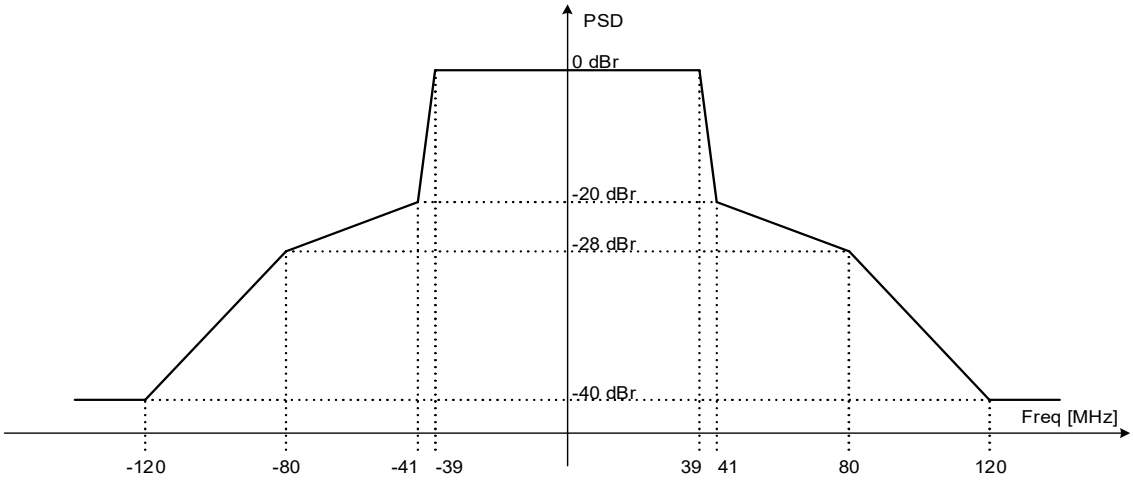

**Figure 21-31—Example transmit spectral mask for 80 MHz mask PPDU**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

For a 160 MHz mask PPDU of non-HT, non-HT duplicate, HT or VHT format, the interim transmit spectral mask shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth of 158 MHz, –20 dBr at 81 MHz frequency offset, –28 dBr at 160 MHz frequency offset, and –40 dBr at 240 MHz frequency offset and above. The interim transmit spectral mask for frequency offsets in between 79 and 81 MHz, 81 and 160 MHz, and 160 and 240 MHz shall be linearly interpolated in dB domain from the requirements for 79 MHz, 81 MHz, 160 MHz, and 240 MHz frequency offsets. The transmit spectrum shall not exceed the maximum of the interim transmit spectrum mask and –39 dBm/MHz(M25) at any frequency offset. Figure 21-32 (Example transmit spectral mask for 160 MHz mask PPDU) shows an example of the resulting overall spectral mask when the –40 dBr spectrum level is above –39 dBm/MHz(M25).

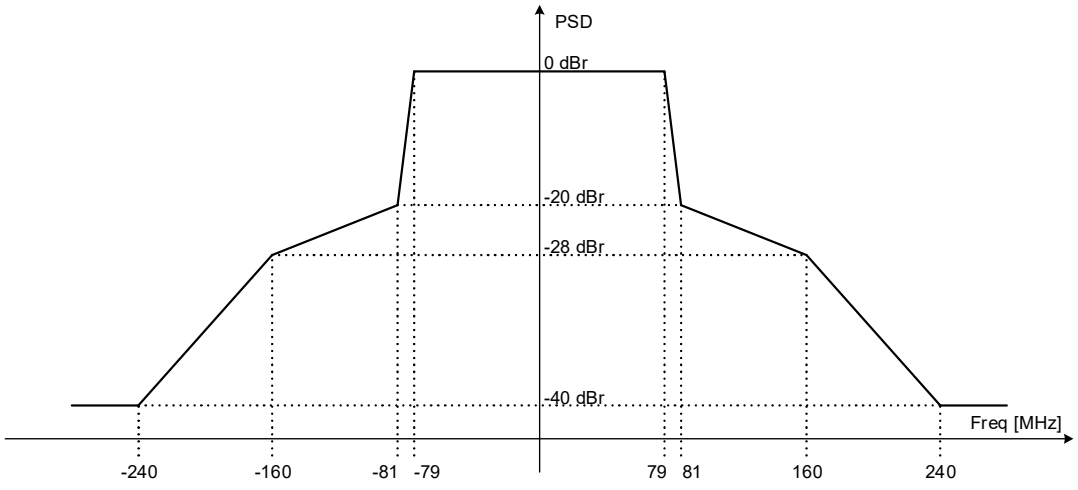

**Figure 21-32—Example transmit spectral mask for 160 MHz mask PPDU**

For an 80+80 MHz mask PPDU of non-HT duplicate or VHT format, the overall transmit spectral mask is constructed in the following manner. First, the 80 MHz interim spectral mask is placed on each of the two 80 MHz frequency segments. Then, for each frequency at which both of the 80 MHz interim spectral masks have values greater than –40 dBr and less than –20 dBr, the sum of the two interim mask values (summed in linear domain) shall be taken as the overall spectral mask value. Next, for each frequency at which neither of the two 80 MHz interim masks have values greater than or equal to –20 dBr and less than or equal to 0 dBr, the higher value of the two interim masks shall be taken as the overall interim spectral value. Finally, for any frequency region where the mask value has not been defined yet, linear interpolation (in dB domain) between the nearest two frequency points with the interim spectral mask value defined shall be used to define the interim spectral mask value. The transmit spectrum shall not exceed the maximum of the interim transmit spectrum mask and –39 dBm/MHz(M25) at any frequency offset. Figure 21-33 (Example transmit spectral mask for 80+80 MHz mask PPDU) shows an example of a transmit spectral mask for a noncontiguous transmission using two 80 MHz channels where the center frequency of the two 80 MHz channels are separated by 160 MHz and the –40 dBr spectrum level is above –39 dBm/MHz(M25).

Different center frequency separation between the two 80 MHz frequency segments of the spectral mask as well as different peak levels of each 80 MHz frequency segment of the spectral mask are possible, in which case a similar procedure in determining the spectral mask as in Figure 21-33 (Example transmit spectral mask for 80+80 MHz mask PPDU) is followed.

The transmit spectral mask for noncontiguous transmissions using two nonadjacent 80 MHz channels is applicable only in regulatory domains that allow for such transmissions.

Measurements shall be made using a 100 kHz resolution bandwidth and a 30 kHz video bandwidth.

This is an unapproved IEEE Standards Draft, subject to change.

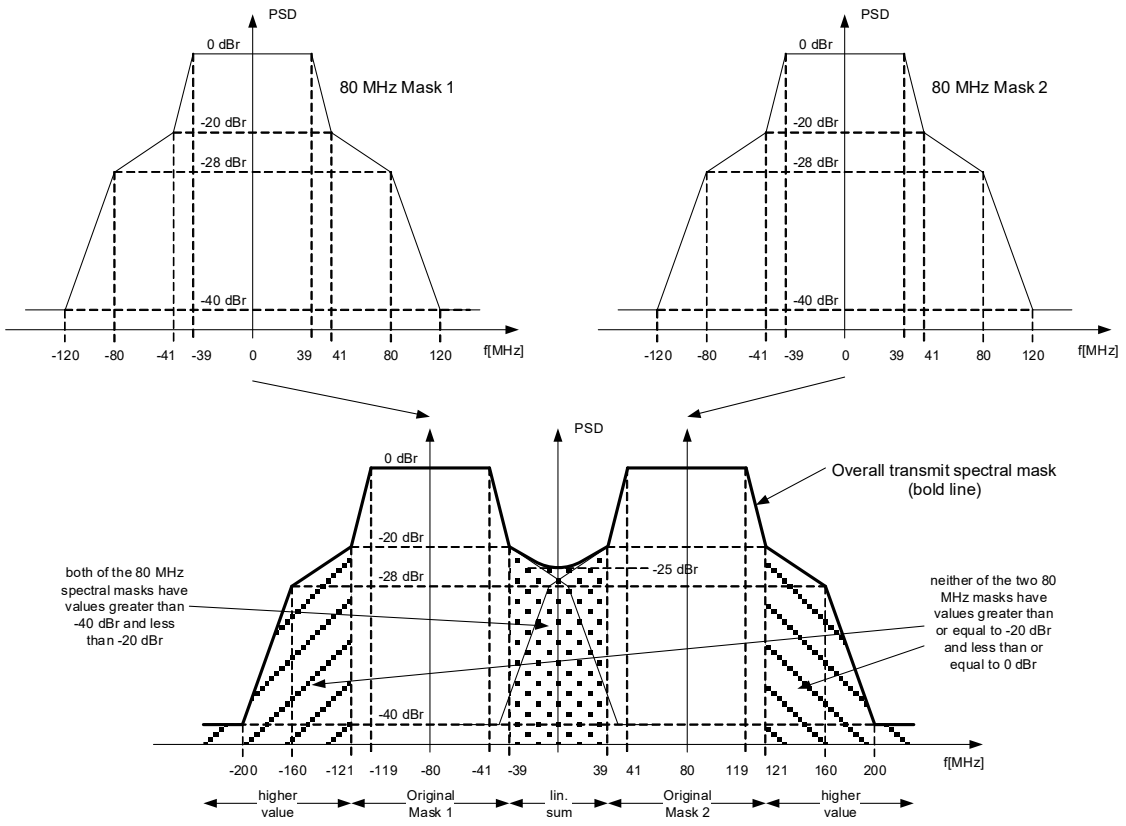

**Figure 21-33—Example transmit spectral mask for 80+80 MHz mask PPDU**

### 21.3.17.2 Spectral flatness

Spectral flatness measurements shall be conducted using BPSK modulated PPDUs. Demodulate the PPDUs according to the following (or equivalent) procedure:

a) Start of PPDU shall be detected.

b) Transition from L-STF to L-LTF shall be detected and fine timing shall be established.

c) Coarse and fine frequency offsets shall be estimated.

d) Symbols in a PPDU shall be derotated according to estimated frequency offset.

e) For each VHT-LTF symbol, transform the symbol into subcarrier received values, estimate the phase from the pilot subcarriers, and derotate the subcarrier values according to the estimated phase.

f) For each of the data OFDM symbols: transform the symbol into subcarrier received values.

The spectral flatness test shall be performed over at least 20 PPDUs. The PPDUs under test shall be at least 16 data OFDM symbols long.

Evaluate spectral flatness using the subcarrier received values or the magnitude of the channel estimation.

Let $E_{i,\,avg}$ denote the magnitude of the channel estimation on subcarrier $i$ or the average constellation energy of a BPSK modulated subcarrier $i$ in a VHT data symbol.

In a contiguous non-HT duplicate or VHT transmission having a bandwidth listed in Table 21-23 (Maximum transmit spectral flatness deviations), $E_{i,\,avg}$ of each of the subcarriers with indices listed as

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

tested subcarrier indices shall not deviate by more than the specified maximum deviation in Table 21-23 (Maximum transmit spectral flatness deviations) from the average of $E_{i,\,avg}$ over subcarrier indices listed as averaging subcarrier indices. Averaging of $E_{i,\,avg}$ is done in the linear domain.

**Table 21-23—Maximum transmit spectral flatness deviations**

| Format | Bandwidth of transmission (MHz) | Averaging subcarrier indices | Tested subcarrier indices | Maximum deviation (dB) |
|---|---|---|---|---|
| VHT | 20 | –16 to –1 and +1 to +16 | –16 to –1 and +1 to +16 | ± 4 |
| | | | –28 to –17 and +17 to +28 | +4/–6 |
| | 40 | –42 to –2 and +2 to +42 | –42 to –2 and +2 to +42 | ± 4 |
| | | | –58 to –43 and +43 to +58 | +4/–6 |
| | 80 | –84 to –2 and +2 to +84 | –84 to –2 and +2 to +84 | ± 4 |
| | | | –122 to –85 and +85 to +122 | +4/–6 |
| | 160 | –172 to –130, –126 to –44, +44 to +126, and +130 to +172 | –172 to –130, –126 to –44, +44 to +126, and +130 to +172 | ± 4 |
| | | | –250 to –173, –43 to –6, +6 to +43, and +173 to +250 | +4/–6 |
| non-HT duplicate | 40 | –42 to –33, –31 to –6, +6 to +31, and +33 to +42 | –42 to –33, –31 to –6, +6 to +31, and +33 to +42 | ± 4 |
| | | | –43 to –58 and +43 to +58 | +4/–6 |
| | 80 | –84 to –70, –58 to –33, –31 to –6, +6 to +31, +33 to +58, +70 to +84 | –84 to –70,–58 to –33, –31 to –6, +6 to +31, +33 to +58, +70 to +84 | ± 4 |
| | | | –122 to –97, –95 to –85 and +85 to +95, +97 to +122 | +4/–6 |
| | 160 | –172 to –161, –159 to –134, –122 to –97, –95 to –70, –58 to –44, +44 to +58, +70 to +95, +97 to +122, +134 to +159, +161 to +172 | –172 to –161, –159 to –134, –122 to –97, –95 to –70, –58 to –44, +44 to +58, +70 to +95, +97 to +122, +134 to +159, +161 to +172 | ± 4 |
| | | | –250 to –225, –223 to –198, –186 to –173, –43 to –33, –31 to –6, +6 to +31, +33 to +43, +173 to +186, +198 to +223, +225 to +250 | +4/–6 |

In an 80+80 MHz transmission, each segment shall meet the spectral flatness requirement for an 80 MHz transmission.

For the spectral flatness test, the transmitting STA shall be configured to use a spatial mapping matrix $Q_k$ (see 21.3.10.11 (OFDM modulation)) with flat frequency response. Each output port under test of the transmitting STA shall be connected through a cable to one input port of the testing instrumentation. The requirements apply to 20 MHz, 40 MHz, 80 MHz, and 160 MHz contiguous transmissions as well as 80+80 MHz transmissions.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

#### 21.3.17.3 Transmit center frequency and symbol clock frequency tolerance

The symbol clock frequency and transmit center frequency tolerance shall be ± 20 ppm. The transmit center frequency and the symbol clock frequency for all transmit antennas and frequency segments shall be derived from the same reference oscillator. Transmit signals with the TXVECTOR parameter CH_BANDWIDTH set to CBW160 or CBW80+80 may be generated using two separate RF LOs, one for each of the lower and upper 80 MHz frequency portions.

NOTE—The signal phase of the two 80 MHz frequency portions might not be correlated.

#### 21.3.17.4 Modulation accuracy

##### 21.3.17.4.1 Introduction to modulation accuracy tests

Transmit modulation accuracy specifications are described in 21.3.17.4.2 (Transmit center frequency leakage) and 21.3.17.4.3 (Transmitter constellation error). The test method is described in 21.3.17.4.4 (Transmitter modulation accuracy (EVM) test).

##### 21.3.17.4.2 Transmit center frequency leakage

TX LO leakage shall meet the following requirements for all formats and bandwidths except 80+80 MHz where the RF LO falls outside both frequency segments:

— When the RF LO is in the center of the transmitted PPDU BW, the power measured at the center of transmission BW using resolution BW 312.5 kHz shall not exceed the maximum of the average power per-subcarrier of the transmitted PPDU and –20 dBm, or equivalently, $max(P - 10\log 10(N_{ST}), -20)$, where $P$ is the transmit power per antenna in dBm, and $N_{ST}$ is defined in Table 21-5 (Timing-related constants).

— When the RF LO is not at the center of the transmitted PPDU BW, the power measured at the location of the RF LO using resolution BW 312.5 kHz shall not exceed the maximum of –32 dB relative to the total transmit power and –20 dBm, or equivalently $max(P - 32, -20)$, where $P$ is the transmit power per antenna in dBm.

For an 80+80 MHz transmission where the RF LO falls outside both frequency segments, the RF LO shall follow the spectral mask requirements as defined in 21.3.17.1 (Transmit spectrum mask).

The transmit center frequency leakage is specified per antenna.

##### 21.3.17.4.3 Transmitter constellation error

The relative constellation RMS error, calculated by first averaging over subcarriers, frequency segments, VHT PPDUs, and spatial streams (#4181)(see Equation (19-89)) shall not exceed a data-rate dependent value according to Table 21-24 (Allowed relative constellation error versus constellation size and coding rate). The number of spatial streams under test shall be equal to the number of utilized transmitting STA antenna (output) ports and also equal to the number of utilized testing instrumentation input ports. In the test, $N_{SS} = N_{STS}$ (no STBC) shall be used and no beamforming steering matrix shall be used. Each output port of the transmitting STA shall be connected through a cable to one input port of the testing instrumentation. The requirements apply to 20 MHz, 40 MHz, 80 MHz, and 160 MHz contiguous transmissions as well as 80+80 MHz noncontiguous transmissions.

For non-HT duplicate transmissions, requirements defined in 17.3.9.7.4 (Transmitter constellation error) apply to each 20 MHz subchannel.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 21-24—Allowed relative constellation error versus constellation size and coding rate**

| Modulation | Coding rate | Relative constellation error (dB) |
|---|---|---|
| BPSK | 1/2 | –5 |
| QPSK | 1/2 | –10 |
| QPSK | 3/4 | –13 |
| 16-QAM | 1/2 | –16 |
| 16-QAM | 3/4 | –19 |
| 64-QAM | 2/3 | –22 |
| 64-QAM | 3/4 | –25 |
| 64-QAM | 5/6 | –27 |
| 256-QAM | 3/4 | –30 |
| 256-QAM | 5/6 | –32 |

#### 21.3.17.4.4 Transmitter modulation accuracy (EVM) test

The transmit modulation accuracy test shall be performed by instrumentation capable of converting the transmitted signals into a stream of complex samples at sampling rate greater than or equal to the bandwidth of the signal being transmitted; except that

— For non-HT duplicate transmissions, each 20 MHz subchannel may be tested independently while all subchannels are being transmitted and

— For noncontiguous transmissions, each frequency segment may be tested independently while both segments are being transmitted.

In this case, transmit modulation accuracy of each segment shall meet the required value in Table 21-24 (Allowed relative constellation error versus constellation size and coding rate) using only the subcarriers within the corresponding segment.

The instrument shall have sufficient accuracy in terms of I/Q arm amplitude and phase balance, DC offsets, phase noise, and analog to digital quantization noise. A possible embodiment of such a setup is converting the signals to a low IF frequency with a microwave synthesizer, sampling the signal with a digital oscilloscope and decomposing it digitally into quadrature components. The sampled signal shall be processed in a manner similar to an actual receiver, according to the following steps, or equivalent procedure:

a) Start of PPDU shall be detected.

b) Transition from L-STF to L-LTF shall be detected and fine timing shall be established.

c) Coarse and fine frequency offsets shall be estimated.

d) Symbols in a PPDU shall be derotated according to estimated frequency offset.

e) For each VHT-LTF symbol, transform the symbol into subcarrier received values, estimate the phase from the pilot subcarriers, and derotate the subcarrier values according to the estimated phase.

f) Estimate the complex channel response coefficient for each of the subcarriers and each of the transmit streams.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

g) For each of the data OFDM symbols: transform the symbol into subcarrier received values, estimate the phase from the pilot subcarriers, derotate the subcarrier values according to the estimated phase, group the results from all of the receiver chains in each subcarrier to a vector, and multiply the vector by a zero-forcing equalization matrix generated from the estimated channel.

h) For each data-carrying subcarrier in each spatial stream, find the closest constellation point and compute the Euclidean distance from it.

i) Compute the average across PPDUs of the RMS of all (#14)Data field errors per PPDU as given by Equation (19-89).

NOTE—In the case the transmit modulation accuracy test is performed simultaneously for the two frequency segments of the 80+80 MHz transmissions, $N_{ST}$ in Equation (19-89) represents the total number of subcarriers of both 80 MHz frequency segments.

The test shall be performed over at least 20 PPDUs [$N_f$ as defined in Equation (19-89)]. The PPDUs under test shall be at least 16 data OFDM symbols long. Random data shall be used for the symbols.

### 21.3.17.5 Time of Departure accuracy

(#8051)The RMS accuracy of the time of departure provided in TIME_OF_DEPARTURE shall be less than or equal to 80 ns.

The Time of Departure accuracy test evaluates TIME_OF_DEPARTURE against aTxPHYTxStartRMS and aTxPHYTxStartRMS against TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH as defined in Annex P with the following test parameters:

— MULTICHANNEL_SAMPLING_RATE is

$20 \times 10^6\left(1 + \left\lceil \frac{f_H - f_L}{20\ \text{MHz}} \right\rceil\right)$ sample/s, for a CH_BANDWIDTH parameter equal to CBW20

$40 \times 10^6\left(1 + \left\lceil \frac{f_H - f_L}{40\ \text{MHz}} \right\rceil\right)$ sample/s, for a CH_BANDWIDTH parameter equal to CBW40

$80 \times 10^6\left(1 + \left\lceil \frac{f_H - f_L}{80\ \text{MHz}} \right\rceil\right)$ sample/s, for a CH_BANDWIDTH parameter equal to CBW80

$160 \times 10^6\left(1 + \left\lceil \frac{f_H - f_L}{160\ \text{MHz}} \right\rceil\right)$ sample/s, for a CH_BANDWIDTH parameter equal to CBW160 or CBW80+80

where

$f_H$ is the nominal center frequency in Hz of the highest channel in the channel set

$f_L$ is the nominal center frequency in Hz of the lowest channel in the channel set, the channel set is the set of channels upon which (#14)PPDUs providing measurements are transmitted, the channel set comprises channels uniformly spaced across $f_H - f_L \leq 50$ MHz

— FIRST_TRANSITION_FIELD is L-STF.

— SECOND_TRANSITION_FIELD is L-LTF.

— TRAINING_FIELD is L-LTF windowed in a manner which should approximate the windowing described in 17.3.2.5 (Mathematical conventions in the signal descriptions) with TTR = 100 ns.

— TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH is 80 ns.

NOTE—The indicated windowing applies to the time of departure accuracy test equipment, and not the transmitter or receiver.

This is an unapproved IEEE Standards Draft, subject to change.

### 21.3.18 VHT receiver specification

For tests in this subclause, the input levels are measured at the antenna connector and are referenced as the average power per receive antenna. (#98)For tests in 21.3.18.1 (Receiver minimum input level sensitivity(#256)), 21.3.18.2 (Adjacent channel rejection), and 21.3.18.3 (Nonadjacent channel rejection), the number of spatial streams under test shall be equal to the number of utilized transmitting STA antenna (output) ports and also equal to the number of utilized (#1768)receiving STA antenna (input) ports. Except where otherwise noted, each output port of the transmitting STA shall be connected through a cable to one input port of the (#1768)receiving STA.

#### 21.3.18.1 Receiver minimum input level sensitivity(#256)

The (#14)PER shall be less than 10% for a PSDU length of 4096 octets with the rate-dependent input levels listed in Table 21-25 (Receiver minimum input level sensitivity). The test in this subclause and the minimum sensitivity levels specified in Table 21-25 (Receiver minimum input level sensitivity) apply only to non-STBC modes, 800 ns GI, BCC, and VHT PPDUs.

**Table 21-25—Receiver minimum input level sensitivity**

| Modulation | Rate (R) | Minimum sensitivity (20 MHz PPDU) (dBm) | Minimum sensitivity (40 MHz PPDU) (dBm) | Minimum sensitivity (80 MHz PPDU) (dBm) | Minimum sensitivity (160 MHz or 80+80 MHz PPDU) (dBm) |
|---|---|---|---|---|---|
| BPSK | 1/2 | –82 | –79 | –76 | –73 |
| QPSK | 1/2 | –79 | –76 | –73 | –70 |
| QPSK | 3/4 | –77 | –74 | –71 | –68 |
| 16-QAM | 1/2 | –74 | –71 | –68 | –65 |
| 16-QAM | 3/4 | –70 | –67 | –64 | –61 |
| 64-QAM | 2/3 | –66 | –63 | –60 | –57 |
| 64-QAM | 3/4 | –65 | –62 | –59 | –56 |
| 64-QAM | 5/6 | –64 | –61 | –58 | –55 |
| 256-QAM | 3/4 | –59 | –56 | –53 | –50 |
| 256-QAM | 5/6 | –57 | –54 | –51 | –48 |

#### 21.3.18.2 Adjacent channel rejection

Adjacent channel rejection for *W* MHz channels (where *W* is 20, 40, 80 or 160) shall be measured by setting the desired signal's strength 3 dB above the rate-dependent sensitivity specified in Table 21-25 (Receiver minimum input level sensitivity) and raising the power of the interfering signal of *W* MHz bandwidth until 10% PER is caused for a PSDU length of 4096 octets. The difference in power between the signals in the interfering channel and the desired channel is the corresponding adjacent channel rejection. The center frequency of the adjacent channel shall be placed *W* MHz away from the center frequency of the desired signal.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Adjacent channel rejection for 80+80 MHz channels shall be measured by setting the desired signal's strength 3 dB above the rate-dependent sensitivity specified in Table 21-25 (Receiver minimum input level sensitivity). Then, an interfering signal of 80 MHz bandwidth is introduced, where the center frequency of the interfering signal is placed 80 MHz away from the center frequency of the frequency segment lower in frequency of the desired signal. The power of the interfering signal is raised until 10% PER is caused for a PSDU length of 4096 octets. Let $\Delta P_1$ be the power difference between the interfering and desired signal. Next, the interfering signal of 80 MHz bandwidth is moved to a frequency where the center frequency of the interfering signal is 80 MHz away from the center frequency of the frequency segment higher in frequency of the desired signal. The power of the interfering signal is raised until 10% PER is caused for a PSDU length of 4096 octets. Let $\Delta P_2$ be the power difference between the interfering and desired signal. The smaller value between $\Delta P_1$ and $\Delta P_2$ is the corresponding adjacent channel rejection.

The interfering signal in the adjacent channel shall be a signal compliant with the VHT PHY, unsynchronized with the signal in the channel under test, and shall have a minimum duty cycle of 50%. The corresponding rejection shall be no less than specified in Table 21-26 (Minimum required adjacent and nonadjacent channel rejection levels).

The test in this subclause and the adjacent sensitivity levels specified in Table 21-26 (Minimum required adjacent and nonadjacent channel rejection levels) apply only to non-STBC modes, 800 ns GI, BCC, and VHT PPDUs.

**Table 21-26—Minimum required adjacent and nonadjacent channel rejection levels**

| Modulation | Rate (R) | Adjacent channel rejection (dB) | | Nonadjacent channel rejection (dB) | |
|---|---|---|---|---|---|
| | | 20/40/80/ 160 MHz Channel | 80+80 MHz Channel | 20/40/80/ 160 MHz Channel | 80+80 MHz Channel |
| BPSK | 1/2 | 16 | 13 | 32 | 29 |
| QPSK | 1/2 | 13 | 10 | 29 | 26 |
| QPSK | 3/4 | 11 | 8 | 27 | 24 |
| 16-QAM | 1/2 | 8 | 5 | 24 | 21 |
| 16-QAM | 3/4 | 4 | 1 | 20 | 17 |
| 64-QAM | 2/3 | 0 | –3 | 16 | 13 |
| 64-QAM | 3/4 | –1 | –4 | 15 | 12 |
| 64-QAM | 5/6 | –2 | –5 | 14 | 11 |
| 256-QAM | 3/4 | –7 | –10 | 9 | 6 |
| 256-QAM | 5/6 | –9 | –12 | 7 | 4 |

The measurement of adjacent channel rejection for 160 MHz operation in a regulatory domain is required only if such a frequency band plan is permitted in that regulatory domain.

### 21.3.18.3 Nonadjacent channel rejection

Nonadjacent channel rejection for *W* MHz channels (where *W* is 20, 40, 80, or 160) shall be measured by setting the desired signal's strength 3 dB above the rate-dependent sensitivity specified in Table 21-25

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

(Receiver minimum input level sensitivity), and raising the power of the interfering signal of $W$ MHz bandwidth until a 10% PER occurs for a PSDU length of 4096 octets. The difference in power between the signals in the interfering channel and the desired channel is the corresponding nonadjacent channel rejection. The nonadjacent channel rejection shall be met with any nonadjacent channels located at least $2\times W$ MHz away from the center frequency of the desired signal.

Nonadjacent channel rejection for 80+80 MHz channels shall be measured by setting the desired signal's strength 3 dB above the rate-dependent sensitivity specified in Table 21-25 (Receiver minimum input level sensitivity). Then, an interfering signal of 80 MHz bandwidth is introduced, where the center frequency of the interfering signal is placed at least 160 MHz away from the center frequency of the frequency segment lower in frequency of the desired signal. The center frequency of the interfering signal shall also be at least 160 MHz away from the center frequency of the frequency segment higher in frequency of the desired signal. The power of the interfering signal is raised until 10% PER is caused for a PSDU length of 4096 octets. Let $\Delta P_1$ be the power difference between the interfering and desired signal. Next, the interfering signal of 80 MHz bandwidth is moved to a frequency where the center frequency of the interfering signal is at least 160 MHz away from the center frequency of the frequency segment higher in frequency of the desired signal. The center frequency of the interfering signal shall also be at least 160 MHz away from the center frequency of the frequency segment lower in frequency of the desired signal. The power of the interfering signal is raised until 10% PER is caused for a PSDU length of 4096 octets. Let $\Delta P_2$ be the difference in power between the signals in the interfering channel and the desired channel. The smaller value between $\Delta P_1$ and $\Delta P_2$ is the corresponding nonadjacent channel rejection.

The interfering signal in the nonadjacent channel shall be a signal compliant with the VHT PHY, unsynchronized with the signal in the channel under test, and shall have a minimum duty cycle of 50%. The corresponding rejection shall be no less than specified in Table 21-26 (Minimum required adjacent and nonadjacent channel rejection levels).

The test in this subclause and the nonadjacent sensitivity levels specified in Table 21-26 (Minimum required adjacent and nonadjacent channel rejection levels) apply only to non-STBC modes, 800 ns GI, BCC, and VHT PPDUs.

The measurement of nonadjacent channel rejection for 160 MHz operation in a regulatory domain is required only if such a frequency band plan is permitted in that regulatory domain.

#### 21.3.18.4 Receiver maximum input level

The receiver shall provide a maximum PER of 10% at a PSDU length of 4096 octets, for a maximum input level of –30 dBm, measured at each antenna for any baseband VHT modulation.

#### 21.3.18.5 CCA sensitivity

#### 21.3.18.5.1 General

The thresholds in this subclause are compared with the signal level at each receiving antenna.

#### 21.3.18.5.2 CCA sensitivity for operating classes requiring CCA-OCSED(#2365)

For the operating classes requiring CCA-Operating Class Specific Energy Detect (CCA-OCSED), the PHY shall also indicate a medium busy condition when CCA-OCSED detects a channel busy condition.

For improved spectrum sharing, CCA-OCSED is required in some bands. The behavior class indicating CCA-OCSED is given in Table D-2 (Behavior limits). The operating classes requiring the corresponding CCA-OCSED behavior class are given in E.1 (Country information and operating classes). The PHY of a STA that is operating within an operating class that requires CCA-OCSED shall operate with CCA-OCSED.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

CCA-OCSED shall detect a channel busy condition when the received signal strength exceeds the CCA-OCSED threshold as given by dot11OFDMEDThreshold for the primary 20 MHz channel, dot11OFDMEDThreshold for the secondary 20 MHz channel (if present), dot11OFDMEDThreshold + 3 dB for the secondary 40 MHz channel (if present), and dot11OFDMEDThreshold + 6 dB for the secondary 80 MHz channel (if present). The CCA-OCSED thresholds for the operating classes requiring CCA-OCSED are subject to the criteria in D.2.5 (CCA-OCSED threshold(#2365)).

NOTE—The requirement to detect a channel busy condition as stated in 21.3.18.5.3 (CCA sensitivity for signals occupying the primary 20 MHz channel) and 21.3.18.5.4 (CCA sensitivity for signals not occupying the primary 20 MHz channel) is a mandatory energy detect requirement on all Clause 21 (Very high throughput (VHT) PHY specification) receivers. Support for CCA-OCSED is an additional requirement that relates specifically to the sensitivities described in D.2.5 (CCA-OCSED threshold(#2365)).

### 21.3.18.5.3 CCA sensitivity for signals occupying the primary 20 MHz channel

A VHT STA with a *W* MHz operating channel width shall detect, with >90% probability, the start of a PPDU that occupies at least the primary 20 MHz channel in an otherwise idle *W* MHz operating channel width, and issue a PHY-CCA.indication(BUSY, {primary}) primitive within a period of aCCATime (see 21.4.4 (VHT PHY)) if one of the following conditions is met:

- The start of a non-HT PPDU as defined in 17.3.10.6 (CCA requirements).
- The start of an HT PPDU as defined in 19.3.19.6 (CCA sensitivity).
- The start of a non-HT duplicate or VHT PPDU for which the power measured within the primary 20 MHz channel is or above –82 dBm.

The CCA signal shall be held busy (PHY-CCA.indication(BUSY, {primary}) primitive) for the duration of the PPDU.

The receiver shall issue a PHY-CCA.indication(BUSY, {primary}) primitive for any signal that exceeds a threshold equal to 20 dB above the minimum modulation and coding rate sensitivity (–82 + 20 = –62 dBm) in the primary 20 MHz channel within a period of aCCATime after the signal arrives at the receiver's antenna(s); then the receiver shall not issue a PHY-CCA.indication(BUSY,{secondary}), PHY-CCA.indication(BUSY,{secondary40}), PHY-CCA.indication(BUSY,{secondary80}), or PHY-CCA.indication(IDLE) primitive while the threshold continues to be exceeded.

### 21.3.18.5.4 CCA sensitivity for signals not occupying the primary 20 MHz channel

The PHY shall issue a PHY-CCA.indication(BUSY, {secondary}) primitive if the conditions for issuing PHY-CCA.indication(BUSY, {primary}) primitive are not present and one of the following conditions are present in an otherwise idle 40 MHz, 80 MHz, 160 MHz, or 80+80 MHz operating channel width:

- Any signal within the secondary 20 MHz channel at or above a threshold of –62 dBm within a period of aCCATime after the signal arrives at the receiver's antenna(s); then the PHY shall not issue a PHY-CCA.indication(BUSY,{secondary40}), PHY-CCA.indication(BUSY,{secondary80}), or PHY-CCA.indication(IDLE) primitive while the threshold continues to be exceeded.
- A 20 MHz (#2095)non-HT, HT-mixed format, HT-greenfield format or VHT PPDU detected in the secondary 20 MHz channel at or above –72 dBm with >90% probability within a period aCCAMidTime (see 21.4.4 (VHT PHY)).

The PHY shall issue a PHY-CCA.indication(BUSY, {secondary40}) primitive if the conditions for issuing a PHY-CCA.indication(BUSY, {primary}) and PHY-CCA.indication(BUSY, {secondary}) primitive are not present and one of the following conditions are present in an otherwise idle 80 MHz, 160 MHz, or 80+80 MHz operating channel width:

- Any signal within the secondary 40 MHz channel at or above a threshold of –59 dBm within a period of aCCATime after the signal arrives at the receiver's antenna(s); then the PHY shall not issue a

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

PHY-CCA.indication(BUSY, {secondary80}) primitive or PHY-CCA.indication(IDLE) primitive while the threshold continues to be exceeded.

— A 40 MHz (#2095)non-HT duplicate, HT-mixed format, HT-greenfield format or VHT PPDU detected in the secondary 40 MHz channel at or above –72 dBm with >90% probability within a period aCCAMidTime (see 21.4.4 (VHT PHY)).

— A 20 MHz (#2095)non-HT, HT-mixed format, HT-greenfield format or VHT PPDU detected in any 20 MHz subchannel of the secondary 40 MHz channel at or above –72 dBm with >90% probability within a period aCCAMidTime.

The PHY shall issue a PHY-CCA.indication(BUSY, {secondary80}) primitive if the conditions for PHYCCA.indication(BUSY, {primary}), PHY-CCA.indication(BUSY, {secondary}), and PHY-CCA.indication(BUSY, {secondary40}) primitive are not present and one of the following conditions are present in an otherwise idle 160 MHz or 80+80 MHz operating channel width:

— Any signal within the secondary 80 MHz channel at or above –56 dBm.

— An 80 MHz non-HT duplicate or VHT PPDU detected in the secondary 80 MHz channel at or above –69 dBm with >90% probability within a period aCCAMidTime (see 21.4.4 (VHT PHY)).

— A 40 MHz (#2095)non-HT duplicate, HT-mixed format, HT-greenfield format or VHT PPDU detected in any 40 MHz subchannel of the secondary 80 MHz channel at or above –72 dBm with >90% probability within a period aCCAMidTime.

— A 20 MHz (#2095)non-HT, HT-mixed format, HT-greenfield format or VHT PPDU detected in any 20 MHz subchannel of the secondary 80 MHz channel at or above –72 dBm with >90% probability within a period aCCAMidTime.

#### 21.3.18.6 RSSI

The RSSI parameter returned in the RXVECTOR shall be calculated during the reception of the VHT-LTFs and shall be a monotonically increasing function of the received power.

#### 21.3.18.7 Received channel power indicator (RCPI) measurement(#2011)

The RCPI is a measure of the received RF power in the selected channel for a received PPDU. This parameter shall be a measurement by the PHY of the received RF power in the channel measured over the VHT-STF or VHT-LTF field of the received PPDU. The received power shall be the average of the power in all active receive chains.

RCPI shall equal the received RF power in dBm within an accuracy of ± 5 dB (95% confidence interval) within the specified dynamic range of the receiver.

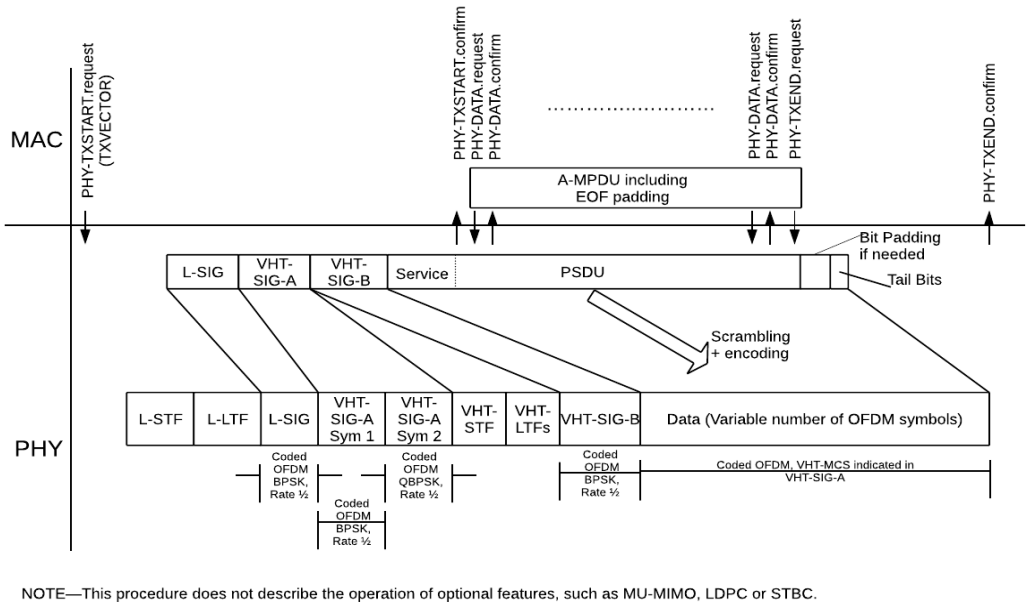
### 21.3.19 PHY transmit procedure

There are two paths for the transmit PHY procedure:

— The first path, for which typical transmit procedures are shown in Figure 21-34 (PHY transmit procedure for SU transmission), is selected if the FORMAT parameter of the PHY-TXSTART.request(TXVECTOR) primitive is VHT. These transmit procedures do not describe the operation of optional features, such as LDPC, STBC or MU.

— The second path is to follow the transmit procedure in Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) if the FORMAT parameter of the PHY-TXSTART.request(TXVECTOR) primitive is NON_HT and the NON_HT_MODULATION parameter is set to NON_HT_DUP_OFDM except that the signal referred to in Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) is instead generated simultaneously on each of the 20 MHz channels that are indicated by the CH_BANDWIDTH parameter as defined in 21.3.8 (VHT preamble) and 21.3.10.12 (Non-HT duplicate transmission).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.



NOTE—This procedure does not describe the operation of optional features, such as MU-MIMO, LDPC or STBC.

**Figure 21-34—PHY transmit procedure for SU transmission**

NOTE 1—For a VHT MU PPDU the A-MPDU is per user in the MAC sublayer and the VHT-STF, VHT-LTFs, VHT-SIG-B, and Data are per user in the PHY in Figure 21-34 (PHY transmit procedure for SU transmission), with the number of VHT-LTF symbols depending on the total number of space-time streams across all users.

NOTE 2—The transmit procedure for NON_HT format where NON_HT_MODULATION is OFDM is specified in 21.2.5.2 (Support for NON_HT format when NON_HT_MODULATION is OFDM). The transmit procedure for (#2095)HT-mixed and HT-greenfield formats is specified in 21.2.5.3 (Support for HT formats).

In both paths, in order to transmit data, the MAC generates a PHY-TXSTART.request primitive, which causes the PHY entity to enter the transmit state. Further, the PHY is set to operate at the appropriate frequency through station management via the PLME, as specified in 21.4 (VHT PLME). Other transmit parameters, such as VHT-MCS Coding types and transmit power, are set via the PHY SAP using the PHY-TXSTART.request(TXVECTOR) primitive, as described in 21.2.2 (TXVECTOR and RXVECTOR parameters). The remainder of the clause applies to the first path.

The PHY indicates the state of the primary channel and other channels (if any) via the PHY-CCA.indication primitive (see 21.3.18.5 (CCA sensitivity) and 8.3.5.12 (PHY-CCA.indication)). Transmission of the PPDU shall be initiated by the PHY after receiving the PHY-TXSTART.request(TXVECTOR) primitive. The TXVECTOR elements for the PHY-TXSTART.request primitive are specified in Table 21-1 (TXVECTOR and RXVECTOR parameters(#12)).

Transmission of the PHY preamble may start if TIME_OF_DEPARTURE_REQUESTED is false, and shall start immediately if TIME_OF_DEPARTURE_REQUESTED is true, based on the parameters passed in the PHY-TXSTART.request primitive.

If all of the following conditions are met:

— If dot11TODImplemented and dot11TODActivated are true or if dot11TimingMsmtActivated is true,

— The TXVECTOR parameter TIME_OF_DEPARTURE_REQUESTED is true,

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

then the PHY shall issue a PHY-TXSTART.confirm primitive to the MAC, forwarding the TIME_OF_DEPARTURE corresponding to the time when the first (#14)PPDU energy is sent by the transmitting port and TIME_OF_DEPARTURE_ClockRate parameter within the TXSTATUS. If dot11TimingMsmtActivated is true, then the PHY shall forward the value of TX_START_OF_FRAME_OFFSET in the TXSTATUS.

After the PHY preamble transmission is started, the PHY entity immediately initiates data scrambling and data encoding. The encoding method for the Data field is based on the FEC_CODING, CH_BANDWIDTH, NUM_STS, STBC, MCS, and NUM_USERS parameter of the TXVECTOR, as described in 21.3.2 (VHT PPDU format).

The SERVICE field and PSDU are encoded as described in 21.3.3 (Transmitter block diagram). The data shall be exchanged between the MAC and the PHY through a series of PHY-DATA.request(DATA) primitives issued by the MAC, and PHY-DATA.confirm primitives issued by the PHY. Zero to seven PHY padding bits are appended to the PSDU to make the number of bits in the coded PSDU an integer multiple of the number of coded bits per OFDM symbol.

Transmission can be prematurely terminated by the MAC through the PHY-TXEND.request primitive. PSDU transmission is terminated by receiving a PHY-TXEND.request primitive. Each PHY-TXEND.request primitive is acknowledged with a PHY-TXEND.confirm primitive from the PHY. In an SU transmission, normal termination occurs after the transmission of the final bit of the last PSDU octet, according to the number of OFDM symbols indicated by $N_{SYM}$ (see 21.4.3 (TXTIME and PSDU_LENGTH calculation)).

In the PHY, the GI or short GI is inserted in every data OFDM symbol as a countermeasure against delay spread.

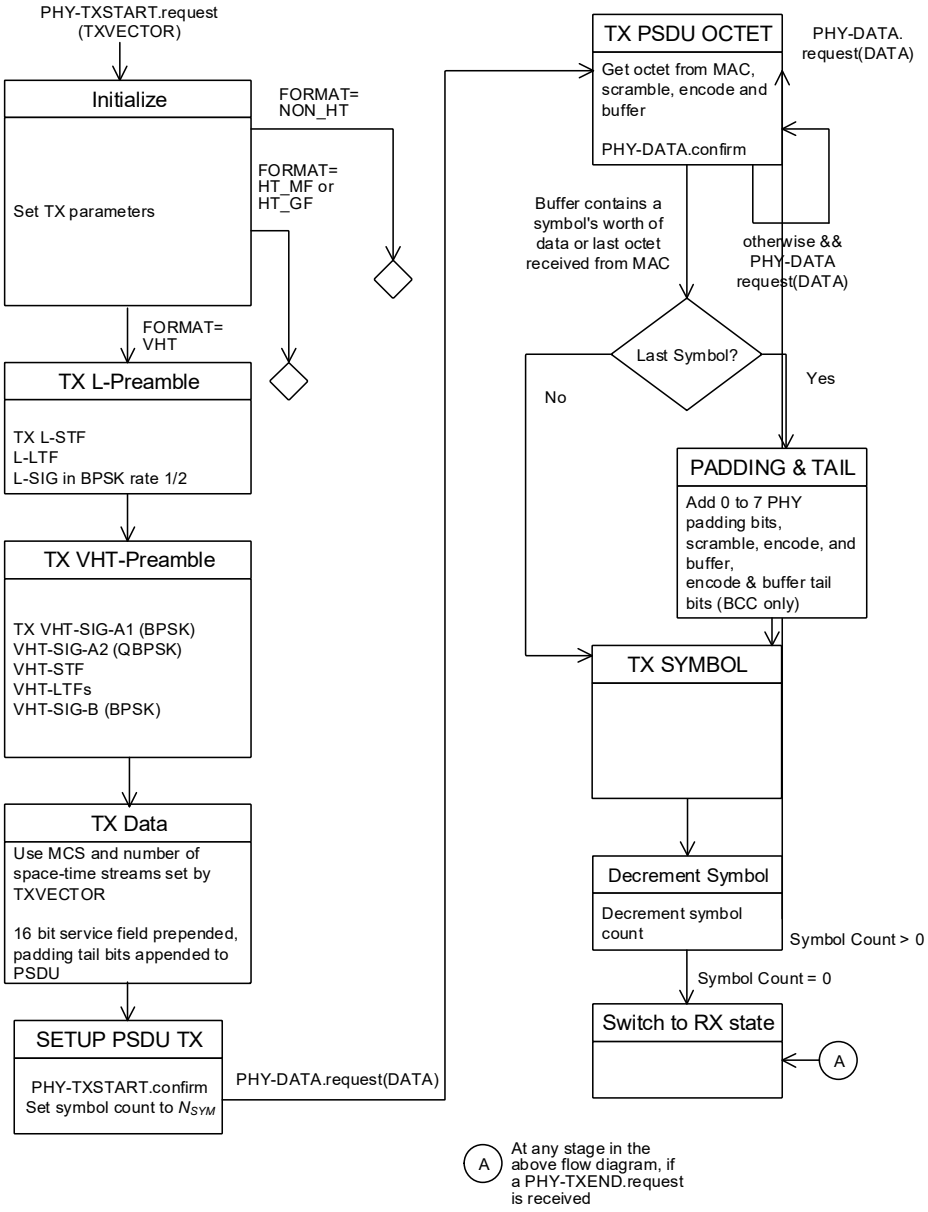
When the PPDU transmission is completed the PHY entity enters the receive state.

A typical state machine implementation of the transmit PHY for an SU transmission is provided in Figure 21-35 (PHY transmit state machine for SU transmission(#14)). Request (.request) and confirmation (.confirm) primitives are issued once per state as shown. This state machine does not describe the operation of optional features, such as multi-user, LDPC or STBC. If the TXVECTOR parameter FORMAT is equal to NON_HT, refer to the transmit procedure and state machine in 17.3.11 (Transmit PHY). If the TXVECTOR parameter FORMAT is equal to HT_MF or HT_GF, refer to the transmit procedure and state machine in 19.3.20 (PHY transmit procedure).

### 21.3.20 PHY receive procedure

A typical PHY receive procedure is shown in Figure 21-36 (PHY receive procedure for SU transmission(#3038)(#4122)) for VHT format. A typical state machine implementation of the receive PHY is given in Figure 21-37 (PHY receive state machine(#18)(#1934)(#3038)(#6467)). This receive procedure and state machine do not describe the operation of optional features, such as LDPC or STBC. If the detected format indicates (#2095)a non-HT PPDU(#238) (denoted “Not VHT-SIG-A” in Figure 21-37 (PHY receive state machine(#18)(#1934)(#3038)(#6467))), refer to the receive procedure and state machine in 17.3.12 (Receive PHY). If the detected format indicates an HT PPDU format (denoted “HT_SIG (HT GF preamble)” and “HT_SIG (HT MF preamble)” in Figure 21-37 (PHY receive state machine(#18)(#1934)(#3038)(#6467))), refer to the receive procedure and state machine in 19.3.21 (PHY receive procedure). Further, through station management (via the PLME) the PHY is set to the appropriate frequency, as specified in 21.4 (VHT PLME). The PHY has also been configured with group information (i.e., group membership and position in group) so that it can receive data intended for the STA. Other receive parameters, such as RSSI and indicated DATARATE, may be accessed via the PHY SAP.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

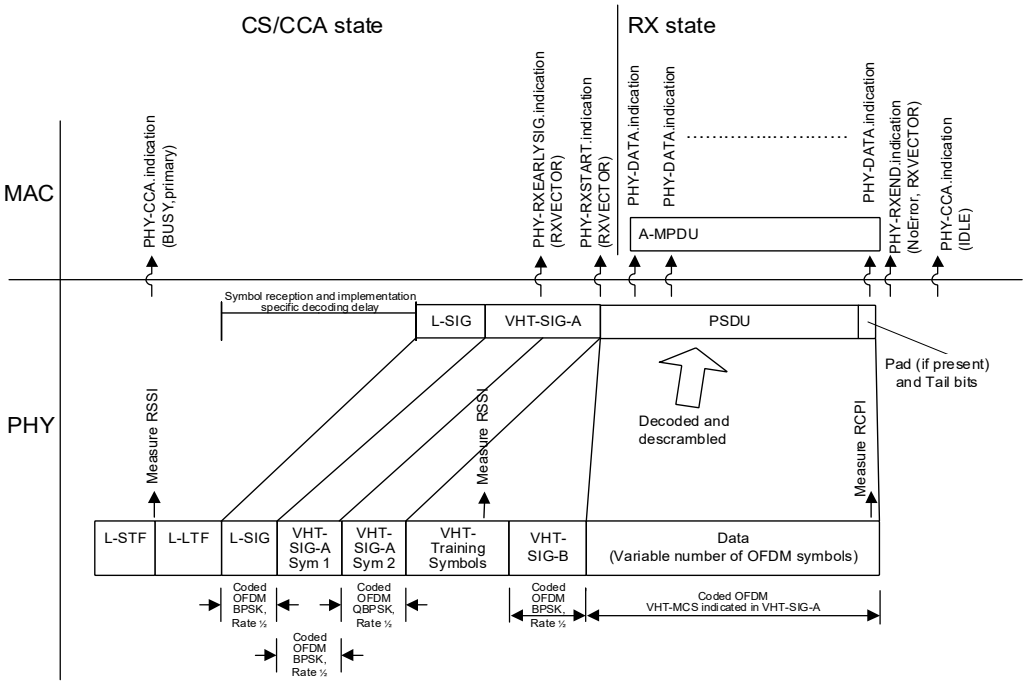


NOTE—This state machine does not describe the operation of optional features, such as MU-MIMO, LDPC or STBC.

**Figure 21-35—PHY transmit state machine for SU transmission(#14)**

Upon receiving the transmitted PHY preamble overlapping the primary 20 MHz channel, the PHY measures a receive signal strength. The PHY indicates this activity to the MAC by issuing a PHY-CCA.indication primitive. A PHY-CCA.indication(BUSY, channel-list) primitive is also issued as an initial indication of reception of a signal as specified in 21.3.18.5 (CCA sensitivity). The channel-list parameter of the PHY-CCA.indication primitive is absent when the operating channel width is 20 MHz. The channel-list parameter

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.



NOTE—This procedure does not describe the operation of optional features, such as LDPC or STBC. This procedure describes the case where VHT-SIG-A indicates a mode not requiring decoding of VHT-SIG-B.

**Figure 21-36—PHY receive procedure for SU transmission(#3038)(#4122)**

is present and includes the entry primary when the operating channel width is 40 MHz, 80 MHz, 160 MHz, or 80+80 MHz.

The PHY shall not issue a PHY-RXSTART.indication primitive in response to a PPDU that does not overlap the primary 20 MHz channel.

The PHY includes the most recently measured RSSI value in the PHY-RXSTART.indication(RXVECTOR) primitive issued to the MAC.

After the PHY-CCA.indication(BUSY, channel-list) primitive is issued, the PHY entity shall begin receiving the training symbols and searching for L-SIG in order to set the duration of the PPDU(#2056).

(#1062)For an HE STA that determines it is receiving a VHT PPDU, the STA's receive procedure shall resume here. Existing state, including knowledge of the L-SIG Parity and RATE checks, is retained.

(#3038)If a valid L-SIG parity bit is indicated, the RATE field indicates 6 Mbps, the L-SIG field indicates at least six OFDM symbols after the L-SIG field, and the first OFDM symbol after the L-LTF field is using BPSK modulation, then the PHY entity shall issue a PHY-RXEARLYSIG.indication primitive.

(#3038)If the check of the L-SIG parity bit is not valid or the RATE field is an undefined value(#18), neither a PHY-RXEARLYSIG.indication nor a PHY-RXSTART.indication primitive is issued, and instead the PHY shall issue the error condition PHY-RXEND.indication(FormatViolation) primitive. If a valid L-SIG parity bit is indicated,(#18) the RATE field indicates 6 Mb/s(#1144), the L-SIG field indicates at least (#1052)six OFDM symbols after the L-SIG field (i.e., the L-SIG LENGTH is at least 13 octets at 6 Mb/s), the first two OFDM symbols after the L-LTF field are using BPSK modulation, and the third OFDM symbol

This is an unapproved IEEE Standards Draft, subject to change.

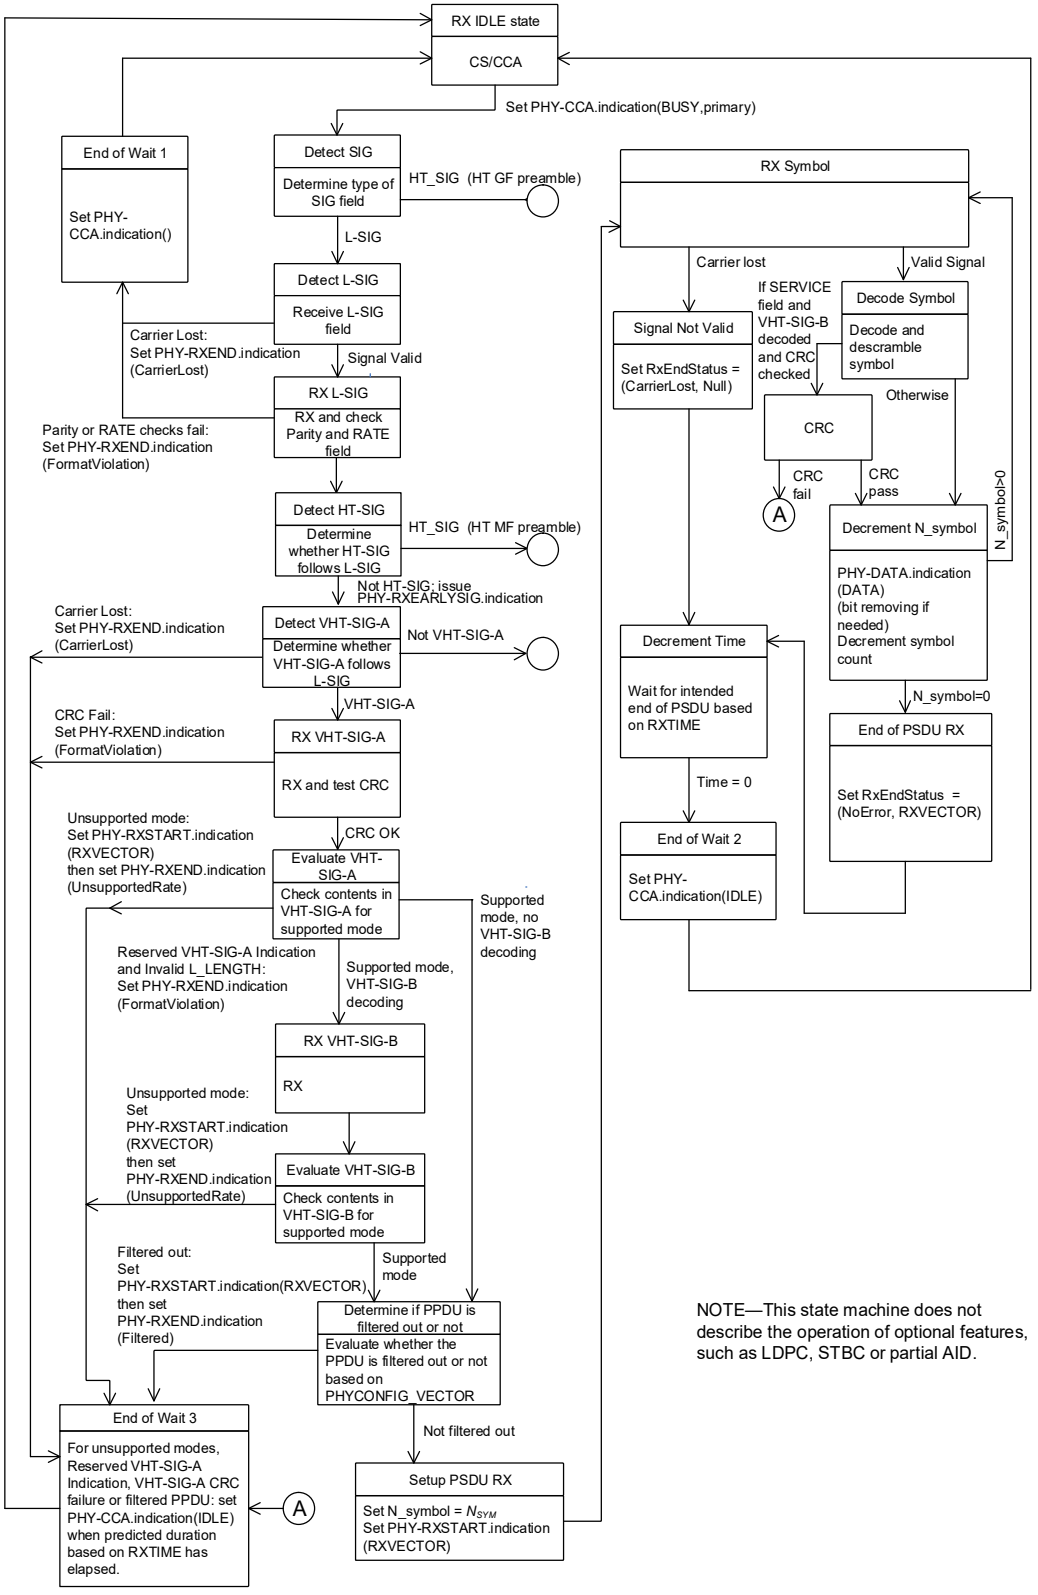

**Figure 21-37—PHY receive state machine(#18)(#1934)(#3038)(#6467)**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

after the L-LTF field is using QBPSK modulation, then the VHT PHY shall maintain PHY-CCA.indication(BUSY, channel-list) primitive for the predicted duration of the transmitted PPDU, as defined by RXTIME in Equation (21-105), for all supported modes, unsupported modes, Reserved VHT-SIG-A Indication, invalid VHT-SIG-A CRC and invalid L-SIG Length field value. The L-SIG Length field value of a VHT PPDU is invalid if it is not divisible by 3. Reserved VHT-SIG-A Indication is defined as a VHT-SIG-A with Reserved bits equal to 0 or MU[$u$] NSTS fields ($u$ = 0, 1, 2, 3) set to 5-7 or Short GI field set to 0 and Short GI NSYM Disambiguation field set to 1, or a combination of VHT-MCS and $N_{STS}$ not included in 21.5 (Parameters for VHT-MCSs) or any other VHT-SIG-A field bit combinations that do not correspond to modes of PHY operation defined in Clause 21 (Very high throughput (VHT) PHY specification). If the VHT-SIG-A indicates an unsupported mode, the PHY shall issue a PHY-RXEND.indication(UnsupportedRate) primitive. If the VHT-SIG-A indicates an invalid CRC or Reserved VHT-SIG-A Indication or if the L-SIG Length field is invalid, the PHY shall issue the error condition PHY-RXEND.indication(FormatViolation) primitive.

After receiving a valid L-SIG and VHT-SIG-A indicating a supported mode, the PHY entity shall begin receiving the VHT-STF, VHT-LTFs and VHT-SIG-B. If the received group ID in VHT-SIG-A has a value indicating a VHT SU PPDU (see 10.19 (Group ID and partial AID in VHT and CMMG PPDUs)), the PHY entity may choose not to decode VHT-SIG-B. If VHT-SIG-B is not decoded, subsequent to an indication of a valid VHT-SIG-A CRC, a PHY-RXSTART.indication(RXVECTOR) primitive shall be issued.

Subsequently, if dot11TimingMsmtActivated is true, a PHY-RXSTART.indication(RXVECTOR) primitive shall be issued and RX_START_OF_FRAME_OFFSET parameter within the RXVECTOR shall be forwarded (see 20.2.2 (TXVECTOR and RXVECTOR parameters)).

NOTE—The RX_START_OF_FRAME_OFFSET value is used (#3049)to estimate when the start of the preamble for the incoming (#14)PPDU was detected on the medium at the receive antenna connector.

The RXVECTOR associated with this primitive includes the parameters specified in Table 21-1 (TXVECTOR and RXVECTOR parameters(#12)).

If the Group ID field in VHT-SIG-A has a value indicating a VHT MU PPDU (see 10.19 (Group ID and partial AID in VHT and CMMG PPDUs)), the PHY, in a STA that is MU beamformee capable, shall decode VHT-SIG-B. If the VHT-SIG-B indicates an unsupported mode, the PHY shall issue the error condition PHY-RXEND.indication(UnsupportedRate) primitive.

If VHT-SIG-B was decoded the PHY may check the VHT-SIG-B CRC in the SERVICE field. If the VHT-SIG-B CRC in the SERVICE field is not checked a PHY-RXSTART.indication(RXVECTOR) primitive shall be issued. The RXVECTOR associated with this primitive includes the parameters specified in Table 21-1 (TXVECTOR and RXVECTOR parameters(#12)).

The PHY optionally filters out the PPDU based on the GroupID, MU[0-3] NSTS and Partial AID fields of VHT-SIG-A and the contents of the PHYCONFIG_VECTOR as follows:

- The PHY shall not filter out the PPDU if one of the following is true:
  - ($g$ = 0) and ($l_{00}$ is true) and (*partialaid* is included in PARTIAL_AID_LIST_GID00)
  - ($g$ = 63) and ($l_{63}$ is true) and (*partialaid* is included in PARTIAL_AID_LIST_GID63)
  - ($1 \le g \le 62$) and (MembershipStatusInGroupID[$g$] = 1) and ($n_{STS}$[UserPositionInGroupID[$g$]] > 0)
- where
  - $l_{NN}$ is the one of the LISTEN_TO_GID*NN* parameters of the PHYCONFIG_VECTOR
  - MembershipStatusInGroupID[$g$] is the Membership Status Array field of the GROUP_ID_MANAGEMENT parameter of the PHYCONFIG_VECTOR for group $g$

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

- $g$ is the value of the GroupID field of VHT-SIG-A
- $n_{STS}[u]$ is the value of the MU[$u$] NSTS field of VHT-SIG-A
- UserPositionInGroupID[$g$] is the User Position Array field of the GROUP_ID_MANAGEMENT parameter of the PHYCONFIG_VECTOR for group $g$
- *partialaid* is the value of the Partial AID field of VHT-SIG-A

— Otherwise, the PHY may filter out the PPDU.

If the PPDU is filtered out, the PHY shall issue a PHY-RXEND.indication(Filtered) primitive.

Following training and signal fields, the Data field shall be received. The number of symbols in the Data field is determined by Equation (21-104).

$$N_{SYM} = \begin{cases} N'_{SYM} - 1, \text{ if Short GI = 1 and Short GI NSYM Disambiguation = 1} \\ N'_{SYM}, \text{ otherwise} \end{cases} \quad (21\text{-}104)$$

where

$$N'_{SYM} = \left\lfloor \frac{\text{RXTIME} - \left( \begin{array}{l} T_{\text{L-STF}} + T_{\text{L-LTF}} + T_{\text{L-SIG}} + T_{\text{VHT-SIG-A}} + \\ \quad T_{\text{VHT-STF}} + N_{VHT\text{-}LTF} T_{\text{VHT-LTF}} + T_{\text{VHT-SIG-B}} \end{array} \right)}{T_{SYM}} \right\rfloor$$

$$\text{RXTIME}(\mu s) = \left\lceil \frac{\text{LENGTH} + 3}{3} \right\rceil \cdot 4 + 20 \quad (21\text{-}105)$$

where LENGTH is the LENGTH field in L-SIG.

The value of the PSDU_LENGTH parameter returned in the RXVECTOR using BCC encoding is calculated using Equation (21-106).

$$\text{PSDU\_LENGTH} = \left\lfloor \frac{N_{SYM} N_{DBPS} - N_{service} - N_{tail} \cdot N_{ES}}{8} \right\rfloor \quad (21\text{-}106)$$

For a VHT SU PPDU, the SU/MU[0] Coding field of VHT-SIG-A2 indicates the type of coding. The PHY entity shall use an LDPC decoder to decode the C-PSDU if this bit is 1; otherwise, BCC decoding shall be used. For an MU transmission, the SU/MU[0] Coding, MU[1] Coding, MU[2] Coding and MU[3] Coding fields of VHT-SIG-A2 indicate the type of coding for user $u$ with USER_POSITION[$u$] = 0, 1, 2, and 3, respectively. The PHY entity shall use an LDPC decoder to decode the C-PSDU for the respective user if its bit for its C-PSDU is 1. BCC decoding shall be used otherwise. When an LDPC decoder is to be used, $N_{SYM,init}$ is obtained from Equation (21-107).

$$N_{SYM,init} = \begin{cases} N_{SYM,init}, \text{ if LDPC Extra OFDM Symbol = 0} \\ N_{SYM,init} - 1, \text{ if LDPC Extra OFDM Symbol = 1 and STBC = 0} \\ N_{SYM,init} - 2, \text{ if LDPC Extra OFDM Symbol = 1 and STBC = 1} \end{cases} \quad (21\text{-}107)$$

where

LDPC Extra OFDM Symbol and STBC are fields in VHT-SIG-A (see Table 21-12 (Fields in the VHT-SIG-A field))

The value of the PSDU_LENGTH parameter returned in the RXVECTOR using LDPC encoding is calculated using Equation (21-108).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$\text{PSDU\_LENGTH} = \left\lfloor \frac{N_{SYM,init} N_{DBPS} - N_{service}}{8} \right\rfloor \quad (21\text{-}108)$$

The value of the PSDU_LENGTH parameter returned in the RXVECTOR for an NDP is 0.

If VHT-SIG-B is decoded and the VHT-SIG-B CRC in the SERVICE field is checked and not valid, the PHY shall issue the error condition PHY-RXEND.indication(FormatViolation) primitive. If the VHT-SIG-B field is decoded and the VHT-SIG-B CRC field is checked and valid, a PHY-RXSTART.indication(RXVECTOR) primitive shall be issued. The RXVECTOR associated with this primitive includes the parameters specified in Table 21-1 (TXVECTOR and RXVECTOR parameters(#12)).

If signal loss occurs during reception prior to completion of the PSDU reception, the error condition shall be reported to the MAC using a PHY-RXEND.indication(CarrierLost) primitive. After waiting for the intended end of the PSDU as determined by Equation (21-105), the PHY shall generate a PHY-CCA.indication(IDLE) primitive and return to RX IDLE state.

The received PSDU bits are assembled into octets, decoded, and presented to the MAC using a series of PHY-DATA.indication(DATA) primitive exchanges. Any final bits that cannot be assembled into a complete octet are considered pad bits and discarded. After the reception of the final bit of the last PSDU octet, and possible padding and tail bits, the receiver shall be returned to the RX IDLE state, as shown in Figure 21-37 (PHY receive state machine(#18)(#1934)(#3038)(#6467)). A PHY-RXEND.indication(NoError) primitive shall be issued on entry to the RX IDLE state.

## 21.4 VHT PLME

### 21.4.1 PLME SAP layer management primitives(#6320)

Table 21-27 (VHT PHY MIB attributes) lists the MIB attributes that may be accessed by the PHY entities and the intralayer of higher level LMEs. These attributes are accessed via the PLME-GET, PLME-SET, PLME-RESET, and PLME-CHARACTERISTICS primitives defined in 6.7 (PLME SAP interface).

### 21.4.2 PHY MIB

VHT PHY MIB attributes are defined in Annex C with specific values defined in Table 21-27 (VHT PHY MIB attributes). The (#4177)Operational semantics column in Table 21-27 (VHT PHY MIB attributes) contains two types: static and dynamic.

— Static MIB attributes are fixed and cannot be modified for a given PHY implementation.

— Dynamic MIB attributes are interpreted according to the MAX-ACCESS field of the MIB attribute.

When MAX-ACCESS is read-only, the MIB attribute value may be updated by the PLME and read from the MIB attribute by management entities. When MAX-ACCESS is read-write, the MIB attribute may be read and written by management entities but shall not be updated by the PLME.

### 21.4.3 TXTIME and PSDU_LENGTH calculation

The value of the TXTIME parameter returned by the PLME-TXTIME.confirm primitive shall be calculated for a VHT PPDU using Equation (21-109) for short GI and Equation (21-110) for long GI.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$\text{TXTIME} = T_{\text{LEG\_PREAMBLE}} + T_{\text{L-SIG}} + T_{\text{VHT-SIG-A}} + T_{\text{VHT\_PREAMBLE}} + T_{\text{VHT-SIG-B}} + T_{SYML} \times \left\lceil \frac{T_{SYMS} \times N_{SYM}}{T_{SYML}} \right\rceil \quad (21\text{-}109)$$

$$\text{TXTIME} = T_{\text{LEG\_PREAMBLE}} + T_{\text{L-SIG}} + T_{\text{VHT-SIG-A}} + T_{\text{VHT\_PREAMBLE}} + T_{\text{VHT-SIG-B}} + T_{SYML} \times N_{SYM} \quad (21\text{-}110)$$

where

$T_{\text{LEG\_PREAMBLE}} = T_{\text{L-STF}} + T_{\text{L-LTF}}$

$T_{\text{VHT\_PREAMBLE}} = T_{\text{VHT-STF}} + N_{VHT\text{-}LTF} T_{\text{VHT-LTF}}$

$T_{SYML}$, $T_{SYMS}$, $T_{\text{L-SIG}}$, $T_{\text{VHT-SIG-A}}$, $T_{\text{VHT-SIG-B}}$, $T_{\text{L-STF}}$, $T_{\text{VHT-STF}}$, $T_{\text{L-LTF}}$, and $T_{\text{VHT-LTF}}$ (#89)are defined in Table 21-5 (Timing-related constants)

$N_{VHT\text{-}LTF}$ is defined in Table 21-13 (Number of VHT-LTFs required for different numbers of space-time streams)

For an NDP, there is no Data field and $N_{SYM} = 0$.

For a VHT SU PPDU using BCC encoding, the total number of data symbols in the Data field is given by Equation (21-111).

$$N_{SYM} = m_{\text{STBC}} \times \left\lceil \frac{8 \cdot \text{APEP\_LENGTH} + N_{service} + N_{tail} \cdot N_{ES}}{m_{\text{STBC}} \cdot N_{DBPS}} \right\rceil \quad (21\text{-}111)$$

where

$m_{\text{STBC}}$ is equal to 2 when STBC is used, and 1 otherwise

For a VHT SU PPDU using LDPC encoding, the total number of data symbols in the Data field, $N_{SYM}$, is given in 21.3.10.5.4 (LDPC coding) (computed using Equation (19-41) in step d) of 19.3.11.7.5 (LDPC PPDU encoding process)).

For a VHT MU PPDU, the total number of data symbols in the Data field, $N_{SYM}$, is given by Equation (21-67).

The value of the PSDU_LENGTH parameter returned in the PLME-TXTIME.confirm primitive for a VHT SU PPDU using BCC encoding is calculated using Equation (21-112).

$$\text{PSDU\_LENGTH} = \left\lfloor \frac{N_{SYM} N_{DBPS} - N_{service} - N_{tail} \cdot N_{ES}}{8} \right\rfloor \quad (21\text{-}112)$$

The value of the PSDU_LENGTH parameter returned in the PLME-TXTIME.confirm primitive for a VHT SU PPDU using LDPC encoding is calculated using Equation (21-113).

$$\text{PSDU\_LENGTH} = \left\lfloor \frac{N_{SYM,init} N_{DBPS} - N_{service}}{8} \right\rfloor \quad (21\text{-}113)$$

where

$N_{SYM,init}$ is given by Equation (21-62)

The value of the PSDU_LENGTH parameter for user $u$ returned in the PLME-TXTIME.confirm primitive and in the RXVECTOR for a VHT MU PPDU is calculated using Equation (21-114).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$\text{PSDU\_LENGTH}_u = \begin{cases} \left\lfloor \dfrac{N_{SYM} N_{DBPS,u} - N_{service} - N_{tail} \cdot N_{ES,u}}{8} \right\rfloor & \text{when BCC is used for user } u \\ \left\lfloor \dfrac{N_{\text{SYM\_max\_init}} N_{DBPS,u} - N_{service}}{8} \right\rfloor & \text{when LDPC is used for user } u \end{cases} \quad (21\text{-}114)$$

where

$N_{SYM}$ is given by Equation (21-67)

$N_{\text{SYM\_max\_init}}$ is given by Equation (21-65)

The value of the PSDU_LENGTH parameter returned in the PLME-TXTIME.confirm primitive for an NDP is 0.

### 21.4.4 VHT PHY

(#2123)The VHT PHY characteristics, provided through the PLME-CHARACTERISTICS service primitive, are shown in Table 19-25 (HT PHY characteristics) unless otherwise listed in Table 21-28 (VHT PHY characteristics). The definitions for these characteristics are given in 6.7.4 (PLME-CHARACTERISTICS.confirm).

**Table 21-28—VHT PHY characteristics**

| Characteristics | Value |
|---|---|
| aCCAMidTime | 25 µs |
| aPPDUMaxTime | 5.484 ms |
| aPSDUMaxLength | (#3166)4 692 478 octets (see NOTE 1) |
| aRxPHYStartDelay | (#3038)24 µs (see NOTE 2) |
| aAPEPMaxLengthVHTMU20 | 262 140 octets (see NOTE 3) |
| aAPEPMaxLengthVHTMU40 | 524 284 octets (see NOTE 3) |
| aAPEPMaxLengthVHTMU80orMore | 2 097 148 octets (see NOTE 3 and NOTE 4) |

NOTE 1—This is the maximum length in octets for a VHT SU PPDU with a bandwidth of 160 MHz or 80+80 MHz, VHT-MCS 9, and 8 spatial streams, and limited by 1504 possible Short GI data symbols in aPPDUMaxTime. This is the maximum PSDU length a VHT PHY could support assuming no restrictions in MAC. See (#2369)10.12.2 (A-MPDU length limit rules) and 9.2.4.8.1 (General) for additional restrictions on the maximum number of octets the MAC could support.

NOTE 2—This value arises from the time to the end of (#3038)when the HT_MF PPDU format is excluded, which is at the end of the first OFDM symbol after the L-SIG field (see Figure 21-4 (VHT PPDU format)).

NOTE 3—This value is derived inversely from Equation (21-46) using corresponding VHT-SIG-B Length in Table 21-14 (Fields in the VHT-SIG-B field).

NOTE 4—This value is larger than the constraint by the Maximum A-MPDU Length Exponent of 7 and the maximum A-MPDU length is(M118) limited by the Maximum A-MPDU Length Exponent (see 10.12.2 (A-MPDU length limit rules) and 10.13 (PPDU duration constraint)).

## 21.5 Parameters for VHT-MCSs

The rate-dependent parameters for 20 MHz, 40 MHz, 80 MHz, 160 MHz, and 80+80 MHz $N_{SS}$ = 1, …, 8 are given in Table 21-29 (VHT-MCSs for mandatory 20 MHz, NSS = 1) to Table 21-60 (VHT-MCSs for optional 160 MHz and 80+80 MHz, NSS = 8). Support for 400 ns GI is optional in all cases. Support for VHT-MCS 8 and 9 (when valid) is optional in all cases. A VHT STA shall support single spatial stream VHT-MCSs within the range VHT-MCS 0 to VHT-MCS 7 for all channel widths for which it has indicated support regardless of the Tx or Rx Highest Supported Long GI Data Rate subfield values in the Supported VHT-MCS and NSS Set field. When more than one spatial stream is supported, the Tx or Rx Highest Supported Long GI Data Rate subfield values in the Supported VHT-MCS and NSS Set field may result in a reduced VHT-MCS range (cut-off) for $N_{SS}$ = 2, …, 8 . Support for 20 MHz, 40 MHz, and 80 MHz with $N_{SS}$ = 1 is mandatory. Support for 20 MHz, 40 MHz, and 80 MHz with $N_{SS}$ = 2, …, 8 is optional. Support for 160 MHz and 80+80 MHz with $N_{SS}$ = 1, …, 8 is optional. $N_{ES}$ values were chosen to yield an integer number of punctured blocks for each BCC encoder per OFDM symbol.

Table 21-29 (VHT-MCSs for mandatory 20 MHz, NSS = 1) to Table 21-32 (VHT-MCSs for optional 20 MHz, NSS = 4), Table 21-37 (VHT-MCSs for mandatory 40 MHz, NSS = 1) to Table 21-40 (VHT-MCSs for optional 40 MHz, NSS = 4), Table 21-45 (VHT-MCSs for mandatory 80 MHz, NSS = 1) to Table 21-48 (VHT-MCSs for optional 80 MHz, NSS = 4), and Table 21-53 (VHT-MCSs for optional 160 MHz and 80+80 MHz, NSS = 1) to Table 21-56 (VHT-MCSs for optional 160 MHz and 80+80 MHz, NSS = 4) define VHT-MCSs not only for SU transmission but also for user *u* of MU transmission. In the case of VHT-MCSs for MU transmission, the parameters, $N_{SS}$, $R$, $N_{BPSCS}$, $N_{CBPS}$, $N_{DBPS}$, and $N_{ES}$ are replaced with $N_{SS,u}$, $R_u$, $N_{BPSCS,u}$, $N_{CBPS,u}$, $N_{DBPS,u}$, and $N_{ES,u}$, respectively. Note that the 400 ns GI rate values are rounded to 1 decimal place.

**Table 21-29—VHT-MCSs for mandatory 20 MHz, $N_{SS}$ = 1**

| VHT-MCS Index | Modulation | $R$ | $N_{BPSCS}$ | $N_{SD}$ | $N_{SP}$ | $N_{CBPS}$ | $N_{DBPS}$ | $N_{ES}$ | Data rate (Mb/s) | |
|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | 800 ns GI | 400 ns GI (see NOTE) |
| 0 | BPSK | 1/2 | 1 | 52 | 4 | 52 | 26 | 1 | 6.5 | 7.2 |
| 1 | QPSK | 1/2 | 2 | 52 | 4 | 104 | 52 | 1 | 13.0 | 14.4 |

# 22. Television very high throughput (TVHT) PHY specification

## 22.1 Introduction

### 22.1.1 Introduction to the TVHT PHY

Clause 22 (Television very high throughput (TVHT) PHY specification) specifies the PHY entity for a television very high throughput (TVHT) orthogonal frequency division multiplexing (OFDM) system.

Three basic channel units (BCUs) are defined as 6 MHz, 7 MHz, or 8 MHz, depending on the regulatory domain, and denoted in the rest of this clause as a BCU or TVHT_W. Many of the terms used in this clause refer to different bands, depending on the regulatory domain. These terms include

— TVHT_2W, which represents two contiguous BCUs (12 MHz, 14 MHz, or 16 MHz)
— TVHT_W+W, which represents two noncontiguous BCU (6+6 MHz, 7+7 MHz, or 8+8 MHz)
— TVHT_4W, which represents four contiguous BCUs (24 MHz, 28 MHz, or 32 MHz)
— TVHT_2W+2W, which represents two noncontiguous frequency segments, each of which is composed of two BCUs (12+12 MHz, 14+14 MHz, or 16+16 MHz)

The TVHT PHY is based on the VHT PHY, as defined in 21.3 (VHT PHY), 21.4 (VHT PLME), and 21.5 (Parameters for VHT-MCSs), and on Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification).

All TVHT transmissions in one BCU shall use the VHT PHY parameters for 40 MHz channel defined in 21.3 (VHT PHY), 21.4 (VHT PLME), and 21.5 (Parameters for VHT-MCSs) with a sampling clock change to fit into each of the BCU bandwidths and with the number of encoders ($N_{ES}$) always being 1 (for SU-MIMO and per user in MU-MIMO).

Table 22-8 (Timing-related parameters) describes the sampling clock for each of the BCUs and the basic PHY parameters for transmission over one BCU.

For all VHT PPDUs and non-HT PPDUs in TVWS band, timing-related parameters shall be used as defined in Table 22-5 (Timing-related constants in Non-HT PPDU) and Table 22-8 (Timing-related parameters); frequently used parameters shall be used as defined in Table 22-6 (Tone location in Non-HT PPDU) and Table 22-9 (Tone location); phase rotation parameter $\Upsilon_{k,\mathrm{BW}}$ shall be replaced by $\Upsilon_{k,\mathrm{M}}$, which is defined in Table 22-12 (Transmission mode and Gamma subk,m); and cyclic shift parameters shall be used as defined in 22.3.8.3.2 (Cyclic shift for TVHT modulated fields).

As shown in Table 22-8 (Timing-related parameters), the design is based on defining 144 OFDM tones in the 6 MHz and 8 MHz channel units and using up to tone 58 on each side of the DC tone for data and pilots, exactly matching the VHT 40 MHz PHY parameters. The 7 MHz channel unit is split into 168 tones to maintain the same tone spacing and PHY design as used for 6 MHz channels (note the ratio of 168 to 144 is identical to the ratio of 7 to 6). The choice of 144 and not 128 was made to reduce the PHY channel BW from 6 MHz to 5 1/3 MHz in order to allow sharper filtering to achieve 55 dB ACLR.

The TVHT PHY defines the following transmission modes that incorporate transmission on one, two, or four BCUs:

a) Mandatory transmission mode - one BCU (TVHT_MODE_1)
b) Optional transmission modes - multi-BCUs
    1) Two contiguous BCUs (TVHT_MODE_2C)
    2) Two noncontiguous BCUs (TVHT_MODE_2N)
    3) Four contiguous BCUs (TVHT_MODE_4C)

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

4) Two noncontiguous frequency segments, each of which comprises two contiguous BCUs (TVHT_MODE_4N)

The tone spacing, DFT duration, and other timing parameters remain unchanged for all optional modes compared with the definition in Table 22-8 (Timing-related parameters).

The number of occupied tones in each BCU of any optional mode is the same as the number defined in Table 22-8 (Timing-related parameters).

The location of the occupied tones in each BCU of any optional mode is shown in Table 22-9 (Tone location).

The DATA encoding process for multi-BCUs transmission is similar to one BCU transmission and is defined in 22.3.10 (Data field).

A TVHT STA shall support the following features:

— TVHT_MODE_1 (one BCU)
— Single spatial stream MCSs 0 to 7 (transmit and receive)
— BCC coding
— Normal and short guard interval (transmit and receive)

A TVHT STA may support the following features:

— TVHT_MODE_2C, TVHT_MODE_2N, TVHT_MODE_4C, or TVHT_MODE_4N (two or four BCUs)
— Two or more spatial streams (transmit and receive)
— Beamforming sounding (by sending a VHT NDP)
— Respond to transmit beamforming sounding (provide compressed beamforming feedback)
— STBC (transmit and receive)
— LDPC (transmit and receive)
— VHT MU PPDUs (transmit and receive)
— MCSs 8 and 9 (transmit and receive)

### 22.1.2 Scope of TVHT PHY services

The services provided to the MAC by the TVHT PHY consist of a protocol function that defines the characteristics and method of transmitting and receiving data through a wireless medium between two or more STAs. These STAs support a TVHT PHY.

### 22.1.3 TVHT PHY functions

#### 22.1.3.1 General

See 21.1.3.1 (General) with “TVHT” replacing “VHT”.

#### 22.1.3.2 PHY management entity (PLME)

See 21.1.3.2 (PHY management entity (PLME)).

#### 22.1.3.3 Service specification method

See 21.1.3.3 (Service specification method) with “TVHT” replacing “VHT”.

### 22.1.4 PPDU formats

The structure of the PPDU transmitted by a TVHT STA is determined by the TXVECTOR parameters as defined in 22.2.2 (TXVECTOR and RXVECTOR parameters).

The FORMAT parameter determines the overall structure of the PPDU and includes the following:

— Non-HT format (NON_HT), based on Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification). Support for non-HT format is mandatory.

— VHT format (VHT). Support for TVHT_W VHT format is mandatory.

## 22.2 TVHT PHY service interface

### 22.2.1 Introduction

See 21.2.1 (Introduction).

### 22.2.2 TXVECTOR and RXVECTOR parameters

The TXVECTOR and RXVECTOR parameters are defined in Table 22-1 (TXVECTOR and RXVECTOR parameters).

The TXVECTOR parameter FORMAT shall be set to NON_HT or VHT. When the TXVECTOR parameter FORMAT equals NON_HT, then NON_HT_MODULATION shall be set to NON_HT_DUP_OFDM.

When the TXVECTOR parameter FORMAT equals NON_HT, the TXVECTOR parameter L_DATARATE indicates the data rate used to transmit the PSDU in Mb/s. The allowed values are 6 Mb/s, 9 Mb/s, 12 Mb/s, 18 Mb/s, 24 Mb/s, 36 Mb/s, 48 Mb/s, and 54 Mb/s divided by 7.5 for 6 MHz and 7 MHz unit channels and by 5.625 for 8 MHz channels.

When the TXVECTOR parameter FORMAT equals VHT, the TXVECTOR parameter CH_BANDWIDTH indicates the channel width of the transmitted PPDU:

Enumerated type:

— TVHT_W for one BCU

— TVHT_2W for two contiguous BCUs

— TVHT_W+W for two noncontiguous BCUs

— TVHT_4W for four contiguous BCUs

— TVHT_2W+2W for two noncontiguous frequency segments, each of which comprises two contiguous BCUs

Note that TVHT_W represents the broadcast channel bandwidth for the regulatory domain, e.g., TVHT_W is 6 MHz, 7 MHz, or 8 MHz. TVHT_2W represents two contiguous BCUs with the same regulatory domain, e.g., TVHT_2W is 12 MHz, 14 MHz, or 16 MHz.

When the TXVECTOR parameter FORMAT equals NON_HT, the TXVECTOR parameter CH_BANDWIDTH indicates the channel width of the transmitted PPDU on transmission and the estimated channel width of the received PPDU on reception:

Enumerated type:

— TVHT_W, TVHT_2W, TVHT_W+W, TVHT_4W, TVHT_2W+2W

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

When the TXVECTOR parameter FORMAT equals VHT, the TXVECTOR parameter NUM_STS indicates the number of space-time streams: range 1 to 4 for SU, 1 to 3 per user for MU. NUM_STS summed over all users shall be less than or equal to 4. The TXVECTOR parameter NUM_STS is not present when the TXVECTOR parameter FORMAT equals to NON_HT.

**Table 22-1—TXVECTOR and RXVECTOR parameters**

| Parameter | Condition | Value | TXVECTOR | RXVECTOR |
|---|---|---|---|---|
| FORMAT | | Determines the format of the PPDU.<br>Enumerated type:<br>NON_HT indicates non-HT duplicated PPDU format. In this case, the modulation is determined by the NON_HT_MODULATION parameter.<br>VHT indicates VHT format. | Y | Y |
| NON_HT_MODULATION | FORMAT is NON_HT | In TXVECTOR, indicates the format type of the transmitted non-HT PPDU.<br>In RXVECTOR, indicates the estimated format type of the received non-HT PPDU.<br>Enumerated type:<br>NON_HT_DUP_OFDM indicates non-HT duplicate format. | Y | Y |
| | Otherwise | Not present | N | N |
| L_LENGTH | FORMAT is NON_HT | Indicates the length of the PSDU in octets in the range 1 to 4095. This value is used by the PHY to determine the number of octet transfers that occur between the MAC and the PHY. | Y | Y |
| | FORMAT is VHT | Not present<br>NOTE—The Length field of the L-SIG field(#4145) in VHT PPDUs is defined in Equation (22-9) using the scaling factor defined in 22.3.8.2.1 (Cyclic shift definition for pre-TVHT modulated fields). | N | N |
| L_DATARATE | FORMAT is NON_HT | Indicates the data rate used to transmit the PSDU in Mb/s. The allowed values are 6, 9, 12, 18, 24, 36, 48, and 54 divided by 7.5 for 6 MHz and 7 MHz unit channels and by 5.625 for 8 MHz channels. | Y | Y |
| | FORMAT is VHT | Not present<br>NOTE—The RATE field in the L-SIG field in a VHT PPDU is set to the value representing 6/*X* Mb/s in TVWS band "Modulation BPSK and Coding rate 1/2" row of Table 22-4 (RATE field in L-SIG). | N | N |
| N_TX | FORMAT is VHT | Indicates the number of transmit chains. | Y | N |
| | Otherwise | Not present | N | N |

**Table 22-1—TXVECTOR and RXVECTOR parameters *(continued)***

| Parameter | Condition | Value | TXVECTOR | RXVECTOR |
|---|---|---|---|---|
| EXPANSION_MAT_TYPE | FORMAT is VHT and EXPANSION_MAT is present. | Set to COMPRESSED_SV | Y | N |
| | Otherwise | See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters) | | |
| EXPANSION_MAT | FORMAT is VHT | Contains a vector in the number of selected subcarriers containing feedback matrices as defined in 22.3.11.2 (Beamforming Feedback Matrix V) based on the channel measured during the training symbols of a previous VHT NDP. | M<br>U | N |
| | Otherwise | See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters) | | |
| CHAN_MAT_TYPE | FORMAT is VHT and PSDU_LENGTH equals zero | Set to COMPRESSED_SV<br>NOTE—This parameter is present only for TVHT NDPs. | N | Y |
| | FORMAT is VHT and PSDU_LENGTH is greater than zero | Not present | N | N |
| | Otherwise | See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters) | | |
| CHAN_MAT | FORMAT is VHT and PSDU_LENGTH equals zero | Contains a set of compressed beamforming feedback matrices as defined in 21.3.11.2 (Beamforming Feedback Matrix V) based on the channel measured during the training symbols of the received VHT NDP. | N | Y |
| | FORMAT is VHT and PSDU_LENGTH is greater than zero | Not present | N | N |
| | Otherwise | See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters) | | |
| DELTA_SNR | FORMAT is VHT | Contains an array of delta SNR values as defined in 9.4.1.50 (TVHT MU Exclusive Beamforming Report field) based on the channel measured during the training symbols of the received VHT NDP.<br>NOTE—In the RXVECTOR this parameter is present only for VHT NDPs for MU sounding. | M<br>U | Y |
| | Otherwise | Not present | N | N |

This is an unapproved IEEE Standards Draft, subject to change.

**Table 22-1—TXVECTOR and RXVECTOR parameters *(continued)***

| Parameter | Condition | Value | TXVECTOR | RXVECTOR |
|---|---|---|---|---|
| SNR | FORMAT is VHT | Contains an array of measures of the received SNR for each spatial stream. SNR indications of 8 bits are supported. SNR shall be the sum of the decibel values of SNR per tone divided by the number of tones represented in each stream as described in 9.4.1.48 (TVHT Compressed Beamforming Report field). | N | Y |
| | Otherwise | See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters) | | |
| NO_SIG_EXTN | FORMAT is VHT | Not present | N | N |
| | Otherwise | See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters) | | |
| FEC_CODING | FORMAT is HT | Indicates which FEC encoding is used.<br>Enumerated type:<br>BCC_CODING indicates binary convolutional code.<br>LDPC_CODING indicates low-density parity check code. | M<br>U | Y |
| | Otherwise | See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters) | | |
| STBC | FORMAT is VHT | Indicates whether STBC is used.<br>0 indicates no STBC ($N_{STS}=N_{SS}$ in the Data field).<br>1 indicates STBC is used ($N_{STS}=2N_{SS}$ in the Data field). | Y | Y |
| | Otherwise | See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters) | | |
| GI_TYPE | FORMAT is VHT | Indicates whether a short guard interval is used in the transmission of the Data field of the PPDU.<br>Enumerated type:<br>LONG_GI indicates short GI is not used in the Data field of the PPDU.<br>SHORT_GI indicates short GI is used in the Data field of the PPDU. | Y | Y |
| | Otherwise | Not present | N | N |
| TXPWR_LEVEL_INDEX | FORMAT is VHT | The allowed values for the TXPWR_LEVEL_INDEX parameter are in the range 1 to $N/2$, where $N$ is the number of octets in dot11TxPowerLevelExtended. This parameter is used to indicate which of the available transmit output power levels defined in dot11TxPowerLevelExtended shall be used for the current transmission. | Y | N |
| | Otherwise | See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters) | | |

Copyright © 2024 IEEE. All rights reserved.

**Table 22-1—TXVECTOR and RXVECTOR parameters *(continued)***

| Parameter | Condition | Value | TXVECTOR | RXVECTOR |
|---|---|---|---|---|
| RSSI | FORMAT is VHT | The allowed values for the RSSI parameter are in the range 0 to 255. This parameter is a (#1132)measurement by the PHY of the power observed at the antenna connector used to receive the current PPDU measured during the reception of the TVHT-LTF field. RSSI is intended to be used in a relative manner, and it is a monotonically increasing function of the received power. | N | Y |
| | Otherwise | See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters) | | |
| MCS | FORMAT is VHT | Indicates the modulation and coding scheme used in the transmission of the PPDU.<br>Integer: range 0 to 9 | M<br>U | Y |
| | Otherwise | See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters) | | |
| REC_MCS | FORMAT is VHT | Indicates the MCS that the STA's receiver recommends. | N | O |
| | Otherwise | Not present | N | N |
| CH_BANDWIDTH | FORMAT is VHT | Indicates the channel width of the transmitted PPDU:<br>Enumerated type:<br>TVHT_W for one BCU<br>TVHT_2W for two contiguous BCUs<br>TVHT_W+W for two noncontiguous BCUs<br>TVHT_4W for four contiguous BCUs<br>TVHT_2W+2W for two noncontiguous frequency segments, each of which comprises two contiguous BCUs | Y | Y |
| | FORMAT is NON_HT | In TXVECTOR, indicates the channel width of the transmitted PPDU.<br>In RXVECTOR, indicates the estimated channel width of the received PPDU.<br>Enumerated type:<br>TVHT_W, TVHT_2W, TVHT_W+W, TVHT_4W, TVHT_2W+2W if NON_HT_MODULATION equals NON_HT_DUP_OFDM | Y | Y |
| DYN_BANDWIDTH_IN_NON_HT | FORMAT is NON_HT | (#1782)In TXVECTOR, if present, indicates whether the transmitter is capable of dynamic bandwidth operation as an RTS originator. In RXVECTOR, if valid, indicates whether the transmitter is capable of dynamic bandwidth operation as an RTS originator (see 10.3.2.9 (CTS and DMG CTS procedure)).<br>Enumerated type:<br>— Static if the transmitter is only capable of static bandwidth operation.<br>— Dynamic if the transmitter is capable of dynamic bandwidth operation.<br>NOTE—In the RXVECTOR, the validity of this parameter is determined by the MAC based on the contents of the received MPDU. | O | Y |
| | Otherwise | Not present | N | N |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 22-1—TXVECTOR and RXVECTOR parameters *(continued)***

| Parameter | Condition | Value | TXVECTOR | RXVECTOR |
|---|---|---|---|---|
| CH_BANDWIDTH_IN_NON_HT | FORMAT is NON_HT | In TXVECTOR, if present, indicates the channel width of the transmitted PPDU, which is signaled via the scrambling sequence. In RXVECTOR, if valid, indicates the channel width of the received PPDU, which is signaled via the scrambling sequence. Enumerated type: TVHT_W, TVHT_2W, TVHT_W+W, TVHT_4W, TVHT_2W+2W. NOTE—In the RXVECTOR, the validity of this parameter is determined by the MAC based on the contents of the received MPDU. | O | Y |
| | Otherwise | Not present | N | N |
| APEP_LENGTH | FORMAT is VHT | If equal to 0, indicates a TVHT NDP for both RXVECTOR and TXVECTOR. If greater than zero, in the TXVECTOR, indicates the number of octets in the range 1 to 1 048 575 in the A-MPDU pre-EOF padding (see 10.12.2 (A-MPDU length limit rules)) carried in the PSDU. If greater than zero, in the RXVECTOR, is the value obtained from the VHT-SIG-B Length field multiplied by 4. | M U | O |
| | Otherwise | Not present | N | N |
| PSDU_LENGTH | FORMAT is VHT | Indicates the number of octets in the VHT PSDU in the range 0 to 1 065 600 octets. A value of 0 indicates a VHT NDP. | N | Y |
| | Otherwise | Not present | N | N |
| USER_POSITION | FORMAT is VHT and 1 ≤ GROUP_ID ≤ 62 | Index for user in MU transmission. Integer: range 0 to 3. NOTE—The entries in the USER_POSITION array are in ascending order. | M U | O |
| | Otherwise | Not present | N | N |
| NUM_STS | FORMAT is VHT | Indicates the number of space-time streams. Integer: range 1 to 4 for SU, 1 to 3 per user in the TXVECTOR, and 0 to 4 in the RXVECTOR for MU. NUM_STS summed over all users is between 1 and 4. | M U | Y |
| | Otherwise | Not present | N | N |
| GROUP_ID | FORMAT is VHT | Indicates the group ID. Integer: range 0 to 63 (see Table 22-12 (Transmission mode and Gamma subk,m)) A value of 0 or 63 indicates a VHT SU PPDU. A value in the range 1 to 62 indicates a VHT MU PPDU. | Y | Y |
| | Otherwise | Not present | N | N |

**Table 22-1—TXVECTOR and RXVECTOR parameters *(continued)***

| Parameter | Condition | Value | TXVECTOR | RXVECTOR |
|---|---|---|---|---|
| PARTIAL_AID | FORMAT is VHT and GROUP_ID is 0 or 63 | Provides an abbreviated indication of the intended recipient(s) of the PSDU (see 10.19 (Group ID and partial AID in VHT and CMMG PPDUs)).<br>Integer: range 0 to 511. | Y | Y |
| | Otherwise | Not present | N | N |
| NUM_USERS | FORMAT is VHT | Indicates the number of users with nonzero space-time streams.<br>Integer: range 1 to 4. | Y | N |
| | Otherwise | Not present | N | N |
| BEAMFORMED | FORMAT is VHT and GROUP_ID is 0 or 63 | Set to 1 if a beamforming steering matrix is applied to the waveform in an SU transmission. Set to 0 otherwise.<br>NOTE—When BEAMFORMED is(M118) 1, smoothing is not recommended. | Y | O |
| | Otherwise | Not present | N | N |
| TXOP_PS_NOT_ALLOWED | FORMAT is VHT | Indicates whether a TVHT AP allows non-AP TVHT STAs in TXOP power save mode to enter doze state during the TXOP.<br><br>0 indicates that the TVHT AP allows non-AP TVHT STAs to enter doze state during a TXOP.<br><br>1 indicates that the TVHT AP does not allow non-AP TVHT STAs to enter doze state during a TXOP. | Y | Y |
| | Otherwise | Not present | N | N |
| TIME_OF_DEPARTURE_REQUESTED | | Boolean value:<br>true indicates that the MAC entity requests that the PHY entity measures and reports time of departure parameters corresponding to the time when the first PPDU energy is sent by the transmitting port.<br>false indicates that the MAC entity requests that the PHY entity neither measures nor reports time of departure parameters. | O | N |

This is an unapproved IEEE Standards Draft, subject to change.

**Table 22-1—TXVECTOR and RXVECTOR parameters *(continued)***

| Parameter | Condition | Value | TXVECTOR | RXVECTOR |
|---|---|---|---|---|
| RX_START_OF_FRAME_OFFSET | dot11TimingMsmtActivated is true | 0 to $2^{32}$– 1. An estimate of the offset (in 10 ns units) from the point in time at which the start of the preamble (#14)of the PPDU arrived at the receive antenna connector to the point in time at which this primitive is issued to the MAC. | N | Y |
| | Otherwise | Not present | N | N |

NOTE 1—In the TXVECTOR and RXVECTOR columns, the following apply:
Y = Present;
N = Not present;
O = Optional;
MU indicates that the parameter is present once for a VHT SU PPDU and present per user for a VHT MU PPDU. Parameters specified to be present per user are conceptually supplied as an array of values indexed by *u*, where *u* takes values 0 to NUM_USERS – 1.

NOTE 2—On reception, where valid, the CH_BANDWIDTH_IN_NON_HT parameter is likely to be a more reliable indication of subformat and channel width than the NON_HT_MODULATION and CH_BANDWIDTH parameters, since for non-HT or non-HT duplicate (#14)PPDUs, CH_BANDWIDTH is a receiver estimate of the bandwidth, whereas CH_BANDWIDTH_IN_NON_HT is the signaled bandwidth.

### 22.2.3 Effects of CH_BANDWIDTH parameter on PPDU format

Table 22-2 (PPDU format as a function of CH_BANDWIDTH parameter) shows the PPDU format as a function of the CH_BANDWIDTH and FORMAT parameters.

**Table 22-2—PPDU format as a function of CH_BANDWIDTH parameter**

| FORMAT | CH_BANDWIDTH | PPDU format |
|---|---|---|
| VHT | TVHT_W | The STA transmits a VHT PPDU in TVWS bands (when FORMAT is VHT) with TVHT_MODE_1. |
| VHT | TVHT_2W | The STA transmits a VHT PPDU in TVWS bands (when FORMAT is VHT) with TVHT_MODE_2C. |
| VHT | TVHT_4W | The STA transmits a VHT PPDU in TVWS bands (when FORMAT is VHT) with TVHT_MODE_4C. |
| VHT | TVHT_W+W | The STA transmits a VHT PPDU in TVWS bands (when FORMAT is VHT) with TVHT_MODE_2N. |
| VHT | TVHT_2W+2W | The STA transmits a VHT PPDU in TVWS bands (when FORMAT is VHT) with TVHT_MODE_4N. |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 22-2—PPDU format as a function of CH_BANDWIDTH parameter *(continued)***

| FORMAT | CH_BANDWIDTH | PPDU format |
|---|---|---|
| NON_HT | TVHT_W | The STA transmits a non-HT PPDU(#238) with NON_HT_MODULATION set to NON_HT_DUP_OFDM using one TVHT_W channel as defined in 22.3.10.12 (Non-HT duplicate transmission). If the BSS bandwidth is wider than TVHT_W, then the transmission shall use the primary TVHT_W channel. |
| NON_HT | TVHT_2W | The STA transmits a non-HT PPDU(#238) with NON_HT_MODULATION set to NON_HT_DUP_OFDM using two adjacent TVHT_W channels as defined in 22.3.10.12 (Non-HT duplicate transmission). If the BSS bandwidth is wider than TVHT_2W, then the transmission shall use the primary TVHT_2W channel. |
| NON_HT | TVHT_4W | The STA transmits a non-HT PPDU(#238) with NON_HT_MODULATION set to NON_HT_DUP_OFDM using four adjacent TVHT_W channels as defined in 22.3.10.12 (Non-HT duplicate transmission). |
| NON_HT | TVHT_W+W | The STA transmits a non-HT PPDU(#238) with NON_HT_MODULATION set to NON_HT_DUP_OFDM using two nonadjacent frequency segments, with each frequency segment consisting of single TVHT_W channels as defined in 22.3.10.12 (Non-HT duplicate transmission). |
| NON_HT | TVHT_2W+2W | The STA transmits a non-HT PPDU(#238) with NON_HT_MODULATION set to NON_HT_DUP_OFDM using two nonadjacent frequency segments, with each frequency segment consisting of two adjacent TVHT_W channels as defined in 22.3.10.12 (Non-HT duplicate transmission). |

### 22.2.4 Support for NON_HT and HT formats

Transmission of HT PPDUs is not supported in Clause 22 (Television very high throughput (TVHT) PHY specification). Except for Non-HT duplicate transmission defined in 22.3.10.12 (Non-HT duplicate transmission), transmission of NON_HT is not supported in Clause 22 (Television very high throughput (TVHT) PHY specification).

Non-HT duplicate transmission is based on Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification), unless otherwise stated in Clause 22 (Television very high throughput (TVHT) PHY specification).

(#3423)Non-HT PPDU format is shown in Figure 17-1 (PPDU format). The PPDU encoding process is defined in 17.3.2.2 (Overview of the PPDU encoding process) except for following modifications:

Modulation-dependent parameters for Non-HT duplicate mode in TVWS band is defined in Table 22-3 (Modulation-dependent parameters for Non-HT duplicate mode in TVWS band). Timing related parameters are defined in Table 22-5 (Timing-related constants in Non-HT PPDU). $t_{SIGNAL}$ in Equation (17-2) is equal to 16 multiplied by $X$ µs, and $t_{DATA}$ in Equation (17-2) is equal to 20 multiplied by $X$ µs where $X$ is 7.5 for 6 MHz and 7 MHz unit channels and $X$ is 5.625 for 8 MHz channels.

The timings for preamble are multiplied by $X$ where $X$ is 7.5 for 6 MHz and 7 MHz unit channels and $X$ is 5.625 for 8 MHz channels.

This is an unapproved IEEE Standards Draft, subject to change.

**Table 22-3—Modulation-dependent parameters for Non-HT duplicate mode in TVWS band**

| Modulation | Coding rate ($R$) | Coded bits per subcarrier ($N_{BPSC}$) | Coded bits per OFDM symbol ($N_{CBPS}$) | Data bits per OFDM symbol ($N_{DBPS}$) | Data rate (Mb/s) (TVWS band) |
|---|---|---|---|---|---|
| BPSK | 1/2 | 1 | 48 | 24 | 6/$X$ (see NOTE) |
| BPSK | 3/4 | 1 | 48 | 36 | 9/$X$ (see NOTE) |
| QPSK | 1/2 | 2 | 96 | 48 | 12/$X$ (see NOTE) |
| QPSK | 3/4 | 2 | 96 | 72 | 18/$X$ (see NOTE) |
| 16-QAM | 1/2 | 4 | 192 | 96 | 24/$X$ (see NOTE) |
| 16-QAM | 3/4 | 4 | 192 | 144 | 36/$X$ (see NOTE) |
| 64-QAM | 2/3 | 6 | 288 | 192 | 48/$X$ (see NOTE) |
| 64-QAM | 3/4 | 6 | 288 | 216 | 54/$X$ (see NOTE) |
| NOTE—In TVWS band, $X$ depends on regulatory domain, i.e., 7.5 for 6 MHz and 7 MHz unit channels and 5.625 for 8 MHz channels. | | | | | |

Constructions of L-STF, L-LTF, and L-SIG are same as in 22.3.4.2 (Construction of L-STF), 22.3.4.3 (Construction of the L-LTF), and 22.3.4.4 (Construction of L-SIG) except for the value field parameters in L-SIG.

Interpretation of the bits R1-R4 in the SIGNAL field is modified as in Table 22-4 (RATE field in L-SIG).

**Table 22-4—RATE field in L-SIG**

| R1-R4 | Modulation | Coding rate |
|---|---|---|
| 1101 | BPSK | 1/2 |
| 1111 | BPSK | 3/4 |
| 0101 | QPSK | 1/2 |
| 0111 | QPSK | 3/4 |
| 1001 | 16-QAM | 1/2 |
| 1011 | 16-QAM | 3/4 |
| 0001 | 64-QAM | 2/3 |
| 0011 | 64-QAM | 3/4 |

Table 22-5 (Timing-related constants in Non-HT PPDU) and Table 22-6 (Tone location in Non-HT PPDU) define the timing-related parameters for Non-HT format and location of occupied tones.

Other timing parameters are derived as in Table 17-5 (Timing-related parameters) using the definition of $T_{FFT}$ in Table 22-5 (Timing-related constants in Non-HT PPDU). Table 22-6 (Tone location in Non-HT

**Table 22-6—Tone location in Non-HT PPDU *(continued)***

| Parameter | TVHT_ MODE_1 | TVHT_ MODE_2C | TVHT_ MODE_2N | TVHT_ MODE_4C | TVHT_ MODE_4N | Description |
|---|---|---|---|---|---|---|
| Subcarrier index | –58 to –33, –31 to –6, +6 to +31, and +33 to +58 | –142 to –117, –115 to –90, –78 to –53, –51 to –26, +26 to +51, +53 to +78, +90 to +115, and +117 to +142 | –58 to –33, –31 to –6, +6 to +31, and +33 to +58 for each BCU | –310 to –285, –283 to –258, –246 to –221, –219 to –194, –142 to –117, –115 to –90, –78 to –53, –51 to –26, +26 to +51, +53 to +78, +90 to +115, +117 to +142, +194 to +219, +221 to +246, +258 to +283, and +285 to +310 | –142 to –117, –115 to –90, –78 to –53, –51 to –26, +26 to +51, +53 to +78, +90 to +115, and +117 to +142 for each BCU | Location of occupied subcarriers for 7 MHz |

PPDU) defines the number of occupied tones and their location in all transmission modes. Zero denotes the DC tone of any contiguous segment.

Refer to Table 21-6 (Frequently used parameters) for parameters definition. The definitions in the table are applicable to Clause 22 (Television very high throughput (TVHT) PHY specification) with the exception that in each transmission mode in Clause 22 (Television very high throughput (TVHT) PHY specification) $N_{CBPSSI} = N_{CBPSS}$ for SU and MU PPDUs.

### 22.2.5 PHYCONFIG_VECTOR parameters(#2115)

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a TVHT PHY contains a BASIC_CHANNEL_UNIT parameter, which identifies the basic channel unit with possible values being 6 MHz, 7 MHz, and 8 MHz.

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a TVHT PHY contains an OPERATING_CHANNEL parameter, which identifies the operating or primary channel. The PHY shall set dot11CurrentPrimaryChannel to the value of this parameter.

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a TVHT PHY contains a CHANNEL_WIDTH parameter, which identifies the operating channel and takes one of the values TVHT_W, TVHT_2W, TVHT_W+W, TVHT_4W, and TVHT_2W+2W. The PHY shall set dot11CurrentTVHTChannelWidth to the value of this parameter.

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a TVHT PHY contains a CENTER_FREQUENCY_SEGMENT0 parameter. The PHY shall set dot11CurrentTVHTChannelCenterFrequencyIndex0 to the value of this parameter.

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a TVHT PHY contains a CENTER_FREQUENCY_SEGMENT1 parameter. The PHY shall set dot11CurrentTVHTChannelCenterFrequencyIndex1 to the value of this parameter.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

(#4383)The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a TVHT PHY contains a GROUP_ID_MANAGEMENT parameter, which specifies membership status and STA position for each of the group IDs as described in 9.6.22.3 (Group ID Management frame format).

(#4383)The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a TVHT PHY contains a PARTIAL_AID_LIST_GID00 parameter, which includes the list of partial AIDs, of which the STA is an intended recipient, associated with group ID 0. The settings of the PARTIAL_AID are specified in 10.19 (Group ID and partial AID in VHT and CMMG PPDUs).

(#4383)The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a TVHT PHY contains a PARTIAL_AID_LIST_GID63 parameter, which includes the list of partial AIDs, of which the STA is an intended recipient, associated with group ID 63. The settings of the PARTIAL_AID are specified in 10.19 (Group ID and partial AID in VHT and CMMG PPDUs).

(#4383)The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a TVHT PHY contains a LISTEN_TO_GID00 parameter, which, when true, indicates to the PHY not to filter out PPDUs with GROUP_ID field equal to 0.

(#4383)The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a TVHT PHY contains a LISTEN_TO_GID63 parameter, which, when true, indicates to the PHY not to filter out PPDUs with GROUP_ID field equal to 63.

(#4384)Additional PHYCONFIG_VECTOR parameters are defined in Table 8-4 (Vector descriptions(#4383)).

## 22.3 TVHT PHY layer(#4114)

### 22.3.1 Introduction

See 21.3.1 (Introduction).

### 22.3.2 VHT PPDU format in TVWS bands

A single PPDU format is defined for this PHY: the VHT PPDU format in TVWS bands. Figure 22-1 (VHT PPDU format in TVWS bands) shows the VHT PPDU format in TVWS bands, with the timing parameters (8 μs and 4 μs) in Figure 21-4 (VHT PPDU format) replaced by numbers from Table 22-8 (Timing-related parameters).

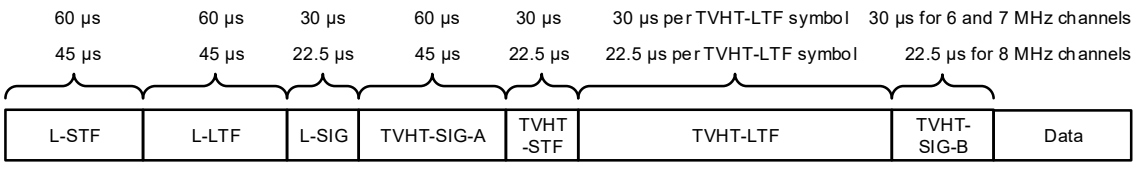

**Figure 22-1—VHT PPDU format in TVWS bands**

The fields of the VHT PPDU format in TVWS bands are summarized in Table 22-7 (Fields of the VHT PPDU in TVWS bands).

The TVHT-SIG-A, TVHT-STF, TVHT-LTF, and TVHT-SIG-B fields exist only in VHT PPDU in TVWS bands. In a TVHT NDP, the Data field is not present. The number of symbols in the TVHT-LTF field,

**Table 22-7—Fields of the VHT PPDU in TVWS bands**

| Field | Description |
|---|---|
| L-STF | Non-HT Short Training field |
| L-LTF | Non-HT Long Training field |
| L-SIG | Non-HT SIGNAL field |
| TVHT-SIG-A | TVHT Signal A field |
| TVHT-STF | TVHT Short Training field |
| TVHT-LTF | TVHT Long Training field |
| TVHT-SIG-B | TVHT Signal B field |
| Data | The Data field includes the PSDU |

$N_{TVHT\text{-}LTF}$, can be 1, 2, or 4 and is determined by the total number of space-time streams across all users being transmitted in the VHT PPDU in TVWS bands (see Table 21-13 (Number of VHT-LTFs required for different numbers of space-time streams)).

### 22.3.3 Transmitter block diagram

The transmit process for the L-SIG and TVHT-SIG-A fields of a VHT PPDU using one BCU is shown in Figure 21-5 (Transmitter block diagram for the L-SIG and VHT-SIG-A fields), with "TVHT" replacing "VHT" and with bandwidth corrected according to TVHT bandwidth.

The transmit process for generating the TVHT-SIG-B field of a VHT SU PPDU and VHT MU PPDU using one frequency segment is shown in Figure 21-5 (Transmitter block diagram for the L-SIG and VHT-SIG-A fields) and Figure 21-7 (Transmitter block diagram for the VHT-SIG-B field of a 20 MHz, 40 MHz, and 80 MHz VHT MU PPDU(#2259)(#7214)), respectively, with "TVHT" replacing "VHT" and with bandwidth corrected according to TVHT bandwidth.

The transmit process for generating the Data field of an SU PPDU in TVHT_MODE_1, TVHT_MODE_2C, or TVHT_MODE_4C with BCC and LDPC encodings, using one BCU, is shown Figure 21-10 (Transmitter block diagram for the Data field of a 20 MHz, 40 MHz, or 80 MHz VHT SU PPDU with BCC encoding) and Figure 21-11 (Transmitter block diagram for the Data field of a 20 MHz, 40 MHz, or 80 MHz VHT SU PPDU with LDPC encoding), respectively, with "TVHT" replacing "VHT" and with bandwidth corrected according to TVHT bandwidth. Single BCC encoder shall be assumed in Figure 21-10 (Transmitter block diagram for the Data field of a 20 MHz, 40 MHz, or 80 MHz VHT SU PPDU with BCC encoding).

The transmit process for generating the Data field of an MU PPDU in TVHT_MODE_1, TVHT_MODE_2C, or TVHT_MODE_4C with BCC and LDPC encoding is shown in Figure 21-12 (Transmitter block diagram for the Data field of a 20 MHz, 40 MHz, or 80 MHz VHT MU PPDU), with "TVHT" replacing "VHT" and with bandwidth corrected according to TVHT bandwidth. In the case of BCC encoding, single BCC encoder shall be assumed in Figure 21-12 (Transmitter block diagram for the Data field of a 20 MHz, 40 MHz, or 80 MHz VHT MU PPDU).

Figure 22-2 (Transmitter block diagram for the Data field of a TVHT_MODE_2N or TVHT_MODE_4N SU PPDU with BCC encoding) and Figure 22-3 (Transmitter block diagram for the Data field of a TVHT_MODE_2N or TVHT_MODE_4N SU PPDU with LDPC encoding) show the transmit process for generating the Data field of a TVHT_MODE_2N or TVHT_MODE_4N SU PPDU with BCC and LDPC encoding, respectively, where the subcarrier allocation block allocates the subcarriers for the two IDFTs in

### 22.3.4 Overview of the PPDU encoding process

#### 22.3.4.1 General

This subclause provides an overview of the VHT PPDU in TVWS bands encoding process.

#### 22.3.4.2 Construction of L-STF

Construct the L-STF field as defined in 22.3.8.2.2 (L-STF definition) following the procedure in 21.3.4.2 (Construction of L-STF) reading "Clause 22 (Television very high throughput (TVHT) PHY specification)" for references to "Clause 21 (Very high throughput (VHT) PHY specification)" except the following:

c) Duplication and phase rotation: Duplicate the L-STF over the BCUs of the CH_BANDWIDTH. Apply appropriate phase rotation as defined in 22.3.7 (Mathematical description of signals).

#### 22.3.4.3 Construction of the L-LTF

Construct the L-LTF field as defined in L-LTF definition following the procedure in 21.3.4.3 (Construction of the L-LTF) reading "Clause 22 (Television very high throughput (TVHT) PHY specification)" for references to "Clause 21 (Very high throughput (VHT) PHY specification)" except the following:

c) Duplication and phase rotation: Duplicate the L-LTF over the BCUs of the CH_BANDWIDTH. Apply appropriate phase rotation as defined in 22.3.7 (Mathematical description of signals).

#### 22.3.4.4 Construction of L-SIG

Construct the L-SIG field as the SIGNAL field defined by 22.3.8.2.4 (L-SIG definition) following the procedure in 21.3.4.4 (Construction of L-SIG) reading "Clause 22 (Television very high throughput (TVHT) PHY specification)" for references to "Clause 21 (Very high throughput (VHT) PHY specification)" except the following:

a) For a VHT PPDU in TVWS bands, set the RATE subfield in the SIGNAL field R1-R4 to 1101. Set the Length, Parity, and Tail bits in the SIGNAL field as defined in 22.3.8.2.4 (L-SIG definition). Add calculated one bit parity and $N_{tail}$ bits into the L-SIG symbol.

f) Duplication and phase rotation: Duplicate the L-SIG field over the BCUs of the CH_BANDWIDTH. Apply appropriate phase rotation as defined in 22.3.7 (Mathematical description of signals).

#### 22.3.4.5 Construction of TVHT-SIG-A

The TVHT-SIG-A field consists of two symbols, TVHT-SIG-A1 and TVHT-SIG-A2, constructed as defined in 22.3.8.3.3 (TVHT-SIG-A definition) following the procedure in 21.3.4.5 (Construction of VHT-SIG-A) reading "Clause 22 (Television very high throughput (TVHT) PHY specification)" for references to "Clause 21 (Very high throughput (VHT) PHY specification)" except the following:

e) Pilot insertion: Insert pilots following the steps defined in 22.3.10.10 (Pilot subcarriers).

f) Duplication and phase rotation: Duplicate TVHT-SIG-A1 and TVHT-SIG-A2 over of the BCUs of the CH_BANDWIDTH. Apply the appropriate phase rotation as defined in 22.3.7 (Mathematical description of signals).

i) Insert GI and apply windowing: Prepend a GI (LONG_GI) and apply windowing as defined in 22.3.7 (Mathematical description of signals).

#### 22.3.4.6 Construction of TVHT-STF

Construct the TVHT-STF field for each BCU as defined in 22.3.8.3.4 (TVHT-STF definition) with channel bandwidth being 40 MHz, following the procedure in 21.3.4.6 (Construction of VHT-STF) reading

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

"Clause 22 (Television very high throughput (TVHT) PHY specification)" for references to "Clause 21 (Very high throughput (VHT) PHY specification)" except the following:

b) Phase rotation: Apply appropriate phase rotation as defined in 22.3.7 (Mathematical description of signals).

f) Insert GI and apply windowing: Prepend a GI (LONG_GI) and apply windowing as defined in 22.3.7 (Mathematical description of signals).

In multiple BCU transmissions TVHT_MODE_2C, TVHT_MODE_2N, TVHT_MODE_4C, and TVHT_MODE_4N, the TVHT-STF subcarriers of one BCU are repeated in each BCU with an appropriate phase rotation factor being applied as described in 22.3.8.3.4 (TVHT-STF definition).

### 22.3.4.7 Construction of TVHT-LTF

Construct the TVHT-LTF field for each BCU as defined in 22.3.8.3.5 (TVHT-LTF definition) with channel bandwidth being 40 MHz, following the procedure in 21.3.4.7 (Construction of VHT-LTF) reading "Clause 22 (Television very high throughput (TVHT) PHY specification)" for references to "Clause 21 (Very high throughput (VHT) PHY specification)" except the following:

b) Phase rotation: Apply appropriate phase rotation as defined in 22.3.7 (Mathematical description of signals).

g) Insert GI and apply windowing: Prepend a GI (LONG_GI) and apply windowing as defined in 22.3.7 (Mathematical description of signals).

In multiple BCU transmissions TVHT_MODE_2C, TVHT_MODE_2N, TVHT_MODE_4C, and TVHT_MODE_4N, the TVHT-LTF subcarriers of one BCU are repeated in each BCU with an appropriate phase rotation factor being applied as described in 22.3.8.3.5 (TVHT-LTF definition).

### 22.3.4.8 Construction of TVHT-SIG-B

The TVHT-SIG-B field is constructed per-user for each BCU as defined in 21.3.4.8 (Construction of VHT-SIG-B) with channel bandwidth being 40 MHz, reading "Clause 22 (Television very high throughput (TVHT) PHY specification)" for references to "Clause 21 (Very high throughput (VHT) PHY specification)" except the following:

i) Pilot insertion: Insert pilots following the steps defined in 22.3.10.10 (Pilot subcarriers).

m) Phase rotation: Apply the appropriate phase rotations as defined in 22.3.7 (Mathematical description of signals).

o) Insert GI and apply windowing: Prepend a GI (LONG_GI) and apply windowing as defined in 22.3.7 (Mathematical description of signals).

In multiple BCU transmissions TVHT_MODE_2C, TVHT_MODE_2N, TVHT_MODE_4C, and TVHT_MODE_4N, the TVHT-SIG-B subcarriers of one BCU are repeated in each BCU with an appropriate phase rotation factor being applied as described in 22.3.8.3.6 (TVHT-SIG-B definition).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 22.3.4.9 Construction of the Data field in an SU PPDU

#### 22.3.4.9.1 Using BCC

The construction of the Data field in a VHT SU PPDU with BCC encoding proceeds as defined in 21.3.4.9.1 (Using BCC) reading "Clause 22 (Television very high throughput (TVHT) PHY specification)" for references to "Clause 21 (Very high throughput (VHT) PHY specification)" except the following:

d) BCC encoder: Only one encoder is used.

f) Segment parser is omitted.

i) Segment deparser is omitted.

l) CSD: Apply CSD for each space-time stream and frequency segment as described in 22.3.8.3.2 (Cyclic shift for TVHT modulated fields).

n) Phase rotation: Apply the appropriate phase rotations as defined in 22.3.7 (Mathematical description of signals).

o) IDFT: When in TVHT_MODE_2N or VHT_MODE_4N, allocate the subcarriers for the two IDFTs in each transmit path as described in 22.3.10.11 (OFDM modulation transmission in VHT format).

p) Insert GI and apply windowing: Prepend a GI (SHORT_GI or LONG_GI) and apply windowing as defined in 22.3.7 (Mathematical description of signals).

#### 22.3.4.9.2 Using LDPC

The construction of the Data field in a VHT SU PPDU with LDPC encoding proceeds as defined in 21.3.4.9.2 (Using LDPC) reading "Clause 22 (Television very high throughput (TVHT) PHY specification)" for references to "Clause 21 (Very high throughput (VHT) PHY specification)" except the following:

f) Segment parser is omitted.

i) Segment deparser is omitted.

l) CSD: Apply CSD for each space-time stream and frequency segment as described in 22.3.8.3.2 (Cyclic shift for TVHT modulated fields).

n) Phase rotation: Apply the appropriate phase rotations as defined in 22.3.7 (Mathematical description of signals). When in TVHT_MODE_2N or VHT_MODE_4N, allocate the subcarriers for the two IDFTs in each transmit path as described in 21.3.10.11.1 (Transmission in VHT format).

o) IDFT: When in TVHT_MODE_2N or VHT_MODE_4N, allocate the subcarriers for the two IDFTs in each transmit path as described in 22.3.10.11 (OFDM modulation transmission in VHT format).

p) Insert GI and apply windowing: Prepend a GI (SHORT_GI or LONG_GI) and apply windowing as defined in 22.3.7 (Mathematical description of signals).

### 22.3.4.10 Construction of the Data field in an MU PPDU

#### 22.3.4.10.1 General

See 21.3.4.10.1 (General).

#### 22.3.4.10.2 Using BCC

A Data field with BCC encoding is constructed using the process defined in 22.3.4.9.1 (Using BCC) before the spatial mapping block and repeated for each user that uses BCC encoding.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

#### 22.3.4.10.3 Using LDPC

A Data field with LDPC encoding is constructed using the process defined in 22.3.4.9.2 (Using LDPC) before the spatial mapping block and repeated for each user that uses LDPC encoding.

#### 22.3.4.10.4 Combining to form an MU PPDU

The per-user data is combined as defined in 21.3.4.10.4 (Combining to form a VHT MU PPDU) except the following:

a) Spatial mapping: The *Q* matrix is applied as defined in 22.3.10.11 (OFDM modulation transmission in VHT format). The combining of all user data is done in this block.

b) Phase rotation: Apply the appropriate phase rotations as defined in 22.3.7 (Mathematical description of signals).

d) Insert GI and apply windowing: Prepend a GI (SHORT_GI or LONG_GI) and apply windowing as defined in 22.3.7 (Mathematical description of signals).

e) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 22.3.7 (Mathematical description of signals) and 22.3.8 (TVHT preamble) for details.

### 22.3.5 Modulation and coding scheme (MCS)

The MCS is a value that determines the modulation and coding used in the Data field of the PPDU. It is a compact representation that is carried in the TVHT-SIG-A field for SU PPDUs and in the TVHT-SIG-B field for MU PPDUs. Rate-dependent parameters for the full set of MCSs are shown in Table 22-26 (TVHT-MCSs for TVHT_MODE_1, NSS = 1) to Table 22-37 (TVHT-MCSs for TVHT_MODE_4C and TVHT_MODE_4N, NSS = 4) (in 22.5 (Parameters for TVHT-MCSs)). These tables give rate-dependent parameters for MCSs with indices 0 to 9, with number of spatial streams from 1 to 4 and bandwidth options of one, two, or four BCUs. Equal modulation (EQM) is applied to all streams for a particular user.

Table 22-26 (TVHT-MCSs for TVHT_MODE_1, NSS = 1) to Table 22-29 (TVHT-MCSs for TVHT_MODE_1, NSS = 4) show rate-dependent parameters for MCSs for one to four streams for one BCU operation. Table 22-30 (TVHT-MCSs for TVHT_MODE_2C and TVHT_MODE_2N, NSS = 1) to Table 22-33 (TVHT-MCSs for TVHT_MODE_2C and TVHT_MODE_2N, NSS = 4) show rate-dependent parameters for MCSs for one to four streams for dual BCU operation. Table 22-34 (TVHT-MCSs for TVHT_MODE_4C and TVHT_MODE_4N, NSS = 1) to Table 22-37 (TVHT-MCSs for TVHT_MODE_4C and TVHT_MODE_4N, NSS = 4) show rate-dependent parameters for MCSs for one to four streams for quad BCU operation.

### 22.3.6 Timing-related parameters

Table 22-8 (Timing-related parameters) and Table 22-9 (Tone location) define the timing-related parameters for VHT format and location of occupied tones in TVWS bands.

**Table 22-8—Timing-related parameters**

| Parameter | 6 MHz | 7 MHz | 8 MHz | Description |
|---|---|---|---|---|
| $N_{SD}$ | 108 | 108 | 108 | Number of complex data numbers per BCU |
| $N_{SP}$ | 6 | 6 | 6 | Number of pilot values per BCU |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 22-8—Timing-related parameters**

| Parameter | 6 MHz | 7 MHz | 8 MHz | Description |
|---|---|---|---|---|
| $N_{ST}$ | 114 | 114 | 114 | Total number of subcarriers per BCU |
| $N_{SR}$ | 58 | 58 | 58 | Highest data subcarrier index per BCU |
| $\Delta_F$ | $\frac{6\text{ MHz}}{144} = 41\frac{2}{3}$ kHz | $\frac{7\text{ MHz}}{168} = 41\frac{2}{3}$ kHz | $\frac{8\text{ MHz}}{144} = 55\frac{5}{9}$ kHz | Subcarrier frequency spacing |
| $T_{DFT}$ | 24 μs | 24 μs | 18 μs | IDFT/DFT period |
| $T_{GI}$ | 6 μs = $T_{DFT}$/4 | 6 μs = $T_{DFT}$/4 | 4.5 μs = $T_{DFT}$/4 | Guard interval duration |

**Table 22-9—Tone location**

| Parameter | TVHT_MODE_1 | TVHT_MODE_2C | TVHT_MODE_2N | TVHT_MODE_4C | TVHT_MODE_4N | Description |
|---|---|---|---|---|---|---|
| $N_{ST}$ | 114 | 114 | 114 | 114 | 114 | Total number of occupied subcarriers per BCU |
| $N_{TT}$ | 114 | 228 | 228 | 456 | 456 | Total number of occupied subcarriers across all BCUs |
| Subcarrier index | –58 to –2 and +2 to +58 | –130 to –74, –70 to –14, +14 to +70, and +74 to +130 | –58 to –2 and +2 to +58 for each BCU | –274 to –218, –214 to –158, –130 to –74, –70 to –14, +14 to +70, +74 to +130, +158 to +214, and +218 to +274 | –130 to –74, –70 to –14, +14 to +70, and +74 to +130 for each BCU | Location of occupied subcarriers for 6 MHz and 8 MHz channel units |
| Subcarrier index | –58 to –2 and +2 to +58 | –142 to –86, –82 to –26, +26 to +82, and +86 to +142 | –58 to –2 and +2 to +58 for each BCU | –310 to –254, –250 to –194, –142 to –86, –82 to –26, +26 to +82, +86 to +142, +194 to +250, and +254 to +310 | –142 to –86, –82 to –26, +26 to +82, and +86 to +142 for each BCU | Location of occupied subcarriers for 7 MHz |

The rest of the timing parameters are derived as in Table 21-5 (Timing-related constants) using the definition of $T_{DFT}$ in Table 22-8 (Timing-related parameters). Table 22-9 (Tone location) defines the number of occupied tones and their location in all transmission modes. Zero denotes the DC tone of any contiguous segment.

Refer to Table 21-6 (Frequently used parameters) for the frequency parameters. The definitions in the table are applicable to Clause 22 (Television very high throughput (TVHT) PHY specification) with the exception

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

that in each transmission mode in Clause 22 (Television very high throughput (TVHT) PHY specification) $N_{CBPSSI} = N_{CBPSS}$ for SU and MU PPDUs.

### 22.3.7 Mathematical description of signals

For a description of the conventions used for the mathematical description of the signals, see 17.3.2.5 (Mathematical conventions in the signal descriptions).

For all VHT PPDU in TVWS bands transmission modes the signal is transmitted on subcarriers as defined in Table 22-9 (Tone location).

Let

$f_{c,\,\mathrm{idx0}}$ = dot11CurrentTVHTChannelCenterFrequencyIndex0 (see Table 22-17 (Fields to specify TVHT channels))

$f_{c,\,\mathrm{idx1}}$ = dot11CurrentTVHTChannelCenterFrequencyIndex1 (see Table 22-17 (Fields to specify TVHT channels))

$f_{\mathrm{PW,\,idx}}$ = dot11CurrentPrimaryChannel (see Table 22-17 (Fields to specify TVHT channels)), where TVHT_W refers to a BCU of 6 MHz, 7 MHz, or 8 MHz

$f_{\mathrm{CH,\,start}}$ = Channel starting frequency given in the operation class (E.1 (Country information and operating classes))

When dot11CurrentTVHTChannelWidth is TVHT_W, TVHT_2W, TVHT_W+W, TVHT_4W, or TVHT_2W+2W, $f_{PW,idx}$ and $f_{c,idx1}$ shall have the relationship specified in Equation (22-1).

$$f_{\mathrm{PW,\,idx}} = f_{c,\,\mathrm{idx0}} + n_{\mathrm{PW}} \tag{22-1}$$

where

$$N_{PW} = \begin{cases} 1 \text{ in TVHT\_W and TVHT\_W+W} \\ 2 \text{ in TVHT\_2W and TVHT\_2W+2W} \\ 4 \text{ in TVHT\_4W} \end{cases}$$

$n_{\mathrm{PW}}$ is an integer with possible range $0 \le n_{\mathrm{PW}} \le N_{PW} - 1$

When dot11CurrentTVHTChannelWidth is TVHT_W, TVHT_2W, TVHT_W+W, TVHT_4W, or TVHT_2W+2W,

— The primary TVHT_W channel is the channel with TVHT_W bandwidth centered at $f_{\mathrm{CH,\,start}} + \mathrm{TVHT\_W} \times f_{\mathrm{PW,\,idx}}$, where $f_{\mathrm{PW,\,idx}}$ is given in Equation (22-1).

When dot11CurrentTVHTChannelWidth is TVHT_2W, TVHT_4W, or TVHT_2W+2W,

— The secondary TVHT_W channel is the channel with TVHT_W bandwidth centered at $f_{\mathrm{CH,\,start}} + \mathrm{TVHT\_W} \times f_{\mathrm{SW,\,idx}}$, where $f_{\mathrm{SW,\,idx}}$ is given in Equation (22-2).

$$f_{\mathrm{SW,\,idx}} = \begin{cases} f_{\mathrm{PW,\,idx}} + 1, & \text{if } n_{\mathrm{PW}} \text{ is even} \\ f_{\mathrm{PW,\,idx}} - 1, & \text{if } n_{\mathrm{PW}} \text{ is odd} \end{cases} \tag{22-2}$$

When dot11CurrentTVHTChannelWidth is TVHT_W+W,

— The secondary TVHT_W channel is the channel with TVHT_W bandwidth centered at $f_{\mathrm{CH,\,start}} + \mathrm{TVHT\_W} \times f_{\mathrm{SW,\,idx}}$, where $f_{\mathrm{SW,\,idx}}$ is given in Equation (22-3).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$f_{\mathrm{SW,\,idx}} = f_{c,\,\mathrm{idx1}} \tag{22-3}$$

When dot11CurrentTVHTChannelWidth is TVHT_2W, TVHT_4W, or TVHT_2W+2W,

— The primary TVHT_2W channel is the channel with TVHT_2W bandwidth centered at $f_{\mathrm{CH,\,start}} + \mathrm{TVHT\_W} \times f_{\mathrm{P2W,\,idx}} + 0.5 \times \mathrm{TVHT\_W}$ MHz, where $f_{\mathrm{P2W,\,idx}}$ is given in Equation (22-4).

— The secondary TVHT_2W channel is the channel with TVHT_2W bandwidth centered at $f_{\mathrm{CH,\,start}} + \mathrm{TVHT\_W} \times f_{S2W,\,\mathrm{idx}} + 0.5 \times \mathrm{TVHT\_W}$ MHz, where $f_{S2W,\,\mathrm{idx}}$ is given in Equation (22-5).

$$f_{\mathrm{P2W,\,idx}} = f_{c,\,\mathrm{idx0}} + 2 \times n_{\mathrm{P2W}} \quad 0 \le n_{\mathrm{P2W}} \le N_{P2W} - 1 \quad N_{P2W} = \begin{cases} 1 \text{ in TVHT\_2W and TVHT\_2W+2W} \\ 2 \text{ in TVHT\_4W} \end{cases} \tag{22-4}$$

When dot11CurrentTVHTChannelWidth is TVHT_4W,

— The secondary TVHT_2W channel is the channel with TVHT_2W bandwidth centered at $f_{\mathrm{CH,\,start}} + \mathrm{TVHT\_W} \times f_{S2W,\,\mathrm{idx}} + 0.5 \times \mathrm{TVHT\_W}$ MHz, where $f_{S2W,\,\mathrm{idx}}$ is given in Equation (22-5).

$$f_{\mathrm{S2W,\,idx}} = \begin{cases} f_{\mathrm{P2W,\,idx}} + 2, & \text{if } n_{\mathrm{P2W}} \text{ is even} \\ f_{\mathrm{P2W,\,idx}} - 2, & \text{if } n_{\mathrm{P2W}} \text{ is odd} \end{cases} \tag{22-5}$$

When dot11CurrentTVHTChannelWidth is TVHT_2W+2W,

— The secondary TVHT_2W channel is the channel with TVHT_2W bandwidth centered at $f_{\mathrm{CH,\,start}} + \mathrm{TVHT\_W} \times f_{S2W,\,\mathrm{idx}} + 0.5 \times \mathrm{TVHT\_W}$ MHz, where $f_{S2W,\,\mathrm{idx}}$ is given in Equation (22-3).

The transmitted signal is defined in complex baseband signal notation. The actual transmitted signal is related to the complex baseband signal by the relation shown in Equation (21-11) in Clause 21 (Very high throughput (VHT) PHY specification).

$f_c^{(i_{Seg})}$ represents the center frequency of the PPDU transmitted in frequency segment $i_{Seg}$ in each transmission mode in Clause 22 (Television very high throughput (TVHT) PHY specification).

Note that in TVHT_MODE_2C and TVHT_MODE_4C, the gap between the center frequencies of the adjacent segments is as shown in Table 22-9 (Tone location).

Table 22-10 (Center frequency of a PPDU transmitted in frequency segment iSeg) shows $f_c^{(i_{Seg})}$ as a function of dot11CurrentTVHTChannelWidth.

**Table 22-10—Center frequency of a PPDU transmitted in frequency segment $i_{Seg}$**

| dot11CurrentTVHTChannelWidth | CH_BANDWIDTH | $f_c^{(i_{Seg})} = f_{\mathrm{CH,\,start}} + \mathrm{TVHT\_W} \times f_{(i_{Seg})} + Correction$ | |
|---|---|---|---|
| | | $(f_{(0)}, Correction)$ | $(f_{(1)}, Correction)$ |
| TVHT_W | TVHT_W | $(f_{c,\,\mathrm{idx0}}, 0)$ | — |
| TVHT_2W | TVHT_W | $(f_{\mathrm{PW,\,idx}}, 0)$ | — |
| | TVHT_2W | $(f_{c,\,\mathrm{idx0}}, 0.5 \times \mathrm{TVHT\_W})$ | — |
| TVHT_W+W | TVHT_W | $(f_{\mathrm{PW,\,idx}}, 0)$ | |
| | TVHT_W+W | $(f_{c,\,\mathrm{idx0}}, 0)$ | $(f_{c,\,\mathrm{idx1}}, 0)$ |

| | TVHT_2W+2W | $(f_{c,\text{ idx0}}, 0.5 \times \text{TVHT\_W})$ | $(f_{c,\text{ idx1}}, 0.5 \times \text{TVHT\_W})$ |

NOTE—Transmitted signals in TVHT_MODE_2N and TVHT_MODE_4N might have different impairments such as phase offset or phase noise between the two frequency segments in TVHT_MODE_2N or TVHT_MODE_4N, which is not shown in Equation (21-11) for simplicity. See 22.3.17.3 (Transmit center frequency and symbol clock frequency tolerance).

The transmitted RF signal is derived by upconverting the complex baseband signal, which consists of several fields. The signal transmitted on frequency segment $i_{Seg}$ of transmit chain $i_{TX}$ is described by Equation (21-12) in 21.3.7 (Mathematical description of signals). The timing boundaries for the various fields are shown in Figure 21-17 (Timing boundaries for VHT PPDU fields).

Each field is defined as the summation of one or more subfields, where each subfield is defined to be an inverse discrete Fourier transform as specified in Equation (21-13) and where references to Table 21-5 (Timing-related constants), Table 21-6 (Frequently used parameters), Table 21-8 (Tone scaling factor and guard interval duration values for PHY fields), Table 21-9 (CH_BANDWIDTH and), Table 21-10 (Cyclic shift values for L-STF, L-LTF, L-SIG, and VHT-SIG-A fields of the PPDU), and Table 21-11 (Cyclic shift values for the VHT modulated fields of a PPDU) are replaced by the corresponding descriptions in Clause 22 (Television very high throughput (TVHT) PHY specification) including Table 22-8 (Timing-related parameters), Table 22-9 (Tone location), Table 22-11 (Tone scaling factor and guard interval duration values for PHY fields), and Table 22-12 (Transmission mode and Gamma subk,m).

Table 22-11 (Tone scaling factor and guard interval duration values for PHY fields) summarizes the various values of $N_{\text{Field}}^{\text{Tone}}$ as a function of number of BCUs (TVHT_MODE_1 has one BCU, TVHT_MODE_2C and TVHT_MODE_2N have two BCUs, and TVHT_MODE_4C and TVHT_MODE_4N have four BCUs).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 22-11—Tone scaling factor and guard interval duration values for PHY fields**

| Field | $N_{\text{Field}}^{\text{Tone}}$ as a function of the number of BCUs | | | Guard interval duration |
|---|---|---|---|---|
| | One | Two | Four | |
| L-STF | 24 | 48 | 96 | — |
| L-LTF | 104 | 208 | 416 | $T_{GI2}$ |
| L-SIG | 104 | 208 | 416 | $T_{GI}$ |
| TVHT-SIG-A | 104 | 208 | 416 | $T_{GI}$ |
| TVHT-STF | 24 | 48 | 96 | - |
| TVHT-LTF | 114 | 228 | 456 | $T_{GI}$ |
| TVHT-SIG- | 114 | 228 | 456 | $T_{GI}$ |
| VHT-Data | 114 | 228 | 484 | $T_{GI}$ or $T_{GIS}$ (see NOTE 2) |
| NON_HT_DUP_OFDM-Data (see NOTE 1) | 104 | 208 | 416 | $T_{GI}$ |

NOTE 1—For notational convenience, NON_HT_DUP_OFDM-Data is used as a label for the Data field of a non-HT PPDU(#238) with format type NON_HT_DUP_OFDM.

NOTE 2—$T_{GI}$ denotes guard interval duration when TXVECTOR parameter GI_TYPE equals LONG_GI, $T_{GIS}$ denotes short guard interval duration when TXVECTOR parameter GI_TYPE equals SHORT_GI.

In addition, the parameter $\Upsilon_{k,\text{BW}}$ in Equation (21-13) is replaced by $\Upsilon_{k,\text{M}}$ as defined in Table 22-12 (Transmission mode and Gamma subk,m).

**Table 22-12—Transmission mode and Gamma sub$_{k,\text{M}}$**

| Transmission mode | $\Upsilon_{k,\text{M}}$ |
|---|---|
| TVHT_MODE_1, TVHT_MODE_2N | $\Upsilon_{k,1}$ per segment |
| TVHT_MODE_2C, TVHT_MODE_4N | $\Upsilon_{k,2}$ per two contiguous segments |
| TVHT_MODE_4C | $\Upsilon_{k,4}$ |

For TVHT_MODE_1 and TVHT_MODE_2N PPDU transmission,

$$\Upsilon_{k,1} = \begin{cases} 1, & k < 0 \\ j, & k \geq 0 \end{cases} \tag{22-6}$$

For TVHT_MODE_2C and TVHT_MODE_4N PPDU transmission,

$$\Upsilon_{k,2} = \begin{cases} 1, & k < -72 \text{ for 6 MHz and 8 MHz channels, } k < -84 \text{ for 7 MHz channels} \\ -1, & k \geq -72 \text{ for 6 MHz and 8 MHz channels, } k \geq -84 \text{ for 7 MHz channels} \end{cases} \tag{22-7}$$

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

For TVHT_MODE_4C PPDU transmission,

$$\Upsilon_{k,4} = \begin{cases} 1, & k < -216 \text{ for 6 MHz and 8 MHz channels, } k < -252 \text{ for 7 MHz channels} \\ -1, & -216 \le k < 0 \text{ for 6 MHz and 8 MHz channels, } -252 \le k < 0 \text{ for 7 MHz channels} \\ 1, & 0 \le k < 72 \text{ for 6 MHz and 8 MHz channels, } 0 \le k < 84 \text{ for 7 MHz channels} \\ -1, & k \ge 72 \text{ for 6 MHz and 8 MHz channels, } k \ge 84 \text{ for 7 MHz channels} \end{cases} \quad (22\text{-}8)$$

### 22.3.8 TVHT preamble

#### 22.3.8.1 Introduction

A TVHT preamble is defined to carry the required information to operate in either single user or multi-user mode.

#### 22.3.8.2 Non-TVHT portion of TVHT format preamble

##### 22.3.8.2.1 Cyclic shift definition for pre-TVHT modulated fields

The cyclic shift value $T_{CS}^{i_{TX}}$ for the L-STF, L-LTF, L-SIG, and TVHT-SIG-A fields of the PPDU for transmit chain $i_{TX}$ out of a total of $N_{TX}$ is defined in Table 21-10 (Cyclic shift values for L-STF, L-LTF, L-SIG, and VHT-SIG-A fields of the PPDU) with a scaling factor to account for the change in sampling clock frequency. The CSD delay values shall be multiplied by the corresponding correction values for the 6 MHz, 7 MHz, and 8 MHz channels, respectively.

The scaling factor for transmissions over 6 MHz and 7 MHz channels is 7.5.

The scaling factor for transmissions over 8 MHz channels is 5.625.

As an example, the CSD value for antenna-2 with 2-transmit antennas is –200 ns, and the corresponding CSD value for 6 MHz channels is –1.5 μs.

##### 22.3.8.2.2 L-STF definition

The L-STF field for each BCU in any transmission mode is defined by Equation (19-9) in 19.3.9.3.3 (L-STF definition).

The time domain representation of the signal on BCU $i_{Seg}$ in transmit chain $i_{TX}$ is specified in Equation (21-20), where $\Upsilon_{k,\mathrm{BW}}$ is replaced by $\Upsilon_{k,\mathrm{M}}$ as defined in Table 22-12 (Transmission mode and Gamma subk,m) and where $N_{\mathrm{SR}}$ and $\Delta_F$ are defined in Table 22-8 (Timing-related parameters).

##### 22.3.8.2.3 L-LTF definition

The L-LTF field for each BCU in any transmission mode is defined by Equation (19-12) in 19.3.9.3.4 (L-LTF definition).

Note that these equations do not include the phase rotations as defined in Table 22-12 (Transmission mode and Gamma subk,m).

The time domain representation of the signal in transmit chain $i_{TX}$ is specified in Equation (21-23), where $\Upsilon_{k,\mathrm{BW}}$ is replaced by $\Upsilon_{k,\mathrm{M}}$ as defined in Table 22-12 (Transmission mode and Gamma subk,m) and where $N_{\mathrm{SR}}$ is defined in Table 22-8 (Timing-related parameters).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

#### 22.3.8.2.4 L-SIG definition

The L-SIG field is used to communicate data rate and length information. The structure of the L-SIG field is defined in Figure 17-5 (SIGNAL field bit assignment).

In a VHT PPDU, the RATE field shall be set to the value corresponding to 6 Mb/s in the 20 MHz channel spacing column of Table 17-6 (Contents of the SIGNAL field).

In a non-HT duplicate PPDU(#238), the RATE field is defined in 17.3.4.2 (RATE field) using the L_DATARATE parameter in the TXVECTOR.

The LENGTH field shall be set to the value given by Equation (22-9).

$$\text{LENGTH} = [(\text{TXTIME} - (20 \times \text{scaling factor}))/(4 \times \text{scaling factor})] \times 3 - 3 \quad (22\text{-}9)$$

where the scaling factor is defined in 22.3.8.2.1 (Cyclic shift definition for pre-TVHT modulated fields) and TXTIME is defined in 22.4.3 (TXTIME and PSDU_LENGTH calculation). In a non-HT duplicate PPDU, the LENGTH field is defined in 17.3.4.3 (PHY LENGTH field) using the L_LENGTH parameter in the TXVECTOR.

The time domain waveform of the L-SIG field in each BCU is specified in Equation (21-25) using $N_{20\text{MHz}} = 2$, where $\Upsilon_{k,\text{BW}}$ is replaced by $\Upsilon_{k,\text{M}}$ as defined in Table 22-12 (Transmission mode and Gamma subk,m) and where the rest of the parameters are specified in 22.3.7 (Mathematical description of signals).

### 22.3.8.3 TVHT portion of TVHT format preamble

#### 22.3.8.3.1 Introduction

The TVHT portion of the VHT format preamble consists of the TVHT-SIG-A, TVHT-STF, TVHT-LTF, and TVHT-SIG-B fields.

Notational conventions are specified in 21.3.8.3.1 (Introduction).

#### 22.3.8.3.2 Cyclic shift for TVHT modulated fields

The definition, application, and CSD values are defined in 21.3.8.3.2 (Cyclic shift for VHT modulated fields) with scaling factors as defined in 22.3.8.2.1 (Cyclic shift definition for pre-TVHT modulated fields).

#### 22.3.8.3.3 TVHT-SIG-A definition

The TVHT-SIG-A field carries information required to interpret VHT PPDU in TVWS bands and is defined in 21.3.8.3.3 (VHT-SIG-A definition).

The time domain waveform of the TVHT-SIG-A field in each BCU is specified in Equation (21-28), where $N_{20\text{MHz}} = 2$ and where the rest of the parameters are specified in 22.3.7 (Mathematical description of signals).

Fields in the TVHT-SIG-A fields are the same as in Table 21-12 (Fields in the VHT-SIG-A field) except for the description B0-B1 (BW) and B10-B21 in TVHT-SIG-A1. Description of B0-B1 is specified in Table 22-13 (B0-B1 (BW) in TVHT-SIG-A1).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 22-13—B0-B1 (BW) in TVHT-SIG-A1**

| B0-B1 | TVHT_MODE |
|---|---|
| 00 | Not used |
| 10 | TVHT_MODE_1 |
| 01 | TVHT_MODE_2C and TVHT_MODE_2N |
| 11 | TVHT_MODE_4C and TVHT_MODE_4N |

Description of B10-B21 ($N_{STS}$/Partial AID) is specified as follows:

For an MU PPDU:

$N_{STS}$ is divided into 4 user positions of 3 bits each. User position $p$, where

$0 \le p \le 3$, uses bits B(10+3$p$)-B(12+3$p$). The number of space-time streams for user $u$ is indicated at user position $p$ = USER_POSITION[$u$] where $u$ = 0, 1, ..., NUM_USER − 1 and where the notation A[$b$] denotes the value of array A at index $b$. Zero space-time streams are indicated at positions not listed in the USER_POSITION array.

Set to 0 for 0 space-time streams
Set to 1 for 1 space-time stream
Set to 2 for 2 space-time streams
Set to 3 for 3 space-time streams
Values 4 to 7 are reserved

For an SU PPDU:

B10-B12

Set to 0 for 1 space-time stream
Set to 1 for 2 space-time streams
Set to 2 for 3 space-time streams
Set to 3 for 4 space-time streams
Values 4 to 7 are reserved

B13-B21

Partial AID: Set to the value of the TXVECTOR parameter PARTIAL_AID. Partial AID provides an abbreviated indication of the intended recipient(s) of the PSDU (see 10.19 (Group ID and partial AID in VHT and CMMG PPDUs)).

### 22.3.8.3.4 TVHT-STF definition

The TVHT-STF field for each BCU in any transmission mode is defined by Equation (21-30) in 21.3.8.3.4 (VHT-STF definition).

The time domain waveform of the TVHT-STF field in each BCU is specified in Equation (21-33), where $\Upsilon_{k,\mathrm{BW}}$ is replaced by $\Upsilon_{k,\mathrm{M}}$ as defined in Table 22-12 (Transmission mode and Gamma subk,m) and where $N_{\mathrm{SR}}$ is defined in Table 22-8 (Timing-related parameters).

### 22.3.8.3.5 TVHT-LTF definition

The TVHT-LTF field is defined in 21.3.8.3.5 (VHT-LTF definition).

The TVHT-LTF sequence transmitted for each BCU in any transmission mode is defined by Equation (21-37).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The time domain waveform of the TVHT-LTF field in each BCU is specified in Equation (21-42), where $\Upsilon_{k,\mathrm{BW}}$ is replaced by $\Upsilon_{k,\mathrm{M}}$ as defined in Table 22-12 (Transmission mode and Gamma subk,m) and where $N_{\mathrm{SR}}$ is defined in Table 22-8 (Timing-related parameters).

#### 22.3.8.3.6 TVHT-SIG-B definition

The TVHT-SIG-B field for each BCU in any transmission mode is defined in 21.3.8.3.6 (VHT-SIG-B definition) for 40 MHz bandwidth.

The 27 TVHT-SIG-B bits are first repeated twice, then BCC encoded, interleaved, and made into constellations as described by Figure 21-22 (VHT-SIG-B bits in 20 MHz, 40 MHz, 80 MHz, 160 MHz, and 80+80 MHz transmissions) and the corresponding text in 21.3.8.3.6 (VHT-SIG-B definition). If the channel bandwidth of the current PPDU is TVHT_W, then the IDFT is conducted as defined in 21.3.8.3.6 (VHT-SIG-B definition).

The time domain waveform for the TVHT-SIG-B field in each BCU in a VHT PPDU is the same as Equation (21-47) with channel bandwidth being 40 MHz. If the channel bandwidth of the current PPDU is larger than TVHT_W, then the TVHT-SIG-B subcarriers as described above are repeated in each BCU, with appropriate phase rotation factors $\Upsilon_{k,\mathrm{M}}$ being applied as shown in Table 22-12 (Transmission mode and Gamma subk,m), before conducting IDFT.

### 22.3.9 Transmission of NON_HT and HT PPDUs with multiple antennas

A TVHT STA that transmits a non-HT PPDU(#238) shall apply the cyclic shifts defined in 22.3.8.2.1 (Cyclic shift definition for pre-TVHT modulated fields) for L-STF, L-LTF, and L-SIG fields of the PPDU.

### 22.3.10 Data field

#### 22.3.10.1 General

See 21.3.10.1 (General), with “TVHT” replacing “VHT”.

#### 22.3.10.2 SERVICE field

See 21.3.10.2 (SERVICE field), with “TVHT” replacing “VHT”.

#### 22.3.10.3 CRC calculation for TVHT-SIG-B

The CRC calculation and insertion is illustrated in Figure 21-23 (VHT-SIG-B and SERVICE field relationship).

The value of the CRC field shall be the 1s complement of Equation (21-59) with the values of *N* set to 21 for all Modes.

#### 22.3.10.4 Scrambler

See 21.3.10.4 (Scrambler) with “TVHT” replacing “VHT”.

#### 22.3.10.5 Coding

See 21.3.10.5 (Coding) with “TVHT” replacing “VHT”.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

#### 22.3.10.6 Stream parser

After coding and puncturing, the data bit streams at the output of the FEC encoders are processed in groups of $N_{CBPS}$ bits. Each of these groups is rearranged into $N_{SS}$ blocks of $N_{CBPSS}$ bits ($N_{SS,u}$ blocks of $N_{CBPSS,u}$ bits in the case of an MU transmission). This operation is referred to as *stream parsing* and is described in 21.3.10.6 (Stream parser).

#### 22.3.10.7 Segment parser

The segment parser as described in 21.3.10.7 (Segment parser) is not used in Clause 22 (Television very high throughput (TVHT) PHY specification). All modes of operation use a common interleaver in the case of BCC or use a common tone mapper in the case of LDPC.

#### 22.3.10.8 BCC interleaver

The BCC interleaver and deinterleaver for one BCU (TVHT_MODE_1) is defined in 21.3.10.8 (BCC interleaver) for 40 MHz.

The BCC interleaver and deinterleaver for TVHT_MODE_2C, TVHT_MODE_2N, TVHT_MODE_4C, and TVHT_MODE_4N reuse the same formulas as described in 21.3.10.8 (BCC interleaver) for 40 MHz with new values for $N_{COL}$ , $N_{ROW}$, and $N_{ROT}$ as defined in Table 22-14 (Number of rows and columns in the interleaver).

**Table 22-14—Number of rows and columns in the interleaver**

| Parameter | TVHT_MODE_1 | TVHT_MODE_2C, TVHT_MODE_2N | TVHT_MODE_4C, TVTH_MODE_4N |
|---|---|---|---|
| $N_{COL}$ | 18 | 27 | 48 |
| $N_{ROW}$ | $6 \times N_{BPSCS}$ | $8 \times N_{BPSCS}$ | $9 \times N_{BPSCS}$ |
| $N_{ROT}$ ($N_{SS} \leq 4$) | 29 | 46 | 78 |

#### 22.3.10.9 Constellation mapping

#### 22.3.10.9.1 General

The mapping between bits at the output of the interleaver and complex constellation points is as described in 21.3.10.9.1 (General).

The streams of complex numbers in frequency subblock $l$ for user $u$ are denoted

$d'_{k,i,n,l,u}$; $k = 0, 1, \ldots, N_{SD} - 1$; $i = 1, \ldots, N_{SS,u}$; $n = 0, 1, \ldots, N_{SYM} - 1$;
$l = 0$ for all transmission modes.

#### 22.3.10.9.2 LDPC tone mapping

The LDPC tone mapping for one BCU (TVHT_MODE_1) is defined in 21.3.10.9.2 (LDPC tone mapping) for 40 MHz.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The LDPC tone mapping for TVHT_MODE_2C, TVHT_MODE_2N, TVHT_MODE_4C, and TVHT_MODE_4N reuses the same formulas as described in 21.3.10.9.2 (LDPC tone mapping) for 40 MHz with values for $D_{TM}$ as defined in Table 22-15 (LDPC Tone Mapping Distance for each transmission mode).

**Table 22-15—LDPC Tone Mapping Distance for each transmission mode**

| Parameter | TVHT_MODE_1 | TVHT_MODE_2C, TVHT_MODE_2N | TVHT_MODE_4C, TVHT_MODE_4N |
|---|---|---|---|
| $D_{TM}$ | 6 | 8 | 9 |

For all Clause 22 (Television very high throughput (TVHT) PHY specification) transmission Modes, the LDPC tone mapping for LDPC-coded streams corresponding to user $u$ is done by permuting the stream of complex numbers

$$d'_{k,i,n,l,u};\quad k = 0, 1, \ldots, N_{SD}-1;\quad i = 1, \ldots, N_{SS,u};\quad n = 0, 1, \ldots, N_{SYM}-1;$$
$$l = 0 \text{ for all transmission modes.}$$

generated by the constellation mappers, to obtain

$$d'_{t(k),i,n,l,u};\quad k = 0, 1, \ldots, N_{SD}-1;\quad i = 1, \ldots, N_{SS,u};\quad n = 0, 1, \ldots, N_{SYM}-1;$$
$$l = 0 \text{ for all transmission modes.}$$

where

$$t(k) = D_{TM}\left(k \bmod \frac{N_{SD}}{D_{TM}}\right) + \left\lfloor \frac{k \times D_{TM}}{N_{SD}} \right\rfloor \quad \text{for all transmission modes}$$

### 22.3.10.9.3 Segment deparser

The segment deparser is not used in Clause 22 (Television very high throughput (TVHT) PHY specification) as no segment parser is used in Clause 22 (Television very high throughput (TVHT) PHY specification).

### 22.3.10.9.4 Space-time block coding

See 21.3.10.9.4 (Space-time block coding) with “TVHT” replacing “VHT”.

### 22.3.10.10 Pilot subcarriers

For TVHT_MODE_1 transmission, six pilot tones shall be inserted in subcarriers –53, –25, –11, 11, 25, and 53. The pilots are generated as described in 21.3.10.10 (Pilot subcarriers) for 40 MHz transmission.

When multiple BCUs are used (TVHT_MODE_2C, TVHT_MODE_2N, TVHT_MODE_4C, and TVHT_MODE_4N), each BCU shall use the same pilot tones, which are generated as described in 21.3.10.10 (Pilot subcarriers) for 40 MHz transmission.

### 22.3.10.11 OFDM modulation transmission in VHT format

For TVHT transmissions, the signal from transmit chain $i_{TX}$, $1 \le i_{TX} \le N_{TX}$ shall be as specified in Equation (21-95), where $\Upsilon_{k,\mathrm{BW}}$ is replaced by $\Upsilon_{k,\mathrm{M}}$ as defined in Table 22-12 (Transmission mode and Gamma subk,m) and where $N_{\mathrm{SR}}$ and $\Delta_F$ are defined in Table 22-8 (Timing-related parameters).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

For TVHT_MODE_1 transmission, parameters shall be selected to be the same with 40 MHz VHT transmission as defined in 21.3.10.11.1 (Transmission in VHT format).

For multi-segment transmissions TVHT_MODE_2C and TVHT_MODE_4C, each frequency segment shall follow the waveform as described in Equation (21-95), and the data and pilot subcarriers are allocated to the IDFT block according to the subcarrier mapping as specified in Table 22-9 (Tone location) in consecutive order from the lowest subcarrier to the highest subcarrier.

For multi-segment transmissions TVHT_MODE_2N and TVHT_MODE_4N, each frequency segment shall follow the waveform as described in Equation (21-95), and the data and pilot subcarriers are allocated by the subcarrier allocation block, as shown in Figure 22-2 (Transmitter block diagram for the Data field of a TVHT_MODE_2N or TVHT_MODE_4N SU PPDU with BCC encoding), to the two IDFT blocks according to the subcarrier mapping as specified in Equation (21-95) and Table 22-9 (Tone location) in consecutive order from the lowest subcarrier to the highest subcarrier in each of the two frequency segments, the lower half of the subcarriers are mapped to the IDFT corresponding to the lower frequency segment, and the upper half of the subcarriers are mapped to the IDFT corresponding to the upper frequency segment.

### 22.3.10.12 Non-HT duplicate transmission

When the TXVECTOR parameter FORMAT is NON_HT and the TXVECTOR parameter NON_HT_MODULATION is NON_HT_DUP_OFDM, the transmitted PPDU shall be a non-HT duplicate. Multiple BCUs non-HT duplicate transmission is used to transmit to TVHT STAs that may be present in a part of a channel.

For non-HT duplicate transmission, the Data field shall be as defined in 21.3.10.12 (Non-HT duplicate transmission), with "TVHT" replacing "VHT" and with references to "Clause 22 (Television very high throughput (TVHT) PHY specification)" replacing references to "Clause 21 (Very high throughput (VHT) PHY specification)", using the parameter values defined in Table 22-16 (Parameters for Non-HT duplicate transmissions). The Data field shall be as defined by Equation (21-100) with following modifications. $N_{20\text{MHz}}$ is defined in Table 22-16 (Parameters for Non-HT duplicate transmissions). $K_{\text{Shift}}(i)$ in Equation (21-100) is replaced by $K_{\text{Shift}}(i) = (N_{20\text{MHz}} - 1 - 2i) \times 32 + 8 \cdot \lfloor N_{20\text{MHz}}/4 \rfloor + 8 \times \lfloor N_{20\text{MHz}}/8 \rfloor - (16 \times \lfloor i/2 \rfloor)$.

$T_{\text{CS}}^{i_{TX}}$ represents the cyclic shift of the transmit chain $i_{TX}$ and is defined in 22.3.8.2.1 (Cyclic shift definition for pre-TVHT modulated fields). $N_{\text{NON\_HT\_DUP\_OFDM-Data}}^{\text{Tone}}$ is defined in Table 22-16 (Parameters for Non-HT duplicate transmissions).

**Table 22-16—Parameters for Non-HT duplicate transmissions**

| Parameter | TVHT_MODE_1 | TVHT_MODE_2C | TVHT_MODE_2N | TVHT_MODE_4C | TVHT_MODE_4N |
|---|---|---|---|---|---|
| $N_{20\text{MHz}}$ | 2 | 4 | 2 | 8 | 4 |
| $N_{\text{NON\_HT\_DUP\_OFDM-Data}}^{\text{Tone}}$ | 104 | 208 | 104 | 416 | 208 |

In addition, the parameter $\Upsilon_{k,BW}$ is replaced by $\Upsilon_{k,M}$ as defined in Table 22-12 (Transmission mode and Gamma subk,m). For a noncontiguous TVHT_W+W or TVHT_2W+2W non-HT duplicate transmission, data transmission in each frequency segment shall be as defined for a TVHT_W or TVHT_2W non-HT duplicate transmission, respectively.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 22.3.11 SU-MIMO and MU-MIMO Beamforming

#### 22.3.11.1 General

SU-MIMO and (#3367)DL MU-MIMO beamforming in TVWS band is used as defined in 21.3.11.1 (General) reading "Clause 22 (Television very high throughput (TVHT) PHY specification)" for references to "Clause 21 (Very high throughput (VHT) PHY specification)" except for feedback report format described in 9.4.1.48 (TVHT Compressed Beamforming Report field).

#### 22.3.11.2 Beamforming Feedback Matrix V

Beamforming Feedback Matrix V is constructed as defined in 21.3.11.2 (Beamforming Feedback Matrix V) reading "Clause 22 (Television very high throughput (TVHT) PHY specification)" for reference to "Clause 21 (Very high throughput (VHT) PHY specification)" except for CSD values defined in 22.3.8.3.2 (Cyclic shift for TVHT modulated fields).

#### 22.3.11.3 Group ID

See 21.3.11.4 (Group ID) with "TVHT" replacing "VHT".

### 22.3.12 TVHT preamble format for sounding PPDUs

The format of a VHT NDP in TVWS bands is constructed as defined Figure 22-1 (VHT PPDU format in TVWS bands).

NOTE—The number of TVHT-LTF symbols in the NDP is determined by the SU $N_{STS}$ field in TVHT-SIG-A.

The TVHT NDP has the following properties:

— Uses the TVHT PPDU format but without the Data field.
— Is a TVHT SU PPDU as indicated by the TVHT-SIG-A field.
— Has the data bits of the TVHT-SIG-B field set to a fixed bit pattern (see 22.3.8.3.6 (TVHT-SIG-B definition)).

### 22.3.13 Regulatory requirements

See 21.3.13 (Regulatory requirements).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 22.3.14 Channelization

A TVHT channel is specified by the four PLME MIB fields specified in Table 22-17 (Fields to specify TVHT channels).

**Table 22-17—Fields to specify TVHT channels**

| Field | Meaning |
|---|---|
| dot11CurrentTVHTChannelWidth | Channel width. Possible values represent TVHT_W, TVHT_2W, TVHT_W+W, TVHT_4W, TVHT_2W+2W. |
| dot11CurrentTVHTChannelCenterFrequencyIndex0 | In TVHT_MODE_1, TVHT_MODE_2C, and TVHT_MODE_4C operation denotes the center frequency of the lowest TV channel.<br>In TVHT_MODE_2N and TVHT_MODE_4N operation, denotes the center frequency of the lowest TV channel in the frequency segment that contains the primary channel.<br>Valid range is 1 to 200.<br>See Equation (22-10). |
| dot11CurrentTVHTChannelCenterFrequencyIndex1 | In TVHT_MODE_2N and TVHT_MODE_4N operation, denotes the center frequency of the lowest TV channel in the frequency segment that does not contain the primary channel.<br>Valid range is 1 to 200.<br>See Equation (22-10).<br>Undefined for TVHT_MODE_1, TVHT_MODE_2C, and TVHT_MODE_4C operation. |
| dot11CurrentPrimaryChannel | Denotes the location of the primary TVHT_W channel.<br>Valid range is 1 to 200.<br>See Equation (22-11). |

Given dot11CurrentTVHTChannelCenterFrequencyIndex0 and dot11CurrentTVHTChannelCenterFrequencyIndex1, the respective channel center frequency is given by Equation (22-10).

$$\text{Channel center frequency [MHz]} = \text{Channel starting frequency} + \text{TVHT\_W} \times \text{dot11CurrentChannelCenterFrequencyIndex} + \text{ChannelCenterFrequencyCorrection} \quad (22\text{-}10)$$

where

Channel starting frequency is given by the Operating Class (E.1 (Country information and operating classes))

dot11CurrentTVHTChannelCenterFrequencyIndex is either
dot11CurrentTVHTChannelCenterFrequencyIndex0 or
dot11CurrentTVHTChannelCenterFrequencyIndex1 and

ChannelCenterFrequencyCorrection is
0 for TVHT_MODE_1 and TVHT_MODE_2N
0.5 × TVHT_W for TVHT_MODE_2C and TVHT+MODE_4N
1.5 × TVHT_W for TVHT_MODE_4C.

NOTE—Channel starting frequency is the frequency that results in the regulatory domain's channel number being the RLAN channel number, i.e., the center frequency of the channel for index 0. For example, the center frequency of United States and its territories(#296) TV channel 2 is 57 MHz. The center frequency of United States and its territories(#296) TV channel 2 is obtained by Equation (22-10) as follows:

Channel center frequency [MHz] = Channel starting frequency + TVHT_W × dot11CurrentTVHTChannelCenterFrequencyIndex + ChannelCenterFrequencyCorrection = (0.045 × 1000) + 6 × 2 + 0 = 57 MHz.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The center frequency of the primary TVHT_W channel is given by Equation (22-11).

$$\text{Primary channel center frequency [MHz]} = \text{Channel starting frequency} + \text{TVHT\_W} \times \text{dot11CurrentPrimaryChannel} \quad (22\text{-}11)$$

where

Channel starting frequency is given by the Operating Class (see E.1 (Country information and operating classes))

For TVHT_MODE_2N operation, any two nonidentical channels may be used.

For TVHT_MODE_4N operation, any two channels that would each be allowed as TVHT_2W channels and whose center frequencies are separated by greater than TVHT_2W (difference between dot11CurrentTVHTChannelCenterFrequencyIndex0 and dot11CurrentTVHTChannelCenterFrequencyIndex1 corresponds to a frequency difference greater than 2) may be used.

For example, in the United States and its territories(#296), a channel specified by

dot11CurrentTVHTChannelWidth = TVHT_2W (12 MHz)
dot11CurrentTVHTChannelCenterFrequencyIndex0 = 15
dot11CurrentPrimaryChannel = 16

is a 12 MHz channel with a center frequency of 482 MHz and the primary 6 MHz channel centered at 485 MHz.

A channel specified by

dot11CurrentTVHTChannelWidth = TVHT_4W (24 MHz)
dot11CurrentTVHTChannelCenterFrequencyIndex0 = 14
dot11CurrentPrimaryChannel = 17

is a 24 MHz channel with a center frequency of 482 MHz and the primary 6 MHz channel centered at 491 MHz.

A channel specified by

dot11CurrentTVHTChannelWidth = TVHT_2W+2W (12+12 MHz)
dot11CurrentTVHTChannelCenterFrequencyIndex0 =15
dot11CurrentTVHTChannelCenterFrequencyIndex1 = 40
dot11CurrentPrimaryChannel = 16

is an 12+12 MHz channel in which frequency segment 0 has 12 MHz bandwidth and center frequency of 482 MHz. Frequency segment 1 also has 12 MHz bandwidth and center frequency of 632 MHz. The primary 6 MHz channel is centered at 485 MHz.

### 22.3.15 Slot time

The slot time for the TVHT PHY shall be 24 μs for 6 MHz and 7 MHz channel units and 20 μs for 8 MHz channel units.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 22.3.16 Transmit and receive port impedance

(#1247)The impedance of exposed transmit and receive antenna connectors are defined in 17.3.8.7 (Transmit and receive impedance at the antenna connector).

### 22.3.17 TVHT transmit specification

#### 22.3.17.1 Transmit spectrum mask

(#1471)The overall transmit spectral mask is constructed using two components. First, an interim spectral mask is constructed whose mask level is determined relative to the maximum spectral density of the signal. Second, an absolute transmit spectral limit is computed based on the mask bandwidth. The overall transmit spectral mask is then constructed by taking the higher of the interim transmit spectral mask and the absolute transmit spectral limit at each frequency offset.

For transmission in TVHT_MODE_1, TVHT_MODE_2C, and TVHT_MODE_4C, the transmit spectral mask shall be as described for 40 MHz mask PPDU in 21.3.17.1 (Transmit spectrum mask) with the frequency axis multiplied by the frequency scaling factor as defined in Table 22-18 (Spectral mask frequency scaling factor for contiguous transmission).

**Table 22-18—Spectral mask frequency scaling factor for contiguous transmission**

| Mode | Scaling for 6 MHz channels | Scaling for 7 MHz channels | Scaling for 8 MHz channels |
|---|---|---|---|
| TVHT_MODE_1 | 6 / 40 | 7 / 40 | 8 / 40 |
| TVHT_MODE_2C | 12 / 40 | 14 / 40 | 16 / 40 |
| TVHT_MODE_4C | 24 / 40 | 28 / 40 | 32 / 40 |

For transmission in mode TVHT_MODE_4N, the transmit spectral mask shall be as described for 80+80 MHz mask PPDU in 21.3.17.1 (Transmit spectrum mask) with the frequency axis multiplied by the frequency scaling factor as defined in Table 22-19 (Spectral mask frequency scaling factor for TVHT_MODE_4N).

**Table 22-19—Spectral mask frequency scaling factor for TVHT_MODE_4N**

| Mode | Scaling for 6 MHz channels | Scaling for 7 MHz channels | Scaling for 8 MHz channels |
|---|---|---|---|
| TVHT_MODE_4N | 12 / 80 | 14 / 80 | 16 / 80 |

NOTE 1—In the presence of additional regulatory restrictions, the device has to meet both the regulatory requirements (measured as defined in the relevant regulation) and the mask defined in this subclause.

NOTE 2—For rules regarding TX center frequency leakage levels, see 22.3.17.4.2 (Transmit center frequency leakage).

For a TVHT_W+W mask PPDU of VHT or non-HT duplicate format, the overall transmit spectral mask is constructed in the following manner. First, the 40 MHz interim transmit spectral mask shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth of 38 MHz, –20 dBr at 21 MHz

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

frequency offset, –28 dBr at 40 MHz frequency offset, and –40 dBr at 60 MHz frequency offset and above. The 40 MHz interim transmit spectral mask for frequency offsets in between 19 MHz and 21 MHz, 21 MHz and 40 MHz, and 40 MHz and 60 MHz shall be linearly interpolated in dB domain from the requirements for 19 MHz, 21 MHz, 40 MHz, and 60 MHz frequency offsets. Then the 40 MHz interim spectral mask frequency points are scaled as defined in Table 22-20 (Spectral mask frequency scaling factor for TVHT_MODE_2N) to produce a TVHT_W interim spectral mask. Then, the TVHT_W interim spectral mask is placed on each of the two segments to produce the TVHT_W+W interim spectral mask. Then, for each frequency at which both of the TVHT_W interim spectral masks have values greater than –40 dBr and less than –20 dBr, the sum of the two TVHT_W interim mask values (summed in linear domain) shall be taken as the overall TVHT_W+W interim spectral mask value. Next, for each frequency at which neither of the two TVHT_W interim masks has values greater than or equal to –20 dBr and less than or equal to 0 dBr, the higher value of the two interim masks shall be taken as the overall TVHT_W+W interim mask spectral value. Finally, for any frequency region where the TVHT_W+W interim mask value has not been defined yet, linear interpolation (in dB domain) between the nearest two frequency points with the TVHT_W+W interim spectral mask value defined shall be used to define the TVHT_W+W interim spectral mask value. The transmit spectrum shall not exceed the maximum of the TVHT_W+W interim transmit spectrum mask and –59 dBm/MHz at any frequency offset.

**Table 22-20—Spectral mask frequency scaling factor for TVHT_MODE_2N**

| Mode | Scaling for 6 MHz channels | Scaling for 7 MHz channels | Scaling for 8 MHz channels |
|---|---|---|---|
| TVHT_MODE_2N | 6 / 40 | 7 / 40 | 8 / 40 |

Example transmit spectral mask for a TVHT_W+W mask PPDU for BCU of 6 MHz and spacing of 12 MHz is shown in Figure 22-4 (Example transmit spectral mask for an 6+6 MHz mask PPDU).

### 22.3.17.2 Spectral flatness

Spectral flatness measurements shall be conducted using BPSK modulated PPDUs. See 22.3.17.4.4 (Transmitter modulation accuracy (EVM) test) for the demodulation procedure of the PPDUs as well as the number of PPDUs and OFDM symbols to be used for testing.

Let $E_{i,\,avg}$ denote the average constellation energy of a BPSK modulated subcarrier $i$ in a TVHT data symbol.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

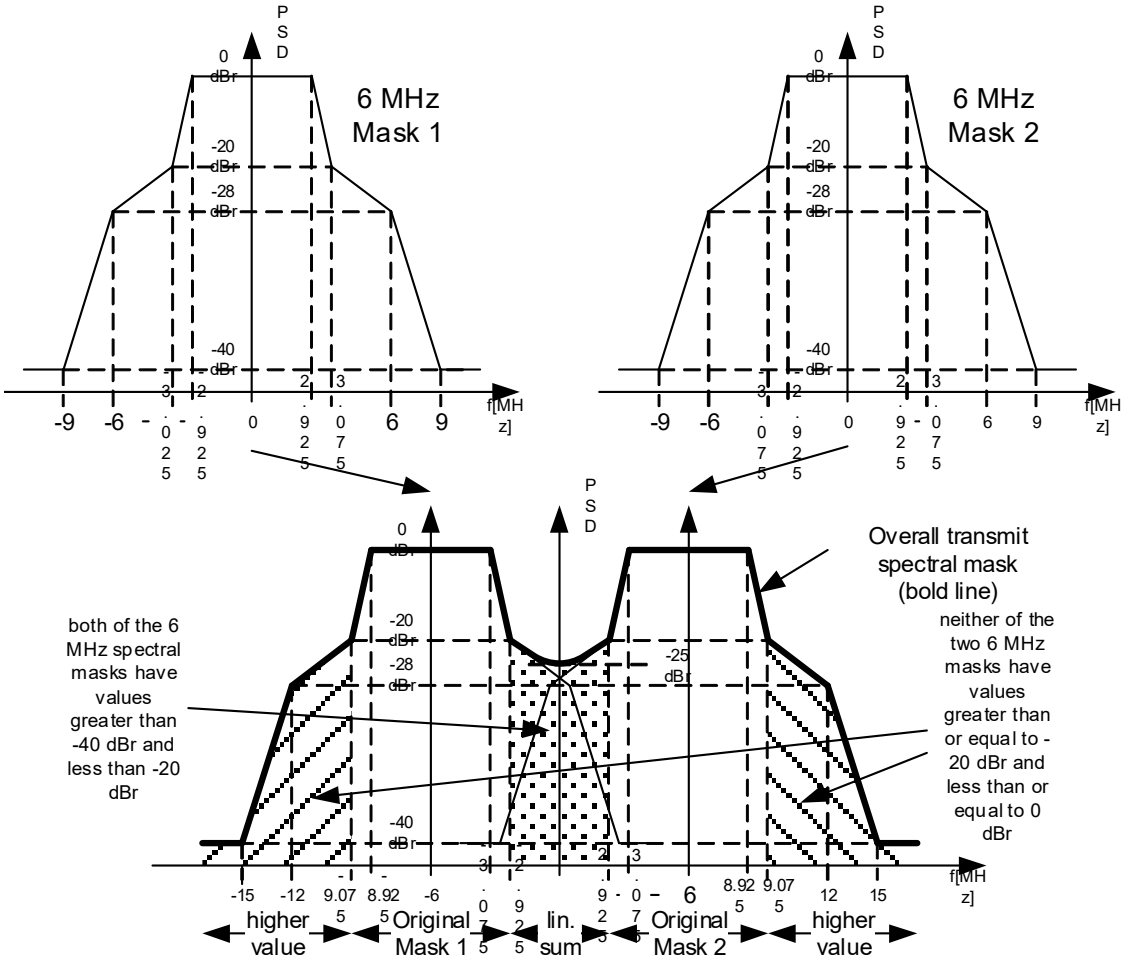

**Figure 22-4—Example transmit spectral mask for an 6+6 MHz mask PPDU**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

For TVHT_MODE_1 contiguous non-HT duplicate or TVHT transmission having a bandwidth listed in Table 22-21 (Maximum transmit spectral flatness deviations), $E_{i,\,avg}$ of each of the subcarriers with indices listed as tested subcarrier indices shall not deviate by more than the specified maximum deviation in Table 22-21 (Maximum transmit spectral flatness deviations) from the average of $E_{i,\,avg}$ over subcarrier indices listed as averaging subcarrier indices. Averaging of $E_{i,\,avg}$ is done in the linear domain.

**Table 22-21—Maximum transmit spectral flatness deviations**

| Format | Bandwidth of transmission (MHz) | Averaging subcarrier indices | Tested subcarrier indices | Maximum deviation (dB) |
|---|---|---|---|---|
| VHT | TVHT_W | –42 to –2 and +2 to +42 | –42 to –2 and +2 to +42 | ± 4 |
| | | | –58 to –43 and +43 to +58 | +4/–6 |
| non-HT duplicate | TVHT_W | –42 to –33, –31 to –6, +6 to +31, and +33 to +42 | –42 to –33, –31 to –6, +6 to +31, and +33 to +42 | ± 4 |
| | | | –43 to –58 and +43 to +58 | +4/–6 |

For transmissions consisting of multiple contiguous or noncontiguous BCUs, each BCU shall meet the spectral flatness requirement for TVHT_MODE_1 transmission.

For the spectral flatness test, the transmitting STA shall be configured to use a spatial mapping matrix $Q_k$ (see 22.3.10.11 (OFDM modulation transmission in VHT format)) with flat frequency response. Each output port under test of the transmitting STA shall be connected through a cable to one input port of the testing instrumentation.

### 22.3.17.3 Transmit center frequency and symbol clock frequency tolerance

The transmitter center frequency tolerance shall be ± 25 ppm. Carrier (LO) and symbol clock frequencies for the all transmit chains and BCUs shall be derived from the same reference oscillator.

NOTE—For multichannel operation, the signal phase of each BCU might be uncorrelated.

The symbol clock frequency tolerance shall be ± 25 ppm. The transmit center frequency and the symbol clock frequency for all transmit antennas and contiguous BCUs shall be derived from the same reference oscillator.

### 22.3.17.4 Modulation accuracy

#### 22.3.17.4.1 Introduction to modulation accuracy tests

Transmit modulation accuracy specifications are defined in 22.3.17.4.2 (Transmit center frequency leakage) and 22.3.17.4.3 (Transmitter constellation error). The test method is described in 21.3.17.4.4 (Transmitter modulation accuracy (EVM) test).

#### 22.3.17.4.2 Transmit center frequency leakage

For transmissions using all formats except noncontiguous where the RF LO falls outside both BCUs, TX LO leakage shall meet the following requirements:

— When the RF LO is in the center of the transmitted PPDU BW, the power measured at the center of transmission BW using resolution BW (6/144 or 8/144) MHz shall not exceed the average power per

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

subcarrier of the transmitted PPDU, or equivalently ($P - 10\log 10(N_{ST})$), where $P$ is the transmit power per antenna in dBm and $N_{ST}$ is defined in Table 22-8 (Timing-related parameters).

— When the RF LO is not at the center of the transmitted PPDU BW, the power measured at the location of the RF LO using resolution BW (6/144 or 8/144) MHz shall not exceed the maximum of –32 dB relative to the total transmit power and –20 dBm, or equivalently $max(P - 32, -20)$, where $P$ is the transmit power per antenna in dBm.

For transmissions using TVHT_MODE_2N and TVHT_MODE_4N, where the RF LO falls outside both BCUs, the RF LO shall follow the spectral mask requirements as defined in 22.3.17.1 (Transmit spectrum mask).

#### 22.3.17.4.3 Transmitter constellation error

For all modes defined in TVHT PHY, the requirements for transmit constellation RMS error are same as defined in 21.3.17.4.3 (Transmitter constellation error).

For non-HT duplicate transmissions, requirements defined in 17.3.9.7.4 (Transmitter constellation error) apply to all parts of the channel bandwidth. The channel bandwidth is determined by the TXVECTOR parameter CH_BANDWIDTH.

#### 22.3.17.4.4 Transmitter modulation accuracy (EVM) test

For the transmit modulation accuracy test, the same methodology as that defined in 21.3.17.4.4 (Transmitter modulation accuracy (EVM) test) shall be applied per BCU (termed frequency segment in Clause 21 (Very high throughput (VHT) PHY specification)). The channel bandwidth is determined by the TXVECTOR parameter CH_BANDWIDTH.

### 22.3.17.5 Time of Departure accuracy

For Time of Departure accuracy test, the test parameters defined in 21.3.17.5 (Time of Departure accuracy) shall be used for evaluation of TOD except the channel bandwidth, TTR and TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH. The channel bandwidth is determined by TXVECTOR parameter CH_BANDWIDTH in 22.2.2 (TXVECTOR and RXVECTOR parameters). TTR and TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH shall be multiplied by the corresponding scaling factor for the 6 MHz, 7 MHz, and 8 MHz channels, where the scaling factor is defined in 22.3.8.2.1 (Cyclic shift definition for pre-TVHT modulated fields).

## 22.3.18 TVHT receiver specification

### 22.3.18.1 General

See 21.3.18 (VHT receiver specification).

### 22.3.18.2 Receiver minimum input level sensitivity(#256)

The (#14)PER shall be less than 10% for a PSDU length of 4096 octets with the rate-dependent input levels listed in Table 22-22 (Receiver minimum input level sensitivity). The test in this subclause and the minimum sensitivity levels specified in Table 22-22 (Receiver minimum input level sensitivity) apply only to non-STBC modes, long GI, BCC, and VHT PPDU in TVWS bands.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 22-22—Receiver minimum input level sensitivity**

| Modulation | Rate (R) | Minimum sensitivity (dBm) | | | | | |
|---|---|---|---|---|---|---|---|
| | | 6 or 7 MHz (TVHT_ MODE_1) | 12/14 MHz (TVHT_ MODE_2C) or 6+6/7+7 MHz (TVHT_ MODE_2N) | 24/28 MHz (TVHT_ MODE_4C or 12+12/ 14+14 MHz (TVHT_ MODE_4N) | 8 MHz (TVHT_ MODE_1) | 16 MHz (TVHT_ MODE_2C) or 8+8 MHz (TVHT_ MODE_2N) | 32 MHz (TVHT_ MODE_4C) or 16+16/ 16+16 MHz (TVHT_ MODE_4N) |
| BPSK | 1/2 | –88 | –85 | –82 | –87 | –84 | –81 |
| QPSK | 1/2 | –85 | –82 | –79 | –84 | –81 | –78 |
| QPSK | 3/4 | –83 | –80 | –77 | –82 | –79 | –76 |
| 16-QAM | 1/2 | –80 | –77 | –74 | –79 | –76 | –73 |
| 16-QAM | 3/4 | –76 | –73 | –70 | –75 | –72 | –69 |
| 64-QAM | 2/3 | –72 | –69 | –66 | –71 | –68 | –65 |
| 64-QAM | 3/4 | –71 | –68 | –65 | –70 | –67 | –64 |
| 64-QAM | 5/6 | –70 | –67 | –64 | –69 | –66 | –63 |
| 256-QAM | 3/4 | –65 | –62 | –59 | –64 | –61 | –58 |
| 256-QAM | 5/6 | –63 | –60 | –57 | –62 | –59 | –56 |

### 22.3.18.3 Adjacent channel rejection

Adjacent channel rejection for TVHT_MODE_1, TVHT_MODE_2C, and TVHT_MODE_4C follow the definition in the first paragraph of 21.3.18.2 (Adjacent channel rejection) and use the values in Table 22-23 (Minimum required adjacent and nonadjacent channel rejection levels).

Adjacent channel rejection for TVHT_MODE_2N (TVHT_W+W) and TVHT_MODE_4N (TVWT_2W+2W) follows the definition in the second paragraph of 21.3.18.2 (Adjacent channel rejection), where “80 MHz” is replaced by “TVHT_W” for TVHT_MODE_2N and “TVHT_2W” for TVHT_MODE_4N, and uses the values in Table 22-23 (Minimum required adjacent and nonadjacent channel rejection levels).

The definitions in the rest of 21.3.18.2 (Adjacent channel rejection) apply to Clause 22 (Television very high throughput (TVHT) PHY specification) using the values in Table 22-23 (Minimum required adjacent and nonadjacent channel rejection levels).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 22-23—Minimum required adjacent and nonadjacent channel rejection levels**

| Modulation | Rate (R) | Adjacent channel rejection (dB) | | Nonadjacent channel rejection (dB) | |
|---|---|---|---|---|---|
| | | 6 MHz, 7 MHz, 8 MHz, 12 MHz (TVHT_MODE_2C), 14 MHz (TVHT_MODE_2C), 16 MHz (TVHT_MODE_2C), 24 MHz (TVHT_MODE_4C), 28 MHz (TVHT_MODE_4C), 32 MHz (TVHT_MODE_4C) | 6+6 MHz (TVHT_MODE_2N), 7+7 MHz (TVHT_MODE_2N), 8+8 MHz (TVHT_MODE_2N), 12+12 MHz (TVHT_MODE_4N), 14+14 MHz (TVHT_MODE_4N), 16+16 MHz (TVHT_MODE_4N) | 6 MHz, 7 MHz, 8 MHz, 12 MHz (TVHT_MODE_2C), 14 MHz (TVHT_MODE_2C), 16 MHz (MTVHT_MODE_2C), 24 MHz (TVHT_MODE_4C), 28 MHz (TVHT_MODE_4C), 32 MHz (TVHT_MODE_4C) | 6+6 MHz (TVHT_MODE_2N), 7+7 MHz (TVHT_MODE_2N), 8+8 MHz (TVHT_MODE_2N), 12+12 MHz (TVHT_MODE_4N), 14+14 MHz (TVHT_MODE_4N), 16+16 MHz (TVHT_MODE_4N) |
| BPSK | 1/2 | 16 | 13 | 32 | 29 |
| QPSK | 1/2 | 13 | 10 | 29 | 26 |
| QPSK | 3/4 | 11 | 8 | 27 | 24 |
| 16-QAM | 1/2 | 8 | 5 | 24 | 21 |
| 16-QAM | 3/4 | 4 | 1 | 20 | 17 |
| 64-QAM | 2/3 | 0 | –3 | 16 | 13 |
| 64-QAM | 3/4 | –1 | –4 | 15 | 12 |
| 64-QAM | 5/6 | –2 | –5 | 14 | 11 |
| 256-QAM | 3/4 | –7 | –10 | 9 | 6 |
| 256-QAM | 5/6 | –9 | –12 | 7 | 4 |

### 22.3.18.4 Nonadjacent channel rejection

Nonadjacent channel rejection for TVHT_MODE_1, TVHT_MODE_2C, and TVHT_MODE_4C channels follows the definition in the first paragraph of 21.3.18.3 (Nonadjacent channel rejection) and use the values in Table 22-23 (Minimum required adjacent and nonadjacent channel rejection levels).

Nonadjacent channel rejection for TVHT_MODE_2N (TVHT_W+W) and TVHT_MODE_4N (TVWT_2W+2W) follows the definition in the second paragraph of 21.3.18.3 (Nonadjacent channel rejection), where “80 MHz” is replaced by “TVHT_W” for TVHT_MODE_2N and “TVHT_2W” for TVHT_MODE_4N, and uses the values in Table 22-23 (Minimum required adjacent and nonadjacent channel rejection levels).

The definitions in the rest of 21.3.18.3 (Nonadjacent channel rejection) apply to Clause 22 (Television very high throughput (TVHT) PHY specification) using the values in Table 22-23 (Minimum required adjacent and nonadjacent channel rejection levels).

### 22.3.18.5 Receiver maximum input level

The receiver shall provide a maximum PER of 10% at a PSDU length of 4096 octets, for a maximum input level of –20 dBm, measured at each antenna for any baseband TVHT modulation.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 22.3.18.6 CCA sensitivity

#### 22.3.18.6.1 General

The thresholds in this subclause are compared with the signal level at each receiving antenna(#2365).

#### 22.3.18.6.2 CCA sensitivity for signals occupying the primary channel

The PHY shall issue a PHY-CCA.indication(BUSY, {primary}) primitive if one of the conditions listed in Table 22-24 (Conditions for CCA BUSY on the primary channel) is met in an otherwise idle TVHT_W (TVHT_MODE_1), TVHT_2W (TVHT_MODE_2C), TVHT_4W (TVHT_MODE_4C), TVHT_W+W (TVHT_MODE_2N), and TVHT_2W+2W (TVHT_MODE_4N) operating channel width. With >90% probability, the PHY shall detect the start of a PPDU that occupies at least the primary TVHT_W channel under the conditions listed in Table 22-24 (Conditions for CCA BUSY on the primary channel) within a period of aCCATime (see 22.4.4 (TVHT PHY)) and hold the CCA signal busy [PHY-CCA.indication(BUSY, channel-list)] for the duration of the PPDU.

**Table 22-24—Conditions for CCA BUSY on the primary channel**

| Frequency segment width | Conditions |
|---|---|
| 6 MHz | The start of a 6 MHz non-HT duplicate or VHT PPDU in TVWS bands in the primary 6 MHz channel at or above –88 dBm. |
| 7 MHz | The start of a 7 MHz non-HT duplicate or VHT PPDU in TVWS bands in the primary 7 MHz channel at or above –88 dBm. |
| 8 MHz | The start of a 8 MHz non-HT duplicate or VHT PPDU in TVWS bands in the primary 8 MHz channel at or above –87 dBm. |

The receiver shall issue a PHY-CCA.indication(BUSY, {primary}) primitive for any signal that exceeds a threshold equal to 20 dB above the minimum modulation and coding rate sensitivity (–88 + 20 = –68 dBm in the case of 6 MHz channel) in the primary TVHT_W channel within a period of aCCATime after the signal arrives at the receiver's antenna(s); then the receiver shall not issue a PHY-CCA.indication(BUSY,{secondary}), PHY-CCA.indication(BUSY,{secondaryTVHT_2W}), or PHY-CCA.indication(IDLE) primitive while the threshold continues to be exceeded.

#### 22.3.18.6.3 CCA sensitivity for signals not occupying the primary channel

The PHY shall issue a PHY-CCA.indication(BUSY, {secondary}) primitive if the conditions for issuing a PHY-CCA.indication(BUSY, {primary}) primitive are not present and one of the following conditions is present in an otherwise idle TVHT_2W (TVHT_MODE_2C), TVHT_4W (TVHT_MODE_4C), TVHT_W+W (TVHT_MODE_2N), and TVHT_2W+2W (TVHT_MODE_4N) operating channel width:

— Any signal within the secondary channel at or above a threshold (–68 dBm for 6 MHz, –68 dBm for 7 MHz, and –67 dBm for 8 MHz) within a period of aCCATime after the signal arrives at the receiver's antenna(s); then the PHY shall not issue a PHY-CCA.indication(BUSY,{secondaryTVHT_2W}) or PHY-CCA.indication(IDLE) primitive while the threshold continues to be exceeded.

— A TVHT_W non-HT duplicate or VHT PPDU in TVWS bands detected in the secondary channel at or above a threshold (–81 dBm for 6 MHz, –81 dBm for 7 MHz, and –80 dBm for 8 MHz) with >90% probability within a period aCCAMidTime (see 22.4.4 (TVHT PHY)).

The PHY shall issue a PHY-CCA.indication(BUSY, {secondaryTVHT_2W}) primitive if the conditions for issuing a PHY-CCA.indication(BUSY, {primary}) primitive and a PHY-CCA.indication(BUSY,

{secondary}) primitive are not present and one of the following conditions is present in an otherwise idle TVHT_4W (TVHT_MODE_4C) and TVHT_2W+2W (TVHT_MODE_4N) operating channel width:

— Any signal within the secondary TVHT_2W channel at or above a threshold (–65 dBm for 12 MHz, –65 dBm for 14 MHz, and –64 dBm for 16 MHz) within a period of aCCATime after the signal arrives at the receiver's antenna(s); then the PHY shall not issue a PHY-CCA.indication(IDLE) primitive while the threshold continues to be exceeded.

— A TVHT_2W non-HT duplicate or VHT PPDU in TVWS bands detected in the secondary TVHT_2W channel at or above a threshold (–78 dBm for 6+6 MHz, –78 dBm for 7+7 MHz, and –77 dBm for 8+8 MHz or 16 MHz) with >90% probability within a period aCCAMidTime (see 22.4.4 (TVHT PHY)).

— A TVHT_W non-HT duplicate or VHT PPDU in TVWS bands detected in any TVHT_W subchannel of the secondary TVHT_2W channel at or above a threshold (–81 dBm for 6 MHz, –81 dBm for 7 MHz, and –80 dBm for 8 MHz) with >90% probability within a period aCCAMidTime.

(TVHT PHY characteristics). The definitions for these characteristics are given in 6.7.4 (PLME-CHARACTERISTICS.confirm).

**Table 22-25—TVHT PHY characteristics**

| Characteristics | Value |
|---|---|
| aSlotTime | 24 μs (BCUs: 6 MHz or 7 MHz) plus any coverage-class-dependent aAirPropagationTime (see Table 9-133 (Coverage Class field parameters))<br>20 μs (BCUs: 8 MHz) plus any coverage-class-dependent aAirPropagationTime (see Table 9-133 (Coverage Class field parameters)) |
| aSIFSTime | 120 μs (BCUs: 6 MHz or 7 MHz)<br>90 μs (BCUs: 8 MHz) |
| aSignalExtension | 0 μs |
| aCCATime | < 15 μs (6 MHz or 7 MHz)<br>< 11.25 μs (8 MHz) |
| aCCAMidTime | < 94 μs (6 MHz or 7 MHz)<br>< 70 μs (8 MHz) |
| aAirPropagationTime | As indicated by the coverage class (see 10.22.5 (Operation with coverage classes)) |
| aPPDUMaxTime | 20 ms |
| aPSDUMaxLength | 1 401 120 octets (see NOTE 1) |
| aRxPHYStartDelay | (#3038)20 μs×<br>7.5 (6 and 7 MHz channels) or 5.625 (8 MHz channels) (see NOTE 2) |
| NOTE 1—This is the maximum length in octets for SU PPDUs with a bandwidth of 32 MHz or 16+16 MHz, MCS 9 and 4 spatial streams, limited by 973 possible Short GI data symbols in aPPDUMaxTime.<br>NOTE 2—This value arises from the time to the end of (#3038)the L-SIG field (see Figure 22-1 (VHT PPDU format in TVWS bands)). | |

## 22.5 Parameters for TVHT-MCSs

The rate-dependent parameters for one BCU mode (6 MHz, 7 MHz, and/or 8 MHz) and corresponding two and four BCU modes with $N_{SS} = 1, \ldots, 4$ are given in Table 22-26 (TVHT-MCSs for TVHT_MODE_1, NSS = 1) to Table 22-37 (TVHT-MCSs for TVHT_MODE_4C and TVHT_MODE_4N, NSS = 4). Support for MCS 8 and 9 (when valid) is optional in all cases. A TVHT STA shall support single spatial stream MCSs within the range MCS 0 to MCS 7 for all channel widths for which it has indicated support regardless of the Tx or Rx Highest Supported Data Rate subfield values in the TVHT Supported MCS Set field. When more than one spatial stream is supported, the Tx or Rx Highest Supported Data Rate subfield values in the TVHT Supported MCS Set field may result in a reduced MCS range (cut-off) for $N_{SS} = 2, \ldots, 4$. Support for 6 MHz, 7 MHz, or 8 MHz with $N_{SS} = 1$ is mandatory. Support for 6 MHz, 7 MHz, and 8 MHz with $N_{SS} = 2, \ldots, 4$ is optional. Support for two BCU modes with 12 MHz, 14 MHz, and 16 MHz or with 6+6 MHz, 7+7 MHz, and 8+8 MHz with $N_{SS} = 1, \ldots, 4$ is optional. Support for four BCU modes with 24 MHz, 28 MHz, and 32 MHz or with 12+12 MHz, 14+14 MHz, and 16+16 MHz with $N_{SS} = 1, \ldots, 4$ is optional. $N_{ES}$ values were chosen to yield an integer number of punctured blocks per OFDM symbol. Note that $N_{ES}$ values are 1 for all Clause 22 (Television very high throughput (TVHT) PHY specification) modulations.

Table 22-26 (TVHT-MCSs for TVHT_MODE_1, NSS = 1) to Table 22-37 (TVHT-MCSs for TVHT_MODE_4C and TVHT_MODE_4N, NSS = 4) define TVHT-MCSs not only for SU transmission but

This is an unapproved IEEE Standards Draft, subject to change.

also for user $u$ of MU transmission. In the case of TVHT-MCSs for MU transmission, the parameters, $N_{SS}$, $R$, $N_{BPSCS}$, $N_{CBPS}$, and $N_{DBPS}$ are replaced with $N_{SS,u}$, $R_u$, $N_{BPSCS,u}$, $N_{CBPS,u}$, and $N_{DBPS,u}$, respectively.

In the MCS parameter tables that follow, data rates for a 400 ns GI are rounded to 1 decimal place.

**Table 22-26—TVHT-MCSs for TVHT_MODE_1, $N_{SS}$ = 1**

| MCS Index | Modulation | $R$ | $N_{BPSCS}$ | $N_{SD}$ | $N_{SP}$ | $N_{CBPS}$ | $N_{DBPS}$ | Data rate (Mb/s) for 6 MHz or 7 MHz | | Data rate (Mb/s) for 8 MHz | |
|---|---|---|---|---|---|---|---|---|---|---|---|

# 23. Sub 1 GHz (S1G) PHY specification(#4095)

## 23.1 Introduction

### 23.1.1 Introduction to the S1G PHY

Clause 23 (Sub 1 GHz (S1G) PHY specification(#4095)) specifies the PHY entity for an S1G orthogonal frequency division multiplexing (OFDM) system.

The S1G PHY is based on the VHT PHY defined in Clause 21 (Very high throughput (VHT) PHY specification), which in turn is based on HT PHY defined in Clause 19 (High Throughput (HT) PHY specification(#2297)) and the OFDM PHY defined in Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification). The S1G PHY defines an OFDM PHY in the sub-1 GHz bands using narrower bandwidths than those in 2.4 GHz and 5 GHz bands, with maximum number of space-time streams supported being four, and with support for downlink multi-user (MU) transmissions. A downlink MU transmission supports up to four users with up to three space-time streams per user with the total number of space-time streams not exceeding four.

The S1G PHY provides support for 1 MHz, 2 MHz, 4 MHz, 8 MHz, and 16 MHz contiguous channel widths. A tone spacing of 31.25 kHz is used in all the bandwidths.

Transmissions of PPDUs with channel bandwidth 2 MHz, 4 MHz, 8 MHz, and 16 MHz are in general modulated the same way as 20 MHz, 40 MHz, 80 MHz and 160 MHz contiguous mode as specified in Clause 21 (Very high throughput (VHT) PHY specification), respectively, except with a 1/10 clock rate. For details refer to Table 23-5 (Timing-related constants) (in 23.3.6 (Timing-related parameters)). Transmissions of PPDUs with 1 MHz channel bandwidth are modulated as described in 23.3.4.4 (Construction of the Preamble part in an S1G_1M PPDU).

The S1G PHY data subcarriers are modulated using binary phase shift keying (BPSK), quadrature phase shift keying (QPSK), 16-quadrature amplitude modulation (16-QAM), 64-QAM, 256-QAM and 1024 QAM.(M102) Forward error correction (FEC) coding (convolutional or LDPC coding) is used with coding rates of 1/2, 2/3, 3/4, and 5/6.

(#306)A non-AP S1G STA shall support the following Clause 23 (Sub 1 GHz (S1G) PHY specification(#4095)) features:

- 1 MHz and 2 MHz channel width
- S1G_1M, S1G_SHORT PPDU
- S1G_LONG PPDU, if ≥ 4 MHz channel width is supported
- Detect and decode SIG-A field of the S1G_LONG preamble.
- Single spatial stream MCSs 0 to 2, and MCS 10 (for 1 MHz PPDU only)
- BCC coding
- Normal Guard Interval $T_{GI}$ as defined in Table 23-5 (Timing-related constants) (in 23.3.6 (Timing-related parameters))
- Fixed Pilots

An S1G AP shall support the following Clause 23 (Sub 1 GHz (S1G) PHY specification(#4095)) features:

- 1 MHz and 2 MHz channel width
- S1G_1M, S1G_SHORT PPDU
- S1G_LONG PPDU, if ≥4 MHz channel width is supported
- Detect and decode SIG-A field of the S1G_LONG preamble.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

- Single spatial stream MCSs 0 to 7, and MCS 10 (for 1 MHz PPDU only)
- BCC coding
- Normal Guard Interval $T_{GI}$ as defined in Table 23-5 (Timing-related constants) (in 23.3.6 (Timing-related parameters))
- Fixed Pilots

An S1G STA may support the following Clause 23 (Sub 1 GHz (S1G) PHY specification(#4095)) features:

- 2 or more spatial streams (transmit and receive)
- S1G_LONG preamble when maximum channel width supported is less than 4 MHz
- Beamforming sounding (through S1G NDP) for an AP
- Beamforming sounding response (i.e., providing compressed beamforming feedback) for a non-AP STA
- STBC (transmit and receive)
- LDPC (transmit and receive)
- S1G MU PPDUs (transmit and receive)
- 4 MHz channel widths
- 8 MHz channel widths
- 16 MHz channel widths
- S1G-MCSs 8 and 9 (transmit and receive) for an AP, and S1G-MCSs 3-9 (transmit and receive) for a non-AP STA
- Short Guard Interval
- Traveling Pilots

### 23.1.2 Scope of S1G PHY services

The services provided to the MAC by the S1G PHY consist of the following protocol functions:

a) A function that defines a method of mapping the PSDUs into a (#14)PPDU format suitable for sending and receiving PSDUs between two or more STAs.

b) A function that defines the characteristics and method of transmitting and receiving data through a wireless medium between two or more STAs.

### 23.1.3 S1G PHY features

#### 23.1.3.1 General

The S1G PHY contains two functional entities: the PHY function, and the physical layer management function (i.e., the PLME). Both of these functions are described in detail in 23.3 (S1G PHY layer(#4114)) and 23.4 (S1G PLME(#6321)).

The S1G PHY service is provided to the MAC through the PHY service primitives defined in Clause 8 (PHY service specification). The S1G PHY service interface is described in 23.2 (S1G PHY service interface).

#### 23.1.3.2 PHY management entity (PLME)

The PLME performs management of the local PHY functions in conjunction with the MLME.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

#### 23.1.3.3 Service specification method

The models represented by figures and state diagrams are intended to be illustrations of the functions provided. It is important to distinguish between a model and a real implementation. The models are optimized for simplicity and clarity of presentation; the actual method of implementation is left to the discretion of the developer.

The service of a layer is the set of capabilities that it offers to a user in the next higher layer. Abstract services are specified here by describing the service primitives and parameters that characterize each service. This definition is independent of any particular implementation.

### 23.1.4 PPDU formats

The structure of the PPDU transmitted by an S1G STA is determined by the TXVECTOR parameters as defined in Table 23-1 (TXVECTOR and RXVECTOR parameters) (in 23.2.2 (TXVECTOR and RXVECTOR parameters)).

The FORMAT parameter determines the overall structure of the PPDU, and the allowed values are:

- S1G, for S1G non-duplicate PPDUs
- S1G_DUP_2M, for S1G 2 MHz duplicate PPDUs
- S1G_DUP_1M, for S1G 1 MHz duplicate PPDUs

The PPDU bandwidth is determined by the CH_BANDWIDTH parameter, and the preamble type (i.e., S1G_1M preamble, S1G_SHORT preamble, and S1G_LONG preamble) is determined by the PREAMBLE_TYPE parameter.

- The 1 MHz format PPDU (S1G_1M) is used for non-duplicate S1G transmissions at 1 MHz bandwidth (i.e., CH_BANDWIDTH = CBW1), and for S1G_DUP_1M transmissions of any bandwidth (i.e., CH_BANDWIDTH = CBW1, CBW2, CBW4, CBW8, or CBW16). The S1G_1M preamble (see 23.3.8.3 (Format for 1 MHz)) is used. Support for the S1G_1M is mandatory.
- The greater than or equal to 2 MHz short format (S1G_SHORT) is used for non-duplicate S1G transmissions and for S1G_DUP_2M transmissions, at bandwidths of 2 MHz and higher (i.e., CH_BANDWIDTH = CBW2, CBW4, CBW8, or CBW16). The S1G_SHORT preamble (see 23.3.8.2.1 (Introduction)) is used. This PPDU format is similar to the HT-greenfield format in Clause 19 (High Throughput (HT) PHY specification(#2297)), which does not contain a legacy portion in the preamble. Support for S1G_SHORT is mandatory.
- The greater than or equal to 2 MHz long format (S1G_LONG) is used for non-duplicate S1G transmissions at bandwidths of 2 MHz and higher (i.e., CH_BANDWIDTH = CBW2, CBW4, CBW8, or CBW16). The S1G_LONG format is not used for S1G_DUP_2M transmissions. The S1G_LONG preamble (see 23.3.8.2.2 (S1G_SHORT preamble)) is used. This PPDU format is similar to the HT-mixed format in Clause 19 (High Throughput (HT) PHY specification(#2297)). Support for S1G_LONG is optional if a STA supports only 1 MHz and 2 MHz PPDUs, and is mandatory if a STA supports wider than 2 MHz PPDUs. All S1G STAs shall support detecting and decoding up to the SIG-A field of S1G_LONG PPDUs.

An S1G_LONG PPDU can be further categorized as an S1G SU PPDU or an S1G MU PPDU. An S1G_LONG PPDU with MU_SU = MU is an S1G MU PPDU, otherwise it is an S1G SU PPDU. An S1G MU PPDU carries one or more PSDUs to one or more STAs and shall be an S1G_LONG PPDU.

## 23.2 S1G PHY service interface

### 23.2.1 Introduction

The PHY provides an interface to the MAC through an extension of the generic PHY service interface defined in 8.3.4 (Basic service and options). The interface includes TXVECTOR, RXVECTOR, and PHYCONFIG_VECTOR.

The TXVECTOR supplies the PHY with per-PPDU transmit parameters. Using the RXVECTOR, the PHY informs the MAC of the received (#14)PPDU's parameters. Using the PHYCONFIG_VECTOR, the MAC configures the PHY for operation, independent of (#14)PPDU transmission or reception.

### 23.2.2 TXVECTOR and RXVECTOR parameters

The parameters in Table 23-1 (TXVECTOR and RXVECTOR parameters) are defined as part of the TXVECTOR parameter list in the PHY-TXSTART.request primitive and/or as part of the RXVECTOR parameter list in the PHY-RXSTART.indication primitive.

**Table 23-1—TXVECTOR and RXVECTOR parameters**

| Parameter | Condition | Value | TXVECTOR | RXVECTOR |
|---|---|---|---|---|
| FORMAT | | Determines the format of the PPDU.<br>Enumerated type:<br>S1G indicates S1G PPDU format.<br>(#2095)S1G_DUP_1M indicates S1G 1 MHz Duplicate format PPDU<br>(#2095)S1G_DUP_2M indicates S1G 2 MHz Duplicate format PPDU | Y | Y |
| PREAMBLE_TYPE | FORMAT is S1G<br>and<br>(CH_BANDWIDTH is CBW2 or CBW4 or CBW8 or CBW16) | Determine the type of preamble of the S1G PPDU.<br>Enumerated type:<br>S1G_SHORT_PREAMBLE indicates the short preamble defined in 23.3.8.2.2 (S1G_SHORT preamble).<br>S1G_LONG_PREAMBLE indicates the long preamble defined in 23.3.8.2.3 (S1G_LONG preamble). | Y | Y |
| | (#447)(FORMAT is S1G and CH_BANDWIDTH is CBW1) or FORMAT is S1G_DUP_1M | Set to S1G_1M_PREAMBLE defined in 23.3.8.3 (Format for 1 MHz) | Y | Y |
| | FORMAT is S1G_DUP_2M | Set to S1G_SHORT_PREAMBLE. | Y | Y |
| | Otherwise | Not present | N | N |

| Parameter | Condition | Value | TXVECTOR | RXVECTOR |
|---|---|---|---|---|
| AGGREGATION | | Indicates whether the PSDU contains an A-MPDU.<br>Enumerated type:<br>AGGREGATED indicates this (#14)PSDU contains an A-MPDU.<br>NOT_AGGREGATED indicates this (#14)PSDU does not contain an A-MPDU. | Y | Y |
| SECTOR_ID | FORMAT is S1G<br>and<br>PREAMBLE_TYPE(#40) is S1G_LONG_PREAMBLE | Indicates which sectorized beam of the available sectorized beams are used in the transmission. The length of the parameter is 8 bits. A 1 in bit position n, relative to the LSB, indicates that Sector n is used.<br>This parameter is present only if sectorization is applied. | O | N |
| | Otherwise | Not present | N | N |
| N_TX | | Indicates the number of transmit chains. | Y | N |
| EXPANSION_MAT | FORMAT is S1G<br>and<br>(CH_BANDWIDTH is CBW2 or CBW4 or CBW8 or CBW16)<br>and<br>MU_SU is MU | Contains a vector in the number of selected subcarriers containing feedback matrices as defined in 23.3.10.2 (Beamforming Feedback Matrix V) based on the channel measured during the training symbols of a previous S1G NDP. | M<br>U | N |
| | FORMAT is S1G<br>and<br>(CH_BANDWIDTH is CBW2 or CBW4 or CBW8 or CBW16)<br>and<br>MU_SU is SU | Contains a vector in the number of selected subcarriers containing feedback matrices as defined in 23.3.10.2 (Beamforming Feedback Matrix V) based on the channel measured during the training symbols of a previous S1G NDP. | O | N |
| | Otherwise | Not present | N | N |
| CHAN_MAT | PSDU_LENGTH equals 0<br>and<br>NDP_INDICATION is 0 | Contains a set of compressed beamforming feedback matrices as defined in 23.3.10.2 (Beamforming Feedback Matrix V) based on the channel measured during the training symbols of the received S1G NDP. | N | Y |
| | Otherwise | Not present | N | N |
| DELTA_SNR | FORMAT is S1G<br>and<br>(CH_BANDWIDTH is CBW2 or CBW4 or CBW8 or CBW16) | Contains an array of delta SNR values as defined in 9.4.1.49 (MU Exclusive Beamforming Report field) based on the channel measured during the training symbols of the received S1G NDP.<br><br>NOTE—In the RXVECTOR this parameter is present only for S1G NDPs for MU sounding. | M<br>U | Y |
| | Otherwise | Not present | N | N |

**Table 23-1—TXVECTOR and RXVECTOR parameters *(continued)***

| Parameter | Condition | Value | TXVECTOR | RXVECTOR |
|---|---|---|---|---|
| RCPI | | Is a measure of the received RF power averaged over all the receive chains in the STF or LTF fields (#3475)of the current PPDU.<br>Refer to 23.3.18.7 (Received channel power indicator (RCPI) measurement(#2011)) for the definition of RCPI.(#1718) | N | Y |
| SNR | | Contains an array of measures of the received SNR for each spatial stream. SNR indications of 8 bits are supported. SNR shall be the sum of the decibel values of SNR per tone divided by the number of tones represented in each stream as described in 9.4.1.47 (VHT Compressed Beamforming Report field). | N | Y |
| FEC_CODING | FORMAT is S1G | Indicates which FEC encoding is used.<br>Enumerated type:<br>BCC_CODING indicates binary convolutional code.<br>LDPC_CODING indicates low-density parity check code. | M<br>U | Y |
| | FORMAT is S1G_DUP_2M or S1G_DUP_1M | Indicates which FEC encoding is used.<br>Enumerated type:<br>BCC_CODING indicates binary convolutional code.<br>LDPC_CODING indicates low-density parity check code. | Y | Y |
| STBC | | Indicates whether or not STBC is used.<br>0 indicates no STBC ($N_{STS}=N_{SS}$ in the Data field).<br>1 indicates STBC is used ($N_{STS}=2N_{SS}$ in the Data field). | Y | Y |
| GI_TYPE | | Indicates whether a short guard interval is used in the transmission of the Data field of the PPDU.<br>Enumerated type:<br>LONG_GI indicates short GI is not used in the Data field of the PPDU.<br>SHORT_GI indicates short GI is used in the Data field of the PPDU. | Y | Y |
| TXPWR_LEVEL | | The allowed values for the TXPWR_LEVEL parameter are in the range from 1 to $N/2$, where $N$ is the number of octets in dot11TxPowerLevelExtended. This parameter is used to indicate which of the available transmit output power levels defined in dot11TxPowerLevelExtended shall be used for the current transmission. | Y | N |
| RSSI | | The allowed values for the RSSI parameter are in the range 0 to 255. This parameter is a (#1132)measurement by the PHY of the power observed at the antenna connector used to receive the current PPDU measured during the reception of the LTF field. RSSI is intended to be used in a relative manner, and it is a monotonically increasing function of the received power. | N | Y |

**Table 23-1—TXVECTOR and RXVECTOR parameters *(continued)***

| Parameter | Condition | Value | TXVECTOR | RXVECTOR |
|---|---|---|---|---|
| MCS | FORMAT is S1G and (CH_BANDWIDTH is CBW2 or CBW4 or CBW8 or CBW16) | Indicates the modulation and coding scheme used in the transmission of the PPDU. Integer: range 0 to 9, 11 and 12(M102) | M U | Y |
| | FORMAT is S1G_DUP_2M | Indicates the modulation and coding scheme used in the transmission of the PPDU. Integer: range 0 to 9, 11 and 12(M102) | Y | Y |
| | Otherwise | Indicates the modulation and coding scheme used in the transmission of the PPDU. Integer: range 0 to 2(M102) | Y | Y |
| REC_MCS | FORMAT is [S1G with (CH_BANDWIDTH is CBW2 or CBW4 or CBW8 or CBW16)] or S1G_DUP_2M | Indicates the MCS that the STA's receiver recommends. Integer: range 0 to 9, 11 and 12(M102) | N | O |
| | Otherwise | Indicates the MCS that the STA's receiver recommends. Integer: range 0 to 2(M102) | N | O |
| CH_BANDWIDTH | FORMAT is S1G | Indicates the channel width of the transmitted PPDU: Enumerated type: CBW1 for 1 MHz CBW2 for 2 MHz CBW4 for 4 MHz CBW8 for 8 MHz CBW16 for 16 MHz | Y | Y |
| | FORMAT is S1G_DUP_2M | In TXVECTOR, indicates the channel width of the transmitted S1G 2 MHz Duplicate PPDU. In RXVECTOR, indicates the estimated channel width of the received S1G 2 MHz Duplicate PPDU. Enumerated type: CBW4 for 4 MHz CBW8 for 8 MHz CBW16 for 16 MHz | Y | Y |
| | FORMAT is S1G_DUP_1M | In TXVECTOR, indicates the channel width of the transmitted S1G 1 MHz Duplicate PPDU. In RXVECTOR, indicates the estimated channel width of the received S1G 1 MHz Duplicate PPDU. Enumerated type: CBW2 for 2 MHz CBW4 for 4 MHz CBW8 for 8 MHz CBW16 for 16 MHz | Y | Y |
| LENGTH | AGGREGATION is AGGREGATED | Indicates the (#14)PPDU duration in number of symbols in the PSDU | Y | Y |
| | AGGREGATION is NOT_AGGREGATED | Indicates the (#14)PPDU duration in number of octets in the PSDU | Y | Y |

**Table 23-1—TXVECTOR and RXVECTOR parameters *(continued)***

| Parameter | Condition | Value | TXVECTOR | RXVECTOR |
|---|---|---|---|---|
| SCRAMBLER_OR_CRC | NDP_INDICATION is 0 | Indicates the (#8126)scrambler initialization value in the (#3409)SERVICE field (as defined in 23.3.9.2 (SERVICE field)) prior to descrambling.<br>Bit sequence of 7 bits in length: [B0:B6] of the SERVICE field value prior to descrambling. | N | Y |
| | FORMAT is S1G<br>and<br>NDP_INDICATION is 1 | Indicates the value of the calculated CRC in the SIG field.<br>Bit sequence of 4 bits in length: Either [B26:B29] of the 1 MHz SIG field or [B38:B41] of the ≥ 2 MHz SIG field. | N | Y |
| | FORMAT is S1G_DUP_2M<br>and<br>NDP_INDICATION is 1 | Indicates the value of the calculated CRC in the SIG field.<br>Bit sequence of 4 bits in length: [B38:B41] of the ≥ 2 MHz SIG field. | N | Y |
| | FORMAT is S1G_DUP_1M<br>and<br>NDP_INDICATION is 1 | Indicates the value of the calculated CRC in the SIG field.<br>Bit sequence of 4 bits in length: [B26:B29] of the 1 MHz SIG field. | N | Y |
| | Otherwise | Not present | N | N |

NOTE—In the TXVECTOR and RXVECTOR columns, the following apply:
Y = Present.
N = Not present.
O = Optionally present.
MU indicates that the parameter is present once for an S1G SU PPDU and present per user for an S1G MU PPDU. Parameters specified to be present per user are conceptually supplied as an array of values indexed by *u*, where *u* takes values 0 to NUM_USERS-1.

### 23.2.3 Effect of CH_BANDWIDTH parameter on PPDU format

Table 23-2 (PPDU format as a function of CH_BANDWIDTH parameter) shows the PPDU format as a function of the CH_BANDWIDTH parameter.

**Table 23-2—PPDU format as a function of CH_BANDWIDTH parameter**

| FORMAT | CH_BANDWIDTH | PPDU format |
|---|---|---|
| S1G | CBW1 | The STA transmits an S1G PPDU of 1 MHz bandwidth. If the operating channel width is wider than 1 MHz, then the transmission shall use the primary 1 MHz channel. |
| S1G | CBW2 | The STA transmits an S1G PPDU of 2 MHz bandwidth. If the operating channel width is wider than 2 MHz, then the transmission shall use the primary 2 MHz channel. |
| S1G | CBW4 | The STA transmits an S1G PPDU of 4 MHz bandwidth. If the operating channel width is wider than 4 MHz, then the transmission shall use the primary 4 MHz channel. |
| S1G | CBW8 | The STA transmits an S1G PPDU of 8 MHz bandwidth. If the operating channel width is wider than 8 MHz, then the transmission shall use the primary 8 MHz channel. |

This is an unapproved IEEE Standards Draft, subject to change.

**Table 23-2—PPDU format as a function of CH_BANDWIDTH parameter *(continued)***

| FORMAT | CH_BANDWIDTH | PPDU format |
|---|---|---|
| S1G | CBW16 | The STA transmits an S1G PPDU of 16 MHz bandwidth. |
| S1G_DUP_2M | CBW4 | The STA transmits an S1G 2 MHz Duplicate PPDU using two adjacent 2 MHz channels as defined in 23.3.9.12.2 (S1G 2 MHz duplicate transmission). If the operating channel width is wider than 4 MHz, then the transmission shall use the primary 4 MHz channel. Phase rotation pattern for each 2 MHz channel is [1 j] from the lowest frequency as defined in Equation (23-7). |
| S1G_DUP_2M | CBW8 | The STA transmits an S1G 2 MHz Duplicate PPDU using four adjacent 2 MHz channels as defined in 23.3.9.12.2 (S1G 2 MHz duplicate transmission). If the BSS operating channel width is 16 MHz, then the transmission shall use the primary 8 MHz channel. Phase rotation pattern for each 2 MHz channel is [1 -1 -1 -1] from the lowest frequency as defined in Equation (23-8). |
| S1G_DUP_2M | CBW16 | The STA transmits an S1G 2 MHz Duplicate PPDU using eight adjacent 2 MHz channels as defined in 23.3.9.12.2 (S1G 2 MHz duplicate transmission). Phase rotation pattern for each 2 MHz channel is [1 -1 -1 -1 1 -1 -1 -1] from the lowest frequency as defined in Equation (23-9). |
| S1G_DUP_1M | CBW2 | The STA transmits an S1G 1 MHz Duplicate PPDU using two adjacent 1 MHz channels as defined in 23.3.9.12.1 (S1G 1 MHz duplicate transmission). If the operating channel width is wider than 2 MHz, then the transmission shall use the primary 2 MHz channel. Phase rotation pattern for each Equation (23-10). |
| S1G_DUP_1M | CBW4 | The STA transmits an S1G 1 MHz Duplicate PPDU using four adjacent 1 MHz channels as defined in 23.3.9.12.1 (S1G 1 MHz duplicate transmission). If the operating channel width is wider than 4 MHz, then the transmission shall use the primary 4 MHz channel. Phase rotation pattern for each 1 MHz channel is [1 j -j -1] from the lowest frequency as defined in Equation (23-11). |
| S1G_DUP_1M | CBW8 | The STA transmits an S1G 1 MHz Duplicate PPDU using eight adjacent 1 MHz channels as defined in 23.3.9.12.1 (S1G 1 MHz duplicate transmission). If the BSS operating channel width is 16 MHz, then the transmission shall use the primary 8 MHz channel. Phase rotation pattern for each 1 MHz channel is [1 -1 1 1 1 1 -1 -1] from the lowest frequency as defined in Equation (23-12). |
| S1G_DUP_1M | CBW16 | The STA transmits an S1G 1 MHz Duplicate PPDU using sixteen adjacent 1 MHz channels as defined in 23.3.9.12.1 (S1G 1 MHz duplicate transmission). Phase rotation pattern for each 1 MHz channel is [1 1 1 -1 1 1 1 -1 -1 -1 1 -1 1 1 -1 1] from the lowest frequency as defined in Equation (23-13). |

### 23.2.4 TXSTATUS parameters(#2017)

The parameters listed in Table 23-3 (TXSTATUS parameters(#2017)) are defined as part of the TXSTATUS parameter list in the PHY-TXSTART.confirm service primitive.

**Table 23-3—TXSTATUS parameters(#2017)**

| Parameter | Value |
|---|---|
| TIME_OF_DEPARTURE | 0 to $2^{32} - 1$. The locally measured time when the first PPDU energy is sent by the transmitting port, in units equal to 1/TIME_OF_DEPARTURE_ClockRate. This parameter is present only if TIME_OF_DEPARTURE_REQUESTED is true in the corresponding request. |

### 23.2.5 PHYCONFIG_VECTOR parameters(#4383)

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a S1G PHY contains a GROUP_ID_MANAGEMENT parameter, which specifies membership status and STA position for each of the group IDs as described in 9.6.22.3 (Group ID Management frame format).

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a S1G PHY contains a PARTIAL_AID_LIST_GID00 parameter, which includes the list of partial AIDs, of which the S1G STA is an intended recipient, in which a frame is addressed to an AP. The settings of the PARTIAL_AID are specified in 10.21 (Group ID, partial AID, Uplink Indication, and COLOR in S1G PPDUs).

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a S1G PHY contains a PARTIAL_AID_LIST_GID63 parameter, which includes the list of partial AIDs, of which the S1G STA is an intended recipient, in which a frame is addressed to a non-AP STA. The settings of the PARTIAL_AID are specified in 10.21 (Group ID, partial AID, Uplink Indication, and COLOR in S1G PPDUs).

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a S1G PHY contains a LISTEN_TO_GID00 parameter, which, when true, indicates to the PHY not to filter out PPDUs with GROUP_ID field equal to 0.

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a S1G PHY contains a LISTEN_TO_GID63 parameter, which, when true, indicates to the PHY not to filter out PPDUs with GROUP_ID field equal to 63.

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a S1G PHY contains a CCA_SENSITIVITY_TYPE parameter, which is an enumerated type that can take the following values:

— CCA_SENSITIVITY_TYPE_1 indicates that the PHY issues a PHYCCA. indication primitive based on the CCA conditions listed in Table 23-37 (Additional conditions for CCA BUSY on the primary 2 MHz in type 1 channelization) and 23.3.18.5.4 (CCA sensitivity for signals not occupying the primary 2 MHz channel).

— CCA_SENSITIVITY_TYPE_2 indicates that the PHY issues a PHYCCA. indication primitive based on the CCA conditions listed in Table 23-38 (Additional conditions for CCA BUSY on the primary 2 MHz in type 2 channelization) and 23.3.18.5.4 (CCA sensitivity for signals not occupying the primary 2 MHz channel).

— CCA_SENSITIVITY_TYPE_2_WIDEBAND indicates that the PHY issues a PHY-CCA.indication primitive based on the CCA conditions listed in Table 23-39 (Additional conditions for CCA BUSY

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

on the primary 2 MHz in type 2 channelization for 8/16 MHz intended channel width) and 23.3.18.5.4 (CCA sensitivity for signals not occupying the primary 2 MHz channel).

## 23.3 S1G PHY layer(#4114)

### 23.3.1 Introduction

This subclause provides the procedure by which PSDUs are converted to and from transmissions on the wireless medium.

During transmission, a PSDU (in the SU case) or one or more PSDUs (in the MU case) are processed (e.g., scrambled and coded) and appended to the PHY preamble to create the PPDU. At the receiver, the PHY preamble is processed to aid in the detection, demodulation and delivery of the PSDU.

### 23.3.2 S1G PPDU format

Three formats are defined for the S1G PHY: S1G_SHORT, S1G_LONG, and S1G_1M.

The general structure for S1G_SHORT is defined as in Figure 23-1 (S1G_SHORT format(#7158)). This format is used for SU transmission using 2 MHz, 4 MHz, 8 MHz, and 16 MHz PPDUs.

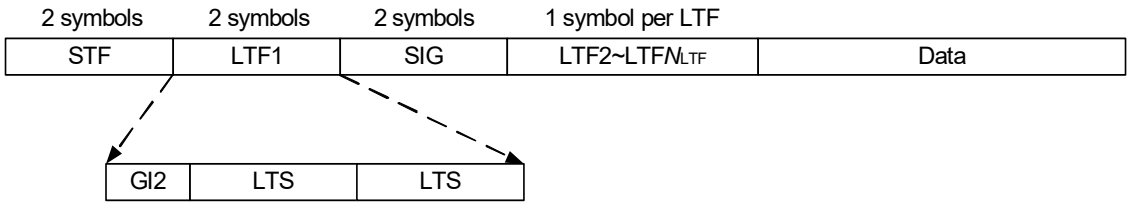

**Figure 23-1—S1G_SHORT format(#7158)**

The general structure for S1G_LONG is defined as in Figure 23-2 (S1G_LONG format(#7158)). This (#14)PPDU format can be used for MU and SU beamformed transmissions using 2 MHz, 4 MHz, 8 MHz, and 16 MHz PPDUs.

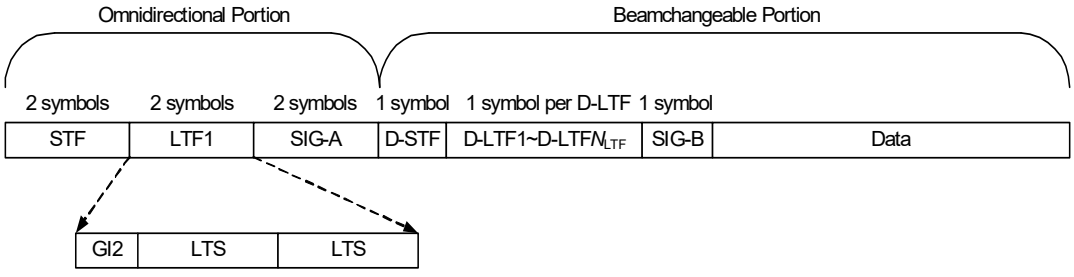

**Figure 23-2—S1G_LONG format(#7158)**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The general structure for S1G_1M is defined as in Figure 23-3 (S1G_1M format(#7158)). This (#14)PPDU format is used for S1G_1M PPDU SU transmission.

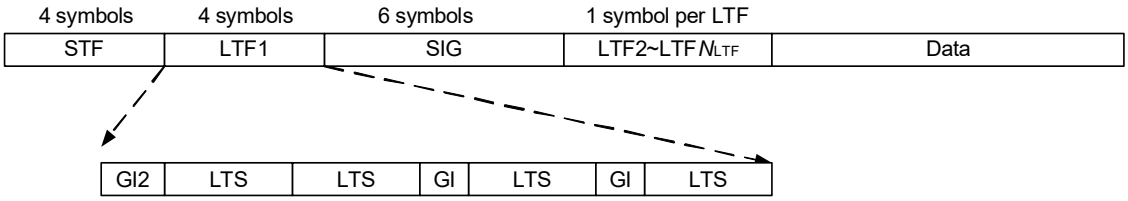

**Figure 23-3—S1G_1M format(#7158)**

The fields of the S1G PPDU formats are summarized in Table 23-4 (Fields of the S1G PPDU).

**Table 23-4—Fields of the S1G PPDU**

| Field | Description |
|---|---|
| STF | Short Training field |
| LTF | Long Training field |
| SIG | SIGNAL field |
| SIG-A | Signal A field |
| D-STF | Short Training field for the beam changeable portion |
| D-LTF | Long Training field for the beam changeable portion |
| SIG-B | Signal B field |
| Data | The Data field carries the PSDU(s) |
| GI | Guard interval |
| GI2 | Double guard interval |
| LTS | Long training symbol |

The SIG-A, D-STF, D-LTF, and SIG-B fields exist only in S1G_LONG format. In an S1G NDP, the Data field is not present (see 23.3.11 (S1G preamble format for NDPs). The number of symbols in the LTF field of S1G_1M and S1G_SHORT, or in the D-LTF field of S1G_LONG, $N_{VHTLTF}$, can be either 1, 2, or 4 and is determined by the total number of space-time streams across all users being transmitted in the S1G PPDU (see Table 23-11 (Number of LTFs required for different numbers of space-time streams) in 23.3.8.2.2 (S1G_SHORT preamble)).

### 23.3.3 Transmitter block diagram

Each field in an S1G PPDU can be generated using a subset of the following blocks (only select blocks are listed below):

a) PHY padding
b) Scrambler
c) BCC encoder parser

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

d) FEC (BCC or LDPC) encoders
e) Stream parser
f) Segment parser (for 16 MHz)
g) BCC Interleaver
h) Replicate the encoded bits (for 1 MHz MCS 10)
i) Constellation mapper
j) Pilot insertion
k) Replicate over multiple 1 MHz or 2 MHz widths
l) Multiply by first column of $P_{HTLTF}$
m) LDPC tone mapper
n) Segment deparser (for 16 MHz)
o) Space-time block code (STBC) encoder
p) Cyclic shift diversity (CSD) per STS insertion
q) Spatial mapper
r) Inverse discrete Fourier transform (IDFT)
s) Cyclic shift diversity (CSD) per chain insertion
t) Guard interval (GI) insertion
u) Windowing

The general transmission flow for S1G_1M MCS 0–9, and all the MCSs for S1G_SHORT and S1G_LONG formats are the same as the corresponding portions in 21.3 (VHT PHY).

Specifically, Figure 21-5 (Transmitter block diagram for the L-SIG and VHT-SIG-A fields), with “20 MHz” replaced by “2 MHz”, shows the transmit process for the SIG-A field of an S1G PPDU in S1G_LONG. These transmit blocks are also used to generate the omnidirectional portion of the S1G_LONG PPDU, except that the BCC encoder and interleaver are not used when generating the STF and LTF1 fields.

Figure 21-6 (Transmitter block diagram for the VHT-SIG-B field of a 20 MHz, 40 MHz, and 80 MHz VHT SU PPDU) and Figure 21-7 (Transmitter block diagram for the VHT-SIG-B field of a 20 MHz, 40 MHz, and 80 MHz VHT MU PPDU(#2259)(#7214)), with “20 MHz” replaced by “2 MHz”, show the transmit process for generating the SIG-B field of a 2 MHz, 4 MHz, and 8 MHz long format S1G PPDU for SU PPDU and MU PPDU, respectively. Figure 21-8 (Transmitter block diagram for the VHT-SIG-B field of a 160 MHz VHT SU PPDU(#7214)), with “160 MHz” replaced by “16 MHz”, shows the transmit process for generating the SIG-B field of a 16 MHz long format S1G SU PPDU.

Figure 21-10 (Transmitter block diagram for the Data field of a 20 MHz, 40 MHz, or 80 MHz VHT SU PPDU with BCC encoding) shows the transmitter blocks used to generate the BCC encoded Data field of a 2 MHz, 4 MHz, and 8 MHz SU PPDU in short or long format, and of an S1G_1M PPDU except MCS 10. It should be noted that the number of encoders is fixed to one for BCC (i.e., $N_{ES}$=1), in S1G operation. A subset of these transmitter blocks consisting of the constellation mapper and CSD blocks, as well as the blocks to the right of, and including, the spatial mapping block, are also used to generate the STF and LTF fields in S1G_1M and S1G_SHORT, or the D-STF and D-LTF fields in S1G_LONG. This is illustrated in Figure 23-6 (Generation of LTF symbols) in 23.3.8.2.2.4 (LTF definition) for the mentioned LTF fields. A similar set of transmit blocks is used to generate the mentioned STF fields.

Figure 21-11 (Transmitter block diagram for the Data field of a 20 MHz, 40 MHz, or 80 MHz VHT SU PPDU with LDPC encoding) shows the transmitter blocks used to generate the LDPC encoded Data field of a 2 MHz, 4 MHz, and 8 MHz SU PPDU in short or long format, and of an S1G_1M PPDU except MCS 10.

This is an unapproved IEEE Standards Draft, subject to change.

Figure 21-12 (Transmitter block diagram for the Data field of a 20 MHz, 40 MHz, or 80 MHz VHT MU PPDU) shows the transmit process for generating the Data field of a 2 MHz, 4 MHz, and 8 MHz MU PPDU in long format with BCC and/or LDPC encoding. The number of encoders is fixed to one (i.e., $N_{ES}$=1) for BCC in S1G operation.

Figure 21-13 (Transmitter block diagram for the Data field of a 160 MHz VHT SU PPDU with BCC encoding) and Figure 21-14 (Transmitter block diagram for the Data field of a 160 MHz VHT SU PPDU with LDPC encoding) show the transmit process for generating the Data field of a 16 MHz SU PPDU in short or long format, with BCC and LDPC encoding, respectively. The number of encoders is fixed to one (i.e., $N_{ES}$=1) for BCC in S1G operation.

Figure 23-4 (Transmitter block diagram for the Data field of an S1G_1M PPDU with BCC or LDPC encoding and MCS 10) below shows the transmit process for generating the Data field of an S1G_1M PPDU with MCS 10, either BCC or LDPC encoded.

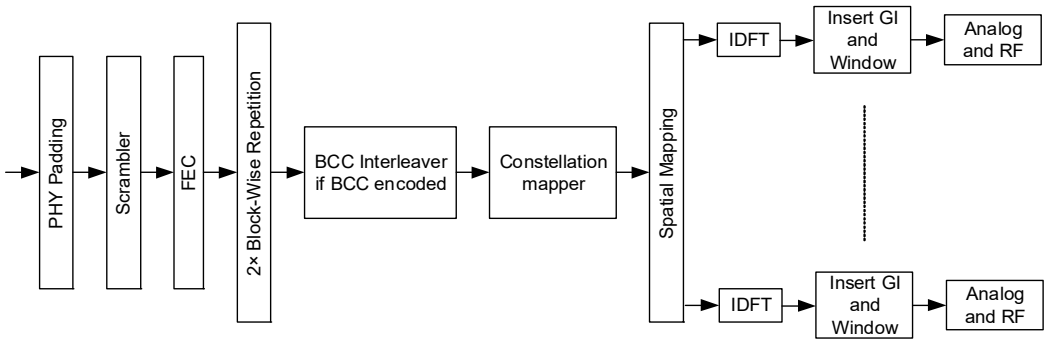

**Figure 23-4—Transmitter block diagram for the Data field of an S1G_1M PPDU with BCC or LDPC encoding and MCS 10**

### 23.3.4 Overview of the PPDU encoding process

#### 23.3.4.1 General

This subclause provides an overview of the S1G PPDU encoding process.

#### 23.3.4.2 Construction of the Preamble part in an S1G_LONG PPDU

##### 23.3.4.2.1 Construction of STF

Construct the STF field as defined in 23.3.8.2.2.3 (STF definition) with the following highlights:

a) Determine the CH_BANDWIDTH from the TXVECTOR.

b) Sequence generation: Generate the STF field sequence over the CH_BANDWIDTH as described in 23.3.8.2.3.2.3 (STF definition).

c) Phase rotation: Apply appropriate phase rotation for each 2 MHz subchannel as described in 23.3.9.11 (OFDM modulation), 23.3.9.12 (S1G 1 MHz and 2 MHz duplicate transmission), and 23.3.7 (Mathematical description of signals).

d) IDFT: Compute the inverse discrete Fourier transform.

e) CSD: Apply CSD for each transmit chain and frequency segment as described in 23.3.8.2.3.2.2 (Cyclic shift for S1G modulated fields).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

f) Insert GI and apply windowing: Prepend a GI of 8 μs in duration and apply windowing as described in 23.3.7 (Mathematical description of signals).

g) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 (Mathematical description of signals) and 23.3.8 (S1G preamble) for details.

#### 23.3.4.2.2 Construction of LTF1

Construct the LTF1 field as defined in 23.3.8.2.2.4 (LTF definition) with the following highlights:

a) Determine the CH_BANDWIDTH from the TXVECTOR.

b) Sequence generation: Generate the LTF1 field sequence over the CH_BANDWIDTH as described in 23.3.8.2.2.4 (LTF definition).

c) Phase rotation: Apply appropriate phase rotation for each 2 MHz subchannel as described in 23.3.9.11 (OFDM modulation), 23.3.9.12 (S1G 1 MHz and 2 MHz duplicate transmission), and 23.3.7 (Mathematical description of signals).

d) IDFT: Compute the inverse discrete Fourier transform.

e) CSD: Apply CSD for each transmit chain and frequency segment as described in 23.3.8.2.3.2.2 (Cyclic shift for S1G modulated fields).

f) Insert GI and apply windowing: Prepend a GI of 16 μs in duration and apply windowing as described in 23.3.7 (Mathematical description of signals).

g) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 (Mathematical description of signals) and 23.3.8 (S1G preamble) for details.

#### 23.3.4.2.3 Construction of SIG-A

The SIG-A field consists of two symbols, SIG-A1 and SIG-A2, as defined in 23.3.8.2.3.2.5 (SIG-A definition) and is constructed as follows:

a) Obtain the CH_BANDWIDTH, STBC, MU_SU, GROUP_ID (MU only), PARTIAL_AID (SU only), NUM_STS, GI_TYPE, FEC_CODING, MCS (SU only), NUM_USERS, LENGTH, AGGREGATION (SU only), RESPONSE_INDICATION, BEAM_CHANGE (SU only for single space-time stream), SMOOTHING and TRAVELING_PILOTS from the TXVECTOR. Add the reserved bits, append the calculated 4-bit CRC, then append the $N_{tail}$ tail bits as shown in 23.3.8.2.3.2.5 (SIG-A definition). This operation gives as a result 48 uncoded bits.

b) BCC encoder: Encode the data by a convolutional encoder at the rate of R=1/2 as described in 17.3.5.6 (Convolutional encoder).

c) BCC interleaver: Interleave as described in 17.3.5.7 (Data interleaving).

d) Constellation mapper: QBPSK modulate the first 48 interleaved bits by rotating by 90° counter-clockwise relative to the original BPSK as described in 23.3.8.2.3.2.5 (SIG-A definition) to form the first symbol of SIG-A field. BPSK modulate the second 48 interleaved bits to form the second symbol of SIG-A field.

e) Pilot insertion: Insert pilots as described in 17.3.5.10 (OFDM modulation).

f) Duplication and phase rotation: Duplicate SIG-A1 and SIG-A2 over each 2 MHz of the CH_BANDWIDTH. Apply the appropriate phase rotation for each 2 MHz subchannel as described in 23.3.9.11 (OFDM modulation), 23.3.9.12 (S1G 1 MHz and 2 MHz duplicate transmission), and 23.3.7 (Mathematical description of signals).

g) IDFT: Compute the inverse discrete Fourier transform.

h) CSD: Apply CSD for each transmit chain as described in 23.3.8.2.3.2.2 (Cyclic shift for S1G modulated fields).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

i) Insert GI and apply windowing: Prepend a GI of 8 μs in duration and apply windowing as described in 17.3.2.5 (Mathematical conventions in the signal descriptions).

j) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 (Mathematical description of signals) and 23.3.8 (S1G preamble) for details.

#### 23.3.4.2.4 Construction of D-STF

The D-STF field is defined in 23.3.8.2.3.3.3 (D-STF definition) and constructed as follows:

a) Sequence generation: Generate the D-STF field in the frequency domain over the bandwidth indicated by CH_BANDWIDTH as described in 23.3.8.2.3.3.3 (D-STF definition).

b) Phase rotation: Apply appropriate phase rotation for each 2 MHz subchannel as described in 23.3.9.11 (OFDM modulation), 23.3.9.12 (S1G 1 MHz and 2 MHz duplicate transmission), and 23.3.7 (Mathematical description of signals).

c) CSD: Apply CSD for each space-time stream and frequency segment as described in 23.3.8.2.3.2.2 (Cyclic shift for S1G modulated fields).

d) Spatial mapping: Apply the $Q$ matrix as described in 23.3.10 (SU-MIMO and (#3367)DL MU-MIMO Beamforming) and 23.3.9.11 (OFDM modulation).

e) IDFT: Compute the inverse discrete Fourier transform.

f) Insert GI and apply windowing: Prepend a GI of 8 μs in duration and apply windowing as described in 17.3.2.5 (Mathematical conventions in the signal descriptions).

g) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 (Mathematical description of signals) and 23.3.8 (S1G preamble) for details.

#### 23.3.4.2.5 Construction of D-LTF

The D-LTF field is defined in 23.3.8.2.3.3.4 (D-LTF definition) and constructed as follows:

a) Sequence generation: Generate the D-LTF field sequence in the frequency domain over the bandwidth indicated by CH_BANDWIDTH as described in 23.3.8.2.3.3.4 (D-LTF definition).

b) Phase rotation: Apply appropriate phase rotation for each 2 MHz subchannel as described in 23.3.9.11 (OFDM modulation), 23.3.9.12 (S1G 1 MHz and 2 MHz duplicate transmission), and 23.3.7 (Mathematical description of signals).

c) $A_{LTF}$ matrix mapping: Apply the $P_{HTLTF}$ matrix to the D-LTF field sequence (the pilot tones are processed differently) as described in 23.3.8.2.3.3.4 (D-LTF definition).

d) CSD: Apply CSD for each space-time stream and frequency segment as described in 23.3.8.2.3.2.2 (Cyclic shift for S1G modulated fields).

e) Spatial mapping: Apply the $Q$ matrix as described in 23.3.10 (SU-MIMO and (#3367)DL MU-MIMO Beamforming) and 23.3.9.11 (OFDM modulation).

f) IDFT: Compute the inverse discrete Fourier transform.

g) Insert GI and apply windowing: Prepend a GI of 8 μs in duration and apply windowing as described in 17.3.2.5 (Mathematical conventions in the signal descriptions).

h) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 (Mathematical description of signals) and 23.3.8 (S1G preamble) for details.

#### 23.3.4.2.6 Construction of SIG-B

The SIG-B field is constructed per user as follows:

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

a) Obtain the MCS (for MU only) from the TXVECTOR.

b) SIG-B bits: Set the MCS (for MU only) as described in 23.3.8.2.3.3.5 (SIG-B definition). Add the reserved bits and $N_{tail}$ bits of tail.

c) SIG-B field Bit Repetition: Repeat the SIG-B field bits as a function of CH_BANDWIDTH as defined in 23.3.8.2.3.3.5 (SIG-B definition).

d) BCC encoder: Encode the SIG-B field using BCC at rate R=1/2 as described in 17.3.5.6 (Convolutional encoder).

e) Segment parser (if needed): For a 16 MHz transmission, divide the output bits of the BCC encoder into two frequency subblocks as described in 23.3.9.7 (Segment parser). This block is bypassed for 2 MHz, 4 MHz, and 8 MHz S1G PPDU transmissions.

f) BCC interleaver: Interleave as described in 23.3.9.8 (BCC interleaver).

g) Constellation mapper: Map to a BPSK constellation as defined in 17.3.5.8 (Subcarrier modulation mapping).

h) Segment deparser (if needed): For a 16 MHz transmission, merge the two frequency subblocks into one frequency segment as described in 23.3.9.9.3 (Segment deparser). This block is bypassed for 2 MHz, 4 MHz, and 8 MHz S1G PPDU transmissions.

i) Pilot insertion: Insert pilots following the steps described in 21.3.10.10 (Pilot subcarriers).

j) $P_{HTLTF}$ matrix mapping: Apply the mapping of the first column of the $P_{HTLTF}$ matrix to the data subcarriers as described in 23.3.8.2.3.3.5 (SIG-B definition). The total number of data and pilot subcarriers is the same as in the Data field.

k) CSD: Apply CSD for each space-time stream and frequency segment as described in 23.3.8.2.3.2.2 (Cyclic shift for S1G modulated fields).

l) Spatial mapping: Apply the $Q$ matrix as described in 23.3.10 (SU-MIMO and (#3367)DL MU-MIMO Beamforming) and 23.3.9.11 (OFDM modulation).

m) Phase rotation: Apply the appropriate phase rotations for each 2 MHz subchannel as described in 23.3.9.11 (OFDM modulation), 23.3.9.12 (S1G 1 MHz and 2 MHz duplicate transmission), and 23.3.7 (Mathematical description of signals).

n) IDFT: Compute the inverse discrete Fourier transform.

o) Insert GI and apply windowing: Prepend a GI of 8 μs in duration and apply windowing as described in 17.3.2.5 (Mathematical conventions in the signal descriptions).

p) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 (Mathematical description of signals) and 23.3.8 (S1G preamble) for details.

#### 23.3.4.3 Construction of the Preamble part in an S1G_SHORT PPDU

##### 23.3.4.3.1 Construction of STF

The STF field is defined in 23.3.8.2.2.3 (STF definition) and constructed as follows:

a) Determine the CH_BANDWIDTH from the TXVECTOR.

b) Sequence generation: Generate the STF field in the frequency domain over the bandwidth indicated by CH_BANDWIDTH as described in 23.3.8.2.2.3 (STF definition).

c) Phase rotation: Apply appropriate phase rotation for each 2 MHz subchannel as described in 23.3.9.11 (OFDM modulation), 23.3.9.12 (S1G 1 MHz and 2 MHz duplicate transmission), and 23.3.7 (Mathematical description of signals).

d) $P_{HTLTF}$ matrix mapping: Apply the mapping of the first column of the $P_{HTLTF}$ matrix to the STF field sequence as described in 23.3.8.2.2.4 (LTF definition).

e) CSD: Apply CSD for each space-time stream and frequency segment as described in 23.3.8.2.2.2 (Cyclic shift for S1G modulated fields).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

f) Spatial mapping: Apply the $Q$ matrix as described in 23.3.10 (SU-MIMO and (#3367)DL MU-MIMO Beamforming) and 23.3.9.11 (OFDM modulation).

g) IDFT: Compute the inverse discrete Fourier transform.

h) Insert GI and apply windowing: Prepend a GI of 8 μs in duration and apply windowing as described in 17.3.2.5 (Mathematical conventions in the signal descriptions).

i) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 (Mathematical description of signals) and 23.3.8 (S1G preamble) for details.

#### 23.3.4.3.2 Construction of LTF1

The LTF1 field is defined in 23.3.8.2.2.4 (LTF definition) and constructed as follows:

a) Determine FORMAT from TXVECTOR.

b) Sequence generation: If FORMAT is S1G, generate the LTF1 field sequence in the frequency domain over the bandwidth indicated by CH_BANDWIDTH as described in 23.3.8.2.2.4 (LTF definition). If format is S1G_DUP_2M, generate the LTF1 field sequence in the frequency domain over a 2 MHz bandwidth.

c) Phase rotation: Apply appropriate phase rotation for each 2 MHz subchannel as described in 23.3.9.11 (OFDM modulation), 23.3.9.12 (S1G 1 MHz and 2 MHz duplicate transmission), and 23.3.7 (Mathematical description of signals).

d) $A_{LTF}$ matrix mapping: Apply the mapping of the first column of the $P_{HTLTF}$ matrix to the LTF1 field sequence (the pilot tones are processed differently) as described in 23.3.8.2.2.4 (LTF definition).

e) CSD: Apply CSD for each space-time stream and frequency segment as described in 23.3.8.2.2.2 (Cyclic shift for S1G modulated fields).

f) Spatial mapping: Apply the $Q$ matrix as described in 23.3.10 (SU-MIMO and (#3367)DL MU-MIMO Beamforming) and 23.3.9.11 (OFDM modulation).

g) IDFT: Compute the inverse discrete Fourier transform.

h) Insert GI and apply windowing: Prepend a GI of 16 μs in duration and apply windowing as described in 17.3.2.5 (Mathematical conventions in the signal descriptions).

i) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 (Mathematical description of signals) and 23.3.8 (S1G preamble) for details.

#### 23.3.4.3.3 Construction of SIG

The SIG field is constructed per-user as follows:

a) Obtain the CH_BANDWIDTH, STBC, PARTIAL_AID, NUM_STS, GI_TYPE, FEC_CODING, MCS, SMOOTHING, NUM_USERS, LENGTH, AGGREGATION, RESPONSE_INDICATION, NDP_INDICATION, TRAVELING_PILOTS, UPLINK_INDICATION, and COLOR, from the TXVECTOR. Add the reserved bits, append the calculated 4-bit CRC, then append the $N_{tail}$ tail bits as shown in 23.3.8.2.2.5 (SIG definition). This operation gives as a result 48 uncoded bits.

b) BCC encoder: Encode the data by a convolutional encoder at the rate of R=1/2 as described in 17.3.5.6 (Convolutional encoder).

c) BCC interleaver: Interleave as described in 17.3.5.7 (Data interleaving).

d) Constellation mapper: QBPSK modulate the first 48 interleaved bits as described in 17.3.5.8 (Subcarrier modulation mapping) to form the first symbol of SIG field. QBPSK modulate the second 48 interleaved bits to form the second symbol of SIG field.

e) Pilot insertion: Insert pilots as described in 17.3.5.10 (OFDM modulation).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

f) $P_{HTLTF}$ matrix mapping: Apply the mapping of the first column of the $P_{HTLTF}$ matrix to the data subcarriers as described in 23.3.8.2.2.5 (SIG definition).

g) CSD: Apply CSD for each space-time stream and frequency segment as described in 23.3.8.2.2.2 (Cyclic shift for S1G modulated fields).

h) Spatial mapping: Apply the $Q$ matrix as described in 23.3.10 (SU-MIMO and (#3367)DL MU-MIMO Beamforming) and 23.3.9.11 (OFDM modulation).

i) Duplication and phase rotation: Duplicate two symbols of SIG field over each 2 MHz of the CH_BANDWIDTH. Apply the appropriate phase rotation for each 2 MHz subchannel as described in 23.3.9.11 (OFDM modulation), 23.3.9.12 (S1G 1 MHz and 2 MHz duplicate transmission), and 23.3.7 (Mathematical description of signals).

j) IDFT: Compute the inverse discrete Fourier transform.

k) Insert GI and apply windowing: Prepend a GI of 8 μs in duration and apply windowing as described in 17.3.2.5 (Mathematical conventions in the signal descriptions).

l) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 (Mathematical description of signals) and 23.3.8 (S1G preamble) for details.

#### 23.3.4.3.4 Construction of LTF2-LTF$N_{LTF}$ (#7158)

The LTF2-LTF$N_{LTF}$ field is defined in 23.3.8.2.2.4 (LTF definition) and constructed as follows:

a) Sequence generation: Generate the (#7158)LTF2-LTF$N_{LTF}$ field sequence in the frequency domain over the bandwidth indicated by CH_BANDWIDTH as described in 23.3.8.2.2.4 (LTF definition).

b) Phase rotation: Apply appropriate phase rotation for each 2 MHz subchannel as described in 23.3.9.11 (OFDM modulation), 23.3.9.12 (S1G 1 MHz and 2 MHz duplicate transmission), and 23.3.7 (Mathematical description of signals).

c) $A_{LTF}$ matrix mapping: Apply the mapping of the $P_{HTLTF}$ matrix (from the second column to the last column) to the (#7158)LTF2-LTF$N_{LTF}$ field sequence (the pilot tones are processed differently) as described in 23.3.8.2.2.4 (LTF definition).

d) CSD: Apply CSD for each space-time stream and frequency segment as described in 23.3.8.2.2.2 (Cyclic shift for S1G modulated fields).

e) Spatial mapping: Apply the $Q$ matrix as described in 23.3.10 (SU-MIMO and (#3367)DL MU-MIMO Beamforming) and 23.3.9.11 (OFDM modulation).

f) IDFT: Compute the inverse discrete Fourier transform.

g) Insert GI and apply windowing: Prepend a GI of 8 μs in duration and apply windowing as described in 17.3.2.5 (Mathematical conventions in the signal descriptions).

h) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 (Mathematical description of signals) and 23.3.8 (S1G preamble) for details.

### 23.3.4.4 Construction of the Preamble part in an S1G_1M PPDU

#### 23.3.4.4.1 Construction of 1 MHz STF

The 1 MHz STF field is defined in 23.3.8.3.3 (STF definition) and constructed as follows:

a) Determine the CH_BANDWIDTH from the TXVECTOR if S1G 1 MHz Duplicate PPDU.

b) Sequence generation: Generate the 1 MHz STF field in the frequency domain over the bandwidth indicated by CH_BANDWIDTH as described in 23.3.8.3.3 (STF definition). Apply the 3 dB power boosting if the MCS from the TXVECTOR equals MCS 10 as described in 23.3.8.3.3 (STF definition).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

c) Phase rotation: Apply appropriate phase rotation for each 1 MHz subchannel if S1G 1 MHz Duplicate PPDU as described in 23.3.9.12 (S1G 1 MHz and 2 MHz duplicate transmission) and 23.3.7 (Mathematical description of signals).

d) $P_{HTLTF}$ matrix mapping: Apply the mapping of the first column of the $P_{HTLTF}$ matrix to the 1 MHz STF field sequence as described in 23.3.8.3.4 (LTF definition).

e) CSD: Apply CSD for each space-time stream and frequency segment as described in 23.3.8.3.2 (Cyclic shift for S1G modulated fields).

f) Spatial mapping: Apply the $Q$ matrix as described in 23.3.9.11 (OFDM modulation).

g) IDFT: Compute the inverse discrete Fourier transform.

h) Insert GI and apply windowing: Prepend a GI of 8 μs in duration and apply windowing as described in 17.3.2.5 (Mathematical conventions in the signal descriptions).

i) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 (Mathematical description of signals) and 23.3.8 (S1G preamble) for details.

#### 23.3.4.4.2 Construction of 1 MHz LTF1

The 1 MHz LTF1 field is defined in 23.3.8.3.4 (LTF definition) and constructed as follows:

a) Determine FORMAT from TXVECTOR.

b) Sequence generation: If FORMAT is S1G, generate the 1 MHz LTF1 field sequence in the frequency domain over the bandwidth indicated by CH_BANDWIDTH as described in 23.3.8.3.4 (LTF definition). If FORMAT is S1G_DUP_1M, generate the LTF1 field sequence in the frequency domain over a 1 MHz bandwidth.

c) Phase rotation: Apply appropriate phase rotation for each 1 MHz subchannel if S1G 1 MHz Duplicate PPDU as described in 23.3.9.12 (S1G 1 MHz and 2 MHz duplicate transmission) and 23.3.7 (Mathematical description of signals).

d) $A_{LTF}$ matrix mapping: Apply the mapping of the first column of the $P_{HTLTF}$ matrix to the 1 MHz LTF1 field sequence (the pilot tones are processed differently) as described in 23.3.8.3.4 (LTF definition).

e) CSD: Apply CSD for each space-time stream and frequency segment as described in 23.3.8.3.2 (Cyclic shift for S1G modulated fields).

f) Spatial mapping: Apply the $Q$ matrix as described in 23.3.9.11 (OFDM modulation).

g) IDFT: Compute the inverse discrete Fourier transform.

h) Insert GI and apply windowing: Prepend a GI of 16 μs in duration for the first two symbols and insert a GI of 8 μs in duration per each subsequent symbol. Apply windowing as described in 17.3.2.5 (Mathematical conventions in the signal descriptions).

i) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 (Mathematical description of signals) and 23.3.8 (S1G preamble) for details.

#### 23.3.4.4.3 Construction of 1 MHz SIG

The SIG field is constructed per-user as follows:

a) Obtain the STBC, NUM_STS, GI_TYPE, FEC_CODING, MCS, SMOOTHING, LENGTH, AGGREGATION, RESPONSE_INDICATION, NDP_INDICATION and TRAVELING_PILOTS from the TXVECTOR. Add the reserved bits, append the calculated 4-bit CRC, then append the $N_{tail}$ tail bits as shown in 23.3.8.3.5 (SIG definition). This operation gives as a result 36 uncoded bits.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

b) BCC encoder: Encode the data by a convolutional encoder at the rate of R=1/2 as described in 17.3.5.6 (Convolutional encoder) and apply the block-wise 2 times repetition on a per-OFDM symbol basis.

c) BCC interleaver: Interleave as described in 23.3.9.8 (BCC interleaver).

d) Constellation mapper: BPSK modulate the interleaved bits as described in 17.3.5.8 (Subcarrier modulation mapping) to form the 6 symbols of SIG field.

e) Pilot insertion: Insert pilots as described in 17.3.5.10 (OFDM modulation).

f) $P_{HTLTF}$ matrix mapping: Apply the mapping of the first column of the $P_{HTLTF}$ matrix to the data subcarriers as described in 23.3.8.3.5 (SIG definition).

g) CSD: Apply CSD for each space-time stream and frequency segment as described in 23.3.8.3.2 (Cyclic shift for S1G modulated fields).

h) Spatial mapping: Apply the $Q$ matrix as described in 23.3.9.11 (OFDM modulation).

i) Duplication and phase rotation: Duplicate 6 symbols of SIG field over each 1 MHz of the CH_BANDWIDTH if S1G 1 MHz Duplicate PPDU. Apply the appropriate phase rotation for each 1 MHz subchannel as described in 23.3.9.12 (S1G 1 MHz and 2 MHz duplicate transmission) and 23.3.7 (Mathematical description of signals).

j) IDFT: Compute the inverse discrete Fourier transform.

k) Insert GI and apply windowing: Prepend a GI of 8 μs in duration and apply windowing as described in 17.3.2.5 (Mathematical conventions in the signal descriptions).

l) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 (Mathematical description of signals) and 23.3.8 (S1G preamble) for details.

#### 23.3.4.4.4 Construction of 1 MHz LTF2-LTF$N_{LTF}$ (#7158)

The 1 MHz LTF2-LTF$N_{LTF}$ field is defined in 23.3.8.3.4 (LTF definition) and constructed as follows:

a) Sequence generation: Generate the 1 MHz (#7158)LTF2-LTF$N_{LTF}$ field sequence in the frequency domain over the bandwidth indicated by CH_BANDWIDTH as described in 23.3.8.3.4 (LTF definition).

b) Phase rotation: Apply appropriate phase rotation for each 1 MHz subchannel as described in 23.3.9.12 (S1G 1 MHz and 2 MHz duplicate transmission) and 23.3.7 (Mathematical description of signals) if S1G 1 MHz Duplicate PPDU.

c) $A_{LTF}$ matrix mapping: Apply the mapping of the $P_{HTLTF}$ matrix (from the second column to the last column) to the 1 MHz (#7158)LTF2-LTF$N_{LTF}$ field sequence (the pilot tones are processed differently) as described in 23.3.8.3.4 (LTF definition).

d) CSD: Apply CSD for each space-time stream and frequency segment as described in 23.3.8.3.2 (Cyclic shift for S1G modulated fields).

e) Spatial mapping: Apply the $Q$ matrix as described in 23.3.9.11 (OFDM modulation).

f) IDFT: Compute the inverse discrete Fourier transform.

g) Insert GI and apply windowing: Prepend a GI of 8 μs in duration and apply windowing as described in 17.3.2.5 (Mathematical conventions in the signal descriptions).

h) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 (Mathematical description of signals) and 23.3.8 (S1G preamble) for details.

#### 23.3.4.5 Construction of Preambles for S1G_DUP_2M and S1G_DUP_1M

For S1G_DUP_2M and S1G_DUP_1M, the preambles are initially constructed according to 23.3.4.3 (Construction of the Preamble part in an S1G_SHORT PPDU) and 23.3.4.4 (Construction of the Preamble part in an S1G_1M PPDU), respectively.

In the case of S1G_DUP_2M, the initial 2 MHz preamble is duplicated in frequency with phase rotation as defined in 23.3.4.3 (Construction of the Preamble part in an S1G_SHORT PPDU) to fill the final transmission bandwidth (i.e., 4 MHz, 8 MHz, or 16 MHz) indicated by the TXVECTOR parameter CH_BANDWIDTH.

In the case of S1G_DUP_1M, the initial 1 MHz preamble is duplicated in frequency with phase rotation as defined in 23.3.4.4 (Construction of the Preamble part in an S1G_1M PPDU) to fill the final transmission bandwidth (i.e., 2 MHz, 4 MHz, 8 MHz, or 16 MHz) indicated by the TXVECTOR parameter CH_BANDWIDTH.

#### 23.3.4.6 Construction of Data field in S1G SU PPDUs for all cases except 1 MHz MCS 10

##### 23.3.4.6.1 Using BCC

The construction of the Data field in an S1G SU PPDU with BCC encoding proceeds as follows:

a) SERVICE field: Generate the SERVICE field as described in 23.3.9.2 (SERVICE field) and append the PSDU to the SERVICE field.

b) PHY padding: Append the PHY pad bits to the PSDU as described in 23.3.9.4.3.2 (Padding for BCC).

c) Scrambler: Scramble the PHY padded data as described in 23.3.9.3 (Scrambler).

d) BCC encoder: Divide the scrambled bits between the encoders by sending bits to different encoders in a round robin manner. The number of encoders is determined by rate-dependent parameters described in 23.5 (Parameters for S1G-MCSs). BCC encode as described in 23.3.9.4.2 (BCC encoder parsing operation) and 23.3.9.4.3 (BCC coding and puncturing).

e) Stream parser: Rearrange the output of the BCC encoders into blocks as described in 23.3.9.6 (Stream parser).

f) Segment parser (if needed): For a contiguous 16 MHz transmission, divide the output bits of each stream parser into two frequency subblocks as described in 23.3.9.7 (Segment parser). This block is bypassed for 1 MHz, 2 MHz, 4 MHz, and 8 MHz S1G PPDU transmissions.

g) BCC interleaver: Interleave as described in 23.3.9.8 (BCC interleaver).

h) Constellation mapper: Map to BPSK, QPSK, 16-QAM, 64-QAM, 256-QAM, or 1024-QAM(M102) constellation points as described in 23.3.9.9 (Constellation mapping).

i) Segment deparser (if needed): For a contiguous 16 MHz transmission, merge the two frequency subblocks into one frequency segment as described in 23.3.9.9.3 (Segment deparser). This block is bypassed for 1 MHz, 2 MHz, 4 MHz, and 8 MHz S1G PPDU transmissions.

j) STBC: Apply STBC as described in 23.3.9.9.4 (Space-time block coding).

k) Pilot insertion: Insert pilots following the steps described in 23.3.9.10 (Pilot subcarriers).

l) CSD: Apply CSD for each space-time stream and frequency segment as described in 23.3.8.2.2.2 (Cyclic shift for S1G modulated fields) if S1G_SHORT preamble is used, 23.3.8.2.3.3.2 (Cyclic shift for S1G modulated fields) if S1G_LONG preamble is used and 23.3.8.3.2 (Cyclic shift for S1G modulated fields) if S1G_1M preamble is used.

m) Spatial mapping: Apply the $Q$ matrix as described in 23.3.10 (SU-MIMO and (#3367)DL MU-MIMO Beamforming) and in 23.3.9.11 (OFDM modulation).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

n) Phase rotation: Apply the appropriate phase rotations for each 2 MHz subchannel if 2 MHz preamble is used or for each 1 MHz subchannel if S1G 1 MHz Duplicate PPDU as described in 23.3.9.11 (OFDM modulation), 23.3.9.12 (S1G 1 MHz and 2 MHz duplicate transmission), and 23.3.7 (Mathematical description of signals).

o) IDFT: Compute the inverse discrete Fourier transform.

p) Insert GI and apply windowing: Prepend a GI and apply windowing as described in 17.3.2.5 (Mathematical conventions in the signal descriptions). If the TXVECTOR parameter GI_TYPE equals LONG_GI, the GI duration shall be 8 μs. If the GI_TYPE parameter is SHORT_GI, the GI duration shall be 8 μs for the first OFDM symbol of the Data field, and 4 μs for all subsequent OFDM symbols.

q) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 (Mathematical description of signals) and 23.3.8 (S1G preamble) for details.

#### 23.3.4.6.2 Using LDPC

The construction of the Data field in an S1G SU PPDU with LDPC encoding proceeds as follows:

a) SERVICE field: Generate the SERVICE field as described in 23.3.9.2 (SERVICE field) and append the PSDU to the SERVICE field.

b) PHY padding: Append the PHY pad bits to the PSDU as described in 23.3.9.4.4.2 (Padding for LDPC).

c) Scrambler: Scramble the PHY padded data as described in 23.3.9.3 (Scrambler).

d) LDPC encoder: The scrambled bits are encoded using the LDPC code with the LENGTH from the TXVECTOR as described in 23.3.9.4.4 (LDPC coding).

e) Stream parser: The output of the LDPC encoder is rearranged into blocks as described in 23.3.9.6 (Stream parser).

f) Segment parser (if needed): For a contiguous 16 MHz transmission, divide the output bits of each stream parser into two frequency subblocks as described in 23.3.9.7 (Segment parser). This block is bypassed for 1 MHz, 2 MHz, 4 MHz, and 8 MHz S1G PPDU transmissions.

g) Constellation mapper: Map to BPSK, QPSK, 16-QAM, 64-QAM, 256-QAM, or 1024-QAM(M102) constellation points as described in 23.3.9.9 (Constellation mapping).

h) LDPC tone mapper: The LDPC tone mapping shall be performed on all LDPC encoded streams as described in 23.3.9.9.2 (LDPC tone mapping). LDPC tone mapper is bypassed for 1 MHz transmission.

i) Segment deparser (if needed): For a contiguous 16 MHz transmission, merge the two frequency subblocks into one frequency segment as described in 23.3.9.9.3 (Segment deparser). This block is bypassed for 1 MHz, 2 MHz, 4 MHz, and 8 MHz S1G PPDU transmissions.

j) STBC: Apply STBC as described in 23.3.9.9.4 (Space-time block coding).

k) Pilot insertion: Insert pilots following the steps described in 23.3.9.10 (Pilot subcarriers).

l) CSD: Apply CSD for each space-time stream and frequency segment as described in 23.3.8.2.2.2 (Cyclic shift for S1G modulated fields) if S1G_SHORT preamble is used, 23.3.8.2.3.3.2 (Cyclic shift for S1G modulated fields) if S1G_LONG preamble is used and 23.3.8.3.2 (Cyclic shift for S1G modulated fields) if S1G_1M preamble is used.

m) Spatial mapping: Apply the $Q$ matrix as described in 23.3.10 (SU-MIMO and (#3367)DL MU-MIMO Beamforming) and in 23.3.9.11 (OFDM modulation).

n) Phase rotation: Apply the appropriate phase rotations for each 2 MHz subchannel if 2 MHz preamble is used or for each 1 MHz subchannel if S1G 1 MHz Duplicate PPDU as described in 23.3.9.11 (OFDM modulation), 23.3.9.12 (S1G 1 MHz and 2 MHz duplicate transmission), and 23.3.7 (Mathematical description of signals).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

o) IDFT: Compute the inverse discrete Fourier transform.

p) Insert GI and apply windowing: Prepend a GI and apply windowing as described in 17.3.2.5 (Mathematical conventions in the signal descriptions). If the TXVECTOR parameter GI_TYPE equals LONG_GI, the GI duration shall be 8 μs. If the GI_TYPE parameter is SHORT_GI, the GI duration shall be 8 μs for the first OFDM symbol of the Data field, and 4 μs for all subsequent OFDM symbols.

q) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 (Mathematical description of signals) and 23.3.8 (S1G preamble) for details.

### 23.3.4.7 Construction of the Data field in an S1G SU PPDU (1 MHz MCS 10 mode)

#### 23.3.4.7.1 Using BCC

The construction of the Data field in an S1G SU PPDU (1 MHz MCS 10 mode) with BCC encoding proceeds as follows:

a) SERVICE field: Generate the SERVICE field as described in 23.3.9.2 (SERVICE field) and append the PSDU to the SERVICE field.

b) PHY padding: Append the PHY pad bits to the PSDU as described in 23.3.9.4.3.2 (Padding for BCC).

c) Scrambler: Scramble the PHY padded data as described in 23.3.9.3 (Scrambler).

d) BCC encoder: BCC encode as described in 23.3.9.4.2 (BCC encoder parsing operation) and 23.3.9.4.3 (BCC coding and puncturing).

e) Block repetition: Apply the block-wise 2 times repetition on a per-OFDM symbol basis as described in 23.3.9.5 (Repetition for 1 MHz MCS 10).

f) BCC interleaver: Interleave as described in 23.3.9.8 (BCC interleaver).

g) Constellation mapper: Map to BPSK constellation points as described in 23.3.9.9 (Constellation mapping).

h) Pilot insertion: Insert pilots following the steps described in 23.3.9.10 (Pilot subcarriers).

i) Spatial mapping: Apply the $Q$ matrix as described in 23.3.9.11 (OFDM modulation).

j) Phase rotation: Apply appropriate phase rotation for each 1 MHz subchannel if S1G 1 MHz Duplicate PPDU as described in 23.3.9.12 (S1G 1 MHz and 2 MHz duplicate transmission) and 23.3.7 (Mathematical description of signals).

k) IDFT: Compute the inverse discrete Fourier transform.

l) Insert GI and apply windowing: Prepend a GI and apply windowing as described in 17.3.2.5 (Mathematical conventions in the signal descriptions). If the TXVECTOR parameter GI_TYPE equals LONG_GI, the GI duration shall be 8 μs. If the GI_TYPE parameter is SHORT_GI, the GI duration shall be 8 μs for the first OFDM symbol of the Data field, and 4 μs for all subsequent OFDM symbols.

m) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 (Mathematical description of signals) and 23.3.8 (S1G preamble) for details.

#### 23.3.4.7.2 Using LDPC

The construction of the Data field in an S1G SU PPDU (1 MHz MCS 10 mode) with LDPC encoding proceeds as follows:

a) SERVICE field: Generate the SERVICE field as described in 23.3.9.2 (SERVICE field) and append the PSDU to the SERVICE field.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

b) PHY padding: Append the PHY pad bits to the PSDU as described in 23.3.9.4.4.2 (Padding for LDPC).

c) Scrambler: Scramble the PHY padded data as described in 23.3.9.3 (Scrambler).

d) LDPC encoder: The scrambled bits are encoded using the LDPC code with the LENGTH from the TXVECTOR as described in 23.3.9.4.4 (LDPC coding).

e) Block repetition: Apply the block-wise 2 times repetition on a per-OFDM symbol basis as described in 23.3.9.5 (Repetition for 1 MHz MCS 10).

f) Constellation mapper: Map to BPSK constellation points as described in 23.3.9.9 (Constellation mapping).

g) Pilot insertion: Insert pilots following the steps described in 23.3.9.10 (Pilot subcarriers).

h) Spatial mapping: Apply the $Q$ matrix as described in 23.3.9.11 (OFDM modulation).

i) Phase rotation: Apply appropriate phase rotations for each 1 MHz subchannel if S1G 1 MHz Duplicate PPDU as described in 23.3.9.12 (S1G 1 MHz and 2 MHz duplicate transmission) and 23.3.7 (Mathematical description of signals).

j) IDFT: Compute the inverse discrete Fourier transform.

k) Insert GI and apply windowing: Prepend a GI and apply windowing as described in 17.3.2.5 (Mathematical conventions in the signal descriptions). If the TXVECTOR parameter GI_TYPE equals LONG_GI, the GI duration shall be 8 μs. If the GI_TYPE parameter is SHORT_GI, the GI duration shall be 8 μs for the first OFDM symbol of the Data field, and 4 μs for all subsequent OFDM symbols.

l) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 (Mathematical description of signals) and 23.3.8 (S1G preamble) for details.

### 23.3.4.8 Construction of the Data field in an S1G MU PPDU

#### 23.3.4.8.1 General

For an MU transmission, the PPDU encoding process is performed on a per-user basis up to the input of the spatial mapping block except that the CSD is applied across users as described in 23.3.8.2.3.3.2 (Cyclic shift for S1G modulated fields) if an S1G_LONG preamble is used. All user data is combined and mapped to the transmit chains in the spatial mapping block. An S1G_1M PPDU, or an S1G_SHORT PPDU, or an 2 MHz S1G duplicate PPDU in S1G_LONG format shall not be used for an MU transmission.

#### 23.3.4.8.2 Using BCC

A Data field with BCC encoding is constructed using the process described in 23.3.4.6.1 (Using BCC) and 23.3.4.7.1 (Using BCC) before the spatial mapping block and repeated for each user that uses BCC encoding.

#### 23.3.4.8.3 Using LDPC

A Data field with LDPC encoding is constructed using the process described in 23.3.4.6.2 (Using LDPC) and 23.3.4.7.2 (Using LDPC) before the spatial mapping block and repeated for each user that uses LDPC encoding.

#### 23.3.4.8.4 Combining to form an S1G MU PPDU

The per-user data is combined as follows:

a) Spatial Mapping: Apply the $Q$ matrix as described in 23.3.10 (SU-MIMO and (#3367)DL MU-MIMO Beamforming). The combining of all user data is done in this block.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

b) Phase rotation: Apply the appropriate phase rotations for each 2 MHz subchannel as described in 23.3.9.11 (OFDM modulation) and 23.3.7 (Mathematical description of signals).

c) IDFT: Compute the inverse discrete Fourier transform.

d) Insert GI and apply windowing: Prepend a GI and apply windowing as described in 17.3.2.5 (Mathematical conventions in the signal descriptions). If the TXVECTOR parameter GI_TYPE equals LONG_GI, the GI duration shall be 8 μs. If the GI_TYPE parameter is SHORT_GI, the GI duration shall be 8 μs for the first OFDM symbol of the Data field, and 4 μs for all subsequent OFDM symbols.

e) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 (Mathematical description of signals) and 23.3.8 (S1G preamble) for details.

### 23.3.5 Modulation and coding scheme

The S1G-MCS is a value that determines the modulation and coding used in the Data field of the PPDU. It is a compact representation that is carried in the SIG field or SIG-A field for S1G SU PPDUs and in the SIG-B field for S1G MU PPDUs using S1G_LONG. Rate-dependent parameters for the full set of S1G-MCSs are shown in Table 23-42 (S1G-MCSs for 1 MHz, Nss = 1) to Table 23-61 (S1G-MCSs for 16 MHz, Nss = 4) (in 23.5 (Parameters for S1G-MCSs)).

Table 23-42 (S1G-MCSs for 1 MHz, Nss = 1) to Table 23-61 (S1G-MCSs for 16 MHz, Nss = 4) give rate-dependent parameters for S1G-MCSs with indices 0 to 9 (and index 10 solely for 1 MHz, $N_{SS}$ = 1), with number of spatial streams from 1 to 4 and bandwidth options of 1 MHz, 2 MHz, 4 MHz, 8 MHz, and 16 MHz. Equal modulation is applied to all streams for a particular user.

### 23.3.6 Timing-related parameters

Table 23-5 (Timing-related constants) defines the timing-related parameters for all S1G PPDU formats, except the SIG field in S1G_SHORT, and the SIG-A field in S1G_LONG. Note that the timing-related parameters for the SIG field in S1G_1M PPDU and the SIG-B field in S1G_LONG are the same as those defined for the Data field as shown in Table 23-5 (Timing-related constants).

**Table 23-5—Timing-related constants**

| Parameter | CBW1 | CBW2 | CBW4 | CBW8 | CBW16 | Description |
|---|---|---|---|---|---|---|
| $N_{SD}$ | 24 | 52 | 108 | 234 | 468 | Number of data subcarriers per OFDM symbol |
| $N_{SP}$ | 2 | 4 | 6 | 8 | 16 | Number of pilot subcarrier per OFDM symbol |
| $N_{ST}$ | 26 | 56 | 114 | 242 | 484 | Total number of useful subcarriers per OFDM symbol |
| $N_{SR}$ | 13 | 28 | 58 | 122 | 250 | Highest data subcarrier index per OFDM symbol |
| $\Delta_F$ | 31.25 kHz | | | | | Subcarrier frequency spacing |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 23-5—Timing-related constants *(continued)***

| Parameter | CBW1 | CBW2 | CBW4 | CBW8 | CBW16 | Description |
|---|---|---|---|---|---|---|
| $T_{DFT}$ | 32 μs = $1/\Delta_F$ | | | | | IDFT/DFT period |
| $T_{GI}$ | 8 μs = $T_{DFT}/4$ | | | | | Guard interval duration |
| $T_{GI2}$ | 16 μs | | | | | Double guard interval |
| $T_{GIS}$ | 4 μs = $T_{DFT}/8$ | | | | | Short guard interval duration |
| $T_{SYML}$ | 40 μs = $T_{DFT} + T_{GI} = 1.25 \times T_{DFT}$ | | | | | Duration of OFDM symbol with normal guard interval |
| $T_{SYMS}$ | 36 μs = $T_{DFT} + T_{GIS} = 1.125 \times T_{DFT}$ | | | | | Duration of OFDM symbol with short guard interval |
| $T_{SYM}$ | $T_{SYML}$ or $T_{SYMS}$ depending on the GI used | | | | | OFDM symbol duration |
| $T_{STF}$ | 160 μs = $4 \times T_{SYML}$ | 80 μs = $2 \times T_{SYML}$ | | | | STF field duration |
| $T_{DSTF}$ | N/A | 40 μs = $T_{SYML}$ | | | | S1G_LONG preamble D-STF field duration |
| $T_{LTF1}$ | 160 μs = $4 \times T_{DFT} + 2 \times T_{GI} + T_{GI2}$ | 80 μs = $2 \times T_{DFT} + T_{GI2}$ | | | | First LTF field duration |
| $T_{LTF}$ | 40 μs = $T_{SYML}$ | | | | | Second and subsequent LTF field duration |
| $T_{DLTF}$ | N/A | 40 μs = $T_{SYML}$ | | | | S1G_LONG preamble D-LTF field duration |
| $T_{SIG}$ | 240 μs = $6 \times T_{SYML}$ | 80 μs = $2 \times T_{SYML}$ | | | | SIG field duration |
| $T_{SIG\text{-}A}$ | N/A | 80 μs = $2 \times T_{SYML}$ | | | | S1G_LONG preamble SIG-A field duration |
| $T_{SIG\text{-}B}$ | N/A | 40 μs = $T_{SYML}$ | | | | S1G_LONG preamble SIG-B field duration |
| *Nservice* | 8 | | | | | Number of bits in the SERVICE field |
| $N_{tail}$ | 6 | | | | | Number of tail bits per BCC encoder |

NOTE— $N_{ST} = N_{SD} + N_{SP}$.

**Table 23-7—Frequently used parameters *(continued)***

| Symbol | Explanation |
|---|---|
| $N_{STS,total}$ | For S1G_1M, S1G_SHORT, and the beam changeable portion of S1G_LONG, $N_{STS,total}$ is the total number of space-time streams in a PPDU.<br>$N_{STS,total} = \sum_{u=0}^{N_u-1} N_{STS,u}$<br>For the omnidirectional portion of S1G_LONG, $N_{STS,total}$ is undefined.<br>Note that $N_{STS,total} = N_{STS}$ for an S1G SU PPDU. |
| $N_{SS}$, $N_{SS,u}$ | Number of spatial streams.<br>For S1G_LONG, the omnidirectional portion always has $N_{SS,u}=1$ (see NOTE); and for the beam changeable portion $N_{SS,u}$ is the number of spatial streams for user $u$, $u = 0,\ldots, N_u-1$.<br>For S1G_1M and S1G_SHORT, $N_{SS} = N_{SS,0}$.<br>For an S1G SU PPDU, $N_{SS} = N_{SS,0}$; for an S1G MU PPDU, $N_{SS}$ is undefined. |
| $N_{TX}$ | Number of transmit chains. |
| $N_{ES}$, $N_{ES,u}$ | The number of BCC encoders.<br>For the SIG-B field of S1G_LONG, $N_{ES}=1$ for each user.<br>For the beam changeable portion of S1G_LONG, $N_{ES,u}$ is the number of BCC encoders for the Data field for user $u$, $u = 0,\ldots, N_u-1$(#515).<br>For the Data field of an S1G SU PPDU, $N_{ES} = N_{ES,0}$.<br>For the Data field of an S1G MU PPDU, $N_{ES}$ is undefined.<br>For the Data field encoded using LDPC, $N_{ES}=1$ for an S1G SU PPDU and $N_{ES,u}=1$ for an S1G MU PPDU for user $u$, $u = 0,\ldots, N_u-1$(#515). |
| $N_{LTF}$ | Number of long training fields in S1G_1M or S1G_SHORT; or the number of data long training fields in S1G_LONG (see 23.3.8.2.2.4 (LTF definition), 23.3.8.2.3.3.3 (D-STF definition), and 23.3.8.3.4 (LTF definition)) |
| $R$, $R_u$ | $R_u$ is the coding rate for user $u$, $u = 0, \ldots, N_u-1$.<br>For an S1G SU PPDU, $R = R_0$<br>For an S1G MU PPDU, $R$ is undefined |
| $M_u$ | For the omnidirectional portion of S1G_LONG, $M_u = 0$. Otherwise,<br>$M_u = \sum_{u'=0}^{u-1} N_{STS,u'}$ with $M_0 = 0$. |
| NOTE—For the omnidirectional portion of S1G_LONG, $u$ is 0 only since $N_u=1$. | |

### 23.3.7 Mathematical description of signals

For a description of the conventions used for the mathematical description of the signals, see 17.3.2.5 (Mathematical conventions in the signal descriptions).

For a 1 MHz S1G PPDU transmission, the 1 MHz is divided into 32 subcarriers. The signal is transmitted on subcarriers –13 to –1 and 1 to 13, with 0 being the center (DC) subcarrier.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

For a 2 MHz S1G PPDU transmission, the 2 MHz is divided into 64 subcarriers. The signal is transmitted on subcarriers –28 to –1 and 1 to 28, with 0 being the center (DC) subcarrier.

For a 4 MHz S1G PPDU transmission, the 4 MHz is divided into 128 subcarriers. The signal is transmitted on subcarriers –58 to –2 and 2 to 58.

For an 8 MHz S1G PPDU transmission, the 8 MHz is divided into 256 subcarriers. The signal is transmitted on subcarriers –122 to –2 and 2 to 122.

For a 16 MHz S1G PPDU transmission, the 16 MHz is divided into 512 subcarriers. The signal is transmitted on subcarriers –250 to –130, –126 to –6, 6 to 126, and 130 to 250.

The transmitted signal is described in complex baseband signal notation. The actual transmitted signal is related to the complex baseband signal by the relation shown in Equation (23-1).

$$r_{RF}(t) = \mathrm{Re}\{r(t)\exp(j2\pi f_c t)\} \quad (23\text{-}1)$$

where

$f_c$ represents the center frequency of the carrier

The transmitted RF signal is derived by upconverting the complex baseband signal, which consists of several fields. The timing boundaries for the various fields of the different (#14)PPDU formats are shown in Figure 23-5 (Timing boundaries for S1G PPDU fields(#7158)), where $N_{LTF}$ is the number of LTF or D-LTF field symbols and is defined in Table 23-11 (Number of LTFs required for different numbers of space-time streams) (in 23.3.8.2.2.4 (LTF definition)), for up to $N_{STS,Total} = 4$.

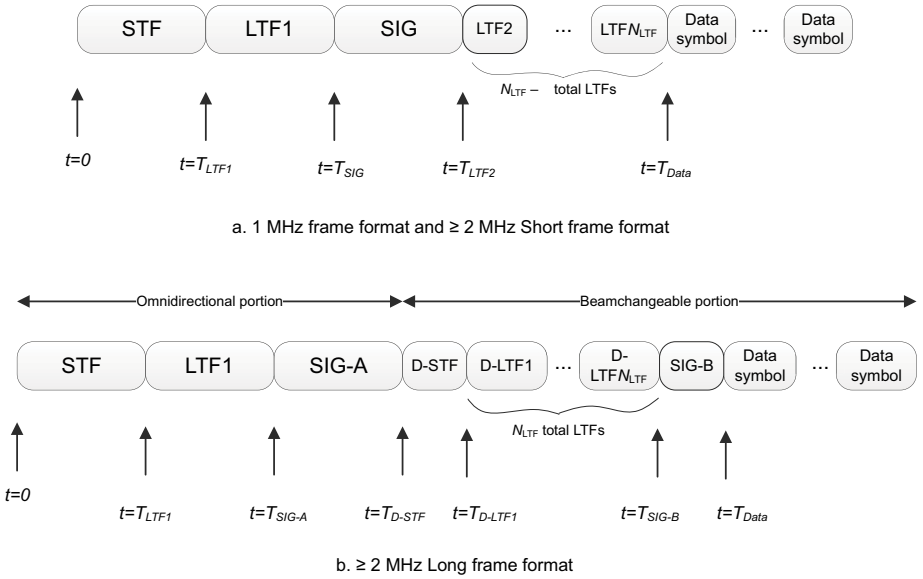

**Figure 23-5—Timing boundaries for S1G PPDU fields(#7158)**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The time offset, $t_{Field}$ , determines the starting time of the corresponding field.

For the S1G_1M PPDU (#14)PPDU format and the S1G_SHORT PPDU (#14)PPDU format, the signal transmitted on transmitted on transmit chain $i_{TX}$ shall be as shown in Equation (23-2).

$$r_{PPDU}^{i_{TX}}(t) = r_{STF}^{i_{TX}}(t) + r_{LTF1}^{i_{TX}}(t - t_{LTF1}) + r_{SIG}^{i_{TX}}(t - t_{SIG}) + \sum_{i_{LTF}=2}^{N_{LTF}} r_{LTF}^{(i_{TX}, i_{LTF})}(t - t_{LTF2} - (i_{LTF} - 2)T_{LTF}) + r_{Data}^{i_{TX}}(t - t_{Data}) \quad (23\text{-}2)$$

where

$$t_{LTF} = T_{STF}$$
$$t_{SIG} = t_{LTF1} + T_{LTF1}$$
$$t_{LTF2} = t_{SIG} + T_{SIG}$$
$$t_{Data} = t_{LTF2} + (N_{LTF} - 1)T_{LTF}$$

For the S1G_LONG PPDU format, the signal transmitted on transmit chain *iTX* shall be as shown in Equation (23-3).

$$r_{\text{PPDU}}^{(i_{\text{TX}})}(t) = r_{\text{STF}}^{(i_{\text{TX}})}(t) + r_{\text{LTF1}}^{(i_{\text{TX}})}(t - t_{\text{LTF1}}) + r_{\text{SIG-A}}^{(i_{\text{TX}})}(t - t_{\text{SIG}}) + r_{\text{D-STF}}^{(i_{\text{TX}})}(t - t_{D-STF}) + \sum_{i_{\text{LTF}}=1}^{N_{\text{LTF}}} r_{\text{D-LTF}}^{(i_{\text{TX}}, i_{\text{LTF}})}(t - t_{\text{D-LTF1}} - (i_{\text{LTF}} - 1)T_{\text{LTF}}) + r_{\text{SIG-B}}^{(i_{\text{TX}})}(t - t_{\text{SIG-B}}) + r_{\text{Data}}^{(i_{\text{TX}})}(t - t_{\text{Data}}) \quad (23\text{-}3)$$

where

$$t_{\text{LTF1}} = T_{\text{STF}}$$
$$t_{\text{SIG-A}} = t_{\text{LTF1}} + T_{\text{LTF1}}$$
$$t_{\text{D-STF}} = t_{\text{SIG-A}} + T_{\text{SIG-A}}$$
$$t_{\text{D-LTF1}} = t_{\text{D-STF}} + T_{\text{D-STF}}$$
$$t_{\text{SIG-B}} = t_{\text{D-LTF1}} + N_{\text{LTF1}} \cdot T_{\text{LTF}}$$
$$t_{\text{Data}} = t_{\text{SIG-B}} + T_{\text{SIG-B}}$$

Each field, $r_{Field}^{(i_{\text{TX}})}(t)$ , is defined as the summation of one or more subfields, where each subfield is defined to be an inverse discrete Fourier transform as specified in Equation (23-4).

$$r_{\text{Field}}^{(i_{\text{TX}})}(t) = \frac{1}{\sqrt{N_{\text{Field}}^{\text{Tone}} N_{\text{Norm}}}} w_{T_{\text{Field}}}(t) \sum_{k=-N_{SR}}^{N_{SR}} \sum_{u=0}^{N_u - 1} \sum_{m=1}^{N_{STS,u}} \left[Q_k\right]_{i_{TX},(M_u+m)} \Upsilon_{k,\text{BW}} X_{k,u}^{(m)} \exp\left(j2\pi k \Delta_F (t - T_{GI,Field} - T_{CS}(M_u + m))\right) \quad (23\text{-}4)$$

This general representation holds for all subfields. When the bandwidth is greater than or equal to 2 MHz and the S1G_LONG format is used, the total power of the time domain beam changeable portion field signals summed over all transmit chains should not exceed the total power of the time domain omnidirectional portion signals summed over all transmit chains. For notational simplicity, the parameter BW is omitted from some bandwidth dependent terms.

Table 23-8 (Tone scaling factor and guard interval duration values for PHY fields) summarizes the various values of $N_{\text{Field}}^{\text{Tone}}$ as a function of bandwidth per frequency segment.

**Table 23-8—Tone scaling factor and guard interval duration values for PHY fields**

| Field | $N_{\text{Field}}^{\text{Tone}}$ as a function of bandwidth per frequency segment | | | | | Guard interval duration |
|---|---|---|---|---|---|---|
| | 1 MHz | 2 MHz | 4 MHz | 8 MHz | 16 MHz | |
| STF | 6 | 12 | 24 | 48 | 96 | N/A (See NOTE 2) |
| LTF1 | 26 | 56 | 114 | 242 | 484 | For bandwidths ≥ 2 MHz, duration is $T_{GI2}$. For 1 MHz bandwidth, duration is $T_{GI2}$ for first and second symbols, and $T_{GI}$ for third and fourth symbols. |
| (#6048)S1G_DUP_1M-LTF1 (see NOTE 4) | N/A | 52 | 104 | 208 | 416 | Duration is $T_{GI2}$ for first and second symbols, and $T_{GI}$ for third and fourth symbols. |
| (#6048)S1G_DUP_2M-LTF1 (see NOTE 4) | N/A | N/A | 112 | 224 | 448 | $T_{GI2}$ |
| SIG | 26 | 52 | 104 | 208 | 416 | $T_{GI}$ |
| SIG-A for long format | N/A | 52 | 104 | 208 | 416 | $T_{GI}$ |
| D-STF for long format | N/A | 12 | 24 | 48 | 96 | N/A |
| (#7158)LTF2~LTF$N_{\text{LTF}}$ | 26 | 56 | 114 | 242 | 484 | $T_{GI}$ |
| (#6048)S1G_DUP_1M-(#7158)LTF2~LTF$N_{\text{LTF}}$ (see NOTE 4) | N/A | 52 | 104 | 208 | 416 | $T_{GI}$ |
| (#6048)S1G_DUP_2M-(#7158)LTF2~LTF$N_{\text{LTF}}$ (see NOTE 4) | N/A | N/A | 112 | 224 | 448 | $T_{GI}$ |
| D-LTF for long format | N/A | 56 | 114 | 242 | 484 | $T_{GI}$ |
| SIG-B for long format | N/A | 56 | 114 | 242 | 484 | $T_{GI}$ |

**Table 23-8—Tone scaling factor and guard interval duration values for PHY fields *(continued)***

| Field | $N_{\text{Field}}^{\text{Tone}}$ as a function of bandwidth per frequency segment | | | | | Guard interval duration |
|---|---|---|---|---|---|---|
| | 1 MHz | 2 MHz | 4 MHz | 8 MHz | 16 MHz | |
| First Data Symbol | 26 | 56 | 114 | 242 | 484 | $T_{GI}$ (see NOTE 3) |
| From second to the last Data Symbols | 26 | 56 | 114 | 242 | 484 | $T_{GI}$ or $T_{GIS}$ (see NOTE 3) |
| S1G_DUP_1M-Data (see NOTE 1) | N/A | 52 | 104 | 208 | 416 | $T_{GI}$ or $T_{GIS}$ (see NOTE 3) |
| S1G_DUP_2M-Data (see NOTE 1) | N/A | N/A | 112 | 224 | 448 | $T_{GI}$ or $T_{GIS}$ (see NOTE 3) |

NOTE 1—For notational convenience, S1G_DUP_1M-Data and S1G_DUP_2M-Data is used as a label for the Data field of a duplicate PPDU with format type S1G_DUP_1M or S1G_DUP-2M, respectively.

NOTE 2—The OFDM symbols of the STF field do not have a guard interval, therefore its duration is not applicable.

NOTE 3—$T_{GI}$ denotes guard interval duration when TXVECTOR parameter GI_TYPE equals LONG_GI, $T_{GIS}$ denotes short guard interval duration when TXVECTOR parameter GI_TYPE equals SHORT_GI. Regardless of the GI_TYPE value in TXVECTOR, the first Data OFDM symbol always uses $T_{GI}$ as its guard interval duration.

(#6048)(#7158)NOTE 4—For notational convenience, S1G_DUP_1M-LTF1 and S1G_DUP_2M-LTF1 are used as a label for the LTF1 of a duplicate PPDU with format type S1G_DUP_1M or S1G_DUP_2M, respectively, and S1G_DUP_1M-LTF2~LTF$N_{\text{LTF}}$ and S1G_DUP_2M-LTF2~LTF$N_{\text{LTF}}$ are used as a label for the LTF2~LTF$N_{\text{LTF}}$ of a duplicate PPDU with format type S1G_DUP_1M or S1G_DUP_2M, respectively.

$N_{\text{Norm}}$ for the omnidirectional portion of the S1G_LONG, $N_{\text{Norm}} = N_{\text{TX}}$, for all other cases, $N_{\text{Norm}} = N_{STS,total}$, where $N_{STS,total}$ is given in Table 23-7 (Frequently used parameters).

$w_{\text{T}_{\text{Field}}}(t)$ is a windowing function. An example function, $w_{\text{T}_{\text{Field}}}(t)$, is given in 17.3.2.5 (Mathematical conventions in the signal descriptions).

$T_{\text{Subfield}}$ is the duration of the subfield being referenced, and its usage is as follows:

- $T_{STF}$ for the STF field, $T_{D\text{-}STF}$ for the D-STF field
- $T_{LTF1}$ for the LTF1 field
- $T_{SIG}$ for the SIG field, $T_{SIG\text{-}A}$ for the SIG-A field
- $T_{LTF}$ for the (#7158)LTF2~LTF$N_{\text{LTF}}$ fields for the S1G_1M, the S1G_SHORT format, and for the D-LTFs fields in the S1G_LONG format
- $T_{SIG\text{-}B}$ field for the SIG-B

$N_u$ is defined in Table 23-7 (Frequently used parameters).

$N_{\text{SR}}$ is the highest data subcarrier index per frequency segment and has values listed in Table 23-5 (Timing-related constants) and in Table 23-6 (Timing-related constants for SIG/SIG-A field in ≥ 2 MHz PPDUs).

$N_{STS,u}$ is defined in Table 23-7 (Frequently used parameters).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$M_u$ is defined in Table 23-7 (Frequently used parameters).

$[X]_{a,b}$ indicates the element in row $a$ and column $b$ of the matrix $X$, where $1 \le a \le N_{\text{row}}$, and $1 \le b \le N_{\text{col}}$. $N_{\text{row}}$ and $N_{\text{col}}$ are the number of rows and columns, respectively, of the matrix $X$.

$Q_k$ is the spatial mapping matrix for the subcarrier $k$. For the omnidirectional portion of S1G_LONG, $Q_k$ is a column vector, denoted as $Q_k^{(omni)}$, with $N_{TX}$ elements with element $i_{TX}$ being $\exp(-j2\pi k\Delta_F T_{CS}^{i_{TX}})$, where $T_{CS}^{i_{TX}}$ represents the cyclic shift for transmitter chain $i_{TX}$ whose values are given in Table 23-13 (Per antenna cyclic shift values of S1G_LONG preamble PPDU) (in 23.3.8.2.3.2.2). For other cases, $Q_k$ is a matrix with $N_{TX}$ rows and $N_{STS,total}$ columns.

$\Delta_F$ is the subcarrier frequency spacing given in Table 23-5 (Timing-related constants).

$X_{k,u}^{(m)}$ is the frequency domain symbol in subcarrier $k$ of user $u$ for of space-time stream $m$. Some of the $X_{k,u}^{(m)}$ within $-N_{\text{SR}} \le k \le N_{\text{SR}}$ have a value of zero. Examples of such cases include the DC tones, guard tones on each side of the transmit spectrum, as well as the unmodulated tones of STF and D-STF fields.

$T_{GI,Field}$ is the guard interval duration used for each OFDM symbol in the field. The value for each field is defined in Table 23-8 (Tone scaling factor and guard interval duration values for PHY fields). $T_{GI}$, $T_{GI2}$ and $T_{GIS}$ are defined in Table 23-5 (Timing-related constants).

$T_{CS}(l)$ for the omnidirectional portion of S1G_LONG, $T_{CS}(l) = 0$. For the other cases, $T_{CS}(l)$ represents the cyclic shift per space-time stream, whose value is defined in Table 23-10 (Cyclic shift values for the S1G_SHORT preamble PPDU) (in 23.3.8.2.2.2) for ≥ 2 MHz, and Table 23-18 (Cyclic shift values of S1G_1M PPDU) (in 23.3.8.3.2).

The function $\Upsilon_{k,\text{BW}}$ is used to represent a rotation of the tones. BW in $\Upsilon_{k,\text{BW}}$ is determined by the TXVECTOR parameter CH_BANDWIDTH as defined in Table 23-9 (CH_BANDWIDTH and Gamma sub$_{\text{k, BW}}$ (#4079)).

**Table 23-9—CH_BANDWIDTH and Gamma sub$_{\text{k, BW}}$ (#4079)**

| CH_BANDWIDTH | $\Upsilon_{k,\text{BW}}$ |
|---|---|
| CBW1 | $\Upsilon_{k,1}$ |
| CBW2 | $\Upsilon_{k,2}$ |
| CBW4 | $\Upsilon_{k,4}$ |
| CBW8 | $\Upsilon_{k,8}$ |
| CBW16 | $\Upsilon_{k,16}$ |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

(#14)If CH_BANDWIDTH is CBW1,

$$\Upsilon_{k,1} = 1 \tag{23-5}$$

(#14)If CH_BANDWIDTH is CBW2,

$$\Upsilon_{k,2} = 1 \tag{23-6}$$

(#14)If FORMAT is S1G or S1G_DUP_2M and CH_BANDWIDTH is CBW4,

$$\Upsilon_{k,4} = \begin{cases} 1, & k < 0 \\ j, & k \geq 0 \end{cases} \tag{23-7}$$

(#14)If FORMAT is S1G or S1G_DUP_2M and CH_BANDWIDTH is CBW8,

$$\Upsilon_{k,8} = \begin{cases} 1, k < -64 \\ -1, k \geq -64 \end{cases} \tag{23-8}$$

(#14)If FORMAT is S1G or S1G_DUP_2M and CH_BANDWIDTH is CBW16,

$$\Upsilon_{k,16} = \begin{cases} 1, & k < -192 \\ -1, & -192 \leq k < 0 \\ 1, & 0 \leq k < 64 \\ -1, & 64 \leq k \end{cases} \tag{23-9}$$

(#14)If FORMAT is S1G_DUP_1M and CH_BANDWIDTH is CBW2,

$$\Upsilon_{k,2} = \begin{cases} 1, k < 0 \\ -1, k \geq 0 \end{cases} \tag{23-10}$$

(#14)If FORMAT is S1G_DUP_1M and CH_BANDWIDTH is CBW4,

$$\Upsilon_{k,4} = \begin{cases} 1, k < -32 \\ j, -32 \leq k < 0 \\ -j, 0 \leq k < 32 \\ -1, 32 \leq k \end{cases} \tag{23-11}$$

(#14)If FORMAT is S1G_DUP_1M and CH_BANDWIDTH is CBW8,

$$\Upsilon_{k,8} = \begin{cases} 1, k < -96 \\ -1, -96 \leq k < -64 \\ 1, -64 \leq k < 64 \\ -1, 64 \leq k \end{cases} \tag{23-12}$$

(#14)If FORMAT is S1G_DUP_1M and CH_BANDWIDTH is CBW16,

$$\Upsilon_{k,16} = \begin{cases} 1, & k < -160 \\ -1, & -160 \le k < -128 \\ 1, & -128 \le k < -32 \\ -1, & -32 \le k < 64 \\ 1, & 64 \le k < 96 \\ -1, & 96 \le k < 128 \\ 1, & 128 \le k < 192 \\ -1, & 192 \le k < 224 \\ 1, & 224 \le k \end{cases} \quad (23\text{-}13)$$

### 23.3.8 S1G preamble

#### 23.3.8.1 Introduction

Three preamble formats are defined that correspond to the three non-duplicate S1G PPDU formats: the S1G_1M preamble, the S1G_SHORT preamble, and the S1G_LONG preamble. The first two preamble formats are defined solely for single user, and the third preamble format may be used in either single user or multi-user PPDUs. The duplicate mode PPDU formats S1G_DUP_2M and S1G_DUP_1M use the S1G_SHORT and S1G_1M preambles, respectively.

All numeric fields are transmitted in unsigned format, LSB first.

#### 23.3.8.2 Formats for greater than or equal to 2 MHz

##### 23.3.8.2.1 Introduction

This subclause describes the preamble formats used for non-duplicate S1G PPDUs of 2 MHz and greater and duplicate S1G_DUP_2M PPDUs.

##### 23.3.8.2.2 S1G_SHORT preamble

###### 23.3.8.2.2.1 General

The S1G_SHORT preamble is used for the S1G_SHORT and S1G_DUP_2M PPDU formats and is only used for SU transmissions. The S1G_SHORT preamble is structured similarly to the Greenfield format as defined in Clause 19 (High Throughput (HT) PHY specification(#2297)).

###### 23.3.8.2.2.2 Cyclic shift for S1G modulated fields

The cyclic shift values defined in this subclause apply to the STF, LTF, SIG and Data fields of the S1G_SHORT preamble PPDU, for ≥ 2 MHz transmit bandwidths. Throughout the S1G_SHORT preamble, cyclic shifts are applied to prevent beamforming when similar signals are transmitted in different space-time streams. The STF, LTF, and SIG fields start as single stream during generation but are replicated up to $N_{STS,total}$ streams. For the LTF, these replicated streams undergo P-matrix mapping prior to CSD application as shown in Figure 23-6 (Generation of LTF symbols) (in 23.3.8.2.2.4 (LTF definition)). For the STF and SIG the CSDs are applied per stream immediately after replication. The same cyclic shift is applied to the $N_{STS,total}$ streams during the transmission of the Data field of the S1G_SHORT preamble PPDU. The cyclic shift value $T_{CS}(n)$ for space-time stream $n$ out of $N_{STS,total}$ total space-time streams is shown in Table 23-10 (Cyclic shift values for the S1G_SHORT preamble PPDU).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 23-10—Cyclic shift values for the S1G_SHORT preamble PPDU**

| $T_{CS}(n)$ for ≥ 2 MHz, S1G_SHORT Preamble PPDU | | | | |
|---|---|---|---|---|
| Total number of space-time streams ($N_{STS,total}$) | Cyclic shift for space-time stream $n$ (μs) | | | |
| | 1 | 2 | 3 | 4 |
| 1 | 0 | — | — | — |
| 2 | 0 | −4 | — | — |
| 3 | 0 | −4 | −2 | — |
| 4 | 0 | −4 | −2 | −6 |

### 23.3.8.2.2.3 STF definition

The STF field for a 2 MHz or 4 MHz transmission is defined by Equation (19-8) and Equation (19-9), respectively, in 19.3.9.3.3 (L-STF definition). For a 8 MHz or 16 MHz transmission, the STF field is defined by Equation (21-18) and Equation (21-19), respectively, in 21.3.8.2.2 (L-STF definition). Note that these equations do not include the phase rotation per 2 MHz subchannel.

The time domain representation of the STF field signal at transmit chain $i_{TX}$ shall be as specified in Equation (23-14).

$$r_{\mathrm{STF}}^{(i_{\mathrm{TX}})}(t) = \frac{1}{\sqrt{N_{\mathrm{STF}}^{\mathrm{Tone}} N_{\mathrm{STS}}}} w_{T_{\mathrm{STF}}}(t) \sum_{k=-N_{SR}}^{N_{SR}} \sum_{m=1}^{N_{STS}} \left[ Q_k \right]_{i_{TX},m} \left[ P_{HTLTF} \right]_{m,1} \Upsilon_{k,\mathrm{BW}} S_k \exp\left( j2\pi k \Delta_F (t - T_{CS}(m)) \right) \quad (23\text{-}14)$$

where

$N_{SR}$ is 26 for a 2 MHz transmission or defined in Table 23-5 (Timing-related constants) for a 4 MHz, 8 MHz, or 16 MHz transmission

$S_k$ is defined in Equation (19-8), Equation (19-9), Equation (21-8), or Equation (21-9) for a 2 MHz, 4 MHz, 8 MHz, or 16 MHz transmission, respectively.

$T_{CS}(m)$ represents the cyclic shift for space-time stream $m$ with a value given in Table 23-10 (Cyclic shift values for the S1G_SHORT preamble PPDU)

$\Upsilon_{k,BW}$ is defined by Equation (23-6) to Equation (23-9)

$\Delta_F$ is defined in Table 23-5 (Timing-related constants)

$N_{STS}$ is defined in Table 23-7 (Frequently used parameters)

$P_{HTLTF}$ is defined in 19.3.9.4.6 (HT-LTF definition)

$N_{STF}^{Tone}$ has the value given in Table 23-8 (Tone scaling factor and guard interval duration values for PHY fields)

$Q_k$ is defined in 23.3.7 (Mathematical description of signals)

### 23.3.8.2.2.4 LTF definition

The LTF field provides means for the receiver to estimate the MIMO channel between the set of constellation mapper outputs (or, if STBC is applied, the STBC encoder outputs) and the receive chains. The transmitter provides training for $N_{STS}$ space-time streams (spatial mapper inputs) used for the transmission of the PSDU. For each tone, the MIMO channel that can be estimated is an $N_{RX} \times N_{STS}$ matrix. All S1G

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

transmissions have a preamble that contains LTF symbols, where the data tones of each LTF symbol are multiplied by entries belonging to a matrix $P_{HTLTF}$, to enable channel estimation at the receiver.

The pilot tones of each LTF symbol are multiplied by the first column of the $P_{HTLTF}$ matrix. The multiplication of the pilot tones in the LTF symbols by the first column of the $P_{HTLTF}$ matrix instead of the whole $P_{HTLTF}$ matrix is to allow receivers to track phase and frequency offset during MIMO channel estimation using the LTF. The number of LTF symbols, $N_{LTF}$, is a function of the total number of space-time streams $N_{STS}$ as shown in Table 23-11 (Number of LTFs required for different numbers of space-time streams). As a result, the LTF field consists of one, two, or four symbols that are necessary for the demodulation of the Data field in the PPDU or for channel estimation in an NDP.

**Table 23-11—Number of LTFs required for different numbers of space-time streams**

| $N_{STS}$ | $N_{LTF}$ |
|---|---|
| 1 | 1 |
| 2 | 2 |
| 3 | 4 |
| 4 | 4 |

The LTF field for a 2 MHz, 4 MHz, 8 MHz, or 16 MHz transmission is defined by Equation (21-36) Equation (21-37), Equation (21-38), and Equation (21-39), respectively, in 21.3.8.3.5 (VHT-LTF definition). Note that these equations do not include the phase rotation per 2 MHz subchannel.

The generation of the time domain LTF symbols is shown in Figure 23-6 (Generation of LTF symbols) where $A^{k}_{LTF}$ is given in Equation (23-15).

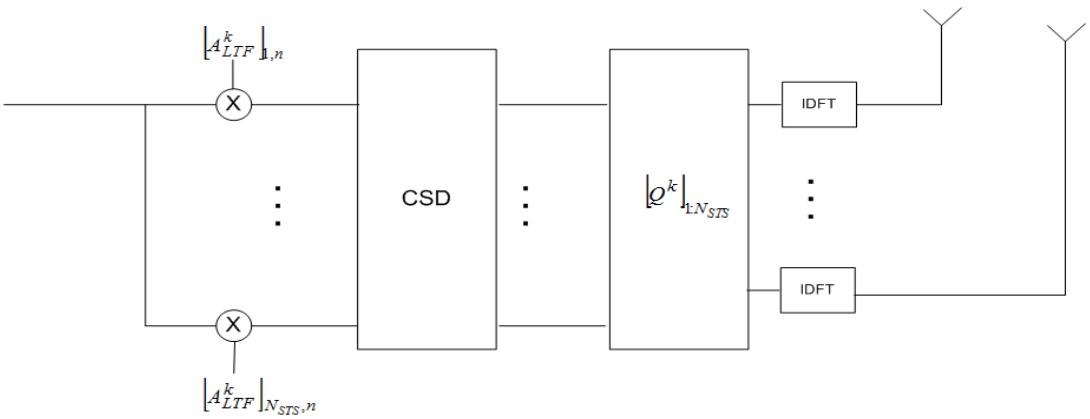

**Figure 23-6—Generation of LTF symbols**

$$A^{k}_{LTF} = \begin{cases} \left[P_{HTLTF}\right]_{*,1} \times \left[1\ 1\ 1\ 1\right], if\ k \in K_{Pilot\_Fix} \\ P_{HTLTF},\ \text{otherwise} \end{cases} \quad (23\text{-}15)$$

where

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$K_{Pilot\_Fix}$ is the subcarrier indices for the fixed pilot tones:

For a 2 MHz transmission, $K_{Pilot\_Fix} = \{\pm 7, \pm 21\}$

For a 4 MHz transmission, $K_{Pilot\_Fix} = \{\pm 11, \pm 25, \pm 53\}$

For an 8 MHz transmission, $K_{Pilot\_Fix} = \{\pm 11, \pm 39, \pm 75, \pm 103\}$

For a 16 MHz transmission,

$K_{Pilot\_Fix} = \{\pm 25, \pm 53, \pm 89, \pm 117, \pm 139, \pm 167, \pm 203, \pm 231\}$

$[P_{HTLTF}]_{*,1}$ is the first column of the $P_{HTLTF}$ matrix

The time domain representation of the LTF1 field, and (#7158)LTF2~LTF$N_{\mathrm{LTF}}$ fields signals at transmit chain $i_{TX}$ shall be as specified in Equation (23-16) and Equation (23-17), respectively.

$$r_{\mathrm{LTF1}}^{(i_{\mathrm{TX}})}(t) = \frac{1}{\sqrt{N_{\mathrm{LTF}}^{\mathrm{Tone}} N_{\mathrm{STS}}}} w_{T_{\mathrm{LTF1}}}(t) \sum_{k=-N_{SR}}^{N_{SR}} \sum_{m=1}^{N_{STS}} \left( \begin{array}{l} \left[ Q_k \right]_{i_{TX},m} \Upsilon_{k,\mathrm{BW}} \left[ A_{LTF}^{k} \right]_{m,1} LTF_k \\ \quad \cdot \exp\left( j 2\pi k \Delta_F (t - T_{GI2} - T_{CS}(m)) \right) \end{array} \right) \tag{23-16}$$

$$\begin{aligned} r_{\mathrm{LTF2\sim LTF}_{\mathrm{N_{LTF}}}}^{(i_{\mathrm{TX}})}(t) = & \frac{1}{\sqrt{N_{\mathrm{LTF}}^{\mathrm{Tone}} N_{\mathrm{STS}}}} \sum_{n=1}^{N_{LTF}-1} w_{T_{\mathrm{LTF}}}(t - (n-1)T_{LTF}) \\ & \sum_{k=-N_{SR}}^{N_{SR}} \sum_{m=1}^{N_{STS}} \left( \begin{array}{l} \left[ Q_k \right]_{i_{TX},m} \Upsilon_{k,\mathrm{BW}} \left[ A_{LTF}^{k} \right]_{m,(n+1)} LTF_k \\ \quad \cdot \exp\left( j 2\pi k \Delta_F (t - (n-1)T_{LTF} - T_{GI} - T_{CS}(m)) \right) \end{array} \right) \end{aligned} \tag{23-17}$$

where

$LTF_k$ is defined in Equation (21-36), Equation (21-37), Equation (21-38), or Equation (21-39) for a 2 MHz, 4 MHz, 8 MHz, or 16 MHz transmission, respectively

$N_{SR}$ and $T_{LTF}$ are defined in Table 23-5 (Timing-related constants)

$T_{CS}(m)$ represents the cyclic shift for space-time stream $m$ with a value given in Table 23-10 (Cyclic shift values for the S1G_SHORT preamble PPDU)

$\Upsilon_{k,BW}$ is defined by Equation (23-6) to Equation (23-9)

$\Delta_F$ is defined in Table 23-5 (Timing-related constants)

$N_{STS}$ is defined in Table 23-7 (Frequently used parameters)

$A_{LTF}^{k}$ is defined in Equation (23-15)

$N_{LTF}^{Tone}$ has the value given in Table 23-8 (Tone scaling factor and guard interval duration values for PHY fields)

$Q_k$ is defined in 23.3.7 (Mathematical description of signals)

The first LTF (LTF1) field consists of two periods of the long training symbol, preceded by a double length (16 μs) cyclic prefix. The placement of the first and subsequent LTF fields in an S1G_SHORT PPDU is shown in Figure 23-1 (S1G_SHORT format(#7158)).

#### 23.3.8.2.2.5 SIG definition

The SIG field carries information required to interpret (#2095)S1G PPDUs sent with a short preamble. The structure of the SIG field for the first symbol (SIG-1) is shown in Figure 23-7 (SIG-1 structure) and for

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

the second symbol (SIG-2) is shown in Figure 23-8 (SIG-2 structure). The SIG field format of NDP CMAC PPDUs is described in Figure 23-21 (SIG field format for ≥ 2 MHz NDP CMAC PPDU) (in 23.3.11).

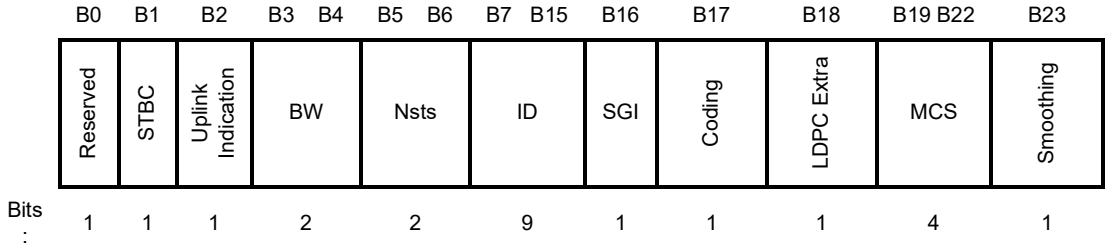

**Figure 23-7—SIG-1 structure**

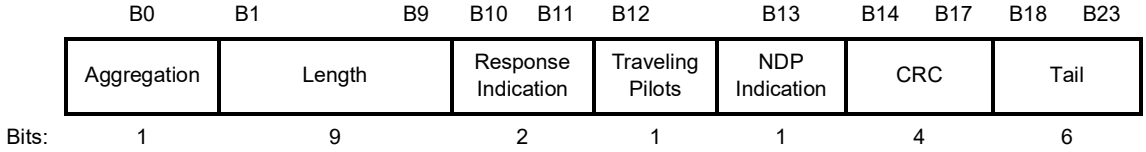

**Figure 23-8—SIG-2 structure**

The SIG field of (#2095)S1G PPDUs sent with a short preamble contains the fields listed in Table 23-12 (Fields in the SIG field of short preamble).

The SIG field is composed of two OFDM symbols, SIG-1 and SIG-2, each providing 24 data bits, as shown in Table 23-12 (Fields in the SIG field of short preamble). SIG-1 is transmitted before SIG-2. The SIG field symbols shall be BCC encoded at rate, R = 1/2, interleaved, mapped to a BPSK constellation, and have pilots inserted following the steps described in 17.3.5.6 (Convolutional encoder), 17.3.5.7 (Data interleaving), 17.3.5.8 (Subcarrier modulation mapping), and 17.3.5.9 (Pilot subcarriers), respectively.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 23-12—Fields in the SIG field of short preamble**

| Symbol | Bit | Field | Description |
|---|---|---|---|
| SIG-1 | B0 | Reserved | (#455)Reserved. Set to 1 on transmit. See 23.3.20 (PHY receive procedure) for behavior on receive. |
| | B1 | STBC | Set to 1 if all spatial streams have space-time block coding and set to 0 if no spatial streams has space-time block coding. |
| | B2 | Uplink Indication | Set to 1 if the PPDU is addressed to an AP. Set to 0 otherwise. (See TXVECTOR parameter UPLINK_INDICATION.) |
| | B3–B4 | BW | If FORMAT is S1G in TXVECTOR, set to<br>0 when CH_BANDWIDTH is CBW2<br>1 when CH_BANDWIDTH is CBW4<br>2 when CH_BANDWIDTH is CBW8<br>3 when CH_BANDWIDTH is CBW16<br><br>If FORMAT is S1G_DUP_2M in TXVECTOR, set to 0. |
| | B5–B6 | Nsts | Set to 0 for 1 space-time stream<br>Set to 1 for 2 space-time streams<br>Set to 2 for 3 space-time streams<br>Set to 3 for 4 space-time streams |
| | B7–B15 | ID | If Uplink Indication field is not present or (M118)1, B7–B15 are the partial AID to provide an abbreviated indication of the intended recipient(s) of the PSDU (see 10.21). If Uplink Indication field is(M118) 0, B7–B9 are an identifier of the BSS and B10–B15 are the partial AID.<br>(See TXVECTOR parameter COLOR and TXVECTOR parameter PARTIAL_AID.) |
| | B16 | Short GI | Set to 0 if short guard interval is not used in the Data field.<br>Set to 1 if short guard interval is used in the Data field. |
| | B17 | Coding | Set to 0 for BCC and 1 for LDPC |
| | B18 | LDPC Extra | If Coding field is 1, set to 1 if the LDPC PPDU encoding process (of an SU PPDU), results in an extra OFDM symbol (or symbols) as described in 21.3.10.5.4 (LDPC coding), otherwise set to 0.<br><br>If Coding field is 0, this field is set to 1. |
| | B19–B22 | MCS | MCS Index |
| | B23 | Smoothing | A value of 1 indicates that channel smoothing is recommended.<br>A value of 0 indicates that channel smoothing is not recommended. |

**Table 23-12—Fields in the SIG field of short preamble *(continued)***

| Symbol | Bit | Field | Description |
|---|---|---|---|
| SIG-2 | B0 | Aggregation | Set to 1 when aggregation is ON (as indicated by AGGREGATION parameter of TXVECTOR), and 0 otherwise.<br>NOTE— S1G PPDUs are transmitted with aggregation ON when PSDU to be carried is greater than 511 octets, as defined in 10.12.5. |
| | B1–B9 | Length | When the Aggregation subfield is equal to 0, set to the number of octets in the PSDU. When the Aggregation subfield is equal to 1, set to $N_{\mathrm{SYM}_i}$ given in 23.4.3 (TXTIME and PSDU_LENGTH calculation).<br>(See TXVECTOR parameter PSDU_LENGTH.) |
| | B10–B11 | Response Indication | Set to the value obtained from the TXVECTOR parameter RESPONSE_INDICATION. The Response Indication field indicates the presence and type of (#14)the PPDU that is expected to follow SIFS after the current (#14)transmission (see 10.3.2.5). |
| | B12 | Traveling Pilots | Set to 1 to indicate traveling pilots usage in (#14)PPDU. Otherwise 0 to indicate regular pilot tone locations. |
| | B13 | NDP Indication | Differentiate the PPDU from an NDP CMAC PPDU:<br>Set to 0 to indicate that the PPDU is not an NDP CMAC PPDU. |
| | B14–B17 | CRC | CRC calculated as in 23.3.8.2.2.6 (CRC calculation for S1G SIG-A fields). |
| | B18–B23 | Tail | Used to terminate the trellis of the convolutional decoder.<br>Set to 0. |

The first and second half of the stream of 96 complex numbers generated by these steps (before pilot insertion) is divided into two groups of 48 complex numbers $d_{k,n}$, $k = 0, \ldots, 47$, where $n = 0, 1$, respectively. All the 96 complex numbers are rotated by 90° counter-clockwise relative to their original BPSK constellation points in order to accommodate differentiation of the S1G_SHORT PPDU from an S1G_1M PPDU, or from an S1G_LONG PPDU. The first rotated 48 complex numbers form the first symbol of SIG field; and the second rotated 48 complex numbers form the second symbol of SIG field, which follow the constellation diagram shown in Figure 23-9 (Data constellation in SIG field of S1G_SHORT).

**Figure 23-9—Data constellation in SIG field of S1G_SHORT**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The time domain waveform for the SIG field in an S1G_SHORT PPDU at transmit chain $i_{TX}$ shall be as specified in Equation (23-18).

$$r_{\mathrm{SIG}}^{(i_{\mathrm{TX}})}(t) = \frac{1}{\sqrt{N_{\mathrm{SIG}}^{\mathrm{Tone}} N_{\mathrm{STS}}}} \sum_{n=0}^{1} w_{T_{\mathrm{SYML}}}\left(t - nT_{SYML}\right) \sum_{i_{BW}=0}^{N_{2MHz}-1} \left( \sum_{k=-26}^{26} \sum_{m=1}^{N_{STS}} \Upsilon_{(k-K_{shift}(i_{BW})),\mathrm{BW}} \left[Q_k\right]_{i_{TX},m} \left[P_{HTLTF}\right]_{m,1} \left(j.D_{k,n,2} + p_n P_k\right) \cdot \exp\left(j2\pi(k - K_{Shift}(i_{BW}))\Delta_F(t - nT_{SYML} - T_{GI} - T_{CS}(m))\right) \right) \tag{23-18}$$

where

$N_{2MHz}$ is the number of 2 MHz subchannels that are contained within the whole bandwidth of the current PPDU (e.g., $N_{2MHz} = 2$ for a 4 MHz PPDU)

$$K_{Shift}(i) = (N_{2MHz} - 1 - 2i).32 \tag{23-19}$$

$$D_{k,n,2} = \begin{cases} 0, & k = 0, \pm 7, \pm 21 \\ d_{M_2'(k),n}, & \text{otherwise} \end{cases} \tag{23-20}$$

where $M'_2(k)$ is defined in Equation (23-21)

$$M_2'(k) = \begin{cases} k + 26, & -26 \le k \le -22 \\ k + 25, & -20 \le k \le -8 \\ k + 24, & -6 \le k \le -1 \\ k + 23, & 1 \le k \le 6 \\ k + 22, & 8 \le k \le 20 \\ k + 21, & 22 \le k \le 26 \end{cases} \tag{23-21}$$

$p_n$ and $P_k$ are defined in 17.3.5.10 (OFDM modulation)

$T_{CS}(m)$ represents the cyclic shift for space-time stream $m$ with a value given in Table 23-10 (Cyclic shift values for the S1G_SHORT preamble PPDU)

$T_{SYML}$ is defined in Table 23-5 (Timing-related constants)

$\Upsilon_{k,BW}$ is defined by Equation (23-6) to Equation (23-9)

$\Delta_F$ is defined in Table 23-5 (Timing-related constants)

$N_{STS}$ is defined in Table 23-7 (Frequently used parameters)

$P_{HTLTF}$ is defined in 19.3.9.4.6 (HT-LTF definition)

$N_{SIG}^{Tone}$ has the value given in Table 23-8 (Tone scaling factor and guard interval duration values for PHY fields)

$Q_k$ is defined in 23.3.7 (Mathematical description of signals)

NOTE—This definition results in a QBPSK modulation on the two symbols of SIG field, where the constellation of the data tones is rotated by 90º counter-clockwise relative to the third and fourth repetitions of LTF1 field in S1G_1M preamble, and relative to the second symbol of SIG-A field of the S1G_LONG preamble, respectively, as shown in Figure 23-1 (S1G_SHORT format(#7158)) to Figure 23-3 (S1G_1M format(#7158)), to facilitate the differentiation among the three preamble formats at the receiver.

This is an unapproved IEEE Standards Draft, subject to change.

#### 23.3.8.2.2.6 CRC calculation for S1G SIG-A fields

The CRC protects bits 0–25 of the 1 MHz SIG field and bits 0–37 of the ≥ 2 MHz SIG-A field. The value of the CRC field shall be the 1s complement of

$$crc(D) = (M(D) \oplus I(D))D^4 \bmod G(D) \quad (23\text{-}22)$$

where

$M(D) = m_0D^N + m_1D^{N-1} + \ldots + m_ND^0$ is the SIG field or SIG-A represented as a polynomial

where

$N$ is 25 for the 1 MHz SIG field and 37 for the ≥ 2 MHz SIG-A field

$m_i$ is the $i$th bit of the corresponding SIG/SIG-A field

$I(D) = \sum_{i=N-3}^{N} D^i$ are initialization values that are added modulo 2 to the first 4 bits of SIG/SIG-A field

$G(D) = D^4 + D^1 + 1$ is the CRC generating polynomial

$crc(D) = c_3D^3 + c_2D^2 + c_1D^1 + c_0D^0$

The CRC field is transmitted with $c_3$ first.

Figure 23-10 (4-bit CRC calculation) shows the operation of the CRC. First, the shift register is reset to all 1s. The bits are then passed through the XOR operation at the input. When the last bit has entered, the output is generated by shifting the bits out of the shift register, C3 first, through an inverter.

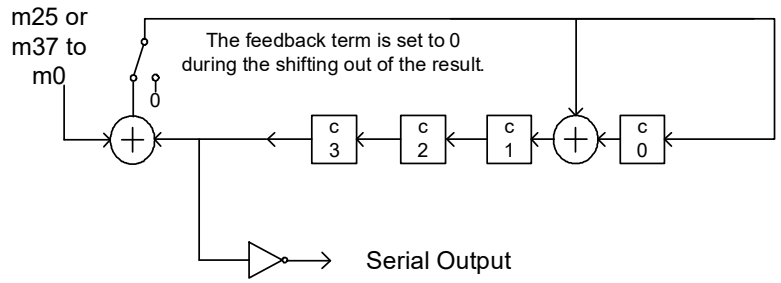

**Figure 23-10—4-bit CRC calculation**

As an example, if bits $\{m_0 \ldots m_{25}\}$ are given by {11 0110 0111 0110 1001 1110 1111}, the output bits $\{b_3 \ldots b_0\}$, where $b_3$ is output first, are {0101}.

### 23.3.8.2.3 S1G_LONG preamble

#### 23.3.8.2.3.1 General

The S1G_LONG preamble is used for the S1G_LONG PPDU format. In contrast to the S1G_1M and S1G_SHORT preambles, the S1G_LONG preamble can be used for MU transmissions, in addition to SU transmissions. The S1G_LONG preamble is structured similarly to the Mixed mode format as defined in Clause 19 (High Throughput (HT) PHY specification(#2297)) and Clause 21 (Very high throughput (VHT) PHY specification).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

#### 23.3.8.2.3.2 Omnidirectional portion

##### 23.3.8.2.3.2.1 General

The omnidirectional portion of the S1G_LONG preamble is single user and single-space-time stream modulated. By definition, to be omnidirectional, no spatial mapping (Q-matrix multiplication) is applied.

##### 23.3.8.2.3.2.2 Cyclic shift for S1G modulated fields

This subclause describes the set of cyclic shift values (defined per-antenna) to be applied to the omnidirectional portion of the S1G_LONG preamble, namely the STF, LTF, and SIG-A fields. The STF, LTF, and SIG-A fields start as single-stream during generation but are replicated up to $N_{TX}$ streams. These fields are mapped to the transmit antennas, at which point the cyclic shifts are applied. The cyclic shift values are defined in Table 23-13 (Per antenna cyclic shift values of S1G_LONG preamble PPDU), which specifies the per-antenna cyclic shift value $T_{CS}^{i_{TX}}$ for antenna $i_{TX}$ of the $N_{TX}$ total transmit antennas.

**Table 23-13—Per antenna cyclic shift values of S1G_LONG preamble PPDU**

| $T_{CS}^{i_{TX}}$ for ≥ 2 MHz, omnidirectional portion of S1G_LONG Preamble PPDU | | | | |
|---|---|---|---|---|
| Total number of Tx antennas | Cyclic shift (for Tx Antenna $i_{TX}$) (μs) | | | |
| | 1 | 2 | 3 | 4 |
| 1 | 0 | N/A | N/A | N/A |
| 2 | 0 | –4 | N/A | N/A |
| 3 | 0 | –4 | –2 | N/A |
| 4 | 0 | –4 | –2 | –6 |
| NOTE—N/A = not applicable. | | | | |

##### 23.3.8.2.3.2.3 STF definition

The STF field for 2 MHz, 4 MHz, 8 MHz, and 16 MHz are the same as the STF field in short preamble as specified in 23.3.8.2.2.3 (STF definition).

The time domain representation of the STF field signal at transmit chain $i_{TX}$ shall be as specified in Equation (23-23).

$$r_{STF}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{STF}^{Tone} N_{TX}}} w_{T_{STF}}(t) \sum_{k=-N_{SR}}^{N_{SR}} [Q_k^{(\text{omni})}]_{i_{TX},1} \Upsilon_{k,\text{BW}} S_k \exp(j2\pi k \Delta_F t) \quad (23\text{-}23)$$

where

$N_{SR}$ is 26 for a 2 MHz transmission or defined in Table 23-5 (Timing-related constants) for a 4 MHz, 8 MHz or 16 MHz transmission.

$S_k$ is defined in Equation (19-8), Equation (19-9), Equation (21-8), or Equation (21-9) for a 2 MHz, 4 MHz, 8 MHz, or 16 MHz transmission, respectively.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$\Upsilon_{k,BW}$ is defined by Equation (23-6) to Equation (23-9)

$\Delta_F$ is defined in Table 23-5 (Timing-related constants)

$N_{STF}^{Tone}$ has the value given in tone scaling factor and guard interval duration values for PHY fields in Table 23-8 (Tone scaling factor and guard interval duration values for PHY fields)

$Q_k^{(omni)}$ is defined in 23.3.7 (Mathematical description of signals)

#### 23.3.8.2.3.2.4 LTF1 definition

The LTF1 field values for 2 MHz, 4 MHz, 8 MHz, and 16 MHz are the same as the LTF field in short preamble as specified in 23.3.8.2.2.4 (LTF definition).

The time domain representation of the LTF1 field signal at transmit chain $i_{TX}$ shall be as specified in Equation (23-24).

$$r_{\mathrm{LTF1}}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{LTF}^{Tone} N_{TX}}} w_{\mathrm{T}_{LTF1}}(t) \sum_{k=-N_{SR}}^{N_{SR}} [Q_k^{(\mathrm{omni})}]_{i_{TX},1} \Upsilon_{k,\mathrm{BW}} LTF_k \exp(j2\pi k\Delta_F(t - T_{GI2})) \quad (23\text{-}24)$$

where

$LTF_k$ is defined in Equation (21-36), Equation (21-37), Equation (21-38), or Equation (21-39) for a 2 MHz, 4 MHz, 8 MHz, or 16 MHz transmission, respectively

$N_{SR}$ is defined in Table 23-5 (Timing-related constants)

$\Upsilon_{k,BW}$ is defined by Equation (23-6) to Equation (23-9)

$\Delta_F$ is defined in Table 23-5 (Timing-related constants)

$N_{STF}^{Tone}$ has the value given in Table 23-8 (Tone scaling factor and guard interval duration values for PHY fields)

$Q_k^{(omni)}$ is defined in 23.3.7 (Mathematical description of signals).

The LTF1 field consists of two periods of the long training symbol, preceded by a double length (16 μs) cyclic prefix. The placement of the first and subsequent LTF fields in an S1G_SHORT PPDU is shown in Figure 23-1 (S1G_SHORT format(#7158)).

#### 23.3.8.2.3.2.5 SIG-A definition

The SIG-A field of the long preamble carries information required to interpret (#2095)S1G PPDUs sent using the long preamble. The structure of the SIG-A field is different for SU PPDUs and MU PPDUs. The structure of the SIG-A field for SU PPDUs for the first symbol (SIG-A1) is shown in Figure 23-11 (SIG-A1 structure for SU PPDU) and for the second symbol (SIG-A2) is shown in Figure 23-12 (SIG-A2 structure for SU PPDU). The structure of the SIG-A field for MU PPDUs for the first symbol (SIG-A1) is shown in Figure 23-13 (SIG-A1 structure for MU PPDU) and for the second symbol (SIG-A2) is shown in Figure 23-14 (SIG-A2 structure for MU PPDU).

The SIG-A field of (#2095)S1G PPDUs sent with an S1G_LONG preamble for SU contains the fields listed in Table 23-14 (Fields in the SIG-A field of S1G_LONG preamble SU PPDU) and for MU, the fields listed in Table 23-15 (Fields in the SIG-A field of S1G_LONG preamble MU PPDU).

**Table 23-14—Fields in the SIG-A field of S1G_LONG preamble SU PPDU**

| Symbol | Bit | Field | Description |
|---|---|---|---|
| SIG-A1 | B0 | MU/SU | Set to 0 for SU PPDUs. |
| | B1 | STBC | Set to 1 if all spatial streams have space-time block coding and set to 0 if no spatial streams has space-time block coding. |
| | B2 | Uplink Indication | Set to 1 if the PPDU is addressed to an AP. Set to 0 otherwise. (See TXVECTOR parameter UPLINK_INDICATION.) |
| | B3–B4 | BW | Set to 0 for 2 MHz, 1 for 4 MHz, 2 for 8 MHz, 3 for 16 MHz |
| | B5–B6 | Nsts | Set to 0 for 1 space-time stream<br>Set to 1 for 2 space-time streams<br>Set to 2 for 3 space-time streams<br>Set to 3 for 4 space-time streams |
| | B7–B15 | ID | If Uplink Indication field is not present or(M118) 1, B7–B15 are the partial AID to provide an abbreviated indication of the intended recipient(s) of the PSDU (see 10.21). If Uplink Indication field is(M118) 0, B7-B9 are an identifier of the BSS and B10–B15 are the partial AID.<br>(See TXVECTOR parameter COLOR and TXVECTOR parameter PARTIAL_AID.) |
| | B16 | Short GI | Set to 0 if short guard interval is not used in the Data field.<br>Set to 1 if short guard interval is used in the Data field. |
| | B17 | Coding | Set to 0 for BCC and 1 for LDPC |
| | B18 | LDPC Extra | If Coding field is 1, set to 1 if the LDPC PPDU encoding process (of an SU PPDU), results in an extra OFDM symbol (or symbols) as described in 21.3.10.5.4 (LDPC coding), otherwise set to 0.<br><br>If Coding field is 0, this field is set to 1. |

**Table 23-14—Fields in the SIG-A field of S1G_LONG preamble SU PPDU *(continued)***

| Symbol | Bit | Field | Description |
|---|---|---|---|
| SIG-A2 | B0 | Aggregation | Set to 1 when aggregation is ON (as indicated by AGGREGATION parameter of TXVECTOR), and 0 otherwise.<br><br>NOTE—S1G PPDUs are transmitted with aggregation ON when PSDU to be carried is greater than 511 octets, as defined in 10.12.5. |
| | B1–B9 | Length | When the Aggregation subfield is equal to 0, set to the number of octets in the PSDU. When the Aggregation subfield is equal to 1, set to $N_{\mathrm{SYM}_i}$, given in 23.4.3 (TXTIME and PSDU_LENGTH calculation). (See TXVECTOR parameter PSDU_LENGTH.) |
| | B10–B11 | Response Indication | Set to the value obtained from the TXVECTOR parameter RESPONSE_INDICATION. The Response Indication field indicates the presence and type of (#14)the PPDU that is expected to follow SIFS after the current (#14)transmission (see 10.3.2.5). |
| | B12 | Reserved | (#455)Reserved. Set to 1 on transmit. See 23.3.20 (PHY receive procedure) for behavior on receive. |
| | B13 | Traveling Pilots | Set to 1 to indicate traveling pilots usage in (#14)PPDU. Otherwise 0 to indicate regular pilot tone locations. |
| | B14–B17 | CRC | CRC calculated as in 23.3.8.2.2.6 (CRC calculation for S1G SIG-A fields). |
| | B18–B23 | Tail | Used to terminate the trellis of the convolutional decoder. Set to 0. |

NOTE 1—When the Nsts subfield indicates 1 space-time stream, if Beam Change/Smoothing Indication field is set to 0, the receiver may (#185)perform channel smoothing. Otherwise, smoothing is not recommended.

NOTE 2—The Q matrix for omnidirectional portion is $Q_k^{(\mathrm{omni})}$ as defined in 23.3.7 (Mathematical description of signals).

This is an unapproved IEEE Standards Draft, subject to change.

The SIG-A field is composed of two OFDM symbols, SIG-A1 and SIG-A2, each containing 24 data bits, as shown in Table 23-14 (Fields in the SIG-A field of S1G_LONG preamble SU PPDU). SIG-A1 is transmitted before SIG-A2. The SIG-A field symbols shall be BCC encoded at rate, R = 1/2, interleaved, mapped to a BPSK constellation, and have pilots inserted following the steps described in 17.3.5.6 (Convolutional encoder), 17.3.5.7 (Data interleaving), 17.3.5.8 (Subcarrier modulation mapping), and 17.3.5.9 (Pilot subcarriers), respectively. The first and second half of the stream of 96 complex numbers generated by these steps (before pilot insertion) is divided into two groups of 48 complex numbers $d_{k,n}$, $k = 0, \ldots, 47$, where $n = 0, 1$, respectively. The first group of the 48 complex numbers are rotated by 90° counter-clockwise relative to their original BPSK constellation points in order to accommodate differentiation of the S1G_LONG PPDU from an S1G_1M PPDU. The second group of the 48 complex numbers without rotations may be used to accommodate differentiation of the S1G_LONG PPDU from an S1G_SHORT PPDU. The first rotated 48 complex numbers form the first symbol of SIG-A; and the second unrotated 48 complex numbers form the second symbol of SIG-A, which follow the constellation diagram shown in Figure 23-15 (Data constellation in SIG-A field of S1G_LONG).

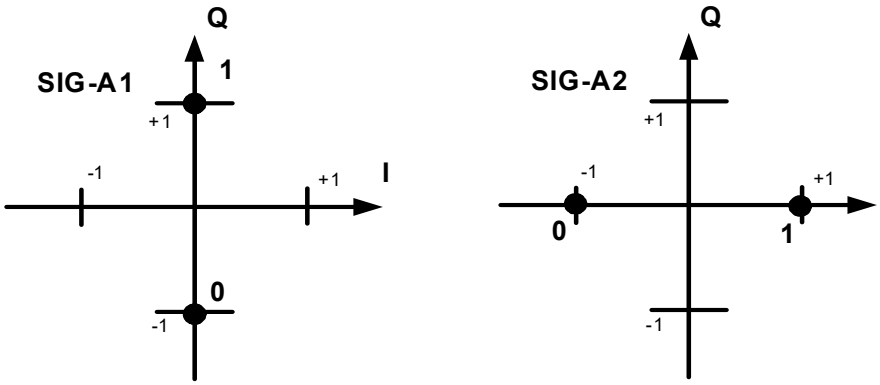

**Figure 23-15—Data constellation in SIG-A field of S1G_LONG**

The time domain waveform for the SIG-A field in an S1G_LONG PPDU at transmit chain $i_{TX}$ shall be as specified in Equation (23-25).

$$r_{SIG-A}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{SIG-A}^{Tone} N_{TX}}} \sum_{n=0}^{1} w_{T_{SYML}}(t - nT_{SYML}) \sum_{i_{BW}=0}^{N_{2MHz}-1} \left( \sum_{k=-26}^{26} [Q_k^{(\text{omni})}]_{i_{TX},1} \Upsilon_{(k-K_{Shift}(i_{BW})),BW}((-1)^n j^{n+1} D_{k,n,2} + p_n P_k) \exp(j2\pi(k - K_{Shift}(i_{BW}))\Delta_F(t - nT_{SYML} - T_{GI})) \right) \quad (23\text{-}25)$$

where

$N_{2MHz}$, $K_{Shift}(i)$, and $D_{k,n,2}$ are the same as those defined in 23.3.8.2.2.5 (SIG definition)

$p_n$ and $P_k$ are defined in 17.3.5.10 (OFDM modulation)

$T_{SYML}$ is defined in Table 23-5 (Timing-related constants)

$\Upsilon_{k,BW}$ is defined by Equation (23-6) to Equation (23-9)

$\Delta_F$ is defined in Table 23-5 (Timing-related constants)

$N_{SIG\text{-}A}^{Tone}$ has the value given in tone scaling factor and guard interval duration values for PHY fields in Table 23-8 (Tone scaling factor and guard interval duration values for PHY fields)

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$Q_k^{(omni)}$ is defined in 23.3.7 (Mathematical description of signals)

NOTE—As shown in Figure 23-1 (S1G_SHORT format(#7158)) to Figure 23-3 (S1G_1M format(#7158)), this definition results in a QBPSK modulation on the first symbol of SIG-A field, where the constellation of the data tones is rotated by 90º counter-clockwise relative to the third repetition of LTF1 field in S1G_1M preamble, facilitating its differentiation from S1G_1M; and the second symbol of SIG-A field is BPSK modulated, facilitating its differentiation from S1G_SHORT.

#### 23.3.8.2.3.3 Beamchangeable portion

##### 23.3.8.2.3.3.1 General

The beamchangeable portion of the S1G_LONG preamble can be either single-user or multi-user modulated with single or multiple space-time streams. Beamforming can be applied through spatial mapping (Q-matrix multiplication) starting with the beamchangeable portion of the preamble and continuing into the Data field.

Beamchangeable portion of the long preamble could be either single user or multi-user modulated.

##### 23.3.8.2.3.3.2 Cyclic shift for S1G modulated fields

This subclause describes the set of cyclic shift values (defined per space-time stream) to be applied to the beamchangeable portion of the S1G_LONG preamble, namely the D-STF, D-LTF, and SIG-B fields. In a transmission, these fields start as single stream and are replicated up to $N_{STS,total}$ streams at which point the cyclic shifts are applied. The cyclic shift values are defined in Table 23-16 (Per space-time stream cyclic shift values of S1G_LONG preamble PPDU), which specifies the per-stream cyclic shift value $T_{CS}(n)$ for space-time stream *n* out of $N_{STS,total}$ total space-time streams.

When the S1G_LONG preamble PPDU is used for an MU transmission, the cyclic shifts of the beamchangeable portion are applied sequentially, first per user and then per space-time stream up to the total number of users and space-time streams $N_{STS,total}$ as follows: the cyclic shift of the space-time stream number m for user *u* is given by $T_{CS}(M_u + m)$, of the row corresponding to $N_{STS,total}$ in Table 23-16 (Per space-time stream cyclic shift values of S1G_LONG preamble PPDU). In this case, the index *n* takes into account the cyclic shifts already applied to space-time streams of prior users ($M_u$), and the space-time stream index ($m$) of the current user *u* in the sequence.

$M_u$ is given by Table 23-7 (Frequently used parameters).

**Table 23-16—Per space-time stream cyclic shift values of S1G_LONG preamble PPDU**

| $T_{CS,S1G}^{long}(n)$ for ≥2 MHz, beam changeable portion of S1G_LONG preamble PPDU | | | | |
|---|---|---|---|---|
| **Total number of space-time streams ($N_{STS,total}$)** | **Cyclic for space-time stream n (μs)** | | | |
| | **1** | **2** | **3** | **4** |
| 1 | 0 | N/A | N/A | N/A |
| 2 | 0 | –4 | N/A | N/A |
| 3 | 0 | –4 | –2 | N/A |
| 4 | 0 | –4 | –2 | –6 |
| NOTE—N/A = not applicable. | | | | |

#### 23.3.8.2.3.3.3 D-STF definition

The main purpose of the D-STF field is to improve automatic gain control estimation in an SU or MU MIMO transmission. The duration of the D-STF field is 40 μs. The frequency domain sequence $\{S_k\}$ used to construct the D-STF field is the same as the STF field in short or long preamble as indicated in 23.3.8.2.2.3 (STF definition).

The time domain representation of the D-STF field signals at transmit chain $i_{TX}$ shall be as specified in Equation (23-26).

$$r_{\text{D-STF}}^{(i_{\text{TX}})}(t) = \frac{1}{\sqrt{N_{\text{D-STF}}^{\text{Tone}} N_{\text{STS,total}}}} w_{T_{\text{D-STF}}}(t) \sum_{k=-N_{SR}}^{N_{SR}} \sum_{u=0}^{N_u-1} \sum_{m=1}^{N_{STS,u}} \left( \begin{array}{l} \left[Q_k\right]_{i_{TX},(M_u+m)} \Upsilon_{k,\text{BW}} \cdot S_k \\ \cdot \exp\left(j2\pi k\Delta_F (t - T_{CS}(M_u+m))\right) \end{array} \right) \quad (23\text{-}26)$$

where

$N_{SR}$ is defined in Table 23-5 (Timing-related constants)

$T_{CS(m)}$ represents the cyclic shift for space-time stream *m* with a value given in Table 23-16 (Per space-time stream cyclic shift values of S1G_LONG preamble PPDU)

$\Upsilon_{k,\text{BW}}$ is defined by Equation (23-6) to Equation (23-9)

$\Delta_F$ is defined in Table 23-5 (Timing-related constants)

$N_{STS,total}$, $N_{STS,u}$, $N_u$, and $M_u$ are defined in Table 23-7 (Frequently used parameters).

$N_{\text{D-STF}}^{\text{Tone}}$ has the value given in tone scaling factor and guard interval duration values for PHY fields in Table 23-8 (Tone scaling factor and guard interval duration values for PHY fields)

$Q_k$ is defined in 23.3.7 (Mathematical description of signals)

The duration of the D-STF field is $T_{\text{D-STF}}$ regardless of the Short GI field setting in SIG-A.

#### 23.3.8.2.3.3.4 D-LTF definition

The D-LTF field values for 2 MHz, 4 MHz, 8 MHz, and 16 MHz are the same as the LTF field in short preamble as specified in 23.3.8.2.2.4 (LTF definition).

The generation of the time domain D-LTF field symbols per frequency segment is shown in Figure 23-6 (Generation of LTF symbols).

The time domain representation of the D-LTF field signals at transmit chain $i_{TX}$ shall be as specified in Equation (23-27).

$$\begin{aligned} r_{\text{D-LTF}}^{(i_{\text{TX}})}(t) = & \frac{1}{\sqrt{N_{\text{D-LTF}}^{\text{Tone}} N_{\text{STS,total}}}} \sum_{n=0}^{N_{LTF}-1} w_{T_{\text{D-LTF}}}(t - nT_{D-LTF}) \\ & \sum_{k=-N_{SR}}^{N_{SR}} \sum_{u=0}^{N_u-1} \sum_{m=1}^{N_{STS,u}} \left( \begin{array}{l} \left[Q_k\right]_{i_{TX},(M_u+m)} \Upsilon_{k,\text{BW}} \cdot \left[A_{LTF}^k\right]_{(M_u+m),(n+1)} LTF_k \\ \cdot \exp\left(j2\pi k\Delta_F (t - nT_{D-LTF} - T_{GI} - T_{CS}(M_u+m))\right) \end{array} \right) \end{aligned} \quad (23\text{-}27)$$

where

$N_{SR}$ is defined in Table 23-5 (Timing-related constants)

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$T_{CS(m)}$ represents the cyclic shift for space-time stream $m$ with a value given in Table 23-16 (Per space-time stream cyclic shift values of S1G_LONG preamble PPDU)

$\Upsilon_{k,\mathrm{BW}}$ is defined by Equation (23-6) to Equation (23-9)

$\Delta_F$ is defined in Table 23-5 (Timing-related constants)

$N_{STS,total}$, $N_{STS,u}$, $N_u$, and $M_u$ are defined in Table 23-7 (Frequently used parameters)

$A_{LTF}^{k}$ is defined in Equation (23-15)

$N_{\mathrm{D\text{-}STF}}^{\mathrm{Tone}}$ has the value given in tone scaling factor and guard interval duration values for PHY fields in Table 23-8 (Tone scaling factor and guard interval duration values for PHY fields)

$Q_k$ is defined in 23.3.7 (Mathematical description of signals)

As indicated by Equation (23-27), the duration of each symbol of the D-LTF field is $T_{\mathrm{D\text{-}LTF}}$ regardless of the Short GI field setting in SIG-A.

The generation of the time domain D-LTF field symbols is the same as Figure 23-6 (Generation of LTF symbols), with $N_{STS}$ replaced by $N_{STS,total}$.

#### 23.3.8.2.3.3.5 SIG-B definition

If the SU/MU Indication subfield in SIG-A field is(M118) 0 (SU), then SIG-B field is one symbol that is identical to the first D-LTF field (D-LTF1). In this case, the time domain representation of the SIG-B field at transmit chain $i_{TX}$ shall be as specified in Equation (23-27) with $n$=0.

If the SU/MU Indication subfield in SIG-A field is(M118) 1 (MU), then SIG-B field is one symbol and contains 26 bits in a 2 MHz PPDU, 27 bits in a 4 MHz PPDU and 29 bits in 8 MHz and 16 MHz PPDUs for each user. The fields in the SIG-B field are listed in Table 23-17 (Fields in the SIG-B field for MU PPDU).

**Table 23-17—Fields in the SIG-B field for MU PPDU**

| Field | Bit Allocation | | | | Description |
|---|---|---|---|---|---|
| | 2 MHz | 4 MHz | 8 MHz | 16 MHz | |
| MCS | B0–B3 | B0–B3 | B0–B3 | B0–B3 | Per-user MCS in MU-MIMO |
| Reserved | B4–B11 | B4–B12 | B4–B14 | B4–B14 | (#455)Set to all 1s on transmit. See 23.3.20 (PHY receive procedure) for behavior on receive. |
| CRC | B12–B19 | B13–B20 | B15–B22 | B15–B22 | |
| Tail | B20–B25 | B21–B26 | B23–B28 | B23–B28 | All 0s |

The 8-bit CRC is calculated according to the procedure described in 23.3.8.2.3.3.6 (CRC calculation for SIG SIG-B field).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

In this case, the repetition, encoding, interleaving and modulation flow for the data subcarriers of SIG-B field in 2 MHz, 4 MHz, 8 MHz, and 16 MHz are identical to those specified for 20 MHz, 40 MHz, 80 MHz, and 160 MHz, respectively, as shown in 21.3.8.3.6 (VHT-SIG-B definition). Different from the VHT-SIG-B field defined in Clause 21 (Very high throughput (VHT) PHY specification), the pilot subcarriers of SIG-B field are mapped by the first column of $P_{\mathrm{HTLTF}}$ matrix to $N_{\mathrm{STS}}$, total space-time streams, and the pilot polarity of the SIG-B symbol is $p_2$ instead of $p_3$. The time domain representation for SIG-B field signal at transmit chain $i_{TX}$ shall be as specified in Equation (23-28).

$$r_{\mathrm{SIG\text{-}B}}^{(i_{\mathrm{TX}})}(t)=\frac{1}{\sqrt{N_{\mathrm{SIG\text{-}B}}^{\mathrm{Tone}}N_{\mathrm{STS,total}}}}w_{T_{\mathrm{SIG\text{-}B}}}(t)\sum_{k=-N_{SR}}^{N_{SR}}\sum_{u=0}^{N_u-1}\sum_{m=1}^{N_{STS,u}}\left(\begin{array}{l}\left[Q_k\right]_{i_{TX},(M_u+m)}\Upsilon_{k,\mathrm{BW}}\cdot\left[P_{HTLTF}\right]_{(M_u+m),1}\left(D_{k,BW}^{(u)}+p_2P_0^k\right)\\ \cdot\exp\left(j2\pi k\Delta_F(t-T_{GI}-T_{CS}(M_u+m))\right)\end{array}\right) \tag{23-28}$$

where

$N_{SR}$ is defined in Table 23-5 (Timing-related constants)

$T_{CS(m)}$ represents the cyclic shift for space-time stream $m$ with a value given in Table 23-16 (Per space-time stream cyclic shift values of S1G_LONG preamble PPDU)

$\Upsilon_{k,\mathrm{BW}}$ is defined by Equation (23-6) to Equation (23-9)

$\Delta_F$ is defined in Table 23-5 (Timing-related constants)

$N_{STS,total}$ , $N_{STS,u}$ , $N_u$ , and $M_u$ are defined in Table 23-7 (Frequently used parameters)

$P_{HTLTF}$ is defined in Equation (19-27) in 19.3.9.4.6 (HT-LTF definition)

$p_n$ is defined in 17.3.5.10 (OFDM modulation)

$P_n^k$ is defined in 21.3.10.10 (Pilot subcarriers)

$N_{\mathrm{SIG\text{-}B}}^{\mathrm{Tone}}$ has the value given in tone scaling factor and guard interval duration values for PHY fields in Table 23-8 (Tone scaling factor and guard interval duration values for PHY fields)

$Q_k$ is defined in 23.3.7 (Mathematical description of signals)

For a 2 MHz transmission,

$$D_{k,2}^{(u)}=\begin{cases}0, k=0,\pm7,\pm21\\ d_{M_2'(k)}^{(u)}, \text{otherwise}\end{cases} \tag{23-29}$$

$$M_2'(k)=\begin{cases}k+28, & -28\le k\le -22\\ k+27, & -20\le k\le -8\\ k+26, & -6\le k\le -1\\ k+25, & 1\le k\le 6\\ k+24, & 8\le k\le 20\\ k+23, & 22\le k\le 28\end{cases} \tag{23-30}$$

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

For a 4 MHz transmission,

$$D_{k,4}^{(u)} = \begin{cases} 0, k = 0, \pm 1, \pm 11, \pm 25, \pm 53 \\ d_{M_4'(k)}^{(u)}, \text{otherwise} \end{cases} \quad (23\text{-}31)$$

$$M_4'(k) = \begin{cases} k+58, & -58 \le k \le -54 \\ k+57, & -52 \le k \le -26 \\ k+56, & -24 \le k \le -12 \\ k+55, & -10 \le k \le -2 \\ k+52, & 2 \le k \le 10 \\ k+51, & 12 \le k \le 24 \\ k+50, & 26 \le k \le 52 \\ k+49, & 54 \le k \le 58 \end{cases} \quad (23\text{-}32)$$

For an 8 MHz transmission,

$$D_{k,8}^{(u)} = \begin{cases} 0, k = 0, \pm 1, \pm 11, \pm 39, \pm 75, \pm 103 \\ d_{M_8'(k)}^{(u)}, \text{otherwise} \end{cases} \quad (23\text{-}33)$$

$$M_8'(k) = \begin{cases} k+122, & -122 \le k \le -104 \\ k+121, & -102 \le k \le -76 \\ k+120, & -74 \le k \le -40 \\ k+119, & -38 \le k \le -12 \\ k+118, & -10 \le k \le -2 \\ k+115, & 2 \le k \le 10 \\ k+114, & 12 \le k \le 38 \\ k+113, & 40 \le k \le 74 \\ k+112, & 76 \le k \le 102 \\ k+111, & 104 \le k \le 122 \end{cases} \quad (23\text{-}34)$$

For a 16 MHz transmission

$$D_{k,16}^{(u)} = \begin{cases} 0, k = 0, \pm 1, \pm 2, \pm 3, \pm 4, \pm 5, \pm 25, \pm 53, \pm 89, \pm 117, \pm 127, \pm 128, \pm 129, \pm 139, \pm 167, \pm 203, \pm 231 \\ d_{M_{16}'(k)}^{(u)}, \text{otherwise} \end{cases}$$

$$M'_{16}(k) = \begin{cases} k+250, & -250 \le k \le -232 \\ k+249, & -230 \le k \le -204 \\ k+248, & -202 \le k \le -168 \\ k+247, & -166 \le k \le -140 \\ k+246, & -138 \le k \le -130 \\ k+243, & -126 \le k \le -118 \\ k+242, & -116 \le k \le -90 \\ k+241, & -88 \le k \le -54 \\ k+240, & -52 \le k \le -26 \\ k+239, & -24 \le k \le -6 \\ k+228, & 6 \le k \le 24 \\ k+227, & 26 \le k \le 52 \\ k+226, & 54 \le k \le 88 \\ k+225, & 90 \le k \le 116 \\ k+224, & 118 \le k \le 126 \\ k+221, & 130 \le k \le 138 \\ k+220, & 140 \le k \le 166 \\ k+219, & 168 \le k \le 202 \\ k+218, & 204 \le k \le 230 \\ k+217, & 232 \le k \le 250 \end{cases} \quad (23\text{-}35)$$

#### 23.3.8.2.3.3.6 CRC calculation for SIG SIG-B field

The CRC protects the MCS and Reserved field bits of the SIG-B field. The value of the CRC field shall be the 1s complement of

$$crc(D) = (M(D) \oplus I(D))D^8 \bmod G(D) \quad (23\text{-}36)$$

where

$M(D) = m_0 D^N + m_1 D^{N-1} + \ldots + m_N D^0$ is the MCS and Reserved field appended (bits 0–$N$ of SIG B) and represented as a polynomial

where

$N$ is 11, 12, 14, and 14 for 2 MHz, 4 MHz, 8 MHz, and 16 MHz SIG-B fields, respectively

$m_i$ is the $i$th bit of the corresponding SIG-B field

$I(D) = \sum_{i=N-7}^{N} D^i$ are the initialization values that are added to the first 8 bits of the SIG-B field

$G(D) = D^8 + D^2 + D^1 + 1$ is the CRC generating polynomial

$crc(D) = c_0 D^7 + c_1 D^6 + \ldots + c_6 D^1 + c_7$

The CRC field is transmitted with $c_7$ first.

Figure 19-8 (HT-SIG CRC calculation) in 19.3.9.4.4 (CRC calculation for HT-SIG) shows the operation of the CRC using the same generator polynomial. For SIG-B CRC operation specifically, the bits are(M118) input serially from $m_N$ to $m_0$.

### 23.3.8.3 Format for 1 MHz

#### 23.3.8.3.1 Introduction

This subclause describes the preamble format used for non-duplicate S1G PPDUs of 1 MHz and duplicate S1G_DUP_1M PPDUs.

#### 23.3.8.3.2 Cyclic shift for S1G modulated fields

The cyclic shift values defined in this subclause apply to the STF, LTF, SIG and Data fields of the S1G_1M PPDU. Throughout the S1G_1M preamble, cyclic shifts are applied to prevent beamforming when similar signals are transmitted in different space-time streams. The STF, LTF, and SIG fields start as single stream during generation but are replicated up to $N_{STS,total}$ streams. For the LTF, these replicated streams undergo P-matrix mapping prior to CSD application as shown in Figure 23-6 (Generation of LTF symbols). For the STF and SIG the CSDs are applied per stream immediately after replication. The same cyclic shift is applied to the $N_{STS,total}$ streams during the transmission of the Data field of the S1G_1M PPDU. The cyclic shift value $T_{CS}(n)$ for space-time stream $n$ out of $N_{STS,total}$ total space-time streams is shown in Table 23-18 (Cyclic shift values of S1G_1M PPDU).

**Table 23-18—Cyclic shift values of S1G_1M PPDU**

| $T_{CS}(n)$ values for S1G_1M PPDU | | | | |
|---|---|---|---|---|
| **Total number of space-time streams ($N_{STS,total}$)** | **Cyclic shift for space-time stream *n* (μs)** | | | |
| | **1** | **2** | **3** | **4** |
| 1 | 0 | — | — | — |
| 2 | 0 | –4 | — | — |
| 3 | 0 | –4 | –1 | — |
| 4 | 0 | –4 | –1 | –5 |

#### 23.3.8.3.3 STF definition

The STF field in S1G_1M preamble is repeated with 4 OFDM symbols, i.e., twice the duration of the STF fields in S1G_SHORT preamble and S1G_LONG preamble.

The time domain representation of the STF field signal at transmit chain $i_{TX}$ shall be as specified in Equation (23-37).

$$r_{\mathrm{STF}}^{(i_{\mathrm{TX}})}(t) = \frac{\alpha(\mathrm{MCS})}{\sqrt{N_{\mathrm{STF}}^{\mathrm{Tone}} N_{\mathrm{STS}}}} w_{T_{\mathrm{STF}}}(t) \sum_{k=-N_{SR}}^{N_{SR}} \sum_{m=1}^{N_{STS}} \left[Q_k\right]_{i_{TX},m} \left[P_{HTLTF}\right]_{m,1} \cdot S_k \exp\left(j2\pi k\Delta_F (t - T_{CS}(m))\right) \quad (23\text{-}37)$$

where

$N_{SR}$ is defined in Table 23-5 (Timing-related constants)

$T_{CS}(m)$ represents the cyclic shift for space-time stream $m$ with a value given in Table 23-18 (Cyclic shift values of S1G_1M PPDU)

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$\Delta_F$ is defined in Table 23-5 (Timing-related constants)

$N_{STS}$ is defined in Table 23-7 (Frequently used parameters)

$P_{HTLTF}$ is defined in Equation (19-27) in 19.3.9.4.6 (HT-LTF definition)

$N_{\mathrm{STF}}^{\mathrm{Tone}}$ has the value given in tone scaling factor and guard interval duration values for PHY fields in Table 23-8 (Tone scaling factor and guard interval duration values for PHY fields)

$S_k$ has nonzero values $[0.5, -1, 1, -1, -1, -0.5] \times (1+j) \times \sqrt{2/3}$ on tones $k = [-12,-8,-4,4,8,12]$, respectively

$\alpha(MCS)$ is an MCS dependent scaling factor, with the following value $\alpha(MCS) = \begin{cases} \sqrt{2}, & \text{MCS=10} \\ 1, & \text{otherwise} \end{cases}$

$Q_k$ is defined in 23.3.7 (Mathematical description of signals)

### 23.3.8.3.4 LTF definition

The duration of the first LTF (LTF1) field in S1G_1M preamble is of 4 OFDM symbols with repetitions, i.e., twice the duration of the LTF1 fields in S1G_LONG preamble and S1G_SHORT preamble. The first two repetitions have the same structure as the LTF1 field in S1G_LONG preamble and S1G_SHORT preamble, i.e., they consist of two periods of the long training symbol, preceded by a double length (16 μs) cyclic prefix. Each of the last two repetitions of LTF1 field consists one period of the long training symbol preceded by a normal length (8 μs) cyclic prefix. The duration of the each of the remaining LTFs in S1G_1M preamble is of one OFDM symbol.

The placement of the first and subsequent LTFs in an S1G_1M PPDU is shown in Figure 23-3 (S1G_1M format(#7158)).

The generation of the time domain LTF symbols is the same as Table 23-7 (Frequently used parameters).

The time domain representation of the first two repetitions of the LTF1 field, and the last two repetitions of the LTF1 field shall be as specified in Equation (23-38) and Equation (23-39), respectively

$$r_{\mathrm{LTF1\_1,2}}^{(i_{\mathrm{TX}})}(t) = \frac{1}{\sqrt{N_{\mathrm{LTF}}^{\mathrm{Tone}} N_{\mathrm{STS}}}} w_{T_{\mathrm{LTF1}}}(t) \sum_{k=-N_{SR}}^{N_{SR}} \sum_{m=1}^{N_{STS}} \left( \begin{array}{l} \left[ Q_k \right]_{i_{TX},m} \Upsilon_{k,\mathrm{BW}} \left[ A_{LTF}^{k} \right]_{m,1} LTF_k \\ \cdot \exp\left( j2\pi k \Delta_F (t - T_{GI2} - T_{CS}(m)) \right) \end{array} \right) \quad (23\text{-}38)$$

$$r_{\mathrm{LTF1\_3,4}}^{(i_{\mathrm{TX}})}(t) = \frac{1}{\sqrt{N_{\mathrm{LTF}}^{\mathrm{Tone}} N_{\mathrm{STS}}}} w_{T_{\mathrm{LTF}}}(t) \sum_{k=-N_{SR}}^{N_{SR}} \sum_{m=1}^{N_{STS}} \left( \begin{array}{l} \left[ Q_k \right]_{i_{TX},m} \Upsilon_{k,\mathrm{BW}} \left[ A_{LTF}^{k} \right]_{m,1} LTF_k \\ \cdot \exp\left( j2\pi k \Delta_F (t - T_{GI} - T_{CS}(m)) \right) \end{array} \right) \quad (23\text{-}39)$$

where

$N_{SR}$, $T_{LTF1}$, and $T_{LTF}$ are defined in Table 23-5 (Timing-related constants)

$T_{CS(m)}$ represents the cyclic shift for space-time stream $m$ with a value given in Table 23-18 (Cyclic shift values of S1G_1M PPDU)

$\Upsilon_{k,\mathrm{BW}}$ is defined by Equation (23-6) to Equation (23-9)

$\Delta_F$ is defined in Table 23-5 (Timing-related constants)

$N_{STS}$ is defined in Table 23-7 (Frequently used parameters)

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$N_{\mathrm{LTF}}^{\mathrm{Tone}}$ has the value given in tone scaling factor and guard interval duration values for PHY fields in Table 23-8 (Tone scaling factor and guard interval duration values for PHY fields)

$A_{LTF}^{k}$ is defined in Equation (23-40)

$Q_k$ is defined in 23.3.7 (Mathematical description of signals)

$$A_{LTF}^{k} = \begin{cases} \left[P_{HTLTF}\right]_{*,1} \times \left[1 \quad 1 \quad 1 \quad 1\right], \text{ if } k \in K_{\text{Pilot\_Fix}} \\ P_{HTLTF}, \text{ otherwise} \end{cases} \tag{23-40}$$

where

$K_{\text{Pilot\_Fix}}$ is the subcarrier indices for the fixed pilot tones. For a 1 MHz transmission, $K_{\text{Pilot\_Fix}} = \{\pm 7\}$ .

$[P_{HTLTF}]_{*,1}$ is the first column of the $P_{HTLTF}$ matrix.

$LTF_{\text{-16:15}} = \{0, 0, 0, 1, -1, 1, -1, -1, 1, -1, 1, 1, -1, 1, 1, 1, 0, -1, -1, -1, 1, -1, -1, -1, 1, -1, 1, 1, 1, -1, 0, 0\}$

NOTE 1—This LTF sequence is chosen to be orthogonal to both halves of the 2 MHz LTF sequence in order to facilitate the differentiation of S1G_1M preambles from S1G_SHORT and S1G_LONG preambles. The orthogonality metric used to select the sequences satisfied the criteria

$$\sum_{k} A(k)B(k)A(k+1)^{*}B(k+1)^{*} = 0$$

where {A} and {B} are the 1 MHz sequence and either of the halves of the 2 MHz sequence, and where k=1,2,3,...,16,18,19,...,31 skipping the 1 MHz DC location on k=17.

NOTE 2—This definition results in a BPSK modulation on the last two symbols of LTF1 field, to facilitate the differentiation of S1G_1M preambles from S1G_SHORT and S1G_LONG preamble.

The time domain representation of the (#7158)LTF2~LTF$N_{\mathrm{LTF}}$ field signals at transmit chain $i_{TX}$ shall be as specified in Equation (23-41).

$$r_{\mathrm{LTF2\sim LTF}_{N_{\mathrm{LTF}}}}^{(i_{\mathrm{TX}})}(t) = \frac{1}{\sqrt{N_{\mathrm{LTF}}^{\mathrm{Tone}} N_{\mathrm{STS}}}} \sum_{n=1}^{N_{LTF}-1} w_{T_{\mathrm{LTF}}}\left(t-(n-1)T_{LTF}\right) \sum_{k=-N_{SR}}^{N_{SR}} \sum_{m=1}^{N_{STS}} \left( \begin{array}{l} \left[Q_k\right]_{i_{TX},m} \cdot \left[A_{LTF}^{k}\right]_{m,(n+1)} LTF_k \\ \quad \cdot \exp\left(j2\pi k \Delta_F (t-(n-1)T_{LTF} - T_{GI} - T_{CS}(m))\right) \end{array} \right) \tag{23-41}$$

where

$N_{SR}$ and $T_{LTF}$ are defined in Table 23-5 (Timing-related constants)

$T_{CS(m)}$ represents the cyclic shift for space-time stream $m$ with a value given in Table 23-16 (Per space-time stream cyclic shift values of S1G_LONG preamble PPDU)

$\Delta_F$ is defined in Table 23-5 (Timing-related constants)

$N_{STS}$ is defined in Table 23-7 (Frequently used parameters)

$A_{LTF}^{k}$ is defined in Equation (23-40)

$N_{\mathrm{LTF}}^{\mathrm{Tone}}$ has the value given in tone scaling factor and guard interval duration values for PHY fields in Table 23-8 (Tone scaling factor and guard interval duration values for PHY fields)

$Q_k$ is defined in 23.3.7 (Mathematical description of signals)

This is an unapproved IEEE Standards Draft, subject to change.

#### 23.3.8.3.5 SIG definition

The SIG field carries information required to interpret S1G_1M PPDUs. The structure of the 6 symbol SIG field (which carries 6 information bits per symbol) is shown in Figure 23-16 (Structure of the 6 symbol SIG field of S1G_1M PPDU). Note that unlike other SIG field structures the indexing of the bits incorporates all the SIG field symbols, i.e., B0–B5 denote the first symbol, B6–B11 the second, and so on. The SIG field format of NDP CMAC PPDUs is described in Figure 23-20 (SIG field format for 1 MHz NDP CMAC PPDU) and Figure 23-21 (SIG field format for ≥ 2 MHz NDP CMAC PPDU) (in 23.3.11).

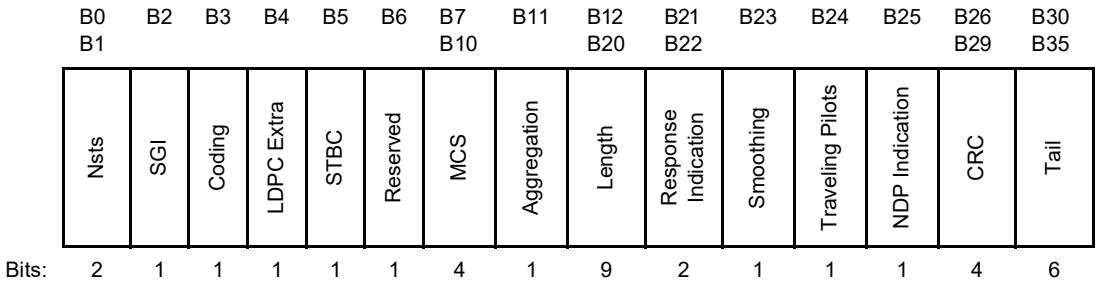

**Figure 23-16—Structure of the 6 symbol SIG field of S1G_1M PPDU**

The SIG field of S1G_1M PPDU contains the fields listed in Table 23-19 (Fields in the SIG field of S1G_1M PPDU).

**Table 23-19—Fields in the SIG field of S1G_1M PPDU**

| Symbol | Bit | Field | Description |
|---|---|---|---|
| SIG-1 | B0–B1 | NSTS | Set to 0 for 1 space-time stream<br>Set to 1 for 2 space-time streams<br>Set to 2 for 3 space-time streams<br>Set to 3 for 4 space-time streams |
| | B2 | Short GI | Set to 0 if short guard interval is not used in the Data field.<br>Set to 1 if short guard interval is used in the Data field. |
| | B3 | Coding | Set to 0 for BCC and 1 for LDPC |
| | B4 | LDPC Extra | If Coding field is 1, set to 1 if the LDPC PPDU encoding process (of an SU PPDU), results in an extra OFDM symbol (or symbols) as described in 21.3.10.5.4 (LDPC coding), otherwise set to 0.<br><br>If Coding field is 0, this field is set to 1. |
| | B5 | STBC | Set to 1 if all spatial streams have space-time block coding and set to 0 if no spatial streams has space-time block coding. |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 23-19—Fields in the SIG field of S1G_1M PPDU *(continued)***

| Symbol | Bit | Field | Description |
|---|---|---|---|
| SIG-2 | B6 | Reserved | (#455)Reserved. Set to 1 on transmit. See 23.3.20 (PHY receive procedure) for behavior on receive. |
| | B7–B10 | MCS | MCS Index |
| | B11 | Aggregation | Set to 1 when aggregation is ON (as indicated by AGGREGATION parameter of TXVECTOR), and 0 otherwise.<br><br>NOTE— S1G PPDUs are transmitted with aggregation ON when PSDU to be carried is greater than 511 octets, as defined in 10.12.5. |
| SIG-3 and SIG-4 | B12–B20 | Length | When the Aggregation subfield is equal to 0, set to the number of octets in the PSDU. When the Aggregation subfield is equal to 1, set to $N_{\mathrm{SYM}_i}$, given in 23.4.3 (TXTIME and PSDU_LENGTH calculation).<br>(See TXVECTOR parameter PSDU_LENGTH.) |
| | B21–B22 | Response Indication | Set to the value obtained from the TXVECTOR parameter RESPONSE_INDICATION. The Response Indication field indicates the presence and type of (#14)the PPDU that is expected to follow SIFS after the current (#14)transmission (see 10.3.2.5). |
| | B23 | Smoothing | A value of 1 indicates that channel smoothing is recommended. A value of 0 indicates that channel smoothing is not recommended. |
| SIG-5 | B24 | Traveling Pilots | Set to 1 to indicate traveling pilots usage in (#14)PPDU. Otherwise 0 to indicate regular pilot tone locations. |
| | B25 | NDP Indication | Differentiate the PPDU from an NDP CMAC PPDU:<br>Set to 0 to indicate that the PPDU is not an NDP CMAC PPDU. |
| | B26–B29 | CRC | CRC calculated as in 23.3.8.2.2.6 (CRC calculation for S1G SIG-A fields). |
| SIG-6 | B30–B35 | Tail | Used to terminate the trellis of the convolutional decoder.<br>Set to 0. |

The SIG field of S1G_1M is composed of six OFDM symbols, SIG-1 ~ SIG-6, each containing 6 data bits, as shown in Table 23-19 (Fields in the SIG field of S1G_1M PPDU). SIG-1 is transmitted first and SIG-6 is the last. The SIG field symbols shall be BCC encoded at rate, R = 1/2, and repeated two times for the encoded bits within each OFDM symbol, interleaved, mapped to a BPSK constellation, and have pilots inserted, following the steps for MCS 10 transmission flow described in 23.3.9 (Data field). The stream of 144 complex numbers generated by these steps (before pilot insertion) is divided into six groups of 24 complex numbers $d_{k,n}$, $k = 0, \ldots, 23$, where $n = 0, 1, \ldots, 5$, respectively. All the 144 complex numbers are BPSK modulated. The first 24 complex numbers form the first symbol of SIG field; and the second 24 complex numbers form the second symbol of SIG field, and so forth.

The time domain waveform for the SIG field in an S1G_1M PPDU at transmit chain $i_{TX}$ shall be as specified in Equation (23-42).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$r_{\mathrm{SIG}}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{\mathrm{SIG}}^{\mathrm{Tone}} N_{\mathrm{STS}}}} \sum_{n=0}^{5} w_{T_{\mathrm{SYML}}}(t - nT_{SYML}) \cdot \sum_{k=-13}^{13} \sum_{m=1}^{N_{STS}} \left[Q_k\right]_{i_{TX},m} \left[P_{HTLTF}\right]_{m,1} \left(D_{k,n,1} + p_n P_n^k\right) \cdot \exp\left(j2\pi k \Delta_F (t - nT_{SYML} - T_{GI} - T_{CS}(m))\right) \quad (23\text{-}42)$$

where

$p_n$ is defined in 17.3.5.10 (OFDM modulation), and $P_n^k$ for S1G_1M is defined in 23.3.9.10 (Pilot subcarriers)

$T_{CS(m)}$ represents the cyclic shift for space-time stream $m$ with a value given in Table 23-18 (Cyclic shift values of S1G_1M PPDU)

$T_{SYML}$ is defined in Table 23-5 (Timing-related constants)

$\Delta_F$ is defined in Table 23-5 (Timing-related constants)

$N_{STS}$ is defined in Table 23-7 (Frequently used parameters)

$P_{HTLTF}$ is defined in Equation (19-27) in 19.3.9.4.6 (HT-LTF definition)

$N_{\mathrm{SIG}}^{\mathrm{Tone}}$ has the value given in tone scaling factor and guard interval duration values for PHY fields in Table 23-8 (Tone scaling factor and guard interval duration values for PHY fields)

$Q_k$ is defined in 23.3.7 (Mathematical description of signals)

$$D_{k,n,1} = \begin{cases} 0, & k = 0, \pm 7 \\ d_{M_1'(k),n}, & \text{otherwise} \end{cases} \quad (23\text{-}43)$$

where

$M'_1(k)$ is defined in Equation (23-44)

$$M_1'(k) = \begin{cases} k+13, & -13 \le k \le -8 \\ k+12, & -6 \le k \le -1 \\ k+11, & 1 \le k \le 6 \\ k+10, & 8 \le k \le 13 \end{cases} \quad (23\text{-}44)$$

### 23.3.9 Data field

#### 23.3.9.1 General

The number of OFDM symbols in the Data field is determined by the Length field in SIG field or SIG-A field of the three S1G PPDU formats, the preamble duration and the setting of the Short GI field in SIG field or SIG-A field, (see 23.3.8.2.2.5 (SIG definition), 23.3.8.2.3.2.5 (SIG-A definition), and 23.3.8.3.5 (SIG definition)). When BCC encoding is used, the Data field shall consist of the SERVICE field, the PSDU, the PHY pad bits and the tail bits (bits for SU and bits for each user *u* in MU). When LDPC encoding is used, the Data field shall consist of the SERVICE field, the PSDU and the PHY pad bits. No tail bits are present when LDPC encoding is used.

#### 23.3.9.2 SERVICE field

In S1G PPDUs, the SERVICE field has 8 bits, which shall be denoted as bits 0–7. The bit 0 shall be transmitted first in time.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The SERVICE field is as shown in Table 23-20 (SERVICE field).

**Table 23-20—SERVICE field**

| Bits | Field | Description |
|---|---|---|
| B0–B6 | Scrambler Initialization | Set to 0 |
| B7 | Reserved | (#455)Set to 0 on transmit and ignored on receive |

#### 23.3.9.3 Scrambler

The SERVICE, PSDU and PHY pad parts of the Data field shall be scrambled by the scrambler defined in 17.3.5.5 (PHY DATA scrambler and descrambler).

#### 23.3.9.4 Coding

##### 23.3.9.4.1 General

The Data field shall be encoded using either the binary convolutional code (BCC) defined in 23.3.9.4.2 (BCC encoder parsing operation) and 23.3.9.4.3 (BCC coding and puncturing), or the low-density parity check (LDPC) code defined in 23.3.9.4.4 (LDPC coding). The encoder is selected by the coding bit(s) in SIG field or SIG-A field of the three S1G PPDU formats, as defined in 23.3.8.2.2.5 (SIG definition), 23.3.8.2.3.2.5 (SIG-A definition), and 23.3.8.3.5 (SIG definition). When BCC FEC encoding is used, the number of encoders is determined by rate-dependent parameters as defined in 23.5 (Parameters for S1G-MCSs). The operation of the BCC FEC is described in 23.3.9.4.2 (BCC encoder parsing operation) and 23.3.9.4.3 (BCC coding and puncturing). The operation of the LDPC coder is described in 23.3.9.4.4 (LDPC coding). Support for the reception of a BCC encoded Data field is mandatory.

##### 23.3.9.4.2 BCC encoder parsing operation

The BCC encoder parsing operation for S1G PPDUs is the same as those specified in 21.3.10.5.2 (BCC encoder parsing operation).

##### 23.3.9.4.3 BCC coding and puncturing

###### 23.3.9.4.3.1 General

The BCC coding and puncturing operation for S1G PPDUs is the same as those specified in 21.3.10.5.3 (BCC coding and puncturing).

###### 23.3.9.4.3.2 Padding for BCC

For a BCC encoder, the number of PHY padding bits, $N_{PAD,u}$, is calculated as

$$N_{PAD,u} = N_{SYM} \times N_{DBPS,u} - 8 \times PSDU\_LENGTH_u - N_{service} - N_{tail} \times N_{ES,u}$$

where

$PSDU\_LENGTH_u$ is the value of the TXVECTOR parameter PSDU_LENGTH for user $u$

$N_{SYM}$ is the number of symbols in the Data field and is given in 23.4.3 (TXTIME and PSDU_LENGTH calculation) by Equation (23-79) for S1G SU PPDUs and Equation (23-82) for S1G MU PPDUs

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

For SU, $N_{PAD} = N_{PAD,0}$ .

The padding flow for BCC encoded PPDUs is as follows:

For an S1G MU PPDU, or an S1G SU PPDU with the Aggregation subfield equal to 1 in its SIG field or SIG-A field, the MAC delivers a PSDU that fills the available octets in the Data field of the PPDU for each user $u$ (i.e., append the maximum number of octets that is less than or equal to $N_{PAD,u}$ ). The PHY determines the number of PHY pad bits, which is $N_{PAD,u}$ modulo 8, and appends them to the PSDU, each of the PHY padding bits could be either 0 or 1. In this case, the Length subfield in SIG field or SIG-A field shall set the appropriate value indicating $N_{SYM}$ data symbols.

For an S1G SU PPDU with the Aggregation subfield equal to 0 in its SIG field or SIG-A field, MAC padding is not conducted and the PHY directly appends $N_{PAD}$ padding bits to the PSDU, each of the PHY padding bits could be either 0 or 1. In this case, the Length field shall set the appropriate value indicating PSDU_LENGTH in number of octets.

Both the PSDU and the PHY padding bits are scrambled and finally the $6.N_{ES}$ zero tail bits are appended after the scrambled PSDU and PHY padding bits.

#### 23.3.9.4.4 LDPC coding

##### 23.3.9.4.4.1 General

For an S1G SU PPDU using LDPC coding to encode the Data field, the LDPC code and encoding process described in 19.3.11.7 (LDPC codes) shall be used with the following modifications. First, all bits in the Data field including the scrambled SERVICE, PSDU, and pad bits are encoded. Thus, $N_{pld}$ for S1G SU PPDUs shall be computed using Equation (23-45) instead of Equation (19-35).

$$N_{pld} = N_{SYM,init} \times N_{DBPS} \tag{23-45}$$

where

$N_{SYM,init}$ is given by Equation (23-46) if the Aggregation subfield in its SIG field or SIG-A field is set to 1 or Equation (23-47) otherwise.

$$N_{SYM,init} = m_{STBC} \times \left\lceil \frac{8 \cdot APEP\_LENGTH + N_{service}}{m_{STBC} \cdot N_{DBPS}} \right\rceil \tag{23-46}$$

$$N_{SYM,init} = m_{STBC} \times \left\lceil \frac{8 \cdot PSDU\_LENGTH + N_{service}}{m_{STBC} \cdot N_{DBPS}} \right\rceil \tag{23-47}$$

where

| | |
|---|---|
| $m_{STBC}$ | is equal to 2 when STBC is used, and 1 otherwise |
| $APEP\_LENGTH$ | is the value of TXVECTOR parameter APEP_LENGTH |
| $PSDU\_LENGTH$ | is the value of TXVECTOR parameter PSDU_LENGTH |

Following the calculation of $N_{pld}$, $N_{avbits}$ shall be computed using Equation (23-48) instead of Equation (19-36).

$$N_{avbits} = N_{SYM,init} \times N_{CBPS} \tag{23-48}$$

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

In addition, if $N_{SYM}$ computed in Equation (19-41) in step d) of 19.3.11.7.5 (LDPC PPDU encoding process) is greater than $N_{SYM,init}$, then the LDPC Extra field of its SIG field or SIG-A field shall be set to 1. Otherwise, the LDPC Extra field of its SIG field or SIG-A field shall be set to 0.

LDPC codes used in S1G MU PPDUs shall follow the definitions in 19.3.11.7 (LDPC codes). Refer to 23.3.9.4.5 (Encoding process for S1G MU PPDUs) for a description of the LDPC encoding process for S1G MU PPDUs.

#### 23.3.9.4.4.2 Padding for LDPC

For LDPC encoding, the number of PHY padding bits for user $u$, $N_{PAD,u}$ is calculated as

$$N_{PAD,u} = N_{SYM,init} \times N_{DBPS,u} - 8 \times PSDU\_LENGTH_u - N_{service}$$

where

$PSDU\_LENGTH_u$ is the value of the TXVECTOR parameter PSDU_LENGTH for user $u$

$N_{SYM,init}$ is the initial number of symbols for the Data field when using LDPC given in 23.4.3 (TXTIME and PSDU_LENGTH calculation) by Equation (23-82) for S1G SU PPDUs and Equation (23-83) for S1G MU PPDUs.

For SU, there is only one user, hence $N_{PAD} = N_{PAD,0}$.

The padding flow for LDPC encoded PPDUs is as follows:

The initial parameter computation $N_{SYM,init}$, $N_{pld}$ and $N_{avbits}$ are identical to those defined in 21.3.10.5.4 (LDPC coding).

For an S1G MU PPDU, or an S1G SU PPDU with the Aggregation subfield equal to 1 in its SIG field or SIG-A field, the MAC delivers a PSDU that fills the available octets in the Data field of the PPDU for each user $u$ (i.e., append the maximum number of octets that is less than or equal to $N_{PAD}$ or $N_{PAD,u}$ ). The PHY determines the number of pad bits, which is $N_{PAD}$ mod 8 or $N_{PAD,u}$ mod 8, and appends them to the PSDU, each of the PHY padding bits could be either 0 or 1. In this case, the Length subfield in SIG field or SIG-A field shall set the appropriate value indicating $N_{SYM}$ data symbols.

For an S1G SU PPDU with the Aggregation subfield equal to 0 in its SIG field or SIG-A field, MAC padding is not conducted and the PHY directly appends $N_{PAD}$ padding bits to the PSDU, each of the PHY padding bits could be either 0 or 1. In this case, the Length field shall set the appropriate value indicating PSDU_LENGTH in number of octets

Both the PSDU and the PHY padding bits are scrambled, and then finally the scrambled PSDU and PHY padding bits are LDPC encoded according to 21.3.10.5.4 (LDPC coding).

In both cases, if $N_{SYM} > N_{SYM,init}$, the LDPC Extra subfield of SIG field or SIG-A field shall be set to 1 (see 23.3.8.2.2.5 (SIG definition), 23.3.8.2.3.2.5 (SIG-A definition), and 23.3.8.3.5 (SIG definition)).

#### 23.3.9.4.5 Encoding process for S1G MU PPDUs

The encoding process for S1G MU PPDUs using S1G_LONG is the same as those specified in 21.3.10.5.5 (Encoding process for VHT MU PPDUs).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

#### 23.3.9.5 Repetition for 1 MHz MCS 10

In an 1 MHz PPDU that is modulated by MCS 10, the 6 information bits of each OFDM symbol are encoded with R=1/2, then the 12 encoded bits in each OFDM symbol is block-wise repeated by the following steps.

Assume that the sequence $[C_1 \ldots C_{12}]$ represents the 12 encoded bits in each OFDM symbol, the output bit stream after the repetition is:

$$C_{out}=[[C_1 \ldots C_{12}], [C_1 \ldots C_{12}] \text{ XOR } s], \quad (23\text{-}49)$$

where

s = [1 0 0 0 0 1 0 1 0 1 1 1]

The 24 output bits of the repetition are then sent to BCC interleaver (if BCC encoded) or the constellation mapper (if LDPC encoded).

#### 23.3.9.6 Stream parser

The stream parser for S1G PPDUs is the same as those specified in 21.3.10.6 (Stream parser) with up to 4 spatial streams.

For S1G_1M PPDU modulated using MCS 10, more than one spatial stream shall not be applied.

#### 23.3.9.7 Segment parser

The segment parser for S1G 16 MHz PPDUs is the same as those specified for 160 MHz PPDUs in 21.3.10.7 (Segment parser).

#### 23.3.9.8 BCC interleaver

The BCC interleavers for S1G 2 MHz, 4 MHz, 8 MHz, and 16 MHz PPDUs are the same as those defined for 20 MHz, 40 MHz, 80 MHz, and 160 MHz PPDUs, respectively, as specified in 21.3.10.8 (BCC interleaver).

For S1G_1M PPDU, the interleaver parameters are defined by Table 23-21 (Number of rows and columns in the interleaver for 1 MHz).

**Table 23-21—Number of rows and columns in the interleaver for 1 MHz**

| Parameter | 1 MHz |
|---|---|
| $N_{COL}$ | 8 |
| $N_{ROW}$ | $3 \times N_{BPSCS}$ |
| $N_{ROT}$ ($N_{SS} \leq 4$) | 2 |

The interleaver parameters for 1 MHz MCS 10 is identical to the parameters used for 1 MHz MCS 0.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

#### 23.3.9.9 Constellation mapping

##### 23.3.9.9.1 General

The constellation mappings for S1G PPDUs modulated using MCS 0 to MCS 9 are the same as those specified in 21.3.10.9.1 (General) with the same MCS indices. The constellation mappings for S1G PPDUs modulated using MCS 11 and MCS 12 are the same as those specified in 27.3.12.9 (Constellation mapping) for 1024-QAM.(M102)

The constellation mapping for 1 MHz MCS 10 is identical to the BPSK constellation mapping that is applied in MCS 0.

##### 23.3.9.9.2 LDPC tone mapping

The LDPC tone mappings for S1G 2 MHz, 4 MHz, 8 MHz, and 16 MHz PPDUs are the same as those defined for 20 MHz, 40 MHz, 80 MHz, and 160 MHz PPDUs, respectively, as specified in 21.3.10.9.2 (LDPC tone mapping).

For LDPC encoded S1G_1M PPDU, LDPC tone mapping is not applied.

##### 23.3.9.9.3 Segment deparser

The segment deparser for S1G 16 MHz PPDUs is the same as those specified for 160 MHz PPDUs in 21.3.10.9.3 (Segment deparser).

##### 23.3.9.9.4 Space-time block coding

The STBC for S1G PPDUs is the same as those specified in 21.3.10.9.4 (Space-time block coding).

For S1G_1M PPDU modulated using MCS 10, STBC shall not be applied.

#### 23.3.9.10 Pilot subcarriers

For an S1G_1M SIG field and Data field, two pilot tones shall be inserted in subcarriers. For fixed pilots, the pilot mapping for subcarrier $k$ for symbol $n$ shall be as specified in Equation (23-50).

$$P_n^{\{-7,7\}} = \{\Psi_{(n \bmod 2)+2}, \Psi_{((n+1) \bmod 2)+2}\} \tag{23-50}$$

$$P_n^{k \notin \{-7,7\}} = 0$$

where

$\Psi_m$ is given in Table 21-21 (Pilot values for 80 MHz transmission) in 21.3.10.10 (Pilot subcarriers)

For S1G_SHORT PPDU and S1G_LONG PPDU, with fixed pilots, $P_n^k$ with same FFT sizes is identical to what is defined in 21.3.10.10 (Pilot subcarriers).

For traveling pilots, at symbol $n$, $P_n^k$ is defined as follows:

$$P_n^k = \begin{cases} 1.5 \times P_{n,\,\text{fix}}^{k_{\text{Pilot\_Fix}}^{(l)}}, k \in K_{\text{Pilot\_Travel}}(n) \text{ and } k = K_{\text{Pilot\_Travel}}^{(l)}(n) \\ 0, \text{ otherwise} \end{cases} \tag{23-51}$$

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

where

$K_{\text{Pilot\_Travel}}(n)$ is the set of traveling pilot subcarrier positions corresponding to data symbol $n$ ($n$ = 0, 1, 2, …, $N_{SYM}$–1)(#515)

$K^{(l)}_{\text{Pilot\_Travel}}(n)$ is the pilot tone position in the pilot subcarrier set $K_{\text{Pilot\_Travel}}(n)$ corresponding to pilot index $l$, as shown in Table 23-22 (Traveling pilot positions for NSTS=1, 1 MHz S1G PPDU) to Table 23-29 (Traveling pilot positions for NSTS=2 and STBC=1, 8 MHz S1G PPDU)

$P^{k}_{n,\text{ fix}}$ is identical to $P^{k}_{n}$ for fixed pilots

$k^{(l)}_{\text{Pilot\_Fix}}$ is the pilot tone position corresponding to pilot index $l$ in the case of fixed pilots, specifically:

For 1 MHz, $\{k^{(0)}_{\text{Pilot\_Fix}}, k^{(1)}_{\text{Pilot\_Fix}}\} = \{-7, 7\}$

For 2 MHz, $\{k^{(0)}_{\text{Pilot\_Fix}}, \ldots, k^{(3)}_{\text{Pilot\_Fix}}\} = \{-21, -7, 7, 21\}$

For 4 MHz, $\{k^{(0)}_{\text{Pilot\_Fix}}, \ldots, k^{(5)}_{\text{Pilot\_Fix}}\} = \{-53, -25, -11, 11, 25, 53\}$

For 8 MHz, $\{k^{(0)}_{\text{Pilot\_Fix}}, \ldots, k^{(7)}_{\text{Pilot\_Fix}}\} = \{-103, -75, -39, -11, 11, 39, 75, 103\}$

For 16 MHz,

$\{k^{(0)}_{\text{Pilot\_Fix}}, \ldots, k^{(15)}_{\text{Pilot\_Fix}}\} = \{-231, -203, -167, -139, -117, -89, -53, -25, 25, 53, 89, 117, 139, 167, 203, 231\}$

The traveling pilot positions for symbol $n$, $K_{\text{Pilot\_Travel}}(n)$ , are derived by the following paragraphs.

For an S1G SU PPDU where in its SIG field or SIG-A field the NSTS subfield indicates one space-time stream and the Traveling Pilots subfield is set to 1, the traveling pilots positions $K_{\text{Pilot\_Travel}}(n)$ varies from symbol to symbol according to Table 23-22 (Traveling pilot positions for NSTS=1, 1 MHz S1G PPDU) to Table 23-25 (Traveling pilot positions for NSTS=1, 8 MHz S1G PPDU) for bandwidth 1 MHz, 2 MHz, 4 MHz, and 8 MHz. In this case, for data symbol $n$ ($n$ = 0, 1, 2, …, $N_{SYM}$–1)(#515), the pilot positions $K_{\text{Pilot\_Travel}}(n)$ equal to those in the column corresponding to the pattern index.:

$$m(n) = n \bmod N_{TP,BW} \tag{23-52}$$

where

$N_{TP,BW}$ is the traveling pilot pattern period with the following values:

$N_{TP,1\text{MHz}} = 13$

$N_{TP,2\text{MHz}} = 14$

$N_{TP,4\text{MHz}} = 19$

$N_{TP,8\text{MHz}} = 32$

$N_{TP,16\text{MHz}} = 32$

| 6 | 70 | 74 | 78 | 82 | 86 | 90 | 94 | 98 | 72 | 76 | 80 | 84 | 88 | 92 | 96 | 100 |
| 7 | 102 | 106 | 110 | 114 | 118 | 122 | 120 | –120 | 104 | 108 | 112 | 116 | 120 | 122 | –2 | –122 |

For a 16 MHz S1G PPDU with traveling pilots, in the data symbol $n$ ($n$ = 0, 1, 2, …, $N_{SYM}$–1)(#515), there are a total of 16 pilot subcarriers, whose positions $K_{\text{Pilot\_Travel}}(n)$ are expressed as

$$K_{\text{Pilot\_Travel}}(n) = \begin{cases} K_{\text{Pilot\_Travel,8MHz}}(n) - 128, \text{ for pilot indices } 0 \le l \le 7 \\ K_{\text{Pilot\_Travel,8MHz}}(n) + 128, \text{ for pilot indices } 8 \le l \le 15 \end{cases} \quad (23\text{-}54)$$

where $K_{\text{Pilot\_Travel,8MHz}}(n)$ is the traveling pilot positions of the 8 pilot subcarriers for symbol index $n$ and 8 MHz, calculated based on Table 23-25 (Traveling pilot positions for NSTS=1, 8 MHz S1G PPDU) for a single space-time stream, or based on Table 23-29 (Traveling pilot positions for NSTS=2 and STBC=1, 8 MHz S1G PPDU) for STBC with two space-time streams.

For S1G MU PPDUs, or S1G SU PPDUs with more than two space-time streams, or S1G SU PPDUs with two space-time streams without STBC, traveling pilots are not defined.

### 23.3.9.11 OFDM modulation

For S1G transmissions using S1G_SHORT, the Data field signal from transmit chain $i_{TX}$, $1 \le i_{TX} \le N_{TX}$, shall be as specified in Equation (23-55).

$$r_{Data}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{\text{Data}}^{\text{Tone}} N_{\text{STS}}}} \sum_{n=0}^{N_{SYM}-1} w_{T_{SYM}}(t - T_{Accum}(n)) \sum_{k=-N_{SR}}^{N_{SR}} \sum_{m=1}^{N_{STS}} ([Q_k]_{i_{TX},m} \gamma_{k,BW} (\tilde{D}_{k,m,n,BW} + [P_{HTLTF}]_{m,g(n)} \cdot p_{n+2} P_n^k) \exp(j2\pi k \Delta_F (t - T_{Accum}(n) - T_{GI,Data}(n) - T_{CS}(m)))) \quad (23\text{-}55)$$

where

$$g(n)=\begin{cases}(n \bmod 2)+1, & \text{if the STBC bit and Traveling Pilots bit in SIG field are both set to 1}\\ 1, & \text{otherwise}\end{cases}$$

For S1G transmissions using S1G_LONG, the Data field signal from transmit chain $i_{TX}$, $1 \le i_{TX} \le N_{TX}$, shall be as specified in Equation (23-56).

$$\begin{aligned}{}^{(i_{TX})}_{Data}(t) = & \frac{1}{\sqrt{N^{\text{Tone}}_{\text{Data}} N_{\text{STS,total}}}} \sum_{n=0}^{N_{SYM}-1} w_{T_{SYM}}(t - T_{Accum}(n)) \\ & \sum_{k=-N_{SR}}^{N_{SR}} \sum_{u=0}^{N_u-1} \sum_{m=1}^{N_{STS,u}} ([Q_k]_{i_{TX},(M_u+m)} \gamma_{k,BW} (\tilde{D}_{k,m,n,BW} + [P_{HTLTF}]_{m,g(n)} \cdot p_{z(n)} P^k_{(z(n)-2)}) \\ & \exp(j2\pi k \Delta_F (t - T_{Accum}(n) - T_{GI,Data}(n) - T_{CS}(m))))\end{aligned} \quad (23\text{-}56)$$

where

$$g(n)=\begin{cases}(n \bmod 2)+1, & \text{if the STBC bit and Traveling Pilots bit in SIG-A field are both set to 1}\\ 1, & \text{otherwise}\end{cases}$$

For S1G transmissions using S1G_1M, the Data field signal from transmit chain $i_{TX}$, $1 \le i_{TX} \le N_{TX}$, shall be as specified in Equation (23-57)(#6052).

$$\begin{aligned}r^{(i_{TX})}_{Data}(t) = & \frac{1}{\sqrt{N^{\text{Tone}}_{\text{Data}} N_{\text{STS}}}} \sum_{n=0}^{N_{SYM}-1} w_{T_{SYM}}(t - T_{Accum}(n)) \\ & \sum_{k=-N_{SR}}^{N_{SR}} \sum_{m=1}^{N_{STS}} ([Q_k]_{i_{TX},m} \gamma_{k,BW} (\tilde{D}_{k,m,n,BW} + [P_{HTLTF}]_{m,g(n)} \cdot p_{n+6} P^k_n) \\ & \exp(j2\pi k \Delta_F (t - T_{Accum}(n) - T_{GI,Data}(n) - T_{CS}(m))))\end{aligned} \quad (23\text{-}57)$$

where

$N_{SR}$ is defined in Table 23-5 (Timing-related constants)

$p_n$ is defined in 17.3.5.10 (OFDM modulation)

$P^k_n$ is defined in 23.3.9.10 (Pilot subcarriers)

$T_{CS(m)}$ represents the cyclic shift for space-time stream $m$ with a value given in Table 23-10 (Cyclic shift values for the S1G_SHORT preamble PPDU) in the case of ≥ 2 MHz formats, and in Table 23-18 (Cyclic shift values of S1G_1M PPDU) in the case of S1G_1M

$\Upsilon_{k,\text{BW}}$ is defined by Equation (23-6) to Equation (23-9)

$\Delta_F$ is defined in Table 23-5 (Timing-related constants)

$N_{STS}$, $N_{STS,total}$, and $N_{STS,u}$ are defined in Table 23-7 (Frequently used parameters)

$P_{HTLTF}$ is defined in Equation (19-27) in 19.3.9.4.6 (HT-LTF definition)

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$N_{\text{Data}}^{\text{Tone}}$ has the value given in tone scaling factor and guard interval duration values for PHY fields in Table 23-8 (Tone scaling factor and guard interval duration values for PHY fields)

$N_u$, and $M_u$ are defined in Table 23-7 (Frequently used parameters)

$z(n)$ in Equation (23-56) is defined as follows:(M118)

$$z(n) = \begin{cases} n+2, \text{ if the MU/SU bit in SIG-A field is 0} \\ n+3, \text{ if the MU/SU bit in SIG-A field is 1} \end{cases}$$

$T_{GI,Data}(n)$ is the guard interval duration with the value as follows:

$$T_{GI,Data}(n) = \begin{cases} T_{GI}, \text{ if } n = 0 \\ T_{GI}, \text{ if } n > 0 \text{ and Short GI subfield of SIG or SIG-A field is 0} \\ T_{SGI}, \text{ if } n > 0 \text{ and Short GI subfield of SIG or SIG-A field is 1} \end{cases} \quad (23\text{-}58)$$

$\tilde{D}_{k,m,n,BW}$ is defined by Equation (23-59).

$$\tilde{D}_{k,m,n,BW} = \begin{cases} 0, & \text{if } k \in K_{\text{Pilot}}(n) \\ d_{M'_{BW}(k),m,n,} & \text{otherwise} \end{cases} \quad (23\text{-}59)$$

where

$$K_{Pilot}(n) = \begin{cases} K_{Pilot\_\text{Fix}}, & \text{if the Traveling Pilot bit in SIG or SIG-A field is 0} \\ K_{Pilot\_\text{Travel}}(n), & \text{if the Traveling Pilot bit in SIG or SIG-A field is 1} \end{cases} \quad (23\text{-}60)$$

in which $K_{\text{Pilot\_Fix}}$ is defined in 23.3.8.2.2.4 (LTF definition) for ≥ 2 MHz and 23.3.8.3.4 (LTF definition) for 1 MHz, and $K_{\text{Pilot\_Travel}}(n)$ is defined in 23.3.9.10 (Pilot subcarriers); and $M'_{BW}(k)$ is defined in Equation (23-30) to Equation (23-35) in 23.3.8.2.3.3.5 (SIG-B definition) for 2 MHz, 4 MHz, 8 MHz, and 16 MHz, as well as Equation (23-44) in 23.3.8.3.5 (SIG definition) for 1 MHz.

$T_{Accum}(n)$ is the accumulated duration from data symbol 0 to data symbol (*n-1*).

$$T_{Accum}(n) = \begin{cases} 0, & \text{if } n = 0 \\ T_{SYML} + (n-1)T_{SYM}, & \text{if } n > 0 \end{cases} \quad (23\text{-}61)$$

where

$T_{SYML}$ and $T_{SYM}$ are defined in Table 23-5 (Timing-related constants)

$Q_k$ is a spatial mapping/steering matrix with $N_{TX}$ rows and $N_{STS}$ or $N_{STS,total}$ columns for subcarrier *k*. $Q_k$ may be frequency dependent. Refer to the examples of listed in 19.3.11.11.2 (Spatial mapping) for examples of that could be used for S1G SU PPDUs. Note that implementations are not restricted to the spatial mapping matrix examples listed in 19.3.11.11.2 (Spatial mapping) and the number of transmit chains $N_{TX}$ could be up to 4. For SU PPDUs to which beamforming is applied, $Q_k$ is a beamforming steering matrix and is derived from the TXVECTOR parameter EXPANSION_MAT. For S1G MU PPDUs, $Q_k$ is the (#3367)DL MU-MIMO steering matrix and is derived from the TXVECTOR parameter EXPANSION_MAT. The beamforming steering matrices and (#3367)DL MU-MIMO steering matrices are implementation specific.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The autodetection between 1 MHz and 2 MHz preambles assumes channel smoothness. It is recommended that the spatial mapping matrix $Q_k$ applied to LTF1 field is chosen such that it preserves the smoothness of the physical channel. This can, for example, be achieved by minimizing the amplitude and phase variation of each element of $Q_k$ in successive tones.

*Examples:*

a) The following may be used $Q_k$: $Q_k$ as defined for cyclic shift diversity using the values specified in the corresponding tables.

b) The following $Q_k$ should not be used:
   — Antenna hopping as described in 19.3.11.11.2 (Spatial mapping) c) 2)
   — The values of $Q_k$ on successive tones flip between 1 and 0

### 23.3.9.12 S1G 1 MHz and 2 MHz duplicate transmission

#### 23.3.9.12.1 S1G 1 MHz duplicate transmission

An S1G 1 MHz duplicate transmission is used to transmit to S1G STAs that may be present in a part of a 2 MHz, 4 MHz, 8 MHz, or 16 MHz channel.

In an S1G 1 MHz duplicate PPDU, both the S1G_1M preamble and Data field are duplicated in each 1 MHz subchannel of the 2 MHz, 4 MHz, 8 MHz, or 16 MHz channel. Both an 1 MHz data PPDU and an 1 MHz NDP may be duplicated.

For S1G 1 MHz duplicate transmission, the Data field signal from transmit chain $i_{TX}$, $1 \le i_{TX} \le N_{TX}$, shall be as specified in Equation (23-62).

$$r_{Data}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{\text{1MHz\_DUP\_Data}}^{\text{Tone}} N_{STS}}} \sum_{n=0}^{N_{SYM}-1} w_{T_{SYM}}(t - T_{Accum}(n)) \sum_{i_{BW}=0}^{N_{1MHz}-1} \Bigg( \sum_{k=-13}^{13} \sum_{m=1}^{N_{STS}} \Big( [Q_k]_{i_{TX}, m} \gamma_{1MHz,\, k-(K_{Shift,\,1MHz}(i_{BW})),\, BW} (\tilde{D}_{k,\,m,\,n,\,1MHz} + [P_{HTLTF}]_{m,\,g(n)} \cdot p_{n+6} P_n^k) \exp(j2\pi(k - K_{Shift,\,1MHz}(i_{BW}))\Delta_F \cdot (t - T_{Accum}(n) - T_{GI,\,Data}(n) - T_{CS}(m))) \Big) \Bigg) \quad (23\text{-}62)$$

where

$T_{GI,Data}(n)$ is defined in Equation (23-58)

$\tilde{D}_{k,n,n,BW}$ is defined in Equation (23-59)

$T_{Accum}(n)$ is defined in Equation (23-61)

$N_{1MHz}$ is the number of 1 MHz subchannels that are contained within the whole bandwidth of the current PPDU (e.g., $N_{1MHz} = 4$ for a 4 MHz PPDU)

$$g(n) = \begin{cases} (n \bmod 2) + 1, & \text{if the STBC bit and Traveling Pilots bit in SIG-A field are both set to 1} \\ 1, & \text{otherwise} \end{cases}$$

$$K_{Shift,1MHz}(i) = (N_{1MHz} - 1 - 2i).16 \quad (23\text{-}63)$$

### 23.3.9.12.2 S1G 2 MHz duplicate transmission

An S1G 2 MHz duplicate transmission is used to transmit to S1G STAs that may be present in a part of a 4 MHz, 8 MHz, or 16 MHz channel.

In an S1G 2 MHz duplicate PPDU, the S1G_SHORT preamble and Data field are duplicated in each 2 MHz subchannel of the 4 MHz, 8 MHz, or 16 MHz channel.

A 2 MHz NDP sounding shall not be duplicated. Instead, a 4 MHz, 8 MHz, or 16 MHz NDP shall be transmitted whenever needed. NDP CMAC PPDUs transmitted over a 4 MHz, 8 MHz, or 16 MHz channel shall be carried in an S1G 2 MHz duplicate (#14)PPDU.

For an S1G 2 MHz duplicate PPDU, the Data field signal from transmit chain $i_{TX}$, $1 \le i_{TX} \le N_{TX}$, shall be as specified in Equation (23-64).

$$r_{Data}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{2MHz\_DUP\_Data}^{Tone} N_{STS}}} \sum_{n=0}^{N_{SYM}-1} w_{T_{SYM}}(t - T_{Accum}(n)) \sum_{i_{BW}=0}^{N_{2MHz}-1} \left( \sum_{k=-28}^{28} \sum_{m=1}^{N_{STS}} \right.$$

$$([Q_k]_{i_{TX},m} \gamma_{(k - K_{Shift}(i_{BW})),BW} (\tilde{D}_{k,m,n,2MHz} + [P_{HTLTF}]_{m,g(n)} \cdot p_{n+2} P_n^k) \quad (23\text{-}64)$$

$$\left. \exp(j2\pi(k - K_{Shift}(i_{BW}))\Delta_F \cdot (t - T_{Accum}(n) - T_{GI,Data}(n) - T_{CS}(m)))) \right)$$

where

$p_n$ is defined in 17.3.5.10 (OFDM modulation)

$P_n^k$ is defined in 23.3.9.10 (Pilot subcarriers)

$T_{CS(m)}$ represents the cyclic shift for space-time stream $m$ with a value given in Table 23-10 (Cyclic shift values for the S1G_SHORT preamble PPDU)

$\Upsilon_{k,\mathrm{BW}}$ is defined by Equation (23-6) to Equation (23-9)

$\Delta_F$ is defined in Table 23-5 (Timing-related constants)

$N_{STS}$ is defined in Table 23-7 (Frequently used parameters)

$P_{HTLTF}$ is defined in Equation (19-27) in 19.3.9.4.6 (HT-LTF definition)

$N_{2MHz\_DUP\_Data}^{Tone}$ has the value given in tone scaling factor and guard interval duration values for PHY fields in Table 23-8 (Tone scaling factor and guard interval duration values for PHY fields)

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$T_{GI,Data}(n)$ is defined in Equation (23-58)

$\tilde{D}_{k,n,n,BW}$ is defined in Equation (23-59)

$T_{Accum}(n)$ is defined in Equation (23-61)

$N_{2MHz}$ is the number of 2 MHz subchannels that are contained within the whole bandwidth of the current PPDU (e.g., $N_{2MHz} = 2$ for a 4 MHz PPDU)

$$g(n) = \begin{cases} (n \bmod 2) + 1, & \text{if the STBC bit and Traveling Pilots bit in SIG-A field are both set to 1} \\ 1, & \text{otherwise} \end{cases}$$

$K_{Shift}(i)$ is defined in Equation (23-19)

### 23.3.10 SU-MIMO and (#3367)DL MU-MIMO Beamforming

#### 23.3.10.1 General

S1G SU-MIMO and (#3367)DL MU-MIMO beamforming are techniques used by a STA with multiple antennas (the beamformer) to steer signals using knowledge of the channel to improve throughput. The general description of SU-MIMO and (#3367)DL MU-MIMO beamforming is identical to its VHT counterparts as described in 21.3.11.1 (General) with VHT replaced by S1G.

In S1G operation, the SU-MIMO allows beamforming up to 4 space-time streams, and (#3367)DL MU-MIMO beamforming allows up to 4 total number of space-time streams for all users each with up to 3 space-time streams.

S1G beamforming exchange is defined only for 2 MHz, 4 MHz, 8 MHz, and 16 MHz.

#### 23.3.10.2 Beamforming Feedback Matrix V

The description of beamforming feedback matrix V in an S1G band is identical to its VHT counterpart as described in 21.3.11.2 (Beamforming Feedback Matrix V) with VHT replaced by S1G.

Compressed beamforming feedback using 19.3.12.3.6 (Compressed beamforming feedback matrix) is the only beamforming feedback format defined for S1G operation. In certain cases when the ψ angle is not included in the feedback frame (e.g., for SU feedback with $N_c = 1$), the ψ angles not included in the feedback report are given the values below, which (M118)corresponds to a single column V matrix having elements with equal magnitude:

If $N_r \times N_c = 4 \times 1$, $\Psi_{21} = 0.25\pi$, $\Psi_{31} = 0.196\pi$, $\Psi_{41} = 0.167\pi$
If $N_r \times N_c = 3 \times 1$, $\Psi_{21} = 0.25\pi$, $\Psi_{31} = 0.196\pi$
If $N_r \times N_c = 2 \times 1$, $\Psi_{21} = 0.25\pi$

#### 23.3.10.3 Maximum Number of Total Spatial Streams in S1G MU PPDUs

An MU capable STA shall support reception of S1G MU PPDUs with the total number of space-time streams across the NUM_USERS users being less than or equal to its Compressed Steering Number of Beamformer Antennas Supported in the S1G Capabilities Information field. The upper limit is 4 spatial streams.

#### 23.3.10.4 Group ID

The description of Group ID in an S1G band is identical to its VHT counterpart as described in 21.3.11.4 (Group ID) with VHT replaced by S1G.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 23.3.11 S1G preamble format for NDPs

An NDP may be used for sounding or for NDP CMAC PPDUs. In the case of NDP sounding, the SIG field in an NDP shall indicate multiple space-time streams and more than one LTF fields; NDP CMAC PPDUs only contain single space-time stream with one LTF field.

NDP is the only S1G sounding format.

NDP for sounding is defined only using the S1G_SHORT, and NDP for sounding is not allowed for 1 MHz transmissions. NDP CMAC PPDUs may either use an S1G_SHORT, or an S1G_1M.

The format of an S1G NDP for sounding is shown in Figure 23-17 (S1G NDP for sounding format(#7158)).

| 2 symbols | 2 symbols | 2 symbols | 1 symbol per LTF |
|---|---|---|---|
| STF | LTF1 | SIG | LTF2 ~ LTF$N_{LTF}$ |

**Figure 23-17—S1G NDP for sounding format(#7158)**

NOTE—The number of LTF symbols in the NDP is determined by the NSTS subfield in SIG field.

Transmission of an S1G NDP for sounding shall comply with the following rules:

- Shall use the S1G PPDU format but without the Data field.
- Shall use the S1G_SHORT.
- Shall use the following settings in SIG field:
  - MCS field is set to 0.
  - Length field is set to 0.
  - Bandwidth field is set to the same value as the TXVECTOR parameter CH_BANDWIDTH in the preceding VHT NDP Announcement frame carried in an S1G PPDU.
  - NSTS field indicates two or more space-time streams.
  - Partial AID field is set as described in 10.21.
  - The NDP indication bit is set to 0.
  - Response Indication field is set to Long Response (see TXVECTOR parameter RESPONSE_INDICATION).

The format of an NDP CMAC PPDU in 2 MHz, 4 MHz, 8 MHz, or 16 MHz is shown in Figure 23-18 (NDP CMAC PPDU for ≥ 2 MHz). The > 2 MHz NDP CMAC PPDUs are 2 MHz NDP CMAC PPDUs duplicated up to the transmission bandwidth according to CH_BANDWIDTH in TXVECTOR.

| 2 symbols | 2 symbols | 2 symbols |
|---|---|---|
| STF | LTF1 | SIG |

**Figure 23-18—NDP CMAC PPDU for ≥ 2 MHz**

The format of an S1G NDP CMAC PPDU in 1 MHz is shown in Figure 23-19 (NDP CMAC PPDU for 1 MHz). S1G NDP CMAC PPDUs for 1 MHz are duplicated up to their transmission bandwidth according to CH_BANDWIDTH in TXVECTOR.

Transmission of an NDP CMAC PPDU shall comply with the following rules:

- Shall use the S1G PPDU format but without the Data field.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

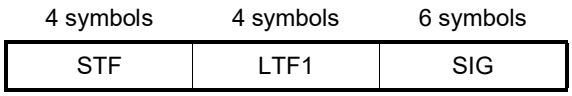

**Figure 23-19—NDP CMAC PPDU for 1 MHz**

— Shall use either the S1G_SHORT or the S1G_1M.
— Shall use the following settings in SIG field:
  — The NDP indication bit is set to 1.
— Shall contain only one LTF field.

The SIG field formats of NDP CMAC PPDUs are shown in Figure 23-20 (SIG field format for 1 MHz NDP CMAC PPDU) and Figure 23-21 (SIG field format for ≥ 2 MHz NDP CMAC PPDU).

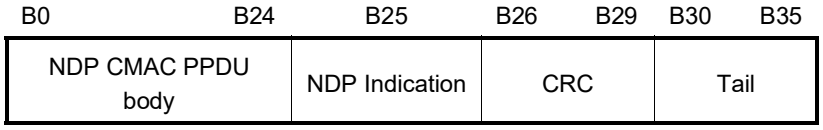

**Figure 23-20—SIG field format for 1 MHz NDP CMAC PPDU**

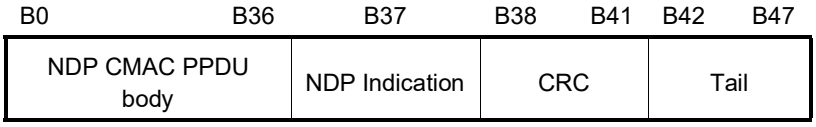

**Figure 23-21—SIG field format for ≥ 2 MHz NDP CMAC PPDU**

The NDP CMAC PPDU body field is described in 23.3.12 (NDP CMAC PPDUs).

The NDP Indication field is set to 1.

The CRC field is described in 23.3.8.2.2.6 (CRC calculation for S1G SIG-A fields). Tail field is set to 0.

### 23.3.12 NDP CMAC PPDUs

#### 23.3.12.1 General

The format of NDP CMAC PPDUs that use the S1G_1M format is shown in Figure 23-19 (NDP CMAC PPDU for 1 MHz). Figure 23-20 (SIG field format for 1 MHz NDP CMAC PPDU) shows the SIG field format that contains the NDP CMAC PPDU body field. B25 of the SIG field (the second bit of the fifth symbol) is set to 1 to indicate an NDP CMAC PPDU. The NDP CMAC PPDU body field is 25 bits for NDP CMAC PPDUs that are transmitted using the S1G_1M format (NDP_1M).

The format of NDP CMAC PPDUs that use the S1G_SHORT format is shown in Figure 23-18 (NDP CMAC PPDU for ≥ 2 MHz). Figure 23-21 (SIG field format for ≥ 2 MHz NDP CMAC PPDU) shows the SIG field format that contains the NDP CMAC PPDU body field. B37 of the SIG field (the fourteenth bit of the second symbol) is set to 1 to indicate an NDP CMAC PPDU. The NDP CMAC PPDU body field is 37 bits for NDP CMAC PPDUs that are transmitted using the S1G_SHORT format (NDP_2M).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

An NDP CMAC PPDU is indicated by setting the TXVECTOR parameter NDP_INDICATION to 1. The TXVECTOR parameter NDP_CMAC_PPDU_BODY is set to the concatenated bits of the NDP CMAC PPDU body field.

An RXVECTOR parameter NDP_INDICATION equal to 1 indicates reception of an NDP CMAC PPDU, and the NDP CMAC PPDU body field of the frame is obtained from the RXVECTOR parameter NDP_CMAC_PPDU_BODY.

The PHY preamble format for transmission of NDP CMAC PPDUs is defined in 23.3.11 (S1G preamble format for NDPs).

This subclause describes the NDP CMAC PPDU body field content for each of the NDP CMAC PPDU types. The type of the NDP CMAC PPDU is indicated in the NDP CMAC PPDU Type field and its values are defined in Table 23-30 (NDP CMAC PPDU Type field values).

NDP CMAC PPDUs(#1400) are not MPDUs but NDPs, but they obey the rules for equivalent MPDUs, as shown in Table 23-30 (NDP CMAC PPDU Type field values).

**Table 23-30—NDP CMAC PPDU Type field values**

| Value | Meaning | Equivalent MPDU | See subclause |
|---|---|---|---|
| 0 | NDP CTS or NDP CF-End | CTS or CF-End | 23.3.12.2.1 (NDP CTS), 23.3.12.2.2 (NDP CF-End) |
| 1 | NDP PS-Poll | PS-Poll | 23.3.12.2.3 (NDP PS-Poll) |
| 2 | NDP Ack | Ack | 23.3.12.2.4 (NDP Ack) |
| 3 | NDP PS-Poll-Ack | Ack to PS-Poll | 23.3.12.2.5 (NDP PS-Poll-Ack) |
| 4 | NDP BlockAck | BlockAck | 23.3.12.2.6 (NDP BlockAck) |
| 5 | NDP Beamforming Report Poll | Beamforming Report Poll | 23.3.12.2.7 (NDP Beamforming Report Poll) |

| 7 | NDP Probe Request | Probe Request | 23.3.12.2.9 (NDP Probe Request) |

### 23.3.12.2 NDP CMAC PPDU details

### 23.3.12.2.1 NDP CTS

#### 23.3.12.2.1.1 NDP_1M CTS

The format of the NDP CMAC PPDU body field of the NDP_1M CTS frame is shown in Figure 23-22 (NDP CMAC PPDU body field of the NDP_1M CTS frame).

The NDP CMAC PPDU Type field is set to 0.

The CTS/CF-End Indicator field is set to 0.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

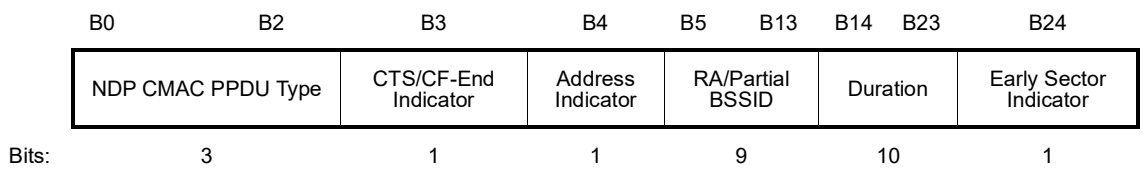

**Figure 23-22—NDP CMAC PPDU body field of the NDP_1M CTS frame**

The Address Indicator field is set to 0 to indicate that the RA/Partial BSSID field contains the partial identifier of the receiving STA. It is set to 1 to indicate that the RA/Partial BSSID field contains the partial BSSID of the BSS of the AP transmitting the frame and is interpreted as a broadcast address (see 10.3.2.9 (CTS and DMG CTS procedure) for the receiving STA's behavior). When the NDP CTS frame is used in the sector training it is set to 1.

The RA/Partial BSSID (PBSSID) field indicates:

— RA: the partial AID of the receiving non-AP STA or the partial BSSID of the receiving AP's BSS as described in 10.21 (Group ID, partial AID, Uplink Indication, and COLOR in S1G PPDUs)

— Partial BSSID: the partial BSSID of the BSS of the transmitting AP as described in 10.21 (Group ID, partial AID, Uplink Indication, and COLOR in S1G PPDUs)

The Duration field is expressed in units of OFDM symbol duration (40 μs) (Table 23-5 (Timing-related constants)) and follows the definitions in 9.3.1.3 (CTS frame format).

The Early Sector Indicator field is set to 1 to indicate that the NDP CTS frame is followed by the sectorized beam frame exchange sequence(#109). It is set to 0 to indicate that the NDP CTS frame is not followed by the sectorized beam frame exchange sequence(#109).

### 23.3.12.2.1.2 NDP_2M CTS

The format of the NDP CMAC PPDU body field of the NDP_2M CTS frame is shown in Figure 23-23 (NDP CMAC PPDU body field of the NDP_2M CTS frame).

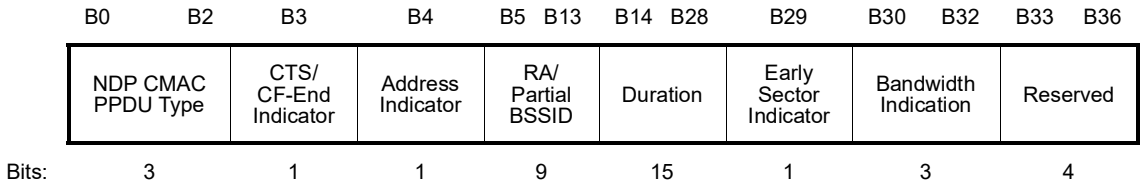

**Figure 23-23—NDP CMAC PPDU body field of the NDP_2M CTS frame**

The NDP CMAC PPDU Type field is set to 0.

The CTS/CF-End Indicator field is set to 0.

The Address Indicator field is set to 0 to indicate that the RA/Partial BSSID field contains the partial identifier of the receiving STA. It is set to 1 to indicate that the RA/Partial BSSID field contains the partial BSSID of the BSS of the AP transmitting the frame and is interpreted as a broadcast address (see 10.3.2.9 (CTS and DMG CTS procedure) for the receiving STA's behavior). When the NDP CTS frame is used in the sector training it is set to 1.

The RA/Partial BSSID (PBSSID) field indicates

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

— RA: the partial AID of the receiving non-AP STA or the partial BSSID of the receiving AP's BSS as described in 10.21 (Group ID, partial AID, Uplink Indication, and COLOR in S1G PPDUs)
— Partial BSSID: the partial BSSID of the BSS of the transmitting AP as described in 10.21 (Group ID, partial AID, Uplink Indication, and COLOR in S1G PPDUs)

The Duration field is expressed in units of microseconds and follows the definitions in 9.3.1.3 (CTS frame format).

The Early Sector Indicator field is set to 1 to indicate that the NDP CTS frame is followed by the sectorized beam frame exchange sequence(#109). It is set to 0 to indicate that the NDP CTS frame is not followed by the sectorized beam frame exchange sequence(#109).

The Bandwidth Indication field is described in 9.2.4.1.11 (Bandwidth Indication and Dynamic Indication subfields).

(#455)The Reserved field shall be set to all 0s on transmit and ignored on receive.

#### 23.3.12.2.2 NDP CF-End

##### 23.3.12.2.2.1 NDP_1M CF-End

The format of the NDP CMAC PPDU body field of the NDP_1M CF-End frame is shown in Figure 23-24 (NDP CMAC PPDU body field of the NDP_1M CF-End frame).

| B0 – B2 | B3 | B4 – B12 | B13 – B22 | B23 – B24 |
|---|---|---|---|---|
| NDP CMAC PPDU Type | CTS/CF-End Indicator | Partial BSSID (TA) | Duration | Reserved |
| Bits: 3 | 1 | 9 | 10 | 2 |

**Figure 23-24—NDP CMAC PPDU body field of the NDP_1M CF-End frame**

The NDP CMAC PPDU Type field is set to 0.

The CTS/CF-End Indicator field is set to 1.

The Partial BSSID field indicates the PARTIAL_AID of the address of the STA contained in the AP.

The Duration field is expressed in units of OFDM symbol time (40 μs) and follows the definitions in 9.3.1.6 (CF-End frame format).

(#455)The Reserved field shall be set to all 0s on transmit and ignored on receive.

##### 23.3.12.2.2.2 NDP_2M CF-End

The format of the NDP CMAC PPDU body field of the NDP_2M CF-End frame is shown in Figure 23-25 (NDP CMAC PPDU body field of the NDP_2M CF-End frame).

The NDP CMAC PPDU Type field is set to 0.

The CTS/CF-End Indicator field is set to 1.

The Partial BSSID field indicates the PARTIAL_AID of the address of the STA contained in the AP.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

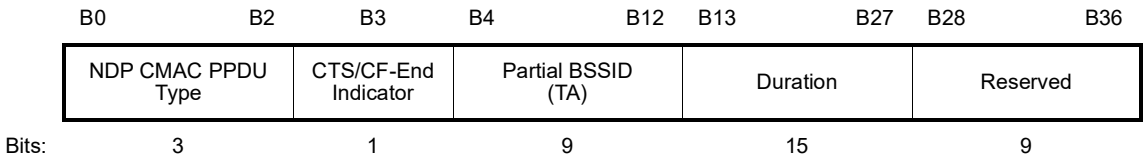

**Figure 23-25—NDP CMAC PPDU body field of the NDP_2M CF-End frame**

The Duration field is expressed in units of microseconds and follows the definitions in 9.3.1.6 (CF-End frame format).

(#455)The Reserved field shall be set to all 0s on transmit and ignored on receive.

### 23.3.12.2.3 NDP PS-Poll

#### 23.3.12.2.3.1 NDP_1M PS-Poll

The format of the NDP CMAC PPDU body field of the NDP_1M PS-Poll frame is shown in Figure 23-26 (NDP CMAC PPDU body field of the NDP_1M PS-Poll frame).

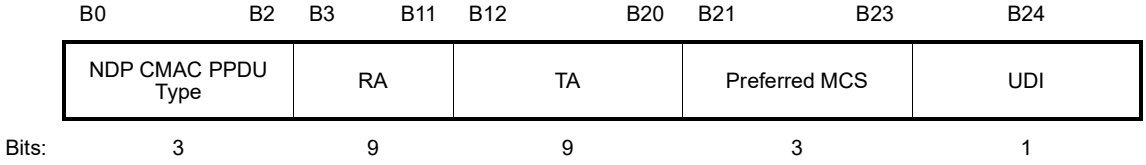

**Figure 23-26—NDP CMAC PPDU body field of the NDP_1M PS-Poll frame**

The NDP CMAC PPDU Type field is set to 1.

The RA field indicates the partial AID of the STA contained in the AP as described in 10.21 (Group ID, partial AID, Uplink Indication, and COLOR in S1G PPDUs).

The TA field indicates the partial AID of the STA transmitting the frame as described in 10.21 (Group ID, partial AID, Uplink Indication, and COLOR in S1G PPDUs).

The Preferred MCS field indicates the preferred MCS level for an 1 MHz channel width of the STA for downlink transmission. Mapping between Preferred MCS value and corresponding MCS index is shown in Table 23-31 (Preferred MCS subfield values for NDP_1M PS-Poll frame).

**Table 23-31—Preferred MCS subfield values for NDP_1M PS-Poll frame**

| Preferred MCS value | MCS Index | Description |
|---|---|---|
| 0 | 0 | BPSK 1/2 |
| 1 | 1 or 2 | QPSK 1/2 or QPSK 3/4 |
| 2 | 3 or 4 | 16-QAM 1/2 or 16-QAM 3/4 |
| 3 | 5 or 6 | 64-QAM 2/3 or 64-QAM 3/4 |
| 4 | 7 or 8 | 64-QAM 5/6 or 256-QAM 3/4 |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 23-31—Preferred MCS subfield values for NDP_1M PS-Poll frame**

| | | |
|---|---|---|
| 5 | 9 | 64-QAM 5/6 |
| 6 | 10 | BPSK 1/4 |
| 7 | No Preference | |

The Uplink Data Indicator (UDI) subfield indicates if the STA has uplink data to transmit:

— Set to 0 to indicate that there is no uplink data present

— Set to 1 to indicate that there is uplink data present

#### 23.3.12.2.3.2 NDP_2M PS-Poll

The format of the NDP CMAC PPDU body field of the NDP_2M PS-Poll frame is shown in Figure 23-27 (NDP CMAC PPDU body field of the NDP_2M PS-Poll frame).

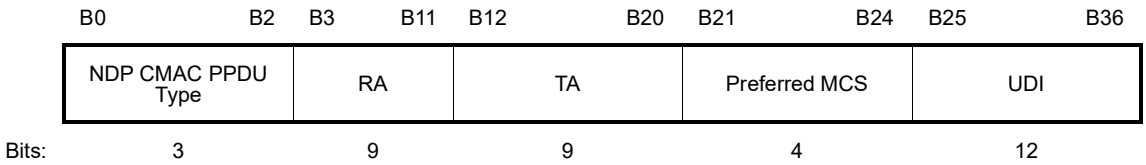

**Figure 23-27—NDP CMAC PPDU body field of the NDP_2M PS-Poll frame**

The NDP CMAC PPDU Type field is set to 1.

The RA field indicates the partial AID of the address of the STA contained in the AP as described in 10.21 (Group ID, partial AID, Uplink Indication, and COLOR in S1G PPDUs).

The TA field indicates the partial AID of the address of the STA transmitting the frame as described in 10.21 (Group ID, partial AID, Uplink Indication, and COLOR in S1G PPDUs).

The Preferred MCS field indicates the preferred MCS level for a 2 MHz channel width of the STA for downlink transmission. Mapping between Preferred MCS value and corresponding MCS index is shown in Table 23-32 (Preferred MCS subfield values for NDP_2M PS-Poll frame).

**Table 23-32—Preferred MCS subfield values for NDP_2M PS-Poll frame**

| Preferred MCS value | MCS Index | Description |
|---|---|---|
| 0–9 | 0–9 | The value represents the MCS index for the STA's preferred MCS level. |
| 10 | No Preference | |
| 11–12(M102) | 11–12 | The value represents the MCS index for the STA's preferred MCS level. |
| 13–15(M102) | Reserved | |

The Uplink Data Indicator (UDI) subfield indicates if the STA has uplink data to transmit and is used by an SST STA to indicate its selected SST channel:

— Set to 0 to indicate that there is no uplink data present

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

— Set to 1 to indicate that there is uplink data present but the estimated time for the transmission of the uplink Data frames that are present at the STA is not determined.
— Set to a value between 2 and 9 to indicate the relative position of the selected SST channel with respect to the lowest numbered channel in the SST Enabled Channel Bitmap field of a received SST Operation element. For example, setting the UDI to 2 indicates that the selected SST channel is the first channel in the SST Enabled Channel Bitmap field, while setting the UDI to 3 indicates that the selected SST channel is the second channel in the SST Enabled Channel Bitmap field, etc.
— Set to a value greater than 9 to indicate the estimated time, in units of 40 μs, required for the transmission of the uplink Data frames that are present at the STA, excluding the duration of their response and applicable IFS durations.

#### 23.3.12.2.4 NDP Ack

##### 23.3.12.2.4.1 General

The NDP Ack frame, used to respond to an S1G frame, other than an NDP PS-Poll frame, is described in this subclause.

##### 23.3.12.2.4.2 NDP_1M Ack

The format of the NDP CMAC PPDU body field of the NDP_1M Ack frame is shown in Figure 23-28 (NDP CMAC PPDU body field of the NDP_1M Ack frame).

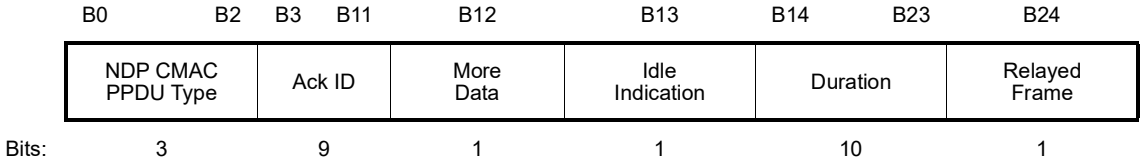

**Figure 23-28—NDP CMAC PPDU body field of the NDP_1M Ack frame**

The NDP CMAC PPDU Type field is set to 2.

The Ack ID field is set to the bit sequence Scrambler Initialization [0:6] || FCS[30:31] obtained from the scrambler initialization value in the (#3409)SERVICE field (as defined in 23.3.9.2 (SERVICE field)) prior to descrambling, and the FCS field of the PSDU that carries the soliciting frame. The scrambler initialization value is obtained from the RXVECTOR parameter SCRAMBLER_OR_CRC.

The More Data field is described in 9.2.4.1.8 (More Data subfield).

The Idle Indication field is set to 0 if the value of the Duration field sets the NAV as described in 9.2.5.6 (Setting for control response frames). Otherwise, it is set to 1 if the value of the Duration field indicates an idle period.

If the Idle Indication field is 0, the Duration field is set as described in 9.2.5.6 (Setting for control response frames) where the value is expressed in units of 40 μs. If the Idle Indication field is 1, the Duration field is set to the duration of time, in milliseconds, during which an idle period (during which there is no frame transmission) is expected from the STA that elicited the response, starting from the end of the NDP Ack frame response.

The Relayed Frame field is set as described in 10.53.5 (Procedures of TXOP sharing for S1G relay operation) and 10.60 (S1G flow control).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

#### 23.3.12.2.4.3 NDP_2M Ack

The format of the NDP CMAC PPDU body field of the NDP_2M Ack frame is shown in Figure 23-29 (NDP CMAC PPDU body field of the NDP_2M Ack frame).

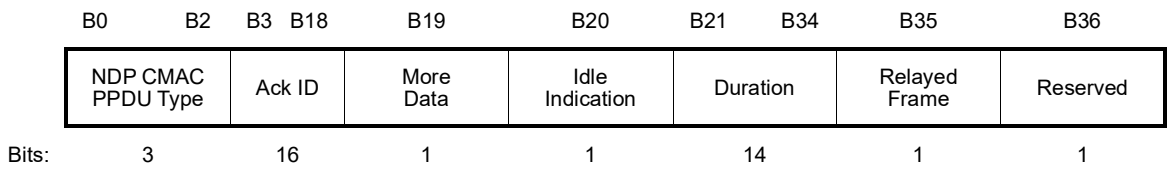

**Figure 23-29—NDP CMAC PPDU body field of the NDP_2M Ack frame**

The NDP CMAC PPDU Type field is set to 2.

The Ack ID field is set to the bit sequence Scrambler Initialization [0:6] || FCS[23:31] obtained from the scrambler initialization value in the (#3409)SERVICE field (as defined in 23.3.9.2 (SERVICE field)) prior to descrambling, and the FCS field of the PSDU that carries the soliciting frame. The scrambler initialization value is obtained from the RXVECTOR parameter SCRAMBLER_OR_CRC.

The More Data field is described in 9.2.4.1.8 (More Data subfield).

The Idle Indication field is set to 0 if the value of the Duration field sets the NAV as described in 9.2.5.6 (Setting for control response frames). Otherwise, it is set to 1 if the value of the Duration field indicates an idle period.

If the Idle Indication field is 0, the Duration field is set as described in 9.2.5.6 (Setting for control response frames) where the value is expressed in units of 1 μs(#8087)(#7198). If the Idle Indication field is 1, the Duration field is set to the duration of time, in milliseconds, during which an idle period (during which there is no frame transmission) is expected from the STA that elicited the response, starting from the end of the NDP Ack frame response.

The Relayed Frame field is set as described in 10.53.5 (Procedures of TXOP sharing for S1G relay operation) and 10.60 (S1G flow control).

(#455)The Reserved field shall be set to all 0s on transmit and ignored on receive.

### 23.3.12.2.5 NDP PS-Poll-Ack

#### 23.3.12.2.5.1 General

The NDP PS-Poll-Ack frame, used to respond to an NDP PS-Poll frame, is described in this subclause.

#### 23.3.12.2.5.2 NDP_1M PS-Poll-Ack

The format of the NDP CMAC PPDU body field of the NDP_1M PS-Poll-Ack frame is shown in Figure 23-30 (NDP CMAC PPDU body field of the NDP_1M PS-Poll-Ack frame).

The NDP CMAC PPDU Type field is set to 3.

The Ack ID field is set to the bit sequence CRC[0:3] || TA[4:8] obtained from the CRC and TA field of the NDP PS-Poll frame that elicited the response. The CRC value is obtained from the RXVECTOR parameter SCRAMBLER_OR_CRC.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

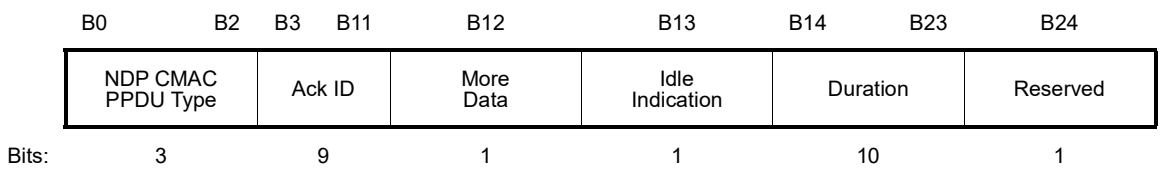

**Figure 23-30—NDP CMAC PPDU body field of the NDP_1M PS-Poll-Ack frame**

The More Data field is described in 9.2.4.1.8 (More Data subfield).

The Idle Indication field is set to 0 if the value of the Duration field is an extension of the Ack ID. Otherwise, it is set to 1 if the value of the Duration field indicates an idle period.

If the Idle Indication field is 0, the Duration field is set to the bit sequence TA[3] || RA[0:8] obtained from the RA and TA fields of the NDP PS-Poll frame that elicited the response. If the Idle Indication is 1, the Duration field is set to the duration of time, in milliseconds, during which an idle period (during which there is no frame transmission) is expected from the STA that elicited the response, starting from the end of the NDP PS-Poll-Ack frame response.

(#455)The Reserved field shall be set to all 0s on transmit and ignored on receive.

#### 23.3.12.2.5.3 NDP_2M PS-Poll-Ack

The format of the NDP CMAC PPDU body field of the NDP_2M PS-Poll-Ack frame is shown in Figure 23-31 (NDP CMAC PPDU body field of the NDP_2M PS-Poll-Ack frame).

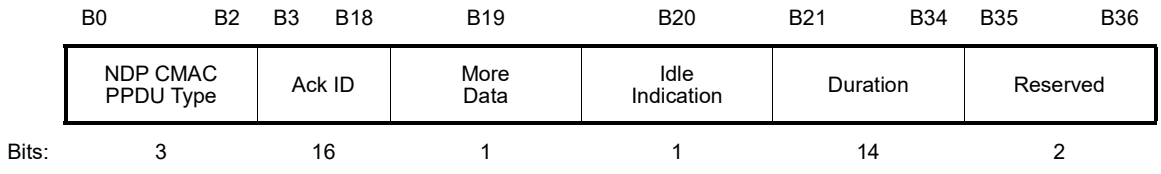

**Figure 23-31—NDP CMAC PPDU body field of the NDP_2M PS-Poll-Ack frame**

The NDP CMAC PPDU Type field is set to 3.

The Ack ID field is set to the bit sequence CRC[0:3] || TA[0:8] || RA[6:8]] obtained from the CRC, TA, and RA field of the NDP PS-Poll frame that elicited the response. The CRC value is obtained from the RXVECTOR parameter SCRAMBLER_OR_CRC.

The More Data field is described in 9.2.4.1.8 (More Data subfield).

The Idle Indication field is set to 0 if the value of the Duration field sets the NAV as described in 10.3.2.15 (NAV distribution). Otherwise, it is set to 1 if the value of the Duration field indicates an idle period.

If the Idle Indication field is 0, the Duration field is set as described in 10.3.2.15 (NAV distribution), where the value is expressed in units of 1 μs(#8087)(#7198).

If the Idle Indication field is 1, the Duration field is set to the duration of time, in milliseconds, during which an idle period (during which there is no frame transmission) is expected from the STA that elicited the response, starting from the end of the NDP PS-Poll-Ack frame response.

(#455)The Reserved field shall be set to all 0s on transmit and ignored on receive.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

#### 23.3.12.2.6 NDP BlockAck

##### 23.3.12.2.6.1 NDP_1M BlockAck

The format of the NDP CMAC PPDU body field of the NDP_1M BlockAck frame is shown in Figure 23-32 (NDP CMAC PPDU body field of the NDP_1M BlockAck frame).

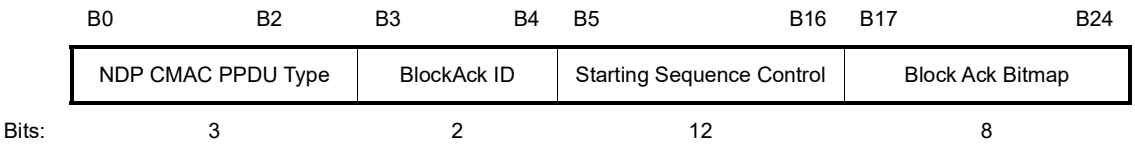

**Figure 23-32—NDP CMAC PPDU body field of the NDP_1M BlockAck frame**

The NDP CMAC PPDU Type field is set to 4.

The BlockAck ID field contains the identifier of the NDP BlockAck frame. It is set to the 2 LSBs of the bit sequence of the scrambler initialization value in the SERVICE field (as defined in 23.3.9.2 (SERVICE field)), prior to descrambling, of the PSDU that carries the soliciting frame. The scrambler initialization value is obtained from the RXVECTOR parameter SCRAMBLER_OR_CRC.

The Starting Sequence Control field contains the sequence number of the first MSDU or A-MSDU for which the NDP BlockAck frame is sent. This field is defined in 10.25.6.5 (Generation and transmission of BlockAck frames by an HT STA, DMG STA, or S1G STA) when the NDP BlockAck is used during a block ack agreement and is defined in 10.3.2.12 (Fragment BA procedure) when it is used in a fragment BA procedure.

The Block Ack Bitmap field of the NDP BlockAck frame is used to indicate the received status of:

— Up to 8 MSDUs and A-MSDUs when the NDP BlockAck is used during a block ack agreement. Each bit that is equal to 1 in the NDP BlockAck bitmap acknowledges the reception of a single MSDU or A-MSDU in the order of sequence number, with the first bit of the NDP BlockAck bitmap corresponding to the MSDU or A-MSDU with the sequence number that matches the value of the Starting Sequence Control field.

— Up to 8 fragments of an MSDU when the NDP BlockAck is used in a fragment BA procedure (see 10.3.2.12 (Fragment BA procedure)). Each bit that is equal to 1 in the BlockAck Bitmap acknowledges the reception of a single fragment of an MSDU, in the order of the fragment number, with the first bit of the BlockAck Bitmap corresponding to the MPDU with fragment number equal to 0 or 8.

The transmitting (receiving) STA encodes (decodes) the BlockAck ID field and the Starting Sequence Control field of the NDP BlockAck frames applying the protection mechanism described in 10.56 (Bitmap protection for NDP BlockAck frames).

##### 23.3.12.2.6.2 NDP_2M BlockAck

The format of the NDP CMAC PPDU body field of the NDP_2M BlockAck frame is shown in Figure 23-33 (NDP CMAC PPDU body field of the NDP_2M BlockAck frame).

The NDP CMAC PPDU Type field is set to 4.

The BlockAck ID field contains the identifier of the NDP BlockAck frame. It is set to the 6 LSBs of the bit sequence of the scrambler initialization value in the SERVICE field (as defined in 23.3.9.2 (SERVICE

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

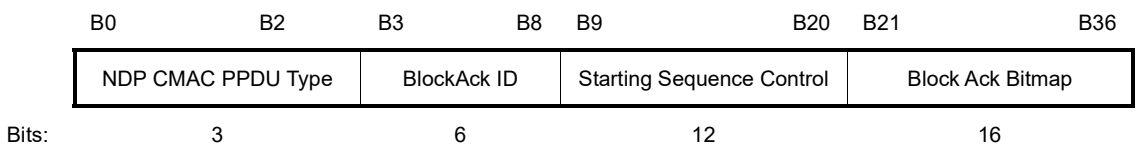

**Figure 23-33—NDP CMAC PPDU body field of the NDP_2M BlockAck frame**

field)), prior to descrambling, of the PSDU that carries the soliciting frame. The scrambler initialization value is obtained from the RXVECTOR parameter SCRAMBLER_OR_CRC.

The Starting Sequence Control field contains the sequence number of the first MSDU or A-MSDU for which the NDP BlockAck frame is sent. This field is defined in when the NDP BlockAck is used during a block ack agreement and is defined in 10.3.2.12 (Fragment BA procedure) when it is used in a fragment BA procedure.

The Block Ack Bitmap field of the NDP BlockAck frame is used to indicate the received status of:

— Up to 16 MSDUs and A-MSDUs when the NDP BlockAck is used during a block ack agreement. Each bit that is equal to 1 in the NDP BlockAck bitmap acknowledges the reception of a single MSDU or A-MSDU in the order of sequence number, with the first bit of the NDP BlockAck bitmap corresponding to the MSDU or A-MSDU with the sequence number that matches the value of the Starting Sequence Control field.

— Up to 16 fragments of an MSDU when the NDP BlockAck is used in a fragment BA procedure (see 10.3.2.12 (Fragment BA procedure)). Each bit that is equal to 1 in the BlockAck Bitmap acknowledges the reception of a single fragment of an MSDU, in the order of the fragment number, with the first bit of the BlockAck Bitmap corresponding to the MPDU with fragment number equal to 0.

The transmitting (receiving) STA encodes (decodes) the BlockAck ID field and the Starting Sequence Control field of the NDP BlockAck frames applying the protection mechanism described in 10.56 (Bitmap protection for NDP BlockAck frames).

#### 23.3.12.2.7 NDP Beamforming Report Poll

##### 23.3.12.2.7.1 NDP_2M Beamforming Report Poll

The format of the NDP CMAC PPDU body field of the NDP_2M Beamforming Report Poll frame is shown in Figure 23-34 (NDP CMAC PPDU body field of the NDP_2M Beamforming Report Poll frame).

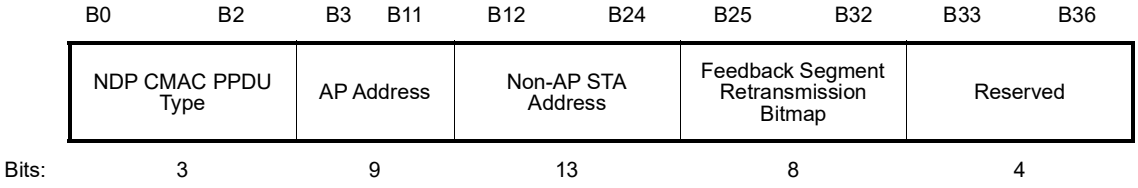

**Figure 23-34—NDP CMAC PPDU body field of the NDP_2M Beamforming Report Poll frame**

The NDP CMAC PPDU Type field is set to 5.

The AP Address field indicates the partial BSSID of the AP's BSS as described in 10.21 (Group ID, partial AID, Uplink Indication, and COLOR in S1G PPDUs).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Non-AP STA Address field indicates the AID of the non-AP STA.

The Feedback Segment Retransmission Bitmap field indicates the feedback segments to be polled in VHT compressed beamforming feedback(#4014)(#317), which is contained in one or more VHT Compressed Beamforming frames.

(#455)The Reserved field shall be set to all 0s on transmit and ignored on receive.

#### 23.3.12.2.8 NDP Paging

##### 23.3.12.2.8.1 General(#8179)

(#8179)An NDP Paging frame is an NDP_1M Paging frame or an NDP_2M Paging frame, as defined in this subclause.

##### 23.3.12.2.8.2 NDP_1M Paging

The format of the NDP CMAC PPDU body field of the NDP_1M Paging frame is shown in Figure 23-35 (NDP CMAC PPDU body field of the NDP_1M Paging frame).

| | B0 – B2 | B3 – B11 | B12 – B20 | B21 | B22 – B24 |
|---|---|---|---|---|---|
| | NDP CMAC PPDU Type | P-ID | APDI/partial AID | Direction | Reserved |
| Bits: | 3 | 9 | 9 | 1 | 3 |

**Figure 23-35—NDP CMAC PPDU body field of the NDP_1M Paging frame**

The NDP CMAC PPDU Type field is set to 6.

The P-ID field is the identifier of the NDP paging requester, as described in 10.46.6 (NDP paging setup).

If the Direction field is 1 the APDI/partial AID field indicates the AP direction information (APDI), where

- The 8 MSBs of the APDI, depending on the value of the Action subfield of the NDP paging response,(#8182) contain
  - The PTSF subfield if the Action subfield is not equal to 4. The PTSF subfield is set to the value of the partial TSF of the transmitting STA as defined in 10.46.6 (NDP paging setup).
  - The ASD subfield if the Action subfield is equal to 4. The ASD subfield is the additional sleep duration and is set to the time, in units of SIFS, after which the receiver STA is in awake state as described in 10.46.6 (NDP paging setup).
- The LSB of the APDI is the Check Beacon Flag subfield and is an indicator of critical changes in the Beacon frame as described in 10.46.6 (NDP paging setup).

If the Direction field is 0, the APDI/partial AID field indicates the partial AID of the NDP paging responder STA.

The Direction field is set to 1, if the NDP paging responder is an AP, otherwise it is set to 0.

(#455)The Reserved field shall be set to all 0s on transmit and ignored on receive.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

#### 23.3.12.2.8.3 NDP_2M Paging

The format of the NDP CMAC PPDU body field of the NDP_2M Paging frame is shown in Figure 23-36 (NDP CMAC PPDU body field of the NDP_2M Paging frame).

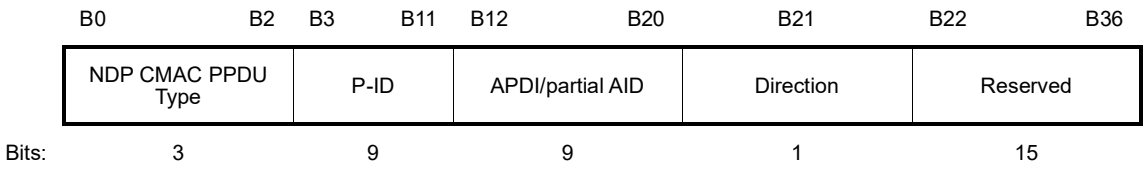

**Figure 23-36—NDP CMAC PPDU body field of the NDP_2M Paging frame**

The NDP CMAC PPDU Type field is set to 6.

The P-ID field is the identifier of the NDP paging requester, as described in 10.46.6 (NDP paging setup).

If the Direction field is 1, the APDI/partial AID field indicates the APDI (AP Direction Information) where:

- The 8 MSBs of the APDI, depending on the value of the Action subfield of the NDP paging response,(#8182) contain
  - The PTSF subfield if the Action subfield is not equal to 4. The PTSF subfield is set to the value of the partial TSF of the transmitting STA as defined in 10.46.6 (NDP paging setup).
  - The ASD subfield if the Action subfield is equal to 4. The ASD subfield is the additional sleep duration and is set to the time, in units of SIFS, after which the receiver STA is in awake state as described in 10.46.6 (NDP paging setup).
- The LSB of the APDI is the Check Beacon Flag subfield and is an indicator of critical changes in the Beacon frame as described in 10.46.6 (NDP paging setup).

If the Direction field is 0, the APDI/partial AID field indicates the partial AID of the NDP paging responder STA.

The Direction field is set to 1, if the NDP paging responder is an AP, otherwise it is set to 0.

(#455)The Reserved field shall be set to all 0s on transmit and ignored on receive.

### 23.3.12.2.9 NDP Probe Request

#### 23.3.12.2.9.1 General

NDP Probe Request frames are used in the procedures described in 11.1.4.3.6 (NDP Probing).

#### 23.3.12.2.9.2 NDP_1M Probe Request

The format of the NDP CMAC PPDU body field of the NDP_1M Probe Request frame is shown in Figure 23-37 (NDP CMAC PPDU body field of the NDP_1M Probe Request frame).

The NDP CMAC PPDU Type field is set to 7.

The CSSID/ANO Present field indicates if the NDP Probe Request frame contains a Compressed SSID field or an Access Network Option field:

- Set to 0 if the NDP Probe Request frame contains the Compressed SSID field.
- Set to 1 if the NDP Probe Request frame contains the Access Network Option field.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

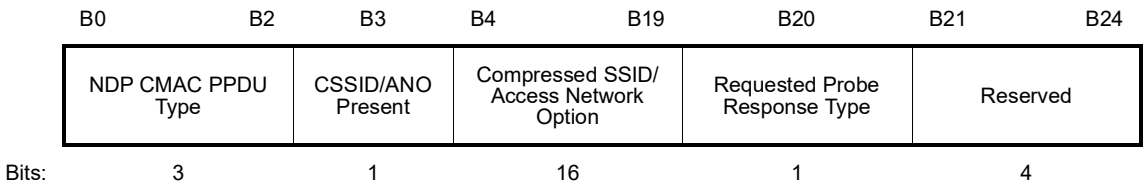

**Figure 23-37—NDP CMAC PPDU body field of the NDP_1M Probe Request frame**

When the CSSID/ANO Present field is 0, the Compressed SSID/Access Network Option field is set to (#8219)the compressed SSID, which is the 2 least significant octets of a 32-bit CRC calculated as defined 9.2.4.9 (FCS field), wherein the calculated fields is the (#8128)SSID.

(#8218)NOTE—This is encoded per 9.2.2 (Conventions). For example, if the short SSID has the coefficient of the highest order term set, and the coefficient of the next-to-lowest order term set, and all other coefficients clear, then the Compressed SSID/Access Network Option field contains 0x02 followed by 0x00.

When the CSSID/ANO Present field is 1, the Compressed SSID/Access Network Option field bits [0:7] are set to Access Network Option, which is defined in 9.4.2.90 (Interworking element) (see Figure 9-564 (Interworking element format)). The Compressed SSID/Access Network Option field bits [8:15] are reserved (#455)and shall be set to all 0s on transmit and ignored on receive.

The Requested Probe Response Type field indicates the Probe Response type:

— Set to 0 if the STA requests a PV1 Probe Response frame.
— Set to 1 if the STA requests a Probe Response frame.

(#455)The Reserved field shall be set to all 0s on transmit and ignored on receive.

### 23.3.12.2.9.3 NDP_2M Probe Request

The format of the NDP CMAC PPDU body field of the NDP_2M Probe Request frame is shown in Figure 23-38 (NDP CMAC PPDU body field of the NDP_2M Probe Request frame(#8219)).

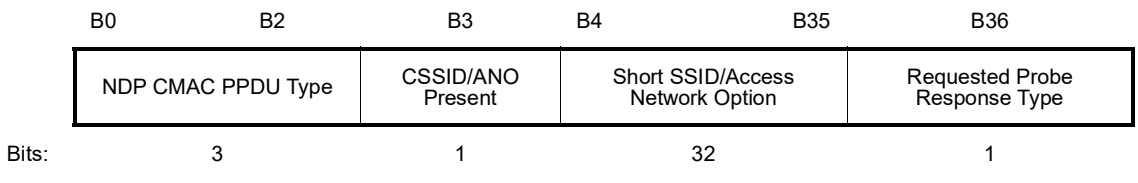

**Figure 23-38—NDP CMAC PPDU body field of the NDP_2M Probe Request frame(#8219)**

The NDP CMAC PPDU Type field is set to 7.

The CSSID/ANO Present field indicates if the NDP Probe Request frame contains a (#8219)Short SSID field or an Access Network Option field:

— Set to 0 if the NDP Probe Request contains the (#8219)Short SSID field.
— Set to 1 if the NDP Probe Request contains the Access Network Option field.

When the CSSID/ANO Present field is 0, (#8219)the Short SSID/Access Network Option field (#8218)is set to the short SSID, which is a 32-bit CRC calculated as defined in 9.2.4.9 (FCS field), wherein the calculated fields is the (#8128)SSID.

When the CSSID/ANO Present field is 1, the (#8219)Short SSID/Access Network Option field bits [0:7] are set to Access Network Option, which is defined in 9.4.2.90 (Interworking element) (see Figure 9-564

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

(Interworking element format)). The(#8219) Short SSID/Access Network Option field bits [8:31] are reserved (#455)and shall be set to all 0s on transmit and ignored on receive.

The Requested Probe Response Type field indicates the Probe Response type:

— Set to 0 if the STA requests a PV1 Probe Response frame.
— Set to 1 if the STA requests a Probe Response frame.

### 23.3.13 Regulatory requirements

WLANs implemented in accordance with this standard are subject to equipment certification and operating requirements established by regional and national regulatory administrations. The PHY specification establishes minimum technical requirements for interoperability, based upon established regulations at the time this standard was issued. These regulations are subject to revision, or may be superseded. Requirements that are subject to local geographic regulations are annotated within the PHY specification. Regulatory requirements that do not affect interoperability are not addressed in this standard. Implementers are referred to the regulatory sources in Annex D for further information. Operation in countries within defined regulatory domains may be subject to additional or alternative national regulations.

### 23.3.14 Channelization

STAs compliant with the physical layer defined in Clause 23 (Sub 1 GHz (S1G) PHY specification(#4095)) operate in the channels (700 MHz – 1 GHz) defined in Annex E.

The channel center frequency, $f_c$, is defined as(#6420)

$$f_c\,[\text{MHz}] = \mathit{ChannelStartingFrequency} + f_{\text{separation}} \times \mathit{ChannelCenterChannelNumber}$$

where

$f_{\text{separation}}$ is the frequency separation between channels, and has the value of 0.5 MHz

*ChannelStartingFrequency* and *ChannelCenterChannelNumber*(#6420) are region and operating class specific and given in Annex E. The Channel spacing column in Annex E denotes the corresponding bandwidth for S1G operation.

The center frequency of the primary 1 MHz or primary 2 MHz channel, $f_{c,\,\text{primary}}$, is defined as:

$$f_{c,\,\text{primary}}\,[\text{MHz}] = \mathit{ChannelStartingFrequency} + f_{\text{separation}} \times \mathit{PrimaryChannelNumber}$$

where

$f_{\text{separation}}$ is the frequency separation between channels, and has the value of 0.5 MHz

*PrimaryChannelNumber* is the subchannel index of the primary 1 or 2 MHz channel within the overall bandwidth for S1G operation

### 23.3.15 Slot time

The slot time for the S1G PHY shall be 52 μs.

### 23.3.16 Transmit and receive port impedance

(#1247)The impedance of exposed transmit and receive antenna ports are defined in 17.3.8.7 (Transmit and receive impedance at the antenna connector).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

## 23.3.17 S1G transmit specification

### 23.3.17.1 Transmit spectrum mask

NOTE 1—In the presence of additional regulatory restrictions, the device has to meet both the regulatory requirements and the mask defined in this subclause.

NOTE 2—Transmit spectral mask figures in this subclause are not drawn to scale.

NOTE 3—For rules regarding TX center frequency leakage levels see 23.3.17.4.2 (Transmitter center frequency leakage). Transmit modulation accuracy specifications are described in 23.3.17.4.2 (Transmitter center frequency leakage) and 23.3.17.4.3 (Transmitter constellation error). The test method is described in 23.3.17.4.4 (Transmitter modulation accuracy (EVM) test). The spectral mask requirements in this subclause do not apply to the RF LO leakage.

(#1471)The overall transmit spectral mask is constructed using two components. First, an interim spectral mask is constructed whose mask level is determined relative to the maximum spectral density of the signal. Second, an absolute transmit spectral limit is computed based on the mask bandwidth. The overall transmit spectral mask is then constructed by taking the higher of the interim transmit spectral mask and the absolute transmit spectral limit at each frequency offset.

For a 1 MHz mask PPDU, the interim transmit spectral mask shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth of 0.9 MHz, –20 dBr at 0.6 MHz frequency offset, –28 dBr at 1 MHz frequency offset and –40 dBr at 1.5 MHz frequency offset and above. The interim transmit spectral mask for frequency offsets in between 0.45 and 0.6 MHz, 0.6 and 1 MHz, and 1 and 1.5 MHz shall be linearly interpolated in dB domain from the requirements for 0.45, 0.6, 1 and 1.5 MHz frequency offsets. The transmit spectrum shall not exceed the maximum of the interim transmit spectral mask and –40 dBm/MHz at any frequency offset. Figure 23-39 (Transmit spectral mask for 1 MHz channel) shows an example of the resulting overall spectral mask when the –40 dBr spectrum level is above –40 dBm/MHz.

Measurements shall be made using a 10 kHz resolution bandwidth and a 100 Hz video bandwidth.

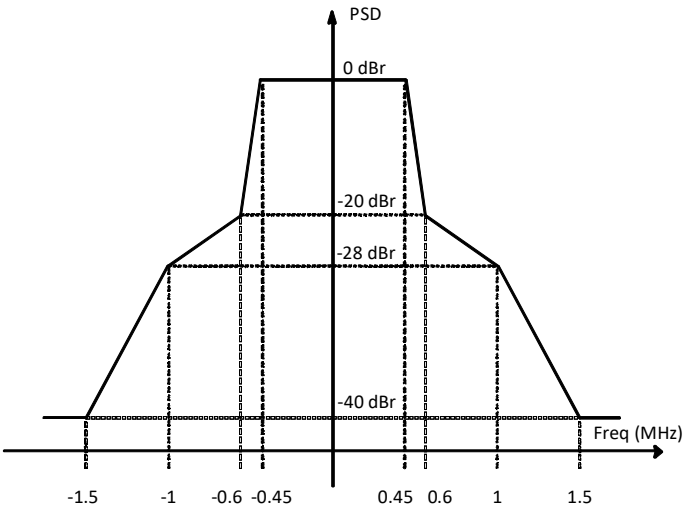

**Figure 23-39—Transmit spectral mask for 1 MHz channel**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

For a 2 MHz mask PPDU, the interim transmit spectral mask shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth of 1.8 MHz, –20 dBr at 1.1 MHz frequency offset, –28 dBr at 2 MHz frequency offset and –40 dBr at 3 MHz frequency offset and above. The interim transmit spectral mask for frequency offsets in between 0.9 and 1.1 MHz, 1.1 and 2 MHz, and 2 and 3 MHz shall be linearly interpolated in dB domain from the requirements for 0.9, 1.1, 2 and 3 MHz frequency offsets. The transmit spectrum shall not exceed the maximum of the interim transmit spectral mask and –43 dBm/MHz at any frequency offset. Figure 23-40 (Transmit spectral mask for 2 MHz channel) shows an example of the resulting overall spectral mask when the –40 dBr spectrum level is above –43 dBm/MHz.

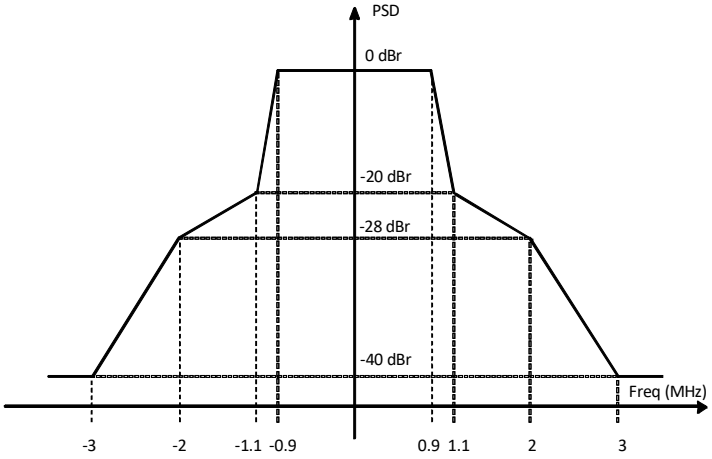

**Figure 23-40—Transmit spectral mask for 2 MHz channel**

For a 4 MHz mask PPDU, the interim transmit spectral mask shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth of 3.8 MHz, –20 dBr at 2.1 MHz frequency offset, –28 dBr at 4 MHz frequency offset and –40 dBr at 6 MHz frequency offset and above. The interim transmit spectral mask for frequency offsets in between 1.9 and 2.1 MHz, 2.1 and 4 MHz, and 4 and 6 MHz shall be linearly interpolated in dB domain from the requirements for 1.9, 2.1, 4 and 6 MHz frequency offsets. The transmit spectrum shall not exceed the maximum of the interim transmit spectral mask and –46 dBm/MHz at any frequency offset. Figure 23-41 (Transmit spectral mask for 4 MHz channel) shows an example of the resulting overall spectral mask when the –40 dBr spectrum level is above –46 dBm/MHz.

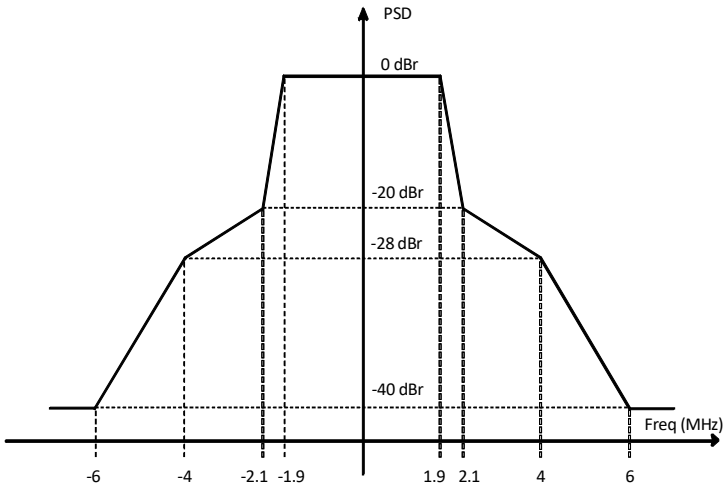

**Figure 23-41—Transmit spectral mask for 4 MHz channel**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

For a 8 MHz mask PPDU, the interim transmit spectral mask shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth of 7.8 MHz, –20 dBr at 4.1 MHz frequency offset, –28 dBr at 8 MHz frequency offset and –40 dBr at 12 MHz frequency offset and above. The interim transmit spectral mask for frequency offsets in between 3.9 and 4.1 MHz, 4.1 and 8 MHz, and 8 and 12 MHz shall be linearly interpolated in dB domain from the requirements for 3.9, 4.1, 8 and 12 MHz frequency offsets. The transmit spectrum shall not exceed the maximum of the interim transmit spectral mask and –49 dBm/MHz at any frequency offset. Figure 23-42 (Transmit spectral mask for 8 MHz channel) shows an example of the resulting overall spectral mask when the –40 dBr spectrum level is above –49 dBm/MHz.

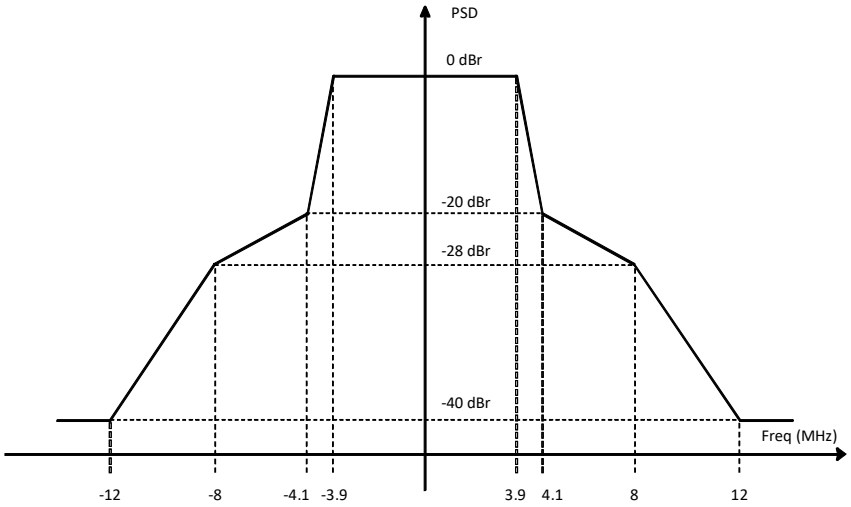

**Figure 23-42—Transmit spectral mask for 8 MHz channel**

For a 16 MHz mask PPDU, the interim transmit spectral mask shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth of 15.8 MHz, –20 dBr at 8.1 MHz frequency offset, –28 dBr at 16 MHz frequency offset and –40 dBr at 24 MHz frequency offset and above. The interim transmit spectral mask for frequency offsets in between 7.9 and 8.1 MHz, 8.1 and 16 MHz, and 16 and 24 MHz shall be linearly interpolated in dB domain from the requirements for 7.9, 8.1, 16 and 24 MHz frequency offsets. The transmit spectrum shall not exceed the maximum of the interim transmit spectral mask and –49 dBm/MHz at any frequency offset. Figure 23-43 (Transmit spectral mask for 16 MHz

channel) shows an example of the resulting overall spectral mask when the –40 dBr spectrum level is above –49 dBm/MHz.

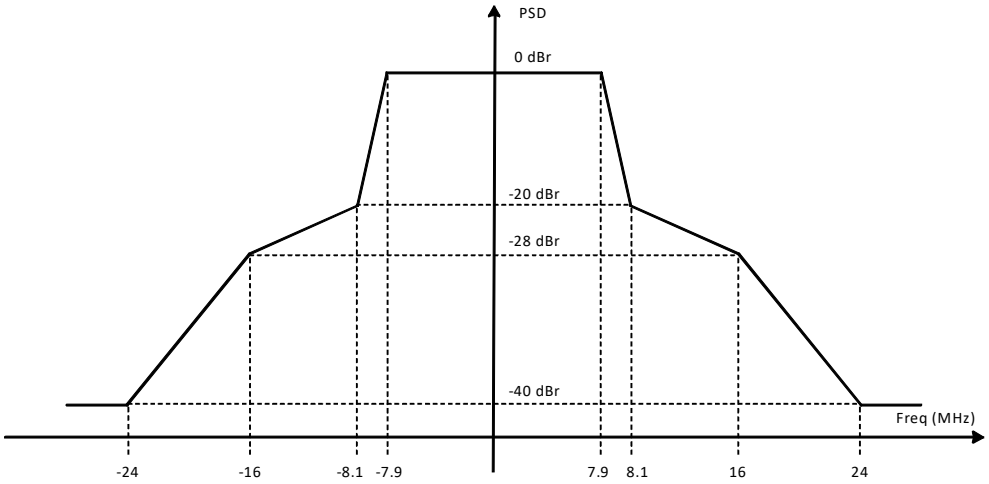

**Figure 23-43—Transmit spectral mask for 16 MHz channel**

### 23.3.17.2 Spectral flatness

Spectral flatness measurements shall be conducted using BPSK modulated PPDUs.

Let $E_{i,\,avg}$ denote the average constellation energy of a BPSK modulated subcarrier $i$ in an S1G data symbol.

In a normal mode S1G transmission or contiguous S1G 1 MHz or 2 MHz Duplicate mode transmission having a bandwidth listed in Table 23-33 (Maximum spectral flatness deviations), $E_{i,\,avg}$ of each of the subcarriers with indices listed as tested subcarrier indices shall not deviate by more than the specified maximum deviation in Table 23-33 (Maximum spectral flatness deviations) from the average of $E_{i,\,avg}$ over subcarrier indices listed as averaging subcarrier indices. Averaging of $E_{i,\,avg}$ is done in the linear domain.

For the spectral flatness test, the transmitting STA shall be configured to use a spatial mapping matrix $Q_k$ with flat frequency response. Each output port under test of the transmitting STA shall be connected through a cable to one input port of the testing instrumentation. The requirements apply to 1 MHz, 2 MHz, 4 MHz, 8 MHz, and 16 MHz normal mode transmissions and transmissions based on 1 and 2 MHz duplicated segments.

### 23.3.17.3 Transmit center frequency and symbol clock frequency tolerance

The symbol clock frequency and transmit center frequency tolerance shall be ± 20 ppm. The transmit center frequency and the symbol clock frequency for all transmit antennas and frequency segments shall be derived from the same reference oscillator.

### 23.3.17.4 Modulation accuracy

#### 23.3.17.4.1 Introduction to modulation accuracy tests

Transmit modulation accuracy specifications are described in 23.3.17.4.2 (Transmitter center frequency leakage) and 23.3.17.4.3 (Transmitter constellation error). The test method is described in 23.3.17.4.4 (Transmitter modulation accuracy (EVM) test).

| | | | –250 to –225, –223 to –198, –186 to –173, –43 to –33, –31 to –6, +6 to +31, +33 to +43, +173 to +186, +198 to 223, and +225 to +250 | +4/–6 |

### 23.3.17.4.2 Transmitter center frequency leakage

TX LO leakage is a consequence of the RF local oscillator (LO) and is the DC power emitted at its tuned center frequency. This TX LO leakage shall meet the following requirements for all formats and bandwidths:

— When the RF LO is in the center of the transmitted PPDU BW, the power measured at the center of transmission BW using resolution BW 31.25 kHz shall not exceed the average power per-subcarrier of the transmitted PPDU, or equivalently,( $P - 10\log 10(N_{ST})$ )(#315), where $P$ is the transmit power per antenna in dBm, and $N_{ST}$ is defined in Table 23-5 (Timing-related constants).

— When the RF LO is not at the center of the transmitted PPDU BW, the power measured at the location of the RF LO using resolution BW 31.25 kHz shall fall within that resolution BW of a 2 MHz channelization boundary and shall not exceed the maximum of –27 dB relative to the total transmit power and –15 dBm, or equivalently max($P$–27,–15), where $P$ is the transmit power per antenna in dBm. If 2 MHz channelization is not allowed in the regulatory region of operation, the TX LO leakage shall fall within the resolution BW of a 1 MHz channelization boundary and shall not exceed the maximum of –27 dB relative to the total transmit power and –15 dBm, or equivalently max($P$–27,–15), where $P$ is the transmit power per antenna in dBm.

The transmit center frequency leakage is specified per antenna.

### 23.3.17.4.3 Transmitter constellation error

The relative constellation RMS error, calculated by first averaging over subcarriers, OFDM PPDUs and spatial streams (#4181)(see Equation (19-89)) shall not exceed a data-rate dependent value according to Table 23-34 (Allowed relative constellation error versus constellation size and coding rate). The number of spatial streams under test shall be equal to the number of utilized transmitting STA antenna (output) ports and also equal to the number of utilized testing instrumentation input ports. In the test, $N_{SS}$=$N_{STS}$ (no STBC) shall be used. Each output port of the transmitting STA shall be connected through a cable to one input port

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

of the testing instrumentation. The requirements apply to 1 MHz, 2 MHz, 4 MHz, 8 MHz, and 16 MHz transmissions.

**Table 23-34—Allowed relative constellation error versus constellation size and coding rate**

| Modulation | Coding rate | Relative constellation error (dB) |
|---|---|---|
| BPSK | 1/2 with 2× repetition | –4 |
| BPSK | 1/2 | –5 |
| QPSK | 1/2 | –10 |
| QPSK | 3/4 | –13 |
| 16-QAM | 1/2 | –16 |
| 16-QAM | 3/4 | –19 |
| 64-QAM | 2/3 | –22 |
| 64-QAM | 3/4 | –25 |
| 64-QAM | 5/6 | –27 |
| 256-QAM | 3/4 | –30 |
| 256-QAM | 5/6 | –32 |
| 1024-QAM(M102) | 3/4 | –35/–32 |
| 1024-QAM(M102) | 5/6 | –35/–32 |

(M102)For 1024-QAM, the relative constellation error shall meet the following requirements:

— The relative constellation error shall be less than or equal to –35 dB with amplitude drift compensation enabled in the test equipment, and the relative constellation error shall be less than or equal to –32 dB with amplitude drift compensation disabled in the test equipment.

(M102)For all other constellations, the relative constellation error shall be less than or equal to the values in Table 23-34 (Allowed relative constellation error versus constellation size and coding rate) regardless of whether amplitude drift compensation is enabled in the test equipment.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

#### 23.3.17.4.4 Transmitter modulation accuracy (EVM) test

The transmit modulation accuracy test shall be performed by instrumentation capable of converting the transmitted signals into a stream of complex samples at sampling rate greater than or equal to the bandwidth of the signal being transmitted; except that for duplicate transmissions, each 1 MHz or 2 MHz subchannel may be tested independently while all subchannels are being transmitted.

The instrument shall have sufficient accuracy in terms of I/Q arm amplitude and phase balance, DC offsets, phase noise, and analog to digital quantization noise. A possible embodiment of such a setup is converting the signals to a low IF frequency with a microwave synthesizer, sampling the signal with a digital oscilloscope and decomposing it digitally into quadrature components. The sampled signal shall be processed in a manner similar to an actual receiver, according to the following steps, or equivalent procedure:

a) Start of PPDU shall be detected.
b) Transition from STF field to LTF1 field shall be detected and fine timing shall be established.
c) Coarse and fine frequency offsets shall be estimated.
d) Symbols in a PPDU shall be derotated according to estimated frequency offset.
e) For each LTF symbol, transform the symbol into subcarrier received values, estimate the phase from the pilot subcarriers, and derotate the subcarrier values according to the estimated phase.
f) Estimate the complex channel response coefficient for each of the subcarriers and each of the transmit streams.
g) For each of the data OFDM symbols: transform the symbol into subcarrier received values, estimate the phase from the pilot subcarriers, derotate the subcarrier values according to the estimated phase, group the results from all the receiver chains in each subcarrier to a vector, and multiply the vector by a zero-forcing equalization matrix generated from the estimated channel.
h) For each data-carrying subcarrier in each spatial stream, find the closest constellation point and compute the Euclidean distance from it.
i) Compute the average across PPDUs of the RMS of all errors per PPDU as given by Equation (19-89).

The test shall be performed over at least 20 PPDUs [as defined in Equation (19-89)]. The PPDUs under test shall be at least 16 data OFDM symbols long. Random data shall be used for the symbols.

### 23.3.17.5 Time of Departure accuracy

(#8052)The RMS accuracy of the time of departure provided in TIME_OF_DEPARTURE shall be less than or equal to 80 ns.

The Time of Departure accuracy test evaluates TIME_OF_DEPARTURE against aTxPHYTxStartRMS and aTxPHYTxStartRMS against TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH as defined in Annex T with the following test parameters:

— MULTICHANNEL_SAMPLING_RATE is

$1 \times 10^6 \left(1 + \left\lceil \frac{f_H - f_L}{1\ \text{MHz}} \right\rceil\right)$ sample/s, for a CH_BANDWIDTH parameter equal to CBW1

$2 \times 10^6 \left(1 + \left\lceil \frac{f_H - f_L}{2\ \text{MHz}} \right\rceil\right)$ sample/s, for a CH_BANDWIDTH parameter equal to CBW2

$4 \times 10^6 \left(1 + \left\lceil \frac{f_H - f_L}{4\ \text{MHz}} \right\rceil\right)$ sample/s, for a CH_BANDWIDTH parameter equal to CBW4

$8 \times 10^6 \left(1 + \left\lceil \frac{f_H - f_L}{8\ \text{MHz}} \right\rceil\right)$ sample/s, for a CH_BANDWIDTH parameter equal to CBW8

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$16 \times 10^6\left(1 + \left\lceil \frac{f_H - f_L}{16\ \text{MHz}} \right\rceil\right)$ sample/s, for a CH_BANDWIDTH parameter equal to CBW16

where

$f_H$ is the nominal center frequency in Hz of the highest channel in the channel set

$f_L$ is the nominal center frequency in Hz of the lowest channel in the channel set, the channel set is the set of channels upon which (#14)PPDUs providing measurements are transmitted.

— FIRST_TRANSITION_FIELD is the STF field.

— SECOND_TRANSITION_FIELD is the LTF1 field.

— TRAINING_FIELD is the LTF1 field windowed in a manner that should approximate the windowing described in 17.3.2.5 (Mathematical conventions in the signal descriptions) with TTR = 1000 ns.

— TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH is 80 ns for a CH_BANDWIDTH parameter equal to CBW16, and unspecified otherwise.

NOTE—The indicated windowing applies to the time of departure accuracy test equipment, and not the transmitter or receiver.

### 23.3.18 S1G receiver specification

#### 23.3.18.1 Receiver minimum input level sensitivity(#256)

The (#14)PER shall be less than 10% for a PSDU length of 256 octets with the rate-dependent input levels listed in Table 23-35 (Receiver minimum input level sensitivity). The test in this subclause and the minimum sensitivity levels specified in Table 23-35 (Receiver minimum input level sensitivity) apply only to non-STBC modes, 8 μs GI, BCC, and S1G PPDU.

**Table 23-35—Receiver minimum input level sensitivity**

| Modulation | Rate (R) | Minimum sensitivity (1 MHz PPDU) (dBm) | Minimum sensitivity (2 MHz PPDU) (dBm) | Minimum sensitivity (4 MHz PPDU) (dBm) | Minimum sensitivity (8 MHz PPDU) (dBm) | Minimum sensitivity (16 MHz PPDU) (dBm) |
|---|---|---|---|---|---|---|
| BPSK | 1/2 with 2× repetition | –98 | N/A | N/A | N/A | N/A |
| BPSK | 1/2 | –95 | –92 | –89 | –86 | –83 |

### 23.3.18.2 Adjacent channel rejection

Adjacent channel rejection for *W* MHz channels (where *W* is 1, 2, 4, 8, or 16) shall be measured by setting the requested signal's strength 3 dB above the rate dependent sensitivity specified in 23.3.18.1 (Receiver minimum input level sensitivity(#256)) and raising the power of the interfering signal of *W* MHz bandwidth until 10% PER is caused for a PSDU length of 256 octets. The power difference between the interfering and requested channel is the corresponding adjacent channel rejection. The center frequency of the adjacent channel shall be placed *W* MHz away from the center frequency of the requested signal.

The interfering signal in the adjacent channel shall be a conformant S1G signal, unsynchronized with the signal in the channel under test, and shall have a minimum duty cycle of 50%. For a conforming S1G PHY, the corresponding rejection shall be no less than specified in Table 23-36 (Minimum required adjacent and nonadjacent channel rejection levels).

The test in this subclause and the adjacent sensitivity levels specified in Table 23-36 (Minimum required adjacent and nonadjacent channel rejection levels) only apply to non-STBC modes with 8 μs GI and BCC.

The measurement of adjacent channel rejection for 2/4/8/16 MHz operation in a regulatory domain is only required if such a frequency band plan is permitted in that regulatory domain.

**Table 23-36—Minimum required adjacent and nonadjacent channel rejection levels**

| Modulation | Rate, R | Adjacent Channel Rejection (dB) | | Nonadjacent Channel Rejection (dB) | |
|---|---|---|---|---|---|
| | | 1 MHz Channel | 2/4/8/16 MHz Channel | 1 MHz Channel | 2/4/8/16 MHz Channel |
| BPSK | 1/2 with 2× repetition | 19 | N/A | 35 | N/A |

### 23.3.18.3 Nonadjacent channel rejection

Nonadjacent channel rejection for *W* MHz channels (where *W* is 1, 2, 4, 8, or 16) shall be measured by setting the requested signal's strength 3 dB above the rate-dependent sensitivity specified in Table 23-36 (Minimum required adjacent and nonadjacent channel rejection levels), and raising the power of the interfering signal of W MHz bandwidth until a 10% PER occurs for a PSDU length of 256 octets. The power difference between the interfering and requested channel is the corresponding nonadjacent channel rejection. The center frequency of the nonadjacent channel shall be placed 2×*W* MHz or more away from the center frequency of the requested signal.

The interfering signal in the nonadjacent channel shall be a conformant S1G signal, unsynchronized with the signal in the channel under test, and shall have a minimum duty cycle of 50%. For a conforming OFDM PHY, the corresponding rejection shall be no less than specified in Table 23-36 (Minimum required adjacent and nonadjacent channel rejection levels).

The test in this subclause and the nonadjacent sensitivity levels specified in Table 23-36 (Minimum required adjacent and nonadjacent channel rejection levels) only apply to non-STBC modes with 8 μs GI and BCC.

The measurement of nonadjacent channel rejection for 2/4/8/16 MHz operation in a regulatory domain is only required if such a frequency band plan is permitted in that regulatory domain.

### 23.3.18.4 Receiver maximum input level

The receiver shall provide a maximum PER of 10% at a PSDU length of 256 octets, for a maximum input level of –30 dBm, measured at each antenna for any baseband S1G modulation.

### 23.3.18.5 CCA sensitivity

### 23.3.18.5.1 General

The thresholds in this subclause are compared with the signal level at each receiving antenna.

### 23.3.18.5.2 Type 1 and type 2 channelization for CCA levels

In S1G operation, the CCA sensitivity levels are defined such that they are dependent and specific to country channelization and channel location within the frequency band. For S1G channelizations in all regions of the world, there are to be two available classifications for channels and CCA levels, defined as type 1 and type 2.

For BSSs set up on channels classified as using type 1, STAs are to use what are referred to in this subclause as type 1 CCA levels when performing their CCA procedures. Likewise, if the BSS is set up on channels

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

classified as type 2, STAs are required to use type 2 specific CCA levels. For SST BSS setups (see 10.51 (Subchannel selective transmission (SST))) where the SST BSS can include both type 1 and type 2 channels, the device in the SST BSS shall use the CCA level (type 1 or type 2) that corresponds to the current channel that is being accessed when performing their CCA procedures. The type 1 and type 2 channel classification for different operating classes in different regions of the world are denoted by "CCA Level Classification" in Table E-4 (Global operating classes) to Table E-5 (S1G operating classes) in Annex E.

In general, type 1 channels have CCA levels set to favor protection of ongoing transmissions and range of devices, relative to type 2 channels. Type 2 channels have CCA levels set to favor higher bandwidth and data rate transmissions, and to allow for higher reuse within the total network across different BSSs (relative to type 1 channels). To achieve this, type 2 channel CCA levels (i.e., thresholds) are defined to be higher than type 1 channel CCA levels.

CCA levels (M118)impact system behavior and performance increasingly with loading, therefore it is generally advantageous for BSSs primarily serving devices requiring more channel and transmission protection to set up on type 1 channels, and for BSSs expected to service devices with higher bandwidth and data rate transmissions to set up on type 2 channels if the region/country has both type 1 and type 2 channels available.

An S1G STA configures its active CCA conditions by generating a PHY-CONFIG.request(PHYCONFIG_VECTOR) primitive with the CCA_SENSITIVITY_TYPE parameter. For operating in type 1 channels, the MAC sublayer generates a PHY-CONFIG.request primitive with a PHYCONFIG_VECTOR parameter CCA_SENSITIVITY_TYPE set to CCA_SENSITIVITY_TYPE_1. For operating in type 2 channels, the MAC sublayer generates a PHY-CONFIG.request primitive with a PHYCONFIG_VECTOR parameter CCA_SENSITIVITY_TYPE set to CCA_SENSITIVITY_TYPE_2. For operating the 8/16 MHz intended channel width in type 2 channels, the MAC sublayer generates a PHY-CONFIG.request primitive with a PHYCONFIG_VECTOR parameter CCA_SENSITIVITY_TYPE set to CCA_SENSITIVITY_TYPE_2_WIDEBAND(#2365).

#### 23.3.18.5.3 CCA sensitivity for signals occupying the primary 2 MHz and/or primary 1 MHz channel

##### 23.3.18.5.3.1 General

In S1G operation, the CCA sensitivity levels a device shall use when detecting the start of S1G PPDUs are based on whether the occupied primary channel in question is classified as type 1 or type 2.

For devices operating in type 1 channels, the PHY shall issue a PHY-CCA.indication(BUSY, {primary1}) if one of the following conditions is present in an otherwise idle primary 1 MHz channel:

— The start of an S1G_1M PPDU or duplicate S1G_1M PPDU detected in the primary 1 MHz channel at or above –98 dBm within the primary 1 MHz channel with > 90% probability within a period aCCATime (see 23.4.4 (PHY characteristics)).

— Any S1G PPDU detected at or above –89 dBm within the primary 1 MHz channel with > 90% probability within a period of aCCAMidTime (see 23.4.4 (PHY characteristics)).

For devices operating in type 2 channels, the PHY shall issue a PHY-CCA.indication(BUSY, {primary1}) if one of the following conditions is present in an otherwise idle primary 1 MHz channel:

— The start of an S1G_1M PPDU or duplicate S1G_1M PPDU detected in the primary 1 MHz channel at or above –89 dBm within the primary 1 MHz channel with > 90% probability within a period aCCATime (see 23.4.4 (PHY characteristics)).

— Any S1G PPDU detected at or above –86 dBm within the primary 1 MHz channel with > 90% probability within a period of aCCAMidTime (see 23.4.4 (PHY characteristics)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The device shall not issue a PHY-CCA.indication(BUSY, {primary2}), PHY-CCA.indication(BUSY, {secondary2}), PHY-CCA.indication(BUSY, {secondary4}), or PHY-CCA.indication(BUSY, {secondary8}) until the end of the duration indicated by the (#14)PPDU or until all conditions above are no longer satisfied. Additionally, for both type 1 and type 2 channels, the device shall issue a PHY-CCA.indication(BUSY, {primary1}) if any received signal in the primary 1 MHz channel (#2365)exceeds –75 dBm within a period aCCATime.

For devices operating in type 1 channels, the PHY shall issue a PHY-CCA.indication(BUSY, {primary2}) if the conditions for issuing PHY-CCA.indication(BUSY, {primary1}) are not present and one of the following conditions is met in an otherwise idle 2 MHz, 4 MHz, 8 MHz, or 16 MHz operating channel width:

— An S1G_1M PPDU detected in the nonprimary 1 MHz portion of the primary 2 MHz channel at or above –89 dBm within the nonprimary 1 MHz with > 90% probability within a period of aCCAMidTime (see 23.4.4 (PHY characteristics)).

— A ≥ 2 MHz S1G PPDU at or above –89 dBm within the primary 2 MHz channel with > 90% probability within a period of aCCAMidTime (see 23.4.4 (PHY characteristics)).

— Any of the applicable conditions listed in Table 23-37 (Additional conditions for CCA BUSY on the primary 2 MHz in type 1 channelization). An applicable condition shall be met (i.e., triggered) if the PHY detects the start of the described PPDU(s) in Table 23-37 (Additional conditions for CCA BUSY on the primary 2 MHz in type 1 channelization) with > 90% probability within a period of aCCATime (see 23.4.4 (PHY characteristics)).

**Table 23-37—Additional conditions for CCA BUSY on the primary 2 MHz in type 1 channelization**

| Operating Channel Width | Conditions |
|---|---|
| 2 MHz, 4 MHz, 8 MHz, 16 MHz | The start of a 2 MHz S1G_SHORT or S1G_LONG PPDU, or of a duplicate S1G_SHORT or S1G_LONG PPDU at or above –92 dBm in the primary 2 MHz channel. |
| 4 MHz, 8 MHz, 16 MHz | The start of a 4 MHz S1G_SHORT or S1G_LONG PPDU, or of a duplicate S1G_SHORT or S1G_LONG PPDU at or above –89 dBm in the primary 4 MHz channel. |
| 8 MHz, 16 MHz | The start of an 8 MHz S1G_SHORT or S1G_LONG PPDU, or of a duplicate S1G_SHORT or S1G_LONG PPDU at or above –86 dBm in the primary 8 MHz channel. |
| 16 MHz | The start of a 16 MHz S1G_SHORT or S1G_LONG PPDU, or of a duplicate S1G_SHORT or S1G_LONG PPDU at or above –83 dBm. |

For devices operating in type 2 channels, the PHY shall issue a PHY-CCA.indication(BUSY, {primary2}) if the conditions for issuing PHY-CCA.indication(BUSY, {primary1}) are not present and one of the following conditions is met in an otherwise idle 2 MHz, 4 MHz, 8 MHz, or 16 MHz operating channel width:

— An S1G_1M PPDU is detected in the nonprimary 1 MHz portion of the primary 2 MHz channel at or above –86 dBm within the nonprimary 1 MHz with > 90% probability within a period of aCCAMidTime (see 23.4.4 (PHY characteristics)).

— A ≥ 2 MHz S1G PPDU at or above –86 dBm within the primary 2 MHz channel with > 90% probability within a period of aCCAMidTime (see 23.4.4 (PHY characteristics)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

— Any of the applicable conditions listed in Table 23-38 (Additional conditions for CCA BUSY on the primary 2 MHz in type 2 channelization). An applicable condition shall be met (i.e., triggered) if the PHY detects the start of the described PPDU(s) in Table 23-38 (Additional conditions for CCA BUSY on the primary 2 MHz in type 2 channelization) with > 90% probability within a period of aCCATime (see 23.4.4 (PHY characteristics)).

**Table 23-38—Additional conditions for CCA BUSY on the primary 2 MHz in type 2 channelization**

| Operating Channel Width | Conditions |
|---|---|
| 2 MHz, 4 MHz, 8 MHz, 16 MHz | The start of a 2 MHz S1G_SHORT or S1G_LONG PPDU, or of a duplicate S1G_SHORT or S1G_LONG PPDU at or above –89 dBm in the primary 2 MHz channel. |
| 4 MHz, 8 MHz, 16 MHz | The start of a 4 MHz S1G_SHORT or S1G_LONG PPDU, or of a duplicate S1G_SHORT or S1G_LONG PPDU at or above –86 dBm in the primary 4 MHz channel. |
| 8 MHz, 16 MHz | The start of an 8 MHz S1G_SHORT or S1G_LONG PPDU, or of a duplicate S1G_SHORT or S1G_LONG PPDU at or above –83 dBm in the primary 8 MHz channel. |
| 16 MHz | The start of a 16 MHz S1G_SHORT or S1G_LONG PPDU, or of a duplicate S1G_SHORT or S1G_LONG PPDU at or above –80 dBm. |

The device shall not issue a PHY-CCA.indication(BUSY, {secondary2}), PHY-CCA.indication(BUSY, {secondary4}), or PHY-CCA.indication(BUSY, {secondary8}) until the end of the duration indicated by the (#14)PPDU or until all conditions above are no longer satisfied. Additionally, for both type 1 and type 2 channels, the device shall issue a PHY-CCA.indication(BUSY, {primary2}) if any received signal in the primary 2 MHz channel (#2365)exceeds –72 dBm within a period aCCATime.

Additionally, when a STA detects an S1G_SHORT or S1G_LONG PPDU with a Partial AID field of its SIG field indicating a partial AID or COLOR value that matches its (#3403)partial AID or BSSID, the PHY shall issue a PHY-CCA.indication(BUSY, {primary2}) for the remaining duration of the PPDU as indicated in its preamble.

#### 23.3.18.5.3.2 CCA sensitivity for devices in type 2 channels implementing intended 8 or 16 MHz transmit channel width channel access procedure

For devices operating in type 2 channels, if the device intends to transmit an 8 or 16 MHz channel width PPDU and the device implements the procedure and rules for high intended BW transmission channel access described in 10.23.2.6, the PHY shall issue a PHY-CCA.indication(BUSY, {primary1}) if one of the following conditions is present in an otherwise idle primary 1 MHz channel:

— The start of an S1G_1M PPDU or duplicate S1G_1M PPDU detected in the primary 1 MHz channel at or above –86 dBm within the primary 1 MHz channel with > 90% probability within a period aCCATime (see 23.4.4 (PHY characteristics)).

— Any S1G PPDU detected at or above –86 dBm with > 90% probability within a period of aCCAMidTime (see 23.4.4 (PHY characteristics)).

The device shall not issue a PHY-CCA.indication(BUSY, {primary2}), PHY-CCA.indication(BUSY, {secondary2}), PHY-CCA.indication(BUSY, {secondary4}), or PHY-CCA.indication(BUSY, {secondary8}) until the end of the duration indicated by the (#14)PPDU or until all conditions above are no

This is an unapproved IEEE Standards Draft, subject to change.

longer satisfied. Additionally, the device shall issue a PHY-CCA.indication(BUSY, {primary1}) if any received signal in the primary 1 MHz channel (#2365)exceeds –75 dBm within a period aCCATime.

The PHY shall issue a PHY-CCA.indication(BUSY, {primary2}) if the conditions for issuing PHY-CCA.indication(BUSY, {primary1}) are not present and one of the following conditions is met in an otherwise idle 8 MHz or 16 MHz operating channel width:

— An S1G_1M PPDU is detected in the nonprimary 1 MHz portion of the primary 2 MHz channel at or above –86 dBm within the nonprimary 1 MHz with > 90% probability within a period of aCCAMidTime (see 23.4.4 (PHY characteristics)).

— A ≥ 2 MHz S1G PPDU at or above –86 dBm within the primary 2 MHz channel with > 90% probability within a period of aCCAMidTime (see 23.4.4 (PHY characteristics)).

— Any of the applicable conditions listed in Table 23-39 (Additional conditions for CCA BUSY on the primary 2 MHz in type 2 channelization for 8/16 MHz intended channel width). An applicable condition shall be met (i.e., triggered) if the PHY detects the start of the described PPDU(s) in Table 23-39 (Additional conditions for CCA BUSY on the primary 2 MHz in type 2 channelization for 8/16 MHz intended channel width) with > 90% probability within a period of aCCATime (see 23.4.4 (PHY characteristics)).

**Table 23-39—Additional conditions for CCA BUSY on the primary 2 MHz in type 2 channelization for 8/16 MHz intended channel width**

| Operating Channel Width | Conditions |
|---|---|
| 8 MHz, 16 MHz | The start of a 2 MHz S1G_SHORT or S1G_LONG PPDU, or of a duplicate S1G_SHORT or S1G_LONG PPDU at or above –86 dBm in the primary 2 MHz channel. |
| 8 MHz, 16 MHz | The start of a 4 MHz S1G_SHORT or S1G_LONG PPDU, or of a duplicate S1G_SHORT or S1G_LONG PPDU at or above –83 dBm in the primary 4 MHz channel. |
| 8 MHz, 16 MHz | The start of an 8 MHz S1G_SHORT or S1G_LONG PPDU, or of a duplicate S1G_SHORT or S1G_LONG PPDU at or above –80 dBm in the primary 8 MHz channel. |
| 16 MHz | The start of a 16 MHz S1G_SHORT or S1G_LONG PPDU, or of a duplicate S1G_SHORT or S1G_LONG PPDU at or above –77 dBm. |

The device shall not issue a PHY-CCA.indication(BUSY, {secondary2}), PHY-CCA.indication(BUSY, {secondary4}), or PHY-CCA.indication(BUSY, {secondary8}) until the end of the duration indicated by the packet or until all conditions above are no longer satisfied. Additionally, for both type 1 and type 2 channels, the device shall issue a PHY-CCA.indication(BUSY, {primary2}) if any received signal in the primary 2 MHz channel (#2365)exceeds –72 dBm within a period of aCCATime.

Additionally, when a STA detects an S1G_SHORT or S1G_LONG PPDU with a Partial AID field of its SIG field indicating a partial AID or COLOR value that matches its (#3403)partial AID or BSSID, the PHY shall issue a PHY-CCA.indication(BUSY, {primary2}) for the remaining duration of the PPDU as indicated in its preamble.

This is an unapproved IEEE Standards Draft, subject to change.

#### 23.3.18.5.4 CCA sensitivity for signals not occupying the primary 2 MHz channel

In S1G operation, the CCA sensitivity levels for detecting signals in the secondary channels may be classified separately for type 1 or type 2 channels.

The PHY shall issue a PHY-CCA.indication(BUSY, {secondary2}) if the conditions for issuing PHY-CCA.indication(BUSY, {primary2}) are not present and one of the following conditions are present in an otherwise idle 4 MHz, 8 MHz, 16 MHz operating channel width:

- For both type 1 and type 2 channels, any signal within the secondary 2 MHz channel at or above a threshold of –72 dBm within a period of aCCATime after the signal arrives at the receiver's antenna(s); then the PHY shall not issue a PHY-CCA.indication(BUSY,{secondary4}), PHY-CCA.indication(BUSY,{secondary8}) or PHY-CCA.indication(IDLE) while the threshold continues to be exceeded.
- For type 1 channels, a 2 MHz S1G PPDU detected in the secondary 2 MHz channel at or above –86 dBm with > 90% probability within a period of aCCAMidTime (see 23.4.4 (PHY characteristics)).
- For type 2 channels, a 2 MHz S1G PPDU detected in the secondary 2 MHz channel at or above –82 dBm with > 90% probability within a period of aCCAMidTime (see 23.4.4 (PHY characteristics)).

The PHY shall issue a PHY-CCA.indication(BUSY, {secondary4}) if the conditions for issuing PHY-CCA.indication(BUSY, {primary2}) and PHY-CCA.indication(BUSY, {secondary2}) are not present and one of the following conditions are present in an otherwise idle 8 MHz, 16 MHz operating channel width:

- For both type 1 and type 2 channels, any signal within the secondary 4 MHz channel at or above a threshold of –69 dBm within a period of aCCATime after the signal arrives at the receiver's antenna(s); then the PHY shall not issue a PHY-CCA.indication(BUSY, {secondary8}) or PHY-CCA.indication(IDLE) while the threshold continues to be exceeded.
- For type 1 channels:
  - A 4 MHz S1G PPDU detected in the secondary 4 MHz channel at or above –86 dBm with > 90% probability within a period of aCCAMidTime (see 23.4.4 (PHY characteristics)).
  - A 2 MHz S1G PPDU detected in any 2 MHz subchannel of the secondary 4 MHz channel at or above –86 dBm with > 90% probability within a period of aCCAMidTime.
- For type 2 channels:
  - A 4 MHz S1G PPDU detected in the secondary 4 MHz channel at or above –82 dBm with > 90% probability within a period of aCCAMidTime (see 23.4.4 (PHY characteristics)).
  - A 2 MHz S1G PPDU detected in any 2 MHz subchannel of the secondary 4 MHz channel at or above –82 dBm with > 90% probability within a period of aCCAMidTime.

The PHY shall issue a PHY-CCA.indication(BUSY, {secondary8}) if the conditions for PHY-CCA.indication(BUSY, {primary2}), PHY-CCA.indication(BUSY, {secondary2}) and PHY-CCA.indication(BUSY,{secondary4}) are not present and one of the following conditions are present in an otherwise idle 16 MHz operating channel width:

- For both type 1 and type 2 channels, any signal within the secondary 8 MHz channel at or above –66 dBm.
- For type 1 channels:
  - An 8 MHz S1G PPDU detected in the secondary 8 MHz channel at or above –83 dBm with > 90% probability within a period of aCCAMidTime (see 23.4.4 (PHY characteristics)).
  - A 4 MHz S1G PPDU detected in any 4 MHz subchannel of the secondary 8 MHz channel at or above –86 dBm with > 90% probability within a period of aCCAMidTime.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

- A 2 MHz S1G PPDU detected in any 2 MHz subchannel of the secondary 8 MHz channel at or above –86 dBm with > 90% probability within a period of aCCAMidTime.

- For type 2 channels:
  - An 8 MHz S1G PPDU detected in the secondary 8 MHz channel at or above –79 dBm with > 90% probability within a period aCCAMidTime (see 23.4.4 (PHY characteristics)).
  - A 4 MHz S1G PPDU detected in any 4 MHz subchannel of the secondary 8 MHz channel at or above –82 dBm with > 90% probability within a period of aCCAMidTime.
  - A 2 MHz S1G PPDU detected in any 2 MHz subchannel of the secondary 8 MHz channel at or above –82 dBm with > 90% probability within a period of aCCAMidTime.

#### 23.3.18.6 RSSI

The RSSI parameter returned in the RXVECTOR shall be calculated during the reception of the (D-)LTFs and shall be a monotonically increasing function of the received power.

#### 23.3.18.7 Received channel power indicator (RCPI) measurement(#2011)

The RCPI is a measure of the received RF power in the selected channel for a received PPDU. This parameter shall be a measurement by the PHY of the received RF power in the channel measured over the STF or LTF fields of the received PPDU. If the RCPI is measured over the STF field for an S1G 1 MHz PPDU using MCS 10, then (#3473)the reported RCPI value is 3 dB less than the measured power over the STF field. The received power shall be the average of the power in all active receive chains.

NOTE—The STF field in an S1G 1 MHz PPDU using MCS 10 has 3 dB higher power than the Data field, hence the reported RCPI value is subtracting from 3 dB from the measured power.

RCPI shall equal the received RF power in dBm within an accuracy of ± 5 dB (95% confidence interval) (#3476)within the specified dynamic range of the receiver.

### 23.3.19 PHY transmit procedure

The typical transmit procedure is shown in Figure 23-44 (PHY transmit procedure for an SU transmission using S1G_1M procedure(#213)), Figure 23-45 (PHY transmit procedure for an SU transmission using S1G_SHORT procedure(#213)), and Figure 23-46 (PHY transmit procedure for an SU transmission using S1G_LONG procedure(#213)). For this transmit procedure, the FORMAT parameter of the PHY-

This is an unapproved IEEE Standards Draft, subject to change.

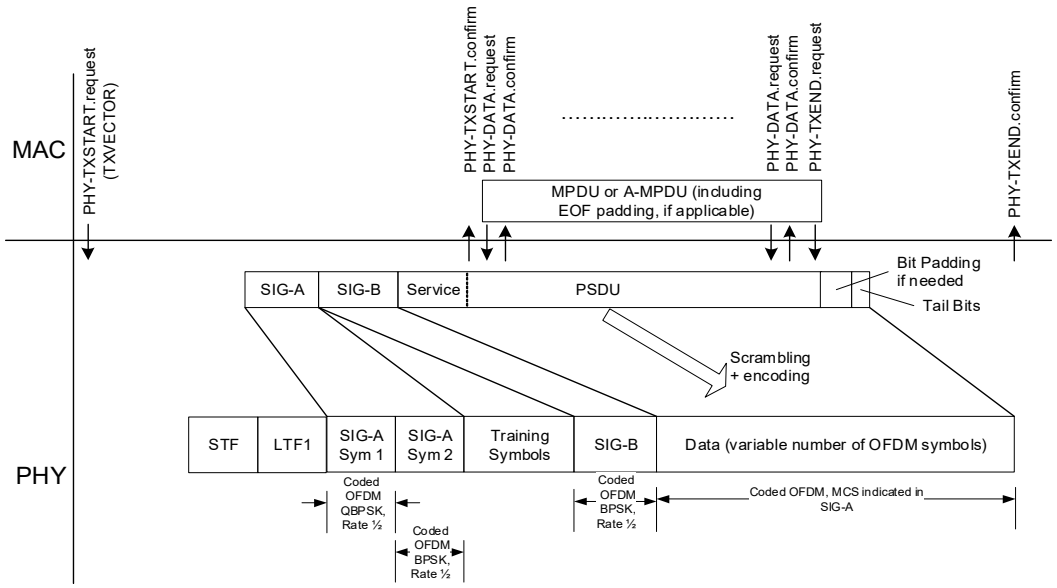
procedure(#213)), with the number S1G training symbols depending on the total number of space-time streams across all users.

In order to transmit data, the MAC generates a PHY-TXSTART.request primitive, which causes the PHY entity to enter the transmit state. Further, the PHY is set to operate at the appropriate frequency through station management via the PLME, as specified in 23.4 (S1G PLME(#6321)).



NOTE—This procedure does not describe the operation of optional features, such as MU-MIMO, LDPC or STBC.

**Figure 23-46—PHY transmit procedure for an SU transmission using S1G_LONG procedure(#213)**

Other transmit parameters, such as S1G-MCS coding types and transmit power, are set via the PHY SAP using the PHY-TXSTART.request(TXVECTOR) primitive, as described in 23.2.2 (TXVECTOR and RXVECTOR parameters).

The PHY indicates the state of the primary channel and other channels (if any) via the PHY-CCA.indication primitive (see 23.3.18.5 (CCA sensitivity) and 8.3.5.12 (PHY-CCA.indication)). Note that under some circumstances, the MAC uses the value of the PHY-CCA.indication primitive before (and if) issuing the PHY-TXSTART.request primitive. Transmission of the PPDU shall be initiated by the PHY after receiving the PHY-TXSTART.request(TXVECTOR) primitive. The TXVECTOR elements for the PHY-TXSTART.request primitive are specified in Table 23-1 (TXVECTOR and RXVECTOR parameters).

Transmission of the PHY preamble shall start immediately, using the parameters passed in the PHY-TXSTART.request primitive and the PHY shall issue a PHY-TXSTART.confirm primitive to the MAC.

After the PHY preamble transmission is started, the PHY entity immediately initiates data scrambling and data encoding. The encoding method for the Data field is based on the FEC_CODING, CH_BANDWIDTH, NUM_STS, STBC, MCS, and NUM_USERS parameter of the TXVECTOR, as described in 23.3.2 (S1G PPDU format).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The SERVICE field and PSDU are encoded as described in 23.3.3 (Transmitter block diagram). The data shall be exchanged between the MAC and the PHY through a series of PHY-DATA.request(DATA) primitives issued by the MAC, and PHY-DATA.confirm primitives issued by the PHY. Zero to seven PHY padding bits are appended to the PSDU to make the number of bits in the coded PSDU an integer multiple of the number of coded bits per OFDM symbol.

Transmission can be prematurely terminated by the MAC through the primitive PHY-TXEND.request primitive. PSDU transmission is terminated by receiving a PHY-TXEND.request primitive. Each PHY-TXEND.request primitive is acknowledged with a PHY-TXEND.confirm primitive from the PHY. In an SU transmission, normal termination occurs after the transmission of the final bit of the last PSDU octet, according to the number of OFDM symbols indicated by NSYM (see 23.4.3 (TXTIME and PSDU_LENGTH calculation)).

In the PHY, the GI or short GI is inserted in every data OFDM symbol as a countermeasure against delay spread.

This is an unapproved IEEE Standards Draft, subject to change.

(#2137)An NDP CMAC PPDU(#1400) transmit procedure is shown in Figure 23-47 (PHY transmit procedure for an NDP CMAC PPDU transmission using S1G_1M format) and Figure 23-48 (PHY transmit procedure for an NDP CMAC PPDU transmission using S1G_SHORT format).

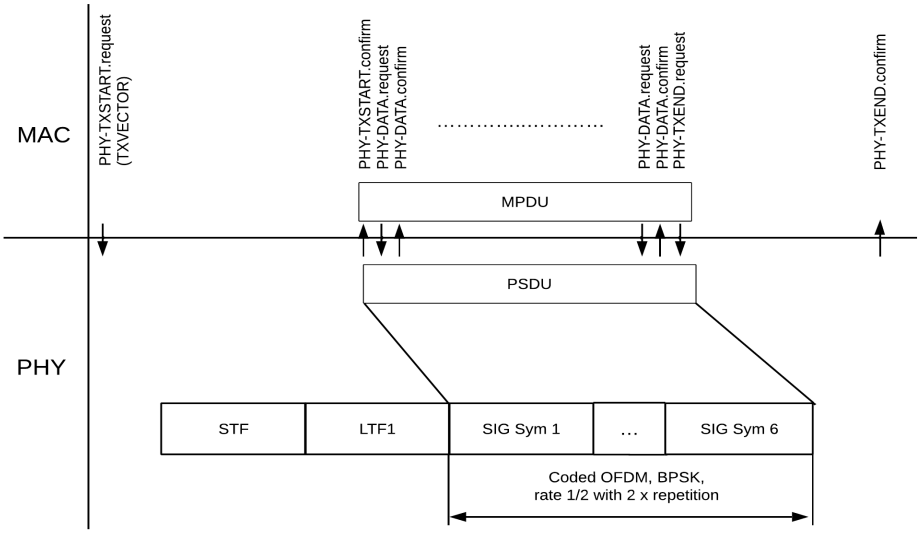

**Figure 23-47—PHY transmit procedure for an NDP CMAC PPDU transmission using S1G_1M format**

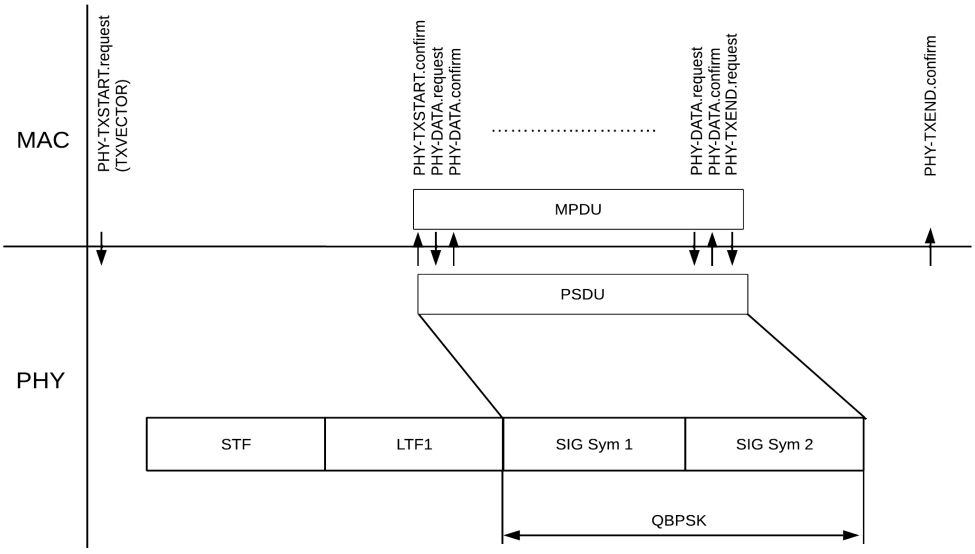

**Figure 23-48—PHY transmit procedure for an NDP CMAC PPDU transmission using S1G_SHORT format**

In case of transmission of the NDP CMAC PPDU, the PHY performs the same procedure like the typical transmit procedure as described in this subclause except as follows

— No service field appended
— No PHY padding bits appended to the PSDU
— No scrambling applied to PSDU

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

— PSDU is mapping to the SIG field

When the PPDU transmission is completed the PHY entity enters the receive state.

A typical state machine implementation of the transmit PHY for an S1G PPDU transmission is provided in Figure 23-49 (PHY transmit state machine for an S1G PPDU transmission(#2260)(#3409)). Request (.request) and confirmation (.confirm) primitives are issued once per state as shown. This state machine does not describe the operation of optional features, such as multi-user, LDPC, or STBC.

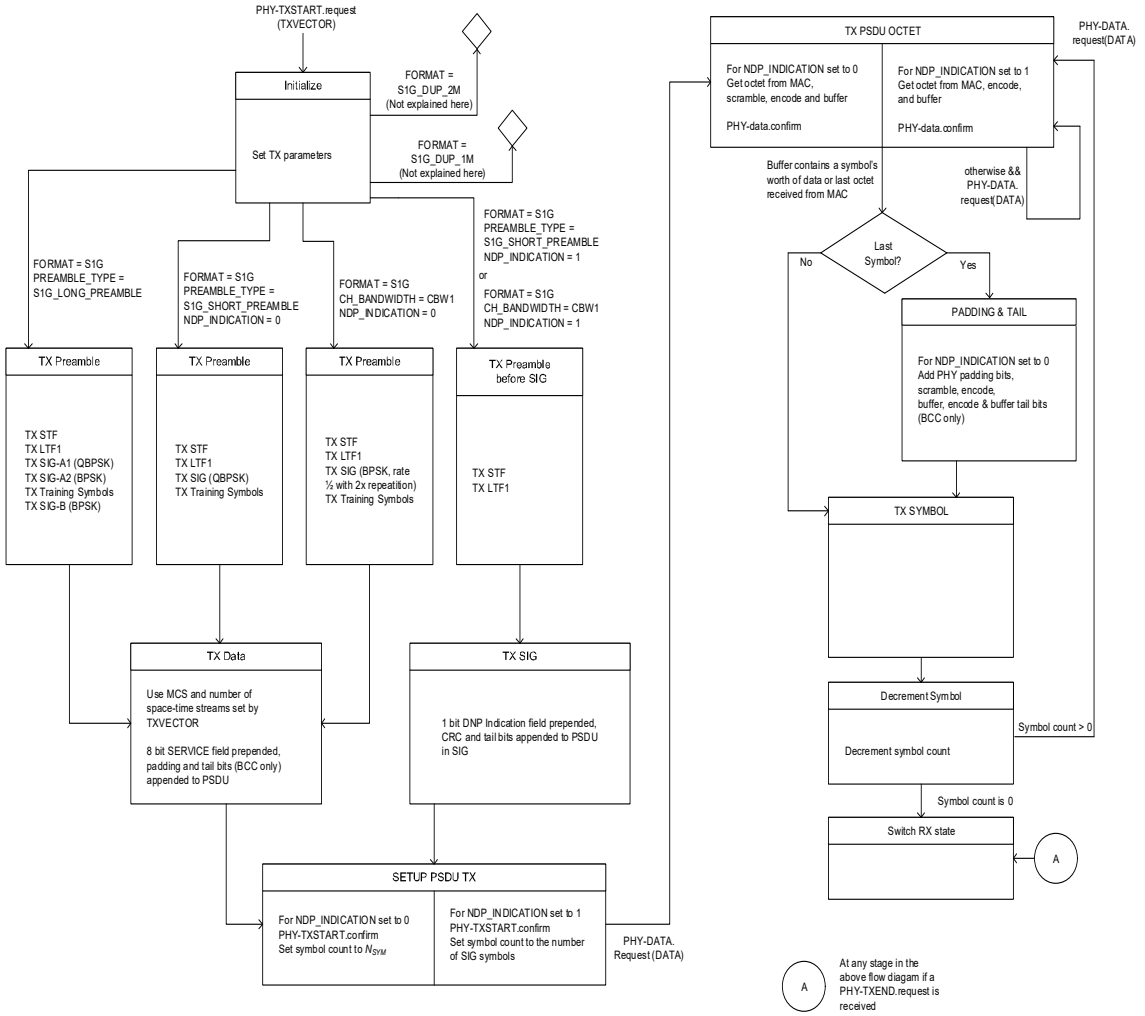

**Figure 23-49—PHY transmit state machine for an S1G PPDU transmission(#2260)(#3409)**

### 23.3.20 PHY receive procedure

Typical PHY receive procedures are shown in Figure 23-50 (PHY receive procedure for an SU transmission, S1G_1M procedure), Figure 23-51 (PHY receive procedure for an SU transmission, S1G_SHORT procedure), and Figure 23-52 (PHY receive procedure for an SU transmission, S1G_LONG procedure), corresponding to S1G_1M preamble format, S1G_SHORT preamble format, and S1G_LONG preamble format, respectively. A typical state machine implementation of the receive PHY is given in Figure 23-53 (PHY receive state machine(#3038)(#342)(#8210)). This receive procedure and state machine do not describe the operation of optional features, such as LDPC or STBC. Through station management (via the

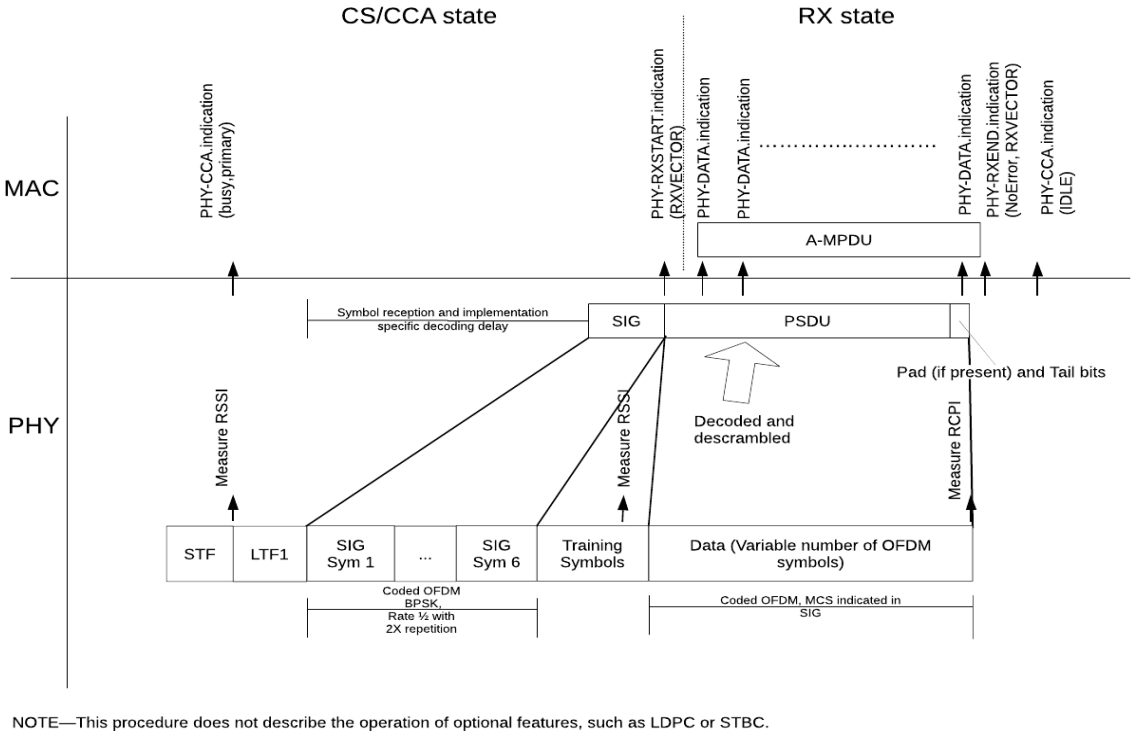
PLME) the PHY is set to the appropriate frequency, as specified in 23.4 (S1G PLME(#6321)). The PHY has also been configured with group information (i.e., group membership and position in group) so that it can receive data intended for the STA. Other receive parameters, such as RSSI and indicated DATARATE, may be accessed via the PHY SAP.



NOTE—This procedure does not describe the operation of optional features, such as LDPC or STBC.

**Figure 23-50—PHY receive procedure for an SU transmission, S1G_1M procedure**

Upon receiving the transmitted PHY preamble overlapping the primary 2 MHz channel in a greater than or equal to 2 MHz BSS, or primary 1 MHz channel in a 1 MHz BSS, the PHY measures a receive signal strength. This activity is indicated by the PHY to the MAC via a PHY-CCA.indication primitive. A PHY-CCA.indication(BUSY, channel-list) primitive is also issued as an initial indication of reception of a signal as specified in 23.3.18.5 (CCA sensitivity). The CH_BANDWIDTH parameter indicates one of the 1 MHz, 2 MHz, 4 MHz, 8 MHz and 16 MHz channel widths.

The PHY shall not issue a PHY-RXSTART.indication primitive in response to a PPDU that does not overlap the primary channel.

The PHY includes the most recently measured RSSI value in the PHY-RXSTART.indication(RXVECTOR) primitive issued to the MAC.

After the PHY-CCA.indication(BUSY, channel-list) is issued, the PHY entity shall begin receiving the training symbols and searching for SIG or SIG-A in order to set the duration of the PPDU(#2056) and get other PHY parameters such as the demodulation type, code type, and the decoding rate. If the check of the SIG or SIG-A CRC is not valid, (#3038)no PHY-RXEARLYSIG.indication or PHY-RXSTART.indication primitive is issued, and instead the PHY shall issue the error condition PHY-RXEND.indication(FormatViolation) primitive, and set PHY_CCA.indication(IDLE) when receive level drops below threshold (minimum modulation and coding rate sensitivity + 20 dB). If a valid SIG or SIG-A

This is an unapproved IEEE Standards Draft, subject to change.

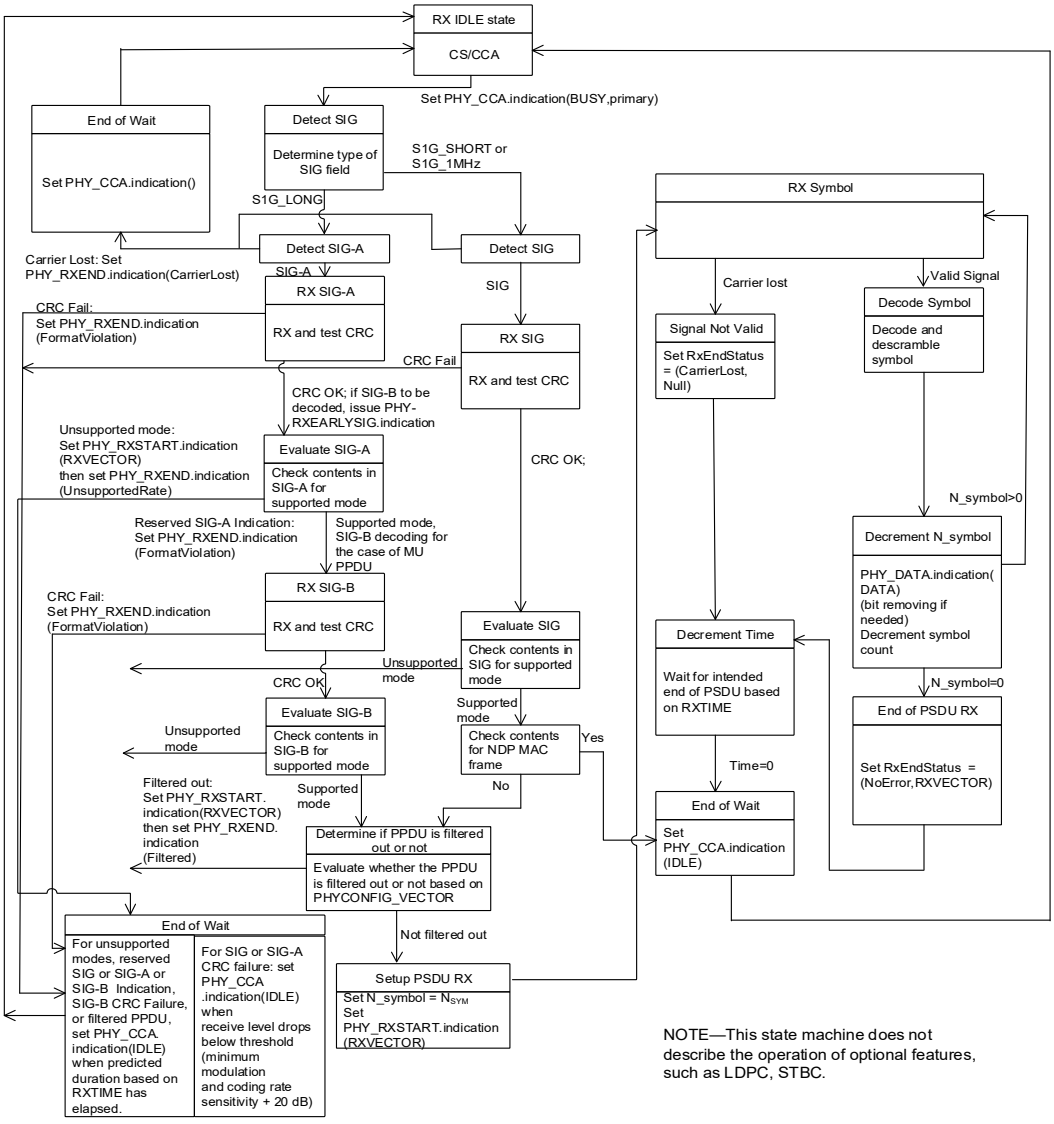

**Figure 23-53—PHY receive state machine(#3038)(#342)(#8210)**

CRC is indicated, and the Uplink Indication bit is 1 and the ID field value matches the PBSSID of the BSS of which the STA is a member or the Uplink Indication bit is 0 and the COLOR field value matches the COLOR indicated by the AP to which the STA is associated, then the S1G PHY shall maintain PHY-CCA.indication(BUSY, channel-list) for the predicted duration of the transmitted PPDU, as defined by RXTIME in Equation (23-69) or Equation (23-70), for all supported modes, unsupported modes, and Reserved SIG or SIG-A Indication. If a valid SIG or SIG-A CRC is indicated, and the Uplink Indication bit is 1 and the ID field value does not match the PBSSID of the BSS of which the STA is a member or the Uplink Indication bit is 0 and the COLOR field value does not match the COLOR indicated by the AP to which the STA is associated, then the S1G PHY shall maintain PHY-CCA.indication(BUSY, channel-list) for the predicted duration of the transmitted PPDU, as defined by RXTIME in Equation (23-69) or Equation (23-70), for all supported modes, unsupported modes, and Reserved SIG-A Indication if the reception meets the minimum CCA sensitivity level specified in 23.3.18.5.3 (CCA sensitivity for signals occupying the primary 2 MHz and/or primary 1 MHz channel). Reserved SIG or SIG-A Indication is

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

defined as an SIG or SIG-A with Reserved bits equal to 0 or a combination not valid as defined in 23.3.8.2.2.5 (SIG definition), 23.3.8.2.3.2.5 (SIG-A definition), or 23.3.8.3.5 (SIG definition), or a combination of S1G-MCS and NSTS not included in 23.5 (Parameters for S1G-MCSs) or any other SIG or SIG-A field bit combinations that do not correspond to modes of PHY operation defined in Clause 23 (Sub 1 GHz (S1G) PHY specification(#4095)).

(#455)NOTE 1—From Figure 23-53 (PHY receive state machine(#3038)(#342)(#8210)), Reserved SIG or SIG-A Indication does not apply to the Reserved fields in NDP CMAC PPDUs since NDP CMAC PPDUs do not use S1G_LONG format.

Subsequently, if dot11TimingMsmtActivated is true, a PHY-RXSTART.indication (RXVECTOR) shall be issued and RX_START_OF_FRAME_OFFSET parameter within the RXVECTOR shall be forwarded (see 23.2.2 (TXVECTOR and RXVECTOR parameters)).

NOTE 2—The RX_START_OF_FRAME_OFFSET value is used (#3049)to estimate when the start of the preamble for the incoming (#14)PPDU was detected on the medium at the receive antenna connector.

If the SIG or SIG-A indicates an unsupported mode, the PHY shall issue PHY-RXEND.indication(UnsupportedRate). If the SIG or SIG-A indicates an invalid CRC or Reserved SIG or SIG-A Indication, the PHY shall issue the error condition PHY-RXEND.indication(FormatViolation).

If the PHY preamble reception is successful and a valid SIG or SIG-A CRC is indicated:

— Upon reception of an S1G_LONG format preamble, after receiving a valid SIG-A indicating a supported mode, the PHY entity shall begin receiving the rest of S1G training symbols and SIG-B. If the received MU/SU subfield in SIG-A has a value indicating SU PPDU (see 23.3.8.2.3.2.5 (SIG-A definition)), the PHY entity does not need to decode SIG-B since in this case SIG-B does not carry any information bit (see 23.3.8.2.3.3.5 (SIG-B definition)). (#3038)If SIG-A is valid and indicates that SIG-B is not to be decoded, then a PHY-RXSTART.indication (RXVECTOR) primitive shall be issued, and otherwise a PHY-RXEARLYSIG.indication primitive shall be issued.

  If the received MU/SU subfield in SIG-A has a value indicating MU PPDU (see 23.3.8.2.3.2.5 (SIG-A definition)), SIG-B shall be decoded. If the check of the SIG-B CRC is not valid, a PHY-RXSTART.indication primitive is not issued, and instead the PHY shall issue the error condition PHY-RXEND.indication(FormatViolation) primitive, and the S1G PHY shall maintain PHYCCA.indication(BUSY, channel-list) for the predicted duration of the transmitted PPDU, as defined by RXTIME in Equation (23-69) or Equation (23-70), for all supported modes, unsupported modes, and Reserved SIG-B Indication. Reserved SIG-B Indication is defined as a SIG-B with the bits of the Reserved field not all 1s or MCS not included in 23.5 (Parameters for S1G-MCSs). If the SIG-B indicates an unsupported mode, the PHY shall issue the error condition PHY-RXEND.indication(UnsupportedRate) primitive, and a PHY-RXSTART.indication primitive shall not be issued. If the check of the SIG-B CRC is valid and it indicates a supported mode, a PHY-RXSTART.indication(RXVECTOR) primitive shall be issued. The RXVECTOR associated with this primitive includes the parameters specified in Table 23-1 (TXVECTOR and RXVECTOR parameters).

— Upon reception of an S1G_SHORT or S1G_1M format preamble, after receiving a valid SIG indicating a supported mode, the PHY entity shall begin receiving the rest of S1G training symbols, and then a PHY-RXSTART.indication(RXVECTOR) primitive shall be issued. The RXVECTOR associated with this primitive includes the parameters specified in Table 23-1 (TXVECTOR and RXVECTOR parameters).

  In this case, if the NDP Indication subfield in SIG field has a value indicating an NDP CMAC PPDU, the PHY shall generate a PHYCCA.indication(IDLE) primitive and return to RX IDLE state, and it shall not issue the PHY-RXSTART.indication(RXVECTOR) primitive.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The PHY optionally filters out the PPDU based on the GID, MU[0-3] NSTS, UPLINK_INDICATION and ID fields of SIG or SIG-A and the contents of the PHYCONFIG_VECTOR as follows:

- The PHY shall not filter out the PPDU if one of the following is true:
  - ($g = 0$) and ($l_{00}$ is true) and (*partialaid* is included in PARTIAL_AID_LIST_GID00)
  - ($g = 63$) and ($l_{63}$ is true) and (*partialaid* is included in PARTIAL_AID_LIST_GID63)
  - ($1 \leq g \leq 62$) and (MembershipStatusInGroupID[$g$] = 1) and ($n_{STS}$[UserPositionInGroupID[$g$]] > 0)
- where
  - $l_{NN}$ is the one of the LISTEN_TO_GID*NN* parameters of the PHYCONFIG_VECTOR
  - MembershipStatusInGroupID[$g$] is the Membership Status Array field of the GROUP_ID_MANAGEMENT parameter of the PHYCONFIG_VECTOR for group $g$
  - $g$ is defined to be
    - The value of the GroupID field of the SIG-A for an S1G MU PPDU
    - 0 for an S1G SU PPDU when UPLINK_INDICATION is equal to 1
    - 63, in all other cases
  - $n_{STS}[u]$ is the value of the MU[$u$] NSTS field of SIG or SIG-A
  - UserPositionInGroupID[$g$] is the User Position Array field of the GROUP_ID_MANAGEMENT parameter of the PHYCONFIG_VECTOR for group $g$
  - *partialaid* is the value of the ID field of SIG or SIG-A
- Otherwise, the PHY may filter out the PPDU.

If the PPDU is filtered out, the PHY shall issue a PHY-RXEND.indication(Filtered) primitive.

The Data field follows the training and signal fields. When the Coding subfield in SIG or SIG-A field indicates BCC, the number of symbols in the Data field is determined by Equation (23-65).

$$N_{SYM} = \begin{cases} \text{LENGTH}, & \text{if Aggregation} = 1 \\ m_{STBC} \times \left\lceil \dfrac{8 \times LENGTH + N_{service} + N_{tail} \times N_{ES}}{m_{STBC} \times N_{DBPS}} \right\rceil, & \text{if Aggregation} = 0 \end{cases} \quad (23\text{-}65)$$

where

| | |
|---|---|
| $N_{ES}$ and $N_{DBPS}$ | are defined in Table 23-7 (Frequently used parameters) |
| $N_{service}$ and $N_{tail}$ | are defined in Table 23-5 (Timing-related constants) |
| $m_{STBC}$ | is equal to 2 when STBC is used, and 1 otherwise |
| LENGTH and Aggregation | are the values indicated by the LENGTH and Aggregation subfields of SIG or SIG-A field, respectively |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

When the Coding subfield in SIG or SIG-A indicates LDPC and Aggregation subfield in SIG or SIG-A field is 1, the number of symbols in the Data field is determined by Equation (23-66).

$$N_{SYM} = LENGTH \tag{23-66}$$

where

LENGTH is the value indicated by the LENGTH subfield of SIG or SIG-A field

When the Coding subfield in SIG or SIG-A indicates LDPC and Aggregation subfield in SIG or SIG-A field is 0, the parameter $N_{SYM, init}$ is determined by Equation (23-67).

$$N_{SYM, init} = m_{STBC} \times \left\lceil \frac{8 \times LENGTH + N_{service}}{m_{STBC} \times N_{DBPS}} \right\rceil \tag{23-67}$$

where

$N_{DBPS}$ is defined in Table 23-7 (Frequently used parameters)

$N_{service}$ is defined in Table 23-5 (Timing-related constants)

$m_{STBC}$ is equal to 2 when STBC is used, and 1 otherwise

LENGTH is the value indicated by the LENGTH subfield of SIG or SIG-A field

In this case, the number of symbols in the Data field $N_{SYM}$ is determined by Equation (23-68).

$$N_{SYM} = \begin{cases} N_{SYM, init}, & \text{if LDPC Extra OFDM Symbol = 0} \\ N_{SYM, init} + 1, & \text{if LDPC Extra OFDM Symbol = 1 and STBC = 0} \\ N_{SYM, init} + 2, & \text{if LDPC Extra OFDM Symbol = 1 and STBC = 1} \end{cases} \tag{23-68}$$

where

LENGTH is the value indicated by the LENGTH subfield of SIG or SIG-A field

LDPC Extra OFDM Symbol is the value indicated by LDPC Extra subfield in SIG or SIG-A field

STBC is the value indicated by the STBC subfield in SIG or SIG-A field

The PHY parameter RXTIME for the case of S1G_SHORT or S1G_1M format is determined by Equation (23-69).

$$RXTIME(\mu s) = \begin{cases} T_{DSTF} + T_{LTF}(N_{LTF} - 1) + N_{SYM} T_{SYML}, & \text{if Short GI = 0} \\ T_{DSTF} + T_{LTF}(N_{LTF} - 1) + T_{SYML} + (N_{SYM} - 1).T_{SYMS}, & \text{if Short GI = 1} \end{cases} \tag{23-69}$$

where

$T_{LTF}$ , $T_{SYML}$ and $T_{SYMS}$ are defined in Table 23-5 (Timing-related constants)

$N_{LTF}$ is defined in Table 23-11 (Number of LTFs required for different numbers of space-time streams)

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The PHY parameter RXTIME for the case of S1G_LONG format is determined by Equation (23-70).

$$RXTIME(\mu s) = \begin{cases} T_{DSTF} + N_{LTF}T_{DLTF} + T_{SIG-B} + N_{SYM}T_{SYML}, & \text{if Short GI = 0} \\ T_{DSTF} + N_{LTF}T_{DLTF} + T_{SIG-B} + T_{SYML} + (N_{SYM} - 1).T_{SYMS}, & \text{if Short GI = 1} \end{cases} \quad (23\text{-}70)$$

where

$T_{DLTF}$ , $T_{SIG-B}$ , $T_{SYML}$ and $T_{SYMS}$ are defined in Table 23-5 (Timing-related constants)

$N_{LTF}$ is defined in Table 23-11 (Number of LTFs required for different numbers of space-time streams)

When the Aggregation subfield in the SIG or SIG-A field is equal to 0, the value of the PSDU_LENGTH parameter returned in the RXVECTOR using is set to the LENGTH field of the SIG/SIG-A.

When the Aggregation subfield in the SIG or SIG-A field is equal to 1, the value of the PSDU_LENGTH parameter returned in the RXVECTOR using BCC encoding is calculated using Equation (23-71).

$$\text{PSDU\_LENGTH} = \left\lfloor \frac{N_{SYM}N_{DBPS} - N_{service} - N_{tail} \cdot N_{ES}}{8} \right\rfloor \quad (23\text{-}71)$$

where

$N_{ES}$ is defined in Table 23-7 (Frequently used parameters)

$N_{DBPS}$ is defined in Table 23-7 (Frequently used parameters)

$N_{service}$ and $N_{tail}$ are defined in Table 23-5 (Timing-related constants)

The value of the PSDU_LENGTH parameter returned in the RXVECTOR using LDPC encoding is calculated using Equation (23-72).

$$PSDU\_LENGTH = \left\lfloor \frac{N_{SYM}.N_{DBPS} - N_{service}}{8} \right\rfloor \quad (23\text{-}72)$$

where

$N_{DBPS}$ is defined in Table 23-7 (Frequently used parameters)

$N_{service}$ is defined in Table 23-5 (Timing-related constants)

When the Aggregation subfield in the SIG or SIG-A field is equal to 1, the value of the PSDU_LENGTH parameter returned in the RXVECTOR for an NDP sounding or an NDP CMAC PPDU is 0.

If signal loss occurs during reception prior to completion of the PSDU reception, the error condition PHY-RXEND.indication(CarrierLost) shall be reported to the MAC. After waiting for the end of the PSDU as determined by Equation (23-69) or Equation (23-70), the PHY shall set the PHY-CCA.indication(IDLE) primitive and return to the RX IDLE state.

The received PSDU bits are assembled into octets, decoded, and presented to the MAC using a series of PHY-DATA.indication(DATA) primitive exchanges. Any final bits that cannot be assembled into a complete octet are considered pad bits and discarded. After the reception of the final bit of the last PSDU octet, and possible padding and tail bits, the receiver shall be returned to the RX IDLE state, as shown in Figure 23-53 (PHY receive state machine(#3038)(#342)(#8210)).

### 23.4.2 PHY MIB

S1G PHY MIB attributes are defined in Annex C with specific values defined in Table 23-40 (S1G PHY MIB attributes). The (#4177)Operational semantics column in Table 23-40 (S1G PHY MIB attributes) contains two types: static and dynamic.

— Static MIB attributes are fixed and cannot be modified for a given PHY implementation.

— Dynamic MIB attributes are interpreted according to the MAX-ACCESS field of the MIB attribute.

When MAX-ACCESS is read-only, the MIB attribute value may be updated by the PLME and read from the MIB attribute by management entities. When MAX-ACCESS is read-write, the MIB attribute may be read and written by management entities but shall not be updated by the PLME.

### 23.4.3 TXTIME and PSDU_LENGTH calculation

For S1G_SHORT preamble, the value of the TXTIME parameter returned by the PLME-TXTIME.confirm primitive shall be calculated for an S1G PPDU using Equation (23-73) for short GI and Equation (23-74) for long GI.

$$\text{TXTIME} = \begin{cases} T_{PREAMBLE} + T_{SIG} + T_{LTF} \cdot (N_{LTF} - 1), \text{ if } N_{SYM} = 0 \\ T_{PREAMBLE} + T_{SIG} + T_{LTF} \cdot (N_{LTF} - 1) + T_{SYML} + T_{SYMS} \cdot (N_{SYM} - 1), \text{ if} N_{SYM} > 0 \end{cases} \quad (23\text{-}73)$$

$$\text{TXTIME} = T_{PREAMBLE} + T_{SIG} + T_{LTF} \cdot (N_{LTF} - 1) + T_{SYML} \cdot N_{SYM} \quad (23\text{-}74)$$

where

$T_{PREAMBLE} = T_{STF} + T_{LTF1}$

$T_{STF}$, $T_{LTF1}$, $T_{LTF}$, $T_{SYML}$ and $T_{SYMS}$ are defined in Table 23-5 (Timing-related constants)

$T_{SIG}$ is defined in Table 23-6 (Timing-related constants for SIG/SIG-A field in ≥ 2 MHz PPDUs)

$N_{LTF}$ is defined in Table 23-11 (Number of LTFs required for different numbers of space-time streams)

For S1G_LONG preamble, the value of the TXTIME parameter returned by the PLME-TXTIME.confirm primitive shall be calculated for an S1G PPDU using Equation (23-75) for short GI and Equation (23-76) for long GI.

$$\text{TXTIME} = \begin{cases} T_{PREAMBLE} + T_{SIG-A} + T_{D\_PREAMBLE} + T_{SIG-B}, \text{ if } N_{SYM} = 0 \\ T_{PREAMBLE} + T_{SIG-A} + T_{D\_PREAMBLE} + T_{SIG-B} + T_{SYML} + T_{SYMS} \cdot (N_{SYM} - 1), \text{ if } N_{SYM} > 0 \end{cases} \quad (23\text{-}75)$$

$$\text{TXTIME} = T_{PREAMBLE} + T_{SIG-A} + T_{D\_PREAMBLE} + T_{SIG-B} + T_{SYML} N_{SYM} \quad (23\text{-}76)$$

where

$T_{PREAMBLE} = T_{STF} + T_{LTF1}$

$T_{D\_PREAMBLE} = T_{DSTF} + T_{DLTF} \cdot N_{LTF}$

$T_{STF}$, $T_{LTF1}$, $T_{DSTF}$, $T_{DLTF}$, $T_{SIG-B}$, $T_{SYML}$ and $T_{SYMS}$ are defined in Table 23-5 (Timing-related constants)

$T_{SIG-A}$ is defined in Table 23-6 (Timing-related constants for SIG/SIG-A field in ≥ 2 MHz PPDUs).

$N_{LTF}$ is defined in Table 23-11 (Number of LTFs required for different numbers of space-time streams).

For S1G_1M preamble, the value of the TXTIME parameter returned by the PLME-TXTIME.confirm primitive shall be calculated for an S1G PPDU using Equation (23-77) for short GI and Equation (23-78) for long GI.

$$\text{TXTIME} = \begin{cases} T_{PREAMBLE} + T_{SIG} + T_{LTF} \cdot (N_{LTF} - 1), \text{ if } N_{SYM} = 0 \\ T_{PREAMBLE} + T_{SIG} + T_{LTF} \cdot (N_{LTF} - 1) + T_{SYML} + T_{SYMS}(N_{SYM} - 1), \text{ if } N_{SYM} > 0 \end{cases} \quad (23\text{-}77)$$

$$\text{TXTIME} = T_{PREAMBLE} + T_{SIG} + T_{LTF} \cdot (N_{LTF} - 1) + T_{SYML} N_{SYM} \quad (23\text{-}78)$$

where

$T_{PREAMBLE} = T_{STF} + T_{LTF1}$

$T_{STF}$, $T_{LTF1}$, $T_{LTF}$, $T_{SIG}$, $T_{SYML}$ and $T_{SYMS}$ are defined in Table 23-5 (Timing-related constants)

$N_{LTF}$ is defined in Table 23-11 (Number of LTFs required for different numbers of space-time streams)

For an NDP, there is no Data field and $N_{SYM} = 0$.

For an S1G SU PPDU using BCC encoding, the total number of data symbols in the Data field, $N_{SYM,}$ is given by Equation (23-79) if the Aggregation subfield in its SIG field or SIG-A field is(M118) 1 or Equation (23-80) otherwise.

$$N_{SYM} = m_{STBC} \times \left\lceil \frac{8 \cdot APEP\_LENGTH + N_{service} + N_{tail} \cdot N_{ES}}{m_{STBC} \cdot N_{DBPS}} \right\rceil \quad (23\text{-}79)$$

$$N_{SYM} = m_{STBC} \times \left\lceil \frac{8 \cdot PSDU\_LENGTH + N_{service} + N_{tail} \cdot N_{ES}}{m_{STBC} \cdot N_{DBPS}} \right\rceil \quad (23\text{-}80)$$

where

$m_{STBC}$ is equal to 2 when STBC is used, and 1 otherwise

$N_{ES}$ and $N_{DBPS}$ are defined in Table 23-7 (Frequently used parameters)

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$N_{service}$ and $N_{tail}$ are defined in Table 23-5 (Timing-related constants)

*PSDU_LENGTH* is the value of TXVECTOR parameter PSDU_LENGTH

For an S1G SU PPDU using LDPC encoding, the total number of data symbols in the Data field, $N_{SYM}$, is given in 23.3.9.4.4 (LDPC coding).

For an S1G MU PPDU, the total number of data symbols in the Data field, $N_{SYM}$, is given by

$$N_{SYM} = \max\{N_{SYM,u}\}_{u=0}^{N_{user}-1}$$

where

$N_{SYM,u}$ is defined in Equation (23-79) replacing $N_{SYM}$, *APEP_LENGTH*, $N_{ES}$, and $N_{DBPS}$ with $N_{SYM,u}$, $APEP\_LENGTH_u$, $N_{ES,u}$, and $N_{DBPS,u}$ for BCC and in 23.3.9.4.4 (LDPC coding) for LDPC

The value of the PSDU_LENGTH parameter returned in the PLME-TXTIME.confirm primitive for an S1G SU PPDU using BCC encoding is calculated using Equation (23-81)

$$PSDU\_LENGTH = \left\lfloor \frac{N_{SYM} \cdot N_{DBPS} - N_{service} - N_{tail} N_{ES}}{8} \right\rfloor \quad (23\text{-}81)$$

where

$N_{SYM}$ is given by Equation (23-79) or Equation (23-80)

$N_{ES}$ and $N_{DBPS}$ are defined in Table 23-7 (Frequently used parameters)

$N_{service}$ and $N_{tail}$ are defined in Table 23-5 (Timing-related constants)

The value of the PSDU_LENGTH parameter returned in the PLME-TXTIME.confirm primitive for an S1G SU PPDU using LDPC encoding is calculated using Equation (23-82)

$$PSDU\_LENGTH = \left\lfloor \frac{N_{SYM,init} \cdot N_{DBPS} - N_{service}}{8} \right\rfloor \quad (23\text{-}82)$$

where

$N_{SYM,init}$ is given by Equation (23-46) or Equation (23-47)

$N_{DBPS}$ is defined in Table 23-7 (Frequently used parameters)

$N_{service}$ is defined in Table 23-5 (Timing-related constants)

The value of the PSDU_LENGTH parameter for user $u$ returned in the PLME-TXTIME.confirm primitive and in the RXVECTOR for an S1G MU PPDU is calculated using Equation (23-83)

$$PSDU\_LENGTH_u = \begin{cases} \left\lfloor \frac{N_{SYM} \cdot N_{DBPS,u} - N_{service} - N_{tail} N_{ES,u}}{8} \right\rfloor & \text{when BCC is used for user } u \\ \left\lfloor \frac{N_{SYM\_max\_init} \cdot N_{DBPS,u} - N_{service}}{8} \right\rfloor & \text{when LDPC is used for user } u \end{cases} \quad (23\text{-}83)$$

where

$N_{SYM\_max\_init}$ is given by Equation (21-65)

|---|---|
| $N_{ES,u}$ | is $N_{ES}$ for user $u$, where $N_{ES}$ is defined in Table 23-7 (Frequently used parameters) |
| $N_{DBPS,u}$ | is $N_{DBPS}$ for user $u$, where $N_{DBPS}$ is defined in Table 23-7 (Frequently used parameters) |
| $N_{service}$ and $N_{tail}$ | are defined in Table 23-5 (Timing-related constants) |

The value of the PSDU_LENGTH parameter returned in the PLME-TXTIME.confirm primitive for an NDP is 0.

### 23.4.4 PHY characteristics

(#2123)The S1G PHY characteristics, provided through the PLME-CHARACTERISTICS service primitive, are shown in Table 23-41 (S1G PHY characteristics). The definitions for these characteristics are given in 6.7.4 (PLME-CHARACTERISTICS.confirm).

**Table 23-41—S1G PHY characteristics**

| Characteristics | Value |
|---|---|
| aSlotTime | 52 μs |
| aSIFSTime | 160 μs |
| aCCATime | < 40 μs |
| aRxPHYStartDelay | 600 μs for S1G_1M preamble;<br>280 μs for S1G_SHORT preamble and S1G_LONG preamble. |
| aRxTxTurnaroundTime | Implementation dependent, see 10.3.7 (DCF timing relations). |
| aTxPHYDelay | Implementation dependent, see 10.3.7 (DCF timing relations). |
| aRxPHYDelay | Implementation dependent, see 10.3.7 (DCF timing relations). |
| aRxTxSwitchTime | Implementation dependent, see 10.3.7 (DCF timing relations). |
| aTxRampOnTime | Implementation dependent, see 10.3.7 (DCF timing relations). |
| aAirPropagationTime | 6 μs |
| aMACProcessingDelay | Implementation dependent, see 10.3.7 (DCF timing relations).(#3263) |
| aCCAMidTime | 212 μs |
| aPPDUMaxTime | 27 920 μs (see NOTE 1) |
| aPSDUMaxLengthWithNoAggregation | 511 octets (see NOTE 2) |
| aPSDUMaxLength | 797 159 octets (see NOTE 3) |

NOTE 1—This is the maximum PPDU duration in μs for an S1G_1M PPDU with a bandwidth of 1 MHz, S1G-MCS 10 and 1 spatial stream, limited by PSDU length of 511 octets.

NOTE 2—This is the maximum PSDU length in octets for an S1G PPDU supported by the Length field in the S1G SIG field when the Aggregation field is 0.

NOTE 3—This is the maximum length in octets for an S1G SU PPDU with a bandwidth of 16 MHz, S1G-MCS 9 and 4 spatial streams, limited by 511 data symbols supported by the Length field in the S1G SIG field, excluding the SERVICE field and tail bits.

## 23.5 Parameters for S1G-MCSs

The rate-dependent parameters for 1 MHz, 2 MHz, 4 MHz, 8 MHz, and 16 MHz, $N_{SS}$ = 1,...,4 are given in Table 23-42 (S1G-MCSs for 1 MHz, Nss = 1) to Table 23-61 (S1G-MCSs for 16 MHz, Nss = 4). Support for 4 μs GI is optional in all cases. Support for MCS 8 and 9 (when valid) is optional in all cases. Support for MCS 11 and 12 (when valid) is optional in all cases.(M102) An S1G AP-STA shall support single spatial stream MCSs within the range MCS 0 to MCS 7 for all channel widths for which it has indicated support regardless of the Tx or Rx Highest Supported Data Rate subfield values in the Supported S1G-MCS and NSS Set and Extended Supported S1G-MCS and NSS Set fields.(M102) (#306)A non-AP S1G STA shall support single spatial stream MCSs within the range MCS 0 to MCS 2 for 1 and 2 MHz channel widths. When more than one spatial stream is supported, the Tx or Rx Highest Supported Data Rate subfield values in the Supported S1G-MCS and NSS Set and Extended Supported S1G-MCS and NSS Set fields(M102) may result in a reduced MCS range (cut-off) for greater than one spatial stream. Support for 1 MHz and 2 MHz with $N_{SS}$ = 1 is mandatory. Support for 1 and 2 MHz with $N_{SS}$ = 2,3,4 is optional. Support for 4 MHz, 8 MHz, and 16 MHz with $N_{SS}$ = 1,...,4 is optional.

NOTE—When LDPC is used with MCS 10, the resulting $N_{CBPS}$ is 12 because the 2× repetition is applied after the LDPC encoding procedure.

**Table 23-42—S1G-MCSs for 1 MHz, $N_{SS}$ = 1**

| MCS Idx | Mod | R | $N_{BPSCS}$ | $N_{SD}$ | $N_{SP}$ | $N_{CBPS}$ | $N_{DBPS}$ | $N_{ES}$ | Data_rate (kb/s) | |

# 24. China directional multi-gigabit (CDMG) PHY specification

## 24.1 CDMG PHY introduction

### 24.1.1 Scope

The CDMG PHY supports a 1.08 GHz channel width in comparison with the DMG PHY in Clause 20 (Directional multi-gigabit (DMG) PHY specification), which supports a 2.16 GHz channel width. As many aspects of CDMG PHY are the same as DMG PHY, this clause mainly lists the new features corresponding to Clause 20 (Directional multi-gigabit (DMG) PHY specification).

The CDMG PHY supports two modulation methods:

— A control modulation using MCS 0 of the CDMG Control mode defined in 24.4 (CDMG control mode)

— A single carrier (SC) modulation using MCS 1 to MCS 16 of the CDMG SC mode defined in 24.5 (CDMG SC mode) and MCS 17 to MCS 23 of the CDMG low-power SC mode defined in 24.6 (CDMG low-power SC mode)

All CDMG modulation methods share a similar preamble (see 24.3.6 (Common preamble)).

The services provided to the MAC by the CDMG PHY consist of the following protocol functions, defined as follows:

a) A function that defines a method of mapping the PHY service data units (PSDU) into a framing format (PPDU) suitable for sending and receiving PSDUs between two or more STAs.

b) A function that defines the characteristics and method of transmitting and receiving data through a wireless medium between two or more STAs. Depending on the MCSs, these STAs support a mixture of CDMG SC mode, CDMG low-power SC mode, and CDMG control mode.

### 24.1.2 CDMG PHY functions

#### 24.1.2.1 General

The CDMG PHY contains two functional entities: the PHY and the layer management function (PLME). Each of these functions is described in detail in 24.3 (Common parameters) to 24.9 (Beamforming). The CDMG PHY service is provided to the MAC through the PHY service primitives defined in Clause 8 (PHY service specification).

#### 24.1.2.2 PHY management entity

The PLME performs management of the local PHY functions in conjunction with the MLME.

#### 24.1.2.3 Service specification method

The description for service specification method is the same as that contained in 20.1.2.2 (Service specification method).

## 24.2 CDMG PHY service interface

### 24.2.1 Introduction

The introduction for CDMG PHY service interface is the same as that contained in 20.2.1 (Introduction).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 24.2.2 TXVECTOR and RXVECTOR parameters

The parameters in Table 24-1 (TXVECTOR and RXVECTOR parameters) are defined as part of the TXVECTOR parameter list in the PHY-TXSTART.request primitive and/or as part of the RXVECTOR parameter list in the PHY-RXSTART.indication primitive.

**Table 24-1—TXVECTOR and RXVECTOR parameters**

| Parameter | Value | TXVECTOR | RXVECTOR |
|---|---|---|---|
| MCS | The MCS parameter is an enumerated type that indicates the modulation and coding scheme used in the transmission of the (#14)PPDU. Values are integers in the range 0–23.<br>— A MCS value of 0 indicates the use of CDMG control mode or CDMG robust PHY mode.<br>— MCS values of 1 to 16 indicate use of Single Carrier modulations. The value is an index to Table 24-9 (CDMG SC mode modulation and coding schemes).<br>— MCS values of 17–23 indicate use of CDMG low-power SC mode. The value is an index toTable 24-11 (CDMG low-power SC mode modulation and coding schemes). The CDMG low-power SC mode is obsolete. Support for this mechanism might be removed in a later revision of the standard. | Y | Y |
| LENGTH | Indicates the number of octets in the PSDU in the range 1–262 143. | Y | Y |
| ADD_PPDU | Enumerated type:<br>— ADD-PPDU indicates that this PPDU is immediately followed by another PPDU with no IFS or preamble on the subsequent PPDU.<br>— NO-ADD-PPDU indicates no additional PPDU follows this PPDU. | Y | Y |
| PPDU_TYPE | Enumerated type:<br>— TRN-R indicates either a PPDU whose Data field is followed by one or more TRN subfields, or a PPDU that is requesting TRN subfields to be appended to a future response PPDU.<br>— TRN-T indicates a PPDU whose Data field is followed by one or more TRN subfields. The transmitter may change AWV configuration at the beginning of each TRN subfield.<br>This parameter is reserved if TRN_LEN is 0. | Y | Y |
| TRN_LEN | TRN_LEN indicates the length of the training field. Values are in the range 0–16 (see 24.9.2.2.3 (BRP PPDU Header field(#6409))). | Y | Y |
| AGGREGATION | Indicates whether the PSDU contains an A-MPDU.<br>Enumerated type:<br>— AGGREGATED indicates this is a PSDU with A-MPDU aggregation.<br>— NOT_AGGREGATED indicates this is a PSDU without A-MPDU aggregation. | Y | Y |
| RSSI | The allowed values for the RSSI parameter are in the range from 0 to 255. This parameter is a (#1132)measurement by the PHY of the power observed at the input of the antennas plus the antenna gain, or equivalent antenna gain for a phase-array antenna, used to receive the current PPDU. RSSI shall be measured during the reception of the PHY preamble. RSSI is intended to be used in a relative manner, and it shall be a monotonically increasing function of the received power. | N | Y |

**Table 24-1—TXVECTOR and RXVECTOR parameters *(continued)***

| Parameter | Value | TXVECTOR | RXVECTOR |
|---|---|---|---|
| SNR | This parameter indicates the SNR measured during the reception of a CDMG control mode (#14)PPDU. Values are –10 dB to 53.75 dB in 0.25 dB steps. | N | Y |
| ANT_CONFIG | Indicates which antenna configuration(s) is to be used throughout the transmission of the (#14)PPDU and when to switch between configurations.<br>Values are implementation dependent. | Y | N |
| CHAN_MEASUREMENT | Channel as measured during the reception of the TRN subfields. Each measurement includes 63 complex numbers. | N | Y |
| TIME_OF_DEPARTURE_REQUESTED | Enumerated type:<br>— true indicates that the MAC entity requests that the PHY entity measure and report time of departure parameters corresponding to the time when the first (#14)PPDU energy is sent by the transmitting port.<br>— false indicates that the MAC entity requests that the PHY entity neither measure nor report time of departure parameters. | O | N |
| RX_START_OF_FRAME_OFFSET | 0 to $2^{32}$–1. An estimate of the offset (in 10 ns(#7198) units) from the point in time at which the start of the preamble (#14)of the PPDU arrived at the receive antenna connector to the point in time at which this primitive is issued to the MAC. | N | See NOTE |
| BEAM_TRACKING_REQUEST | This parameter indicates whether beam tracking is requested.<br>Enumerated type:<br>— BEAM-TRACKING-REQUESTED or BEAM-TRACKING-NOT-REQUESTED. | Y | Y |
| LAST_RSSI | In the TXVECTOR, LAST_RSSI indicates the received power level of the last (#14)PPDU with a valid PHY header that was received a SIFS before transmission of the current (#14)PPDU; otherwise, it is set to 0(#464) (10.3.2.3.3 (SIFS)). In the RXVECTOR, LAST_RSSI indicates the value of the LAST_RSSI field from the (#14)header of the received PPDU.<br>Valid values are integers in the range 0 to 15:<br>— Values of 2 to 14 represent power levels (–74+value×2) dBm.<br>— A value of 15 represents power greater than or equal to –45 dBm.<br>— A value of 1 represents power less than or equal to –71 dBm.<br>— A value of 0 indicates that the previous (#14)PPDU was not received a SIFS before the current transmission. | Y | Y |
| Turnaround | Set to 1 or 0 as specified in 10.3.2.3.3 (SIFS). | Y | Y |
| ENHANCED_BEAM_TRACKING_REQUEST | This parameter indicates whether enhanced beam tracking is requested.<br>Enumerated type:<br>— ENHANCED-BEAM-TRACKING-REQUESTED or ENHANCED-BEAM-TRACKING-NOT-REQUESTED. | Y | Y |

This is an unapproved IEEE Standards Draft, subject to change.

**Table 24-1—TXVECTOR and RXVECTOR parameters *(continued)***

| Parameter | Value | TXVECTOR | RXVECTOR |
|---|---|---|---|
| ROBUST_MODE | This parameter incorporating with the MCS parameter is an enumerated type that indicates CDMG control mode or CDMG robust PHY mode used in the transmission of the (#14)PPDU. It is present if MCS index is 0. Values are integers in the range 0–2.<br>— A CDMG ROBUST_MODE value of 0 indicates the use of CDMG control mode.<br>— A CDMG ROBUST_MODE value of 1 indicates the use of CDMG robust PHY mode 0.<br>— A CDMG ROBUST_MODE value of 2 indicates the use of CDMG robust PHY mode 1.<br>This parameter is not present if MCS index is not 0. | Y | Y |
| NOTE—"Y" if dot11TimingMsmtActivated is true; otherwise, "N". | | | |

### 24.2.3 TXSTATUS parameters

The parameters listed in Table 24-2 (TXSTATUS parameters) are defined as part of the TXSTATUS parameter list in the PHY-TXSTART.confirm primitive.

**Table 24-2—TXSTATUS parameters**

| Parameter | Value |
|---|---|
| TIME_OF_DEPARTURE | When the first (#14)PPDU energy is sent by the transmitting port, in units equal to 1/TIME_OF_DEPARTURE_ClockRate.<br>This parameter is present only if TIME_OF_DEPARTURE_REQUESTED is true in the corresponding request. |
| TIME_OF_DEPARTURE_ClockRate | 0 to $2^{16}$–1. The clock rate, in units of MHz, is used to generate the TIME_OF_DEPARTURE value. This parameter is present only if TIME_OF_DEPARTURE_REQUESTED is true in the corresponding request. |
| TX_START_OF_FRAME_OFFSET | 0 to $2^{32}$–1. An estimate of the offset (in 10 ns(#7198) units) from the point in time at which the start of the preamble (#14)of the PPDU was transmitted at the transmit antenna connector to the point in time at which this primitive is issued to the MAC. |

## 24.3 Common parameters

### 24.3.1 Channelization

The CDMG PHY operates in the channels defined in Annex E and shall support at least channel numbers 2, 35, and 36.

The channel center frequency is defined as:

Channel center frequency = Channel starting frequency + Channel spacing × (Channel number mod 32)

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

where the channel starting frequency is equal to 56.16 GHz, and the channel spacing is defined in Table E-6 (Operating classes in China) in Annex E.

### 24.3.2 Transmit mask

The transmitted spectrum shall adhere to the transmit spectrum mask shown in Figure 24-1 (Transmit mask). The transmit spectrum shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth not exceeding 0.94 GHz, –17 dBr at a 0.6 GHz offset, –22 dBr at a 1.35 GHz offset, and –30 dBr at a 1.53 GHz offset and above, inside the channels allowed for the regulatory domain in which the STA is transmitting. The measurement shall be made using a 1 MHz resolution bandwidth and a 300 kHz video bandwidth.

The transmitted spectrum shall be measured on data (#14)PPDUs longer than 10 μs without the training fields.

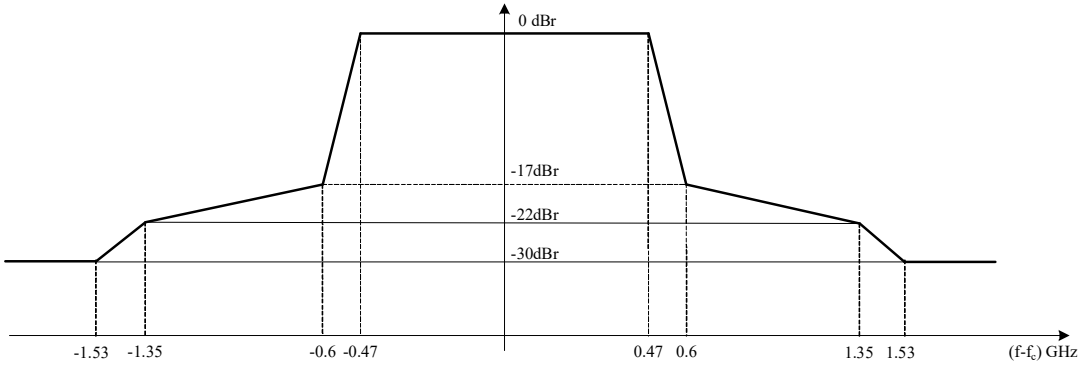

**Figure 24-1—Transmit mask**

### 24.3.3 Common requirements

#### 24.3.3.1 Introduction

This subclause describes the common requirement from all three CDMG modes: control, SC, and low-power SC.

In all of the modes, all defined fields are transmitted bit 0 first in time.

#### 24.3.3.2 Center frequency tolerance

##### 24.3.3.2.1 General

The transmitter center frequency tolerance shall be ± 20 ppm.

##### 24.3.3.2.2 Center frequency convergence

The transmitter center frequency shall converge to within 1 ppm of its final value within 0.9 μs from the start of the (#14)PPDU.

#### 24.3.3.3 Symbol clock tolerance

The symbol clock frequency tolerance shall be ± 20 ppm.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The transmit center frequency and the symbol clock frequency shall be derived from the same reference oscillator.

#### 24.3.3.4 Transmit center frequency leakage

The transmitter center frequency leakage shall not exceed –23 dB relative to the overall transmitted power.

#### 24.3.3.5 Transmit rampup and rampdown

The description for transmit rampup and rampdown for CDMG PHY is the same as that contained in 20.3.3.5 (Transmit rampup and rampdown).

#### 24.3.3.6 Antenna setting

Antenna setting shall remain constant for the transmission of the entire (#14)PPDU except for the case of transmission of BRP-TX PPDU (see 24.9.2.2 (Beam refinement)). During the transmission of BRP-TX PPDUs it shall remain constant for the transmission of the STF, CE field, and Data field.

#### 24.3.3.7 Maximum input requirement

The receiver maximum input level is the maximum power level at the receive antenna(s) of the incoming signal, in dBm, present at the input of the receiver for which the error rate criterion (defined in 24.3.3.8 (Receiver minimum input level sensitivity(#256))) is met. A receiver shall have a receiver maximum input level at the receive antenna(s) of at least 10 $\mu W/cm^2$ for each of the modulation formats that the receiver supports.

#### 24.3.3.8 Receiver minimum input level sensitivity(#256)

For MCS 0, the PER shall be less than 5% for a PSDU length of 256 octets with the MCS dependent input levels listed in Table 24-3 (Receiver minimum input level sensitivity) defined at the antenna connector. For the other MCSs, the PER shall be less than 1% for a PSDU length of 4096 octets with the MCS dependent input levels listed in Table 24-3 (Receiver minimum input level sensitivity) defined at the antenna connector.

NOTE—For RF power measurements performed over the air, the input level is corrected to compensate for the antenna gain in the implementation. The gain of the antenna is the maximum estimated gain by the manufacturer. In the case of the phased-array antenna, the gain of the phased-array antenna is the maximum sum of estimated element gain minus 3 dB implementation loss.(#4045)

### 24.3.4 Timing-related parameters

Table 24-4 (Timing-related parameters) defines timing-related parameters.

### 24.3.5 Mathematical conventions in the signal description

The description for CDMG (#14)PPDU structure and related equations is the same as that contained in 20.3.5.1 (General).

### 24.3.6 Common preamble

#### 24.3.6.1 General

The preamble is the part of the PPDU that is used for (#14)PPDU detection, AGC, frequency offset estimation, synchronization, I/Q imbalance estimation, indication of modulation (SC), and channel

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 24-4—Timing-related parameters *(continued)***

| Parameter | Value |
|---|---|
| $T_{STF}$: Detection sequence duration | $18 \times T_{seq}$ (~2618.2 ns) |
| $T_{CE}$: Channel estimation sequence duration | $9 \times T_{seq}$ (~1309.1 ns) |
| $T_{HEADER}$: header duration | $3 \times 512 \times T_c$ (~1.75 μs) |
| $T_{STF\text{-}CP}$: Control mode short training field duration | $50 \times T_{seq}$ (~7.2727 μs) |
| $T_{CE\text{-}CP}$: Control mode channel estimation field duration | $T_{CE}$ (~1309.1 ns) |
| $T_{Data}$ | ($N_{BLKS}$ × aSCBlockSize + aSCGILength) × $T_c$<br>NOTE—$N_{BLKS}$ is defined in 20.5.3.2.3.3 (LDPC encoding process) and aSCBlockSize and aSCGILength are defined in Table 20-30 (DMG PHY characteristics). |

estimation. The SFS field in the preamble enables the receiver to perform estimation and compensation for the (#14)PPDU in a time domain and frequency domain according to the STF. The format of the preamble consists of a Short Training field followed by a Channel Estimation field. Figure 24-2 (CDMG SC mode preamble) illustrates the SC (#14)PPDU preamble.

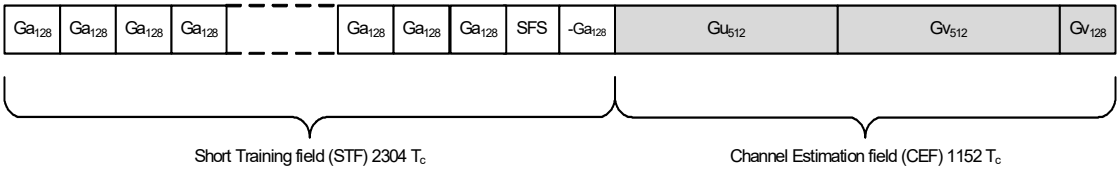

**Figure 24-2—CDMG SC mode preamble**

All numeric fields are transmitted in unsigned format, LSB first.

### 24.3.6.2 Short training field

The Short Training field is composed of 16 repetitions of sequences $Ga_{128}(n)$ of length 128 defined in 20.10 (Golay sequences), a single frequency sequence (SFS) of (#6036)length 128 that used for I/Q imbalance estimation, followed by a single sequence $-Ga_{128}(n)$. The SFS is defined as

$$SFS(n) = \exp\left(j\pi\frac{n}{2}\right), n = 0, 1, \ldots$$

The waveform for the Short Training field is

$$r_{STF}(nT_c) = \begin{cases} (Ga_{128}(n \bmod 128))\exp\left(j\pi\frac{n}{2}\right), n = 0, 1, \ldots, 16 \times 128 - 1 \\ \exp\left(j\pi\frac{n}{2}\right), n = 16 \times 128, \ldots, 17 \times 128 - 1 \\ (-Ga_{128}(n \bmod 128))\exp\left(j\pi\frac{n}{2}\right), n = 17 \times 128, \ldots, 18 \times 128 - 1 \end{cases}$$

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

#### 24.3.6.3 Channel estimation field

The Channel Estimation field is used for channel estimation, as well as indication of which modulation is going to be used for the (#14)PPDU, and enables the receiver to suppress nonlinear impact generated in a power amplification process according to the CE field. The Channel Estimation field is composed of a concatenation of two sequences $Gu_{512}(n)$ and $Gv_{512}(n)$ where the last 128 samples of $Gu_{512}(n)$ are equal to the last 128 samples used in the Short Training field. They are followed by a 128 samples sequence $Gv_{128}(n)$ equal to the first 128 samples of both $Gu_{512}(n)$ and $Gv_{512}(n)$.

The $Gu_{512}$ and $Gv_{512}$ sequences are defined as

$$Gu_{512} = \left[-Gb_{128}\ -Ga_{128}\ Gb_{128}\ -Ga_{128}\right]$$

$$Gv_{512} = \left[-Gb_{128}\ Ga_{128}\ -Gb_{128}\ -Ga_{128}\right]$$

When the (#404)Data field of the (#14)PPDU is modulated using single carrier, the $Gu_{512}$ and $Gv_{512}$ fields are concatenated in the order illustrated in Figure 24-3 (Channel Estimation field for SC PPDUs(#14)).

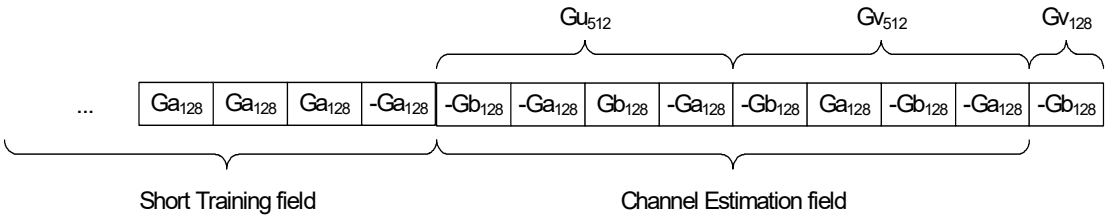

**Figure 24-3—Channel Estimation field for SC PPDUs(#14)**

The waveform for the channel estimation sequence is

$$r_{CE_{SC}}(nT_c) = (Gu_{512}(n) + Gv_{512}(n-512) + Gv_{128}(n-1024))\exp\left(j\pi\frac{n}{2}\right),\ n = 0, 1, \ldots, 1151$$

Note that sequences $Gu_{512}(n)$ and $Gv_{512}(n)$ are defined for $0 \le n \le 511$. For other values of $n$, $Gu_{512}(n)$ and $Gv_{512}(n)$ are set to 0.

### 24.3.7 HCS calculation for headers of CDMG control mode and CDMG SC mode

The description for HCS calculation for headers of CDMG control mode and CDMG SC mode is the same as that contained in 20.3.7 (HCS calculation for headers of DMG control mode and DMG SC mode).

### 24.3.8 Common LDPC parity matrices

The description for common LDPC parity matrices for CDMG PHY is the same as that contained in 20.3.8 (Common LDPC parity matrices).

### 24.3.9 Scrambler

The description for CDMG PHY scrambler is the same as that contained in 20.3.9 (Scrambler).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 24.3.10 Received channel power indicator (RCPI) measurement

The description for received channel power indicator (RCPI) measurement for CDMG PHY is the same as that contained in 20.3.10 (Received channel power indicator (RCPI) measurement).

## 24.4 CDMG control mode

### 24.4.1 Introduction

Transmission and reception of control mode PPDUs are mandatory. CDMG control mode uses the same chip rate as the CDMG SC mode. CDMG control mode is transmitted when the TXVECTOR indicates MCS 0.

The modulation and coding scheme for the CDMG control mode is shown in Table 24-5 (CDMG control mode modulation and coding scheme).

**Table 24-5—CDMG control mode modulation and coding scheme**

| MCS index | Modulation | Code rate | Data rate |
|---|---|---|---|
| 0 | DBPSK | 1/2[a] | 13.75 Mb/s[a] |

[a] Code rate and data rate might be lower due to codeword shortening.

### 24.4.2 PPDU format

(#3626)The CDMG control mode PPDU is shown in Figure 24-4 (CDMG control mode PPDU format).

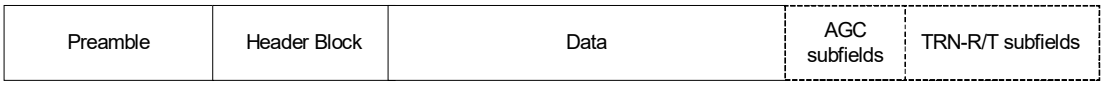

**Figure 24-4—CDMG control mode PPDU format**

### 24.4.3 Transmission

#### 24.4.3.1 Preamble

##### 24.4.3.1.1 General

The preamble is the part of the CDMG control mode PPDU that is used for (#14)PPDU detection, AGC, frequency offset estimation, synchronization, indication of (#14)PPDU type, and channel estimation.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The preamble is composed of two parts as shown in Figure 24-5 (CDMG control mode preamble): the Short Training field and the Channel Estimation field.

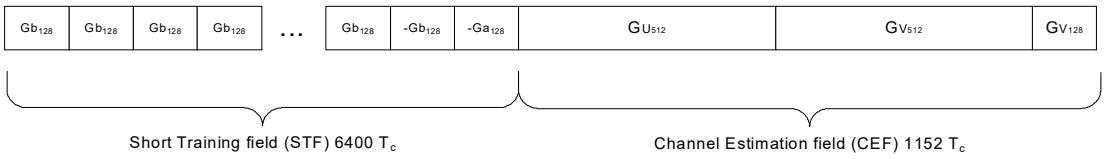

**Figure 24-5—CDMG control mode preamble**

#### 24.4.3.1.2 Short Training field

The Short Training field is composed of 48 repetitions of sequences $Gb_{128}(n)$ of length 128, followed by a single $-Gb_{128}(n)$ sequence (for synchronization) and then a single $-Ga_{128}(n)$ sequence. The sequences $Ga_{128}(n)$ and $Gb_{128}(n)$ are defined in 20.10 (Golay sequences).

The waveform for the Short Training field is

$$r_{STF}(nT_c) = \begin{cases} Gb_{128}(n \bmod 128)\exp\left(j\pi\frac{n}{2}\right), & n = 0, 1, \ldots, 48 \times 128 - 1 \\ -Gb_{128}(n \bmod 128)\exp\left(j\pi\frac{n}{2}\right), & n = 48 \times 128, \ldots, 49 \times 128 - 1 \\ -Ga_{128}(n \bmod 128)\exp\left(j\pi\frac{n}{2}\right), & n = 49 \times 128, \ldots, 50 \times 128 - 1 \end{cases}$$

Note that sequences $Ga_{128}(n)$ and $Gb_{128}(n)$ are defined for $0 \le n \le 127$. For other values of $n$, they are set to 0.

#### 24.4.3.1.3 Channel Estimation field

The Channel Estimation field is the same as the Channel Estimation field of the CDMG SC mode, as defined in Figure 24-3 (Channel Estimation field for SC PPDUs(#14)) of 24.3.6.3 (Channel estimation field).

### 24.4.3.2 Header

#### 24.4.3.2.1 General

In the CDMG control mode, the preamble is followed by the header block. The header consists of several fields that define the details of the PPDU to be transmitted.

The header fields are described in Table 24-6 (CDMG control mode header fields).

(#455)Reserved bits shall be set to 0 by the transmitter and shall be ignored by the receiver.

(#1647)All numeric fields are transmitted in unsigned format, LSB first.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 24-6—CDMG control mode header fields**

| Field name | Bit | Description |
|---|---|---|
| Differential Encoder Initialization | B0 | Used to initialize the differential encoding *c(0)* in 20.4.3.3.4 (Modulation). May be set to any value. |
| Scrambler Initialization | B1–B4 | Bits X1–X4 of the initial scrambler state (see 20.4.3.3.2 (Scrambler)). |
| Length | B5–B14 | Number of data octets in the PSDU.<br>Range 14–1023. |
| PPDU Type | B15 | As defined in Table 24-8 (CDMG SC mode header fields). |
| Training Length | B16–B20 | Length of the training field. The use of this field is defined in 24.9.2.2.3 (BRP PPDU Header field(#6409)). |
| Turnaround | B21 | Contains a copy of the parameter TURNAROUND from the TXVECTOR. |
| Robust PHY Mode Indication(#8102) | B22–B23 | — (#456)Set to 0: control mode.<br>— Set to 1: robust PHY mode 1.<br>— Set to 2: robust PHY mode 0.<br>The value 3 is reserved. |
| HCS | B24–B39 | Header check sequence. Calculation of the header check sequence is defined in 24.3.7 (HCS calculation for headers of CDMG control mode and CDMG SC mode). |

#### 24.4.3.2.2 Generation of HCS bits

The header check sequence (HCS) is calculated over bits 0–23 and uses CRC 16-CCITT as described in 24.3.7 (HCS calculation for headers of CDMG control mode and CDMG SC mode).

#### 24.4.3.2.3 Header encoding and modulation

The header bits followed by the HCS bits are prepended to the (#14)Data field bits and passed into the (#404)Data field encoder per 24.4.3.3 (Data field). The minimal payload length is 14 octets

### 24.4.3.3 Data field

The description for Data field for CDMG control mode is the same as that contained in 20.4.3.3 (Data field).

## 24.4.4 Performance requirements

### 24.4.4.1 Transmit requirements

#### 24.4.4.1.1 Introduction

Transmitter performance requirements of the CDMG control mode are defined in 24.4.4.1.2 (Transmit EVM).

#### 24.4.4.1.2 Transmit EVM

The description for transmit EVM for CDMG control mode is the same as that contained in 20.4.4.1.2 (Transmit EVM).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

#### 24.4.4.2 Receive requirements

##### 24.4.4.2.1 Introduction

This subclause describes the performance requirement from the CDMG control mode receiver.

##### 24.4.4.2.2 CCA

The start of a CDMG control mode transmission at a receive level greater than –71 dBm shall cause CCA to indicate busy with a probability > 90% within 3 μs.

## 24.5 CDMG SC mode

### 24.5.1 Introduction

Transmission and reception of CDMG SC mode PPDUs are mandatory for selected MCSs.

### 24.5.2 PPDU format

(#3626)An(#1424) SC (#14)PPDU is shown in Figure 24-6 (SC PPDU format(#14)).

**Figure 24-6—SC PPDU format(#14)**

The robust PHY modes use the CDMG control mode with short spreading sequences for the data. (See Table 24-7 (CDMG robust PHY modes).) The following Golay complementary sequences Ga(8) and Ga(4) are used as spreading sequences for robust PHY mode 0 and 1, respectively.

Ga(8)=(+1, +1, +1, −1, +1, +1, −1, +1)

Ga(4)=(+1, +1, +1, −1)

**Table 24-7—CDMG robust PHY modes**

| CDMG-Robust mode | Modulation | Code rate | Spreading sequence | Data rate (Mb/s) |
|---|---|---|---|---|
| 0 | DBPSK | 1/2 | Ga(8) | 55 |
| 1 | DBPSK | 1/2 | Ga(4) | 110 |

### 24.5.3 Transmission

#### 24.5.3.1 Header

##### 24.5.3.1.1 General

In the CDMG SC mode, the preamble is followed by the header. The header consists of several fields that define the details of the PPDU to be transmitted. The encoding and modulation of the header are described in 24.5.3.1.4 (Header encoding and modulation).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The header fields are described in Table 24-8 (CDMG SC mode header fields).

**Table 24-8—CDMG SC mode header fields**

| Field name | Number of bits | Start bit | Description |
|---|---|---|---|
| Scrambler Initialization | 7 | 0 | Bits X1–X7 of the initial scrambler state (see 20.3.9 (Scrambler)). |
| MCS | 6 | 7 | Modulation and coding scheme (see Table 24-9 (CDMG SC mode modulation and coding schemes)). |
| Length | 18 | 13 | Number of data octets in the PSDU. Range 1–262 143. |
| Additional PPDU | 1 | 31 | Contains a copy of the parameter ADD_PPDU from the TXVECTOR. A value of 1 indicates that this PPDU is immediately followed by another PPDU with no IFS or preamble on the subsequent PPDU. A value of 0 indicates that no additional PPDU follows this PPDU. |
| PPDU Type | 1 | 32 | Corresponds to the TXVECTOR parameter PPDU_TYPE.<br>— PPDU Type = 0 (BRP-RX PPDU, see 20.9.2.2.3 (BRP PPDU Header field(#6409))), indicates either a (#14)PPDU whose Data field is followed by one or more TRN subfields (when the Beam Tracking Request field is 0 or in CDMG control mode), or a PPDU that contains TRN subfields to be appended to a future response PPDU (when the Beam Tracking Request field is 1).<br>— PPDU Type = 1 (BRP-RX PPDU, see 20.9.2.2.3 (BRP PPDU Header field(#6409))), indicates a PPDU whose Data field is followed by one or more TRN subfields. The transmitter may change AWV at the beginning of each TRN subfield.<br>The field is reserved when the Training Length field is 0. |
| Training Length | 5 | 33 | Corresponds to the TXVECTOR parameter TRN_LEN.<br><br>If the Beam Tracking Request field is 0, the Training Length field indicates the length of the training field. The use of this field is defined in 24.9.2.2.3 (BRP PPDU Header field(#6409)). A value of 0 indicates that no training field is present in this PPDU.<br><br>If the Beam Tracking Request field is 1 and the PPDU Type field is 1, the Training Length field indicates the length of the training field appended to this PPDU. If the PPDU Type field is 0, the Training Length field indicates the length of the training field requested for receive training. |
| Aggregation | 1 | 38 | Set to 1 to indicate that the PPDU in the data portion of the packet contains an A-MPDU; otherwise, set to 0. |
| Beam Tracking Request | 1 | 39 | Corresponds to the TXVECTOR parameter BEAM_TRACKING_REQUEST.<br>Set to 1 to indicate the need for beam tracking (10.41.7 (Beam tracking)); otherwise, set to 0.<br>The Beam Tracking Request field is reserved when the Training Length field is 0. |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 24-8—CDMG SC mode header fields *(continued)***

| Field name | Number of bits | Start bit | Description |
|---|---|---|---|
| Last RSSI | 4 | 40 | Contains a copy of the parameter LAST_RSSI from the TXVECTOR.<br>The value is an unsigned integer:<br>Values of 2 to 14 represent power levels (–74+value×2) dBm.<br>A value of 15 represents a power greater than or equal to –45 dBm.<br>A value of 1 represents a power less than or equal to –71 dBm.<br>A value of 0 indicates that the previous (#14)PPDU was not received a SIFS(#320) before the current transmission. |
| Turnaround | 1 | 44 | As defined in Table 24-1 (TXVECTOR and RXVECTOR parameters). |
| Enhanced Beam Tracking Request | 1 | 45 | Corresponds to the TXVECTOR parameter ENHANCED_BEAM_TRACKING_REQUEST.<br>Set to 1 to indicate that one STF and CE field are appended to the Data and TRN fields.<br>Otherwise, set to 0. |
| Reserved | 2 | 46 | |
| HCS | 16 | 48 | Header check sequence. Definition of this field calculation is in 24.5.3.1.3 (Generation of the HCS bits). |

Reserved bits are set to 0 by the transmitter and shall be ignored by the receiver.

If the Additional PPDU field is equal to 1, the Training Length field shall be set to 0.

(#1647)All numeric fields are transmitted in unsigned format, LSB first.

#### 24.5.3.1.2 Modulation and coding scheme

The modulation and coding scheme (MCS) field specifies the modulation and code rate that is used in the PPDU. The modulation and coding schemes for the SC mode are defined in Table 24-9 (CDMG SC mode modulation and coding schemes).

**Table 24-9—CDMG SC mode modulation and coding schemes**

| MCS index | Modulation | $N_{CBPS}$ | Repetition | Code rate | Data rate (Mb/s) |
|---|---|---|---|---|---|
| 1 | π/2-BPSK | 1 | 2 | 1/2 | 192.5 |
| 2 | π/2-BPSK | 1 | 1 | 1/2 | 385 |
| 3 | π/2-BPSK | 1 | 1 | 5/8 | 481.25 |
| 4 | π/2-BPSK | 1 | 1 | 3/4 | 577.5 |
| 5 | π/2-BPSK | 1 | 1 | 13/16 | 625.625 |
| 6 | π/2-QPSK | 2 | 1 | 1/2 | 770 |
| 7 | π/2-QPSK | 2 | 1 | 5/8 | 962.5 |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 24-9—CDMG SC mode modulation and coding schemes *(continued)***

| MCS index | Modulation | $N_{CBPS}$ | Repetition | Code rate | Data rate (Mb/s) |
|---|---|---|---|---|---|
| 8 | π/2-QPSK | 2 | 1 | 3/4 | 1155 |
| 9 | π/2-QPSK | 2 | 1 | 13/16 | 1251.25 |
| 10 | π/2-16-QAM | 4 | 1 | 1/2 | 1540 |
| 11 | π/2-16-QAM | 4 | 1 | 5/8 | 1925 |
| 12 | π/2-16-QAM | 4 | 1 | 3/4 | 2310 |
| 13 | π/2-16-QAM | 4 | 1 | 13/16 | 2502.5 |
| 14 | π/2-64-QAM | 6 | 1 | 5/8 | 2887.5 |
| 15 | π/2-64-QAM | 6 | 1 | 3/4 | 3465 |
| 16 | π/2-64-QAM | 6 | 1 | 13/16 | 3453.75 |

Transmit and receive support for MCS 9 and below is mandatory. Other MCSs are optional.

#### 24.5.3.1.3 Generation of the HCS bits

Calculation of the HCS for bits 0–47 of the header is defined in 24.3.7 (HCS calculation for headers of CDMG control mode and CDMG SC mode).

#### 24.5.3.1.4 Header encoding and modulation

The description for header encoding and modulation for CDMG SC mode is the same as that contained in 20.5.3.1.4 (Header encoding and modulation).

### 24.5.3.2 The Data field

#### 24.5.3.2.1 General

The (#404)Data field consists of the payload data of the PSDU and possible padding. The data are padded with 0s(M118), scrambled, encoded, and modulated as described in the following subclauses. The amount of padding is defined in 24.5.3.2.3 (Encoding).

#### 24.5.3.2.2 Scrambler

The description for CDMG SC mode scrambler is the same as that contained in 20.5.3.2.2 (Scrambler).

#### 24.5.3.2.3 Encoding

The description for CDMG SC mode encoding is the same as that contained in 20.5.3.2.3 (Encoding).

#### 24.5.3.2.4 Modulation mapping

##### 24.5.3.2.4.1 General

The coded and padded bit stream is converted into a stream of complex constellation points according to the modulation specified in the MCS table.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

#### 24.5.3.2.4.2 π/2-BPSK modulation

The description for CDMG SC mode π/2-BPSK modulation is the same as that contained in 20.5.3.2.4.2 (π/2-BPSK modulation).

#### 24.5.3.2.4.3 π/2-QPSK modulation

The description for CDMG SC mode π/2-QPSK modulation is the same as that contained in 20.5.3.2.4.3 (π/2-QPSK modulation).

#### 24.5.3.2.4.4 π/2-16-QAM modulation

The description for CDMG SC mode π/2-16-QAM modulation is the same as that contained in 20.5.3.2.4.5 (π/2-16-QAM modulation).

#### 24.5.3.2.4.5 π/2-64-QAM modulation

In π/2-64-QAM modulation, the input bit stream is grouped into sets of 6 bits and mapped according to the following equation:

$$\tilde{s}(k) = \frac{1}{\sqrt{42}}((8c_{6k}-4)-(2c_{6k}-1)(4c_{6k+1}-2)+(2c_{6k}-1)(2c_{6k+1}-1)(2c_{6k+2}-1)) + j\frac{1}{\sqrt{42}}((8c_{6k+3}-4)-(2c_{6k+3}-1)(4c_{6k+4}-2)+(2c_{6k+3}-1)(2c_{6+4}-1)(2c_{6k+5}-1))$$

where $k$ is the output symbol index, $k = 0, 1, \ldots$. Each output symbol is then rotated according to the following equation:

$$s_k = s_k \cdot e^{j \cdot \pi \cdot k/2}$$

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The constellation bit encoding for 64-QAM is shown in Figure 24-7 (64-QAM constellation bit encoding).

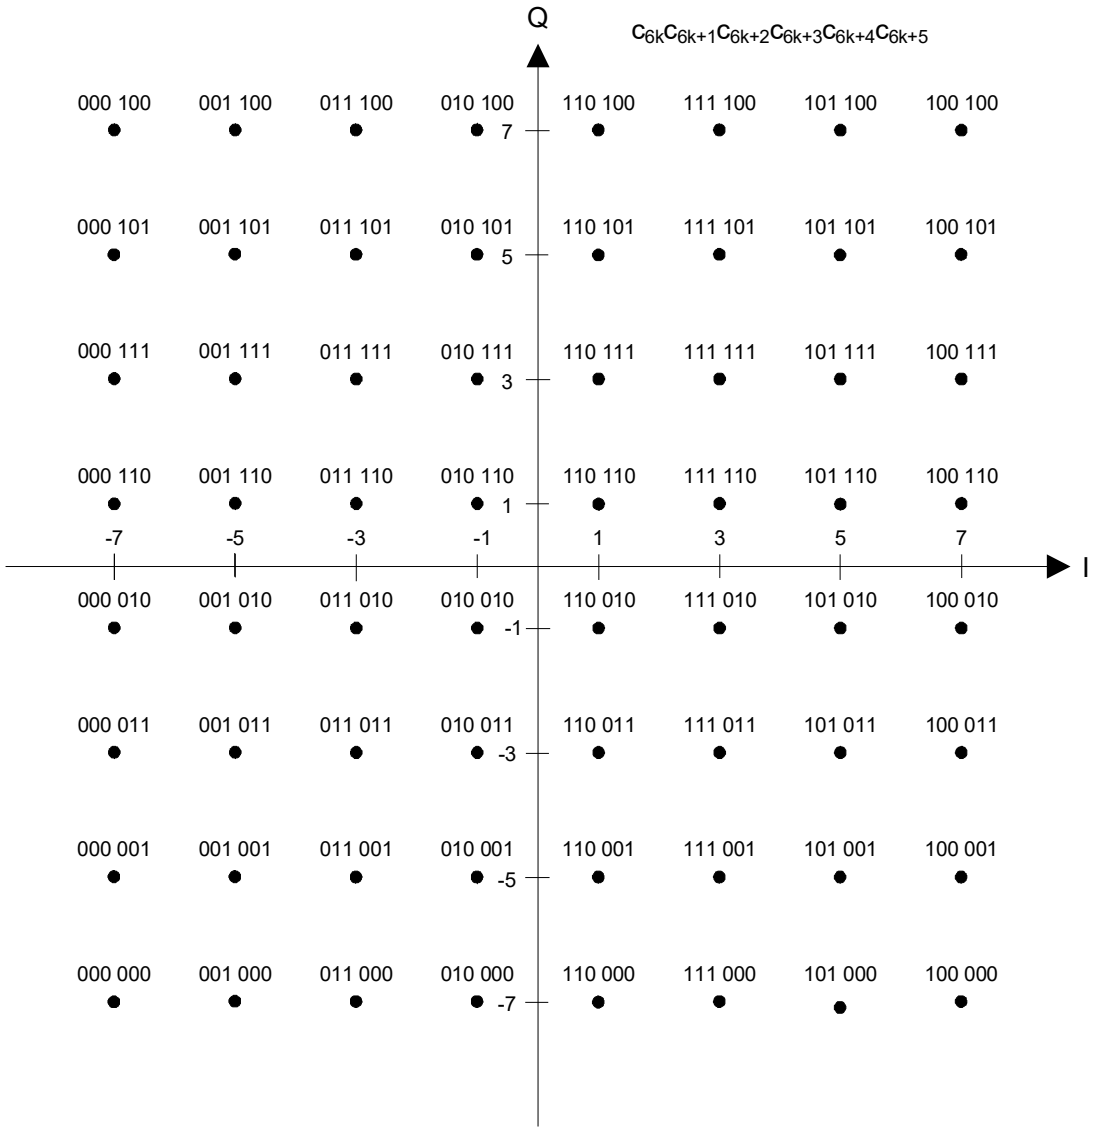

**Figure 24-7—64-QAM constellation bit encoding**

### 24.5.3.2.5 Symbol blocking and guard insertion

The description for CDMG SC mode symbol blocking and guard insertion is the same as that contained in 20.5.3.2.5 (Symbol blocking and guard insertion).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 24.5.4 Performance requirements

#### 24.5.4.1 Transmit requirements

##### 24.5.4.1.1 Transmit EVM

The transmit EVM accuracy test shall be performed by instrumentation capable of converting the transmitted signal into a stream of complex samples, with sufficient accuracy in terms of I/Q arm amplitude and phase balance, dc offsets, phase noise, etc.

The instrumentation shall perform carrier lock, symbol timing recovery, and amplitude adjustment while making the measurements. The equalizer shall be trained using information in the SC preamble (STF and/or CE field). For the CDMG SC mode EVM, measuring $N_s$ samples at the sample rate, the measured symbols should not contain the first and the last hundred symbols of a given (#14)PPDU (ramp up/down). The EVM is calculated according to the formula below: (#315)

$$EVM = 20\log 10\left(\sqrt{\left(\frac{1}{N_s P_{avg}}\sum_{i=1}^{N_S}[(I_i - I_i^* - I_0)^2 + (Q_i - Q_i^* - Q_0)^2]\right)}\right)$$

where

$N_s$ is the number of samples to be measured and $N_s$ should be 1000

$P_{avg}$ is the average power of the constellation

$(I_i, Q_i)$ is the complex coordinates of the measured symbol $i$

$(I_i^*, Q_i^*)$ is the complex coordinates of the ideal constellation point for the measured symbol $i$

$(I_0, Q_0)$ is the complex DC term chosen to reduce EVM

The test equipment should use a root-raised cosine filter with roll-off factor of 0.25 for the pulse shaping filter when conducting EVM measurement.

The transmit pulse shaping used is left to the implementer.

The relative constellation error (EVM) shall not exceed a MCS dependent value according to Table 24-10 (CDMG SC mode EVM requirements).

**Table 24-10—CDMG SC mode EVM requirements**

| MCS index | Modulation | Coding rate | EVM value (dB) |
|---|---|---|---|
| 1 | π/2-BPSK | 1/2 with repetition | –6 |
| 2 | π/2-BPSK | 1/2 | –7 |
| 3 | π/2-BPSK | 5/8 | –9 |
| 4 | π/2-BPSK | 3/4 | –10 |
| 5 | π/2-BPSK | 13/16 | –12 |
| 6 | π/2-QPSK | 1/2 | –11 |
| 7 | π/2-QPSK | 5/8 | –12 |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 24-10—CDMG SC mode EVM requirements *(continued)***

| MCS index | Modulation | Coding rate | EVM value (dB) |
|---|---|---|---|
| 8 | π/2-QPSK | 3/4 | –13 |
| 9 | π/2-QPSK | 13/16 | –15 |
| 10 | π/2-16-QAM | 1/2 | –19 |
| 11 | π/2-16-QAM | 5/8 | –20 |
| 12 | π/2-16-QAM | 3/4 | –21 |
| 13 | π/2-16-QAM | 13/16 | –23 |
| 14 | π/2-64-QAM | 5/8 | –25 |
| 15 | π/2-64-QAM | 3/4 | –26 |
| 16 | π/2-64-QAM | 13/16 | –28 |

#### 24.5.4.1.2 Time of departure accuracy

(#8053)The RMS accuracy of the time of departure provided in TIME_OF_DEPARTURE shall be less than or equal to 80 ns.

The Time of Departure accuracy test evaluates TIME_OF_DEPARTURE against aTxPHYTxStartRMS and aTxPHYTxStartRMS against TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH as defined in Annex P with the following test parameters:

— MULTICHANNEL_SAMPLING_RATE is $880 \times 10^6$ sample/s.
— FIRST_TRANSITION_FIELD is Short Training field.
— SECOND_TRANSITION_FIELD is Channel Estimation field.
— TRAINING_FIELD is Channel Estimation field.
— TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH is 80 ns.

NOTE—The indicated windowing applies to the time of departure accuracy test equipment, and not the transmitter or receiver.

### 24.5.4.2 Receive requirements

#### 24.5.4.2.1 Introduction

This subclause describes the receiver requirements of the CDMG SC mode.

#### 24.5.4.2.2 CCA sensitivity

The start of a CDMG SC mode transmission at a receive level greater than the minimum sensitivity for MCS 1 (–71 dBm) shall cause CCA to indicate busy with a probability > 90% within 1 μs. The receiver shall hold the carrier sense signal busy for any signal 20 dB above the minimum sensitivity for MCS 1.

## 24.6 CDMG low-power SC mode

### 24.6.1 Introduction

The CDMG low-power SC mode is obsolete. Support for this mechanism might be removed in a later revision of the standard.

The CDMG low-power SC mode is an optional SC mode. This mode can provide lower processing power requirements for CDMG transceivers.

### 24.6.2 Transmission

#### 24.6.2.1 Preamble

The CDMG low-power SC mode uses the same preamble as the CDMG SC mode.

#### 24.6.2.2 Header

##### 24.6.2.2.1 General

The CDMG low-power SC mode header fields are the same fields as in the CDMG SC mode (see Table 24-8 (CDMG SC mode header fields) in 24.5.3.1 (Header)).

The CDMG low-power SC mode modulation and coding schemes are listed in Table 24-11 (CDMG low-power SC mode modulation and coding schemes).

**Table 24-11—CDMG low-power SC mode modulation and coding schemes**

| MCS | Modulation | Effective code rate | Coding scheme | $N_{CPB}$ | Rate (Mb/s) |
|---|---|---|---|---|---|
| 17 | π/2-BPSK | 13/28 | RS(224,208)+Block-Code(16,8) | 392 | 313 |
| 18 | π/2-BPSK | 13/21 | RS(224,208)+Block-Code(12,8) | 392 | 417 |
| 19 | π/2-BPSK | 52/63 | RS(224,208)+SPC(9,8) | 392 | 556 |
| 20 | π/2-QPSK | 13/28 | RS(224,208)+Block-Code(16,8) | 392 | 625.5 |
| 21 | π/2-QPSK | 13/21 | RS(224,208)+Block-Code(12,8) | 392 | 834 |
| 22 | π/2-QPSK | 52/63 | RS(224,208)+SPC(9,8) | 392 | 1112 |
| 23 | π/2-QPSK | 13/14 | RS(224,208)+Block-Code(8,8) | 392 | 1251.5 |

##### 24.6.2.2.2 Header encoding and modulation

The description for header encoding and modulation for CDMG low-power SC mode is the same as that contained in 20.6.2.2.2 (Header encoding and modulation).

#### 24.6.2.3 Data field

The description for CDMG SC mode Data field is the same as that contained in 20.6.2.3 (Data field).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

## 24.7 PHY transmit procedure

The PHY transmit procedure is shown in Figure 24-8 (Typical Tx state machine (Training Length=0 is assumed; some optional features such as CDMG SC low-power mode are not shown)). In order to transmit data, a PHY-TXSTART.request primitive shall be enabled so that the PHY entity shall be in the transmit state. Further, the PHY shall be set to operate at the appropriate frequency through station management via the PLME, as specified in 24.10 (CDMG PLME). Other transmit parameters, such as MCS and transmit power, are set via the PHY SAP with the PHY-TXSTART.request(TXVECTOR) primitive, as described in 24.2.2 (TXVECTOR and RXVECTOR parameters).

Transmission of the PHY preamble may start if TIME_OF_DEPARTURE_REQUESTED is false and shall start immediately if TIME_OFDEPARTURE_REQUESTED is true, based on the parameters passed in the PHY-TXSTART.request primitive.

The preamble format (control or SC mode) depends on the MCS in the PHY-TXSTART.request primitive. The PHY shall calculate the length of the (#14)PPDU according the MCS and the length specified in the PHY-TXSTART.request primitive, adding padding bits if necessary.

The PHY continues with the encoding and transmission of the header according to the parameters of the PHY-TXSTART.request(TXVECTOR) primitive. The PHY proceeds with PSDU transmission through a series of data octet transfers from the MAC. The data are encoded as described in 20.4.3.3.3 (Encoder), 20.5.3.2.3 (Encoding), and 20.6.2.3.3 (Encoding). The encoded data are then modulated as described in 24.4 (CDMG control mode), 24.5 (CDMG SC mode), and 24.6 (CDMG low-power SC mode), depending on the MCS requested in the PHY-TXSTART.request primitive. Transmission can be prematurely terminated by the MAC through the PHY-TXEND.request primitive. PHY-TXSTART shall be disabled by receiving a PHY-TXEND.request primitive.

Transmission of the PSDU is completed with the transmission of the last bits of the (encoded) PSDU. If no TRN units are specified in the PHY-TXSTART.request primitive, the PHY shall issue a PHY-TXEND primitive after the transmission of the last bits. If TRN units are requested in the PHY-TXSTART.request primitive, the transmission continues with the transmission of the AGC subfields and TRN units. The PHY issues the PHY-TXEND.confirm primitive to the MAC after the transmission of the last TRN unit. The (#14)PPDU transmission shall be completed, and the PHY entity shall enter the receive state (i.e., PHY-TXSTART shall be disabled). Each PHY-TXEND.request primitive is acknowledged with a PHY-TXEND.confirm primitive from the PHY.

## 24.8 PHY receive procedure

A CDMG STA shall follow the DMG receive procedure defined in 20.8 (PHY receive procedure) when a DMG PPDU is detected on a 2.16 GHz channel.

The CDMG PHY receive procedure follows similar rules as descrived in 20.8 (PHY receive procedure).

## 24.9 Beamforming

### 24.9.1 Beamforming concept

The beamforming concept is the same as that contained in 20.9.1 (Beamforming concept).

### 24.9.2 Beamforming frame format

#### 24.9.2.1 Sector-level sweep

PPDUs transmitted during transmit sector sweep are CDMG control mode PPDUs. PPDUs transmitted during receive sector sweep are CDMG control mode or CDMG SC mode PPDUs.

#### 24.9.2.2 Beam refinement

##### 24.9.2.2.1 General

See 20.9.2.2.1 (General) for the general description of beam refinement.

In addition to DMG beam refinement features, enhanced beam tracking is a process that the CDMG STAs can use to improve their antenna configurations (or antenna weight vectors) both for transmission and reception and measure the backup channel performance of an alternative link via beam tracking. Once the current link has poor quality due to blockage or antenna rotation, the CDMG STAs can switch to an alternative link. Only if the alternative link has been set and enhanced beam tracking is enabled, can CDMG STAs perform enhanced beam tracking. The procedure of enhanced beam tracking is described in 10.41.9 (CDMG enhanced beam tracking).

In addition to TRN training sequences appended, CDMG enhanced beam tracking uses BRP-RX or BRP-TX PPDUs that have an STF and a CE field appended to them.

— BRP-RX PPDUs are PPDUs that have e-TRN-R/TRN-R training sequences following the Data field. These PPDUs with TRN-R sequences enable receiver antenna weight vector training, and these PPDUs with e-TRN-R sequences enable receiver antenna weight vector training and measuring one alternative link.

— BRP-TX PPDUs are PPDUs that have e-TRN-T/TRN-T training sequences following the Data field. The transmitting STA may change antenna configuration at the beginning of each sequence. The receiving STA performs measurements on these sequences and sends feedback to the STA that transmits the BRP-TX PPDU, including the measurement results of alternative link.

##### 24.9.2.2.2 BRP PPDU structure

(#6552)If the Enhanced Beam Tracking Request field in the PHY header is equal to:

— 0, each (#14)BRP PPDU structure is shown in Figure 20-20 (BRP PPDU structure).

— 1, each BRP PPDU structure is shown in Figure 24-9 (BRP PPDU structure (CDMA STAs)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The STF and CE fields at the end of the BRP PPDU have the same structure as those at the beginning of the PPDU as defined in 24.3.6 (Common preamble). The collection of the AGC field, TRN field, STF, and CE field at the end of BRP PPDU is termed an *e-TRN field*. The AGC fields and TRN fields are used to train the current link and the adjacent links of the current link during beam tracking process. The alternative link is a beam link with different propagation characteristic that cannot be measured accurately by the AGC field and the training field (TRN-R/T) that are used for measuring the adjacent beam links. The STF and the CE field at the end of BRP PPDU are used for measuring and training the alternative link of CDMG STAs during enhanced beam tracking (see 10.41.9 (CDMG enhanced beam tracking)). The BRP PPDU structure for CDMG STAs that perform enhanced beam tracking is shown in Figure 24-9 (BRP PPDU structure (CDMA STAs)).

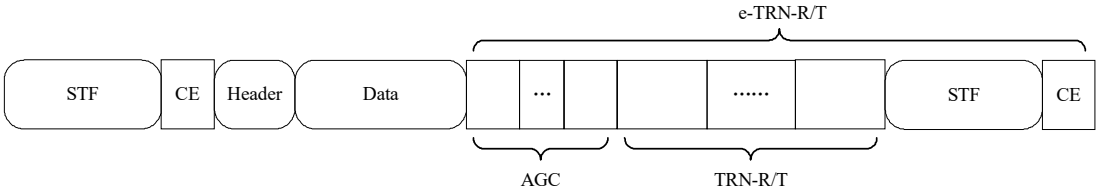

**Figure 24-9—BRP PPDU structure (CDMA STAs)**

### 24.9.2.2.3 BRP PPDU Header field(#6409)

The description for (#6409)BRP PPDU Header field is the same as that contained in 20.9.2.2.3 (BRP PPDU Header field(#6409)).

### 24.9.2.2.4 BRP PPDU duration

The minimum duration of the (#404)Data field of a BRP PPDU when sent in an SC mode is aBRPminSCblocks SC blocks (see 24.5.3.2.5 (Symbol blocking and guard insertion)), and, if needed, the (#404)Data field of the (#14)PPDU shall be extended by extra 0 padding to generate the required number of SC blocks. Table 24-12 (Zero filling for SC BRP PPDUs with MCSs 1 to 9) contains the values of $N_{CWmin}$ for MCSs 1 to 9 necessary to compute the padding described in 20.5.3.2.3.3 (LDPC encoding process).

**Table 24-12—Zero filling for SC BRP PPDUs with MCSs 1 to 9**

| MCS index | Modulation | $N_{CBPS}$ | Repetition | Code rate | Data rate (Mb/s) | $N_{CWmin}$ |
|---|---|---|---|---|---|---|
| 1 | π/2-BPSK | 1 | 2 | 1/2 | 192.5 | 12 |
| 2 | π/2-BPSK | 1 | 1 | 1/2 | 385 | 12 |
| 3 | π/2-BPSK | 1 | 1 | 5/8 | 481.25 | 12 |
| 4 | π/2-BPSK | 1 | 1 | 3/4 | 577.5 | 12 |
| 5 | π/2-BPSK | 1 | 1 | 13/16 | 625.625 | 12 |
| 6 | π/2-QPSK | 2 | 1 | 1/2 | 770 | 23 |
| 7 | π/2-QPSK | 2 | 1 | 5/8 | 962.5 | 23 |
| 8 | π/2-QPSK | 2 | 1 | 3/4 | 1155 | 23 |
| 9 | π/2-QPSK | 2 | 1 | 13/16 | 1251.25 | 23 |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The minimum duration of the (#404)Data field of a BRP PPDU when sent with the low-power SC mode is $N_{BLK\_MIN}$ low-power SC blocks (see 20.6.2.3.3 (Encoding)).

#### 24.9.2.2.5 AGC field

(#14)The AGC fields in the BRP PPDU are composed of 4*N* repetitions of the sequence [$Ga_{64}$ $Ga_{64}$ $Ga_{64}$ $Ga_{64}$ $Ga_{64}$] when the PPDU is transmitted using the SC mode and [$Gb_{64}$ $Gb_{64}$ $Gb_{64}$ $Gb_{64}$ $Gb_{64}$] when the PPDU is transmitted using the control mode. The sequences Ga64 and Gb64 are defined in 20.10 (Golay sequences). The sequences are transmitted using rotated π/2-BPSK modulation.

In a BRP-TX PPDU, the transmitter may change the TX AWV configuration at the beginning of each AGC field. Any transmit signal transients that occur due to this TX AWV configuration change shall completely settle by the end of the first Ga64 or Gb64 subsequence. The set of AWVs used for the AGC subfields should be the same as that used for the TRN-T fields. In a BRP-RX PPDU, the transmitter shall use the same TX AWV as in the preamble and (#404)Data fields of the (#14)PPDU.

#### 24.9.2.2.6 TRN field

The description for TRN field is the same as that contained in 20.9.2.2.6 (TRN field).

#### 24.9.2.2.7 Channel measurement

The description for channel measurement is the same as that contained in 20.9.2.2.7 (Channel measurement).

## 24.10 CDMG PLME

### 24.10.1 PLME SAP layer management primitives(#6320)

Table 24-13 (CDMG PHY MIB attribute default values) lists the MIB attributes that may be accessed by the PHY entities and the intra-layer of higher level LMEs. These attributes are accessed via the PLME-GET, PLME-SET, PLME-RESET, and PLME-CHARACTERISTICS primitives defined in 6.7 (PLME SAP interface).

### 24.10.2 CDMG PHY MIB

All CDMG PHY MIB attributes are defined in Annex C, with specific values defined in Table 24-13 (CDMG PHY MIB attribute default values). The column titled “Operational semantics” in Table 24-13 (CDMG PHY MIB attribute default values) contains two types: static and dynamic. Static MIB attributes are fixed and cannot be modified for a given PHY implementation. Dynamic MIB attributes can be modified by some management entity.

When MAX-ACCESS is read-only, the MIB attribute value may be updated by the PLME and read from the MIB attribute by management entities. When MAX-ACCESS is read-write, the MIB attribute may be read and written by management entities but shall not be updated by the PLME.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 24-13—CDMG PHY MIB attribute default values**

| Managed object | Default value/range | Operational semantics |
|---|---|---|
| **dot11PHYOperationTable** | | |
| dot11PHYType | cdmg(12) | Static |
| **dot11PHYCDMGTable** | | |
| dot11LowPowerSCPHYImplemented | Boolean | Static |
| dot11LowPowerSCPHYActivated | Boolean | Dynamic |

### 24.10.3 TXTIME calculation

The value of the TXTIME parameter returned by the PLME-TXTIME.confirm primitive shall be calculated according to the following equations.

For the CDMG SC PHY ($N_{TRN}$ is Training Length field defined in the header; see, for example, Table 24-8 (CDMG SC mode header fields)):

$$TXTIME = \begin{cases} T_{STF} + T_{CE} + T_{header} + T_{Data} & N_{TRN} = 0 \\ T_{STF} + T_{CE} + T_{header} + \max\{T_{Data}, (\alpha \times \beta + \gamma) \times T_C\} + N_{TRN} \times T_{TRN-Unit} & N_{TRN} > 0 \text{ and SC} \end{cases}$$

where

$\alpha$ = aBRPminSCblocks
$\beta$ = aSCBlockSize
$\gamma$ = aSCGILength
$T_{TRN-Unit}$ = aBRPTRNBlock $\times$ $T_C$

For the CDMG control PHY:

$$TXTIME = T_{STF-CP} + T_{CE-CP} + (11 \times 8 + (Length - 6) \times 8 + N_{CW} \times 168) \times T_C \times 32 + N_{TRN} \times T_{TRN-Unit}$$

where $N_{CW}$ calculation is defined in 20.4.3.3.3 (Encoder).

### 24.10.4 PHY characteristics

(#2123)The CDMG PHY characteristics, provided through the PLME-CHARACTERISTICS service primitive, are shown in Table 24-14 (CDMG PHY characteristics). The definitions for these characteristics are given in 6.7.4 (PLME-CHARACTERISTICS.confirm).

# 25. China millimeter-wave multi-gigabit (CMMG) PHY specification

## 25.1 Introduction

### 25.1.1 Introduction to CMMG PHY

Clause 25 (China millimeter-wave multi-gigabit (CMMG) PHY specification) specifies the PHY entities for China millimeter-wave multi-gigabit (CMMG) single carrier (SC) and orthogonal frequency division multiplexing (OFDM) systems.

The maximum number of space-time streams supported in CMMG SC and OFDM system is four.

The CMMG PHY provides support for 540 MHz and 1080 MHz channel widths.

The CMMG PHY data are modulated using binary phase shift keying (BPSK), quadrature phase shift keying (QPSK), 16-quadrature amplitude modulation (16-QAM), and 64-QAM. Forward error correction (FEC) coding (LDPC coding) is used with coding rates of 1/2, 3/4, 5/8, and 13/16.

A CMMG STA shall support the following features:

- 540 MHz channel width
- (#7168)CMMG control mode and (#7168)CMMG SC mode (directional transmit and receive)
- Single spatial stream MCS 0 ((#7168)CMMG control mode transmit and receive) in all supported channel widths
- Single spatial stream MCSs 1 to 3 ((#7168)CMMG SC mode transmit and receive) in all supported channel widths
- LDPC coding with length 672
- Normal guard interval as defined in Table 25-3 (Timing-related parameters(#7171)(M118))

A CMMG STA may support the following features:

- Support for 1080 MHz channel width
- CMMG-MCSs 4 to 8 ((#7168)CMMG SC mode transmit and receive)
- CMMG-MCSs 9 to 16 ((#7168)CMMG OFDM mode transmit and receive)
- Two or more spatial streams (transmit and receive)
- Short guard interval (transmit and receive)
- LDPC coding with length 2016
- Support MIMO transmission (#7168)CMMG SC mode and CMMG OFDM mode with omnidirectional antenna pattern or quasi-omni antenna pattern transceiver)
- STBC (transmit and receive)
- Transmit beamforming sounding (by sending a CMMG NDP)
- Responding to transmit beamforming sounding

NOTE—MIMO transmission only applies in the case where the antenna pattern is the omnidirectional antenna pattern or quasi-omni antenna pattern.

### 25.1.2 Scope of CMMG PHY services

The CMMG PHY supports three modulation methods:

- A control modulation using MCS 0 (the CMMG control mode; see 25.4 (CMMG control mode))

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

— A single carrier (SC) modulation using MCS 1 to MCS 8 (the CMMG SC mode; see 25.5 (CMMG SC mode))
— An OFDM modulation using MCS 9 to MCS 16 (the CMMG OFDM mode; see 25.6 (CMMG OFDM mode))

All these modulation methods share a common preamble (see 25.3.5 (CMMG PHY preamble)).

The services provided to the MAC by the CMMG PHY consist of the following protocol functions:

a) A function that defines a method of mapping the PSDUs into a (#14)PPDU format suitable for sending and receiving PSDUs between two or more STAs.
b) A function that defines the characteristics and method of transmitting and receiving data through a wireless medium between two or more STAs. Depending on the PPDU format, these STAs support a mixture of CMMG control mode, CMMG SC mode, and CMMG OFDM mode.

### 25.1.3 CMMG PHY functions

#### 25.1.3.1 General

The CMMG PHY contains two functional entities: the PHY function and the physical layer management function (PLME). Each of these functions is described in detail in 25.4 (CMMG control mode) (for CMMG control mode), 25.5 (CMMG SC mode) (for CMMG SC mode), 25.6 (CMMG OFDM mode) (for CMMG OFDM mode), and 25.14 (CMMG PLME) (for CMMG PLME). The CMMG PHY service is provided to the MAC through the PHY service primitives defined in Clause 6 (Layer management).

#### 25.1.3.2 PHY management entity (PLME)

The PLME performs management of the local PHY functions in conjunction with the MLME.

#### 25.1.3.3 Service specification method

The models represented by figures and state diagrams are intended to be illustrations of the functions provided. It is important to distinguish between a model and a real implementation. The models are optimized for simplicity and clarity of presentation; the actual method of implementation is left to the discretion of the CMMG PHY compliant developer. The service of a layer or sublayer is the set of capabilities that it offers to a user in the next higher layer (or sublayer). Abstract services are specified here by describing the service primitives and parameters that characterize each service. This definition is independent of any particular implementation.

#### 25.1.3.4 PPDU formats

The structure of the PPDU transmitted by a CMMG STA is determined by the TXVECTOR parameters as defined in Table 25-1 (TXVECTOR and RXVECTOR parameters).

A CMMG PPDU can be further categorized as a CMMG control mode PPDU, a CMMG SC mode PPDU, or a CMMG OFDM mode PPDU.

## 25.2 CMMG PHY service interface

### 25.2.1 Introduction

The PHY provides an interface to the MAC through an extension of the generic PHY service interface defined in 8.3.4. The interface includes TXVECTOR, RXVECTOR, and PHYCONFIG_VECTOR.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The TXVECTOR supplies the PHY with per-PPDU transmit parameters. Using the RXVECTOR, the PHY informs the MAC of the received (#14)PPDU's parameters. Using the PHYCONFIG_VECTOR, the MAC configures the PHY for operation, independent of (#14)PPDU transmission or reception.

### 25.2.2 TXVECTOR and RXVECTOR parameters

The parameters in Table 25-1 (TXVECTOR and RXVECTOR parameters) are defined as part of the TXVECTOR parameter list in the PHYTXSTART.request primitive and/or as part of the RXVECTOR parameter list in the PHYRXSTART.indication primitive.

**Table 25-1—TXVECTOR and RXVECTOR parameters**

| Parameter | Value | TXVECTOR | RXVECTOR |
|---|---|---|---|
| MCS | The MCS parameter(#1878) indicates the modulation and coding scheme used in the transmission of the packet. Values are integers in the range from 0 to 31.<br>— An MCS value of 0 indicates the use of (#7168)CMMG control mode.<br>— MCS values of 1 to 8 indicate use of single carrier modulations. The value is an index to Table 25-38 (CMMG SC MCSs for mandatory 540 MHz, Nss=1) to Table 25-45 (CMMG SC MCSs for optional 1080 MHz, Nss=4 (Optional)).<br>— MCS values of 9 to 16 indicates use of OFDM modulations. The value is an index to Table 25-46 (CMMG OFDM MCSs for optional 540 MHz, Nss=1 (Optional)) to Table 25-53 (CMMG OFDM MCSs for optional 1080 MHz, Nss=4 (Optional)). | Y | Y |
| LENGTH | Indicates the number of octets in the PSDU in the range from 0 to 262 143. A value of zero indicates a (#14)PPDU in which no Data field follows the SIG. | Y | Y |
| N_TX | Indicates the number of transmit chains. | Y | N |
| NSS | Indicates the number of spatial streams. | Y | N |
| EXPANSION_MAT | If PPDU transmission mode is (#7168)CMMG OFDM mode, contains a set of compressed beamforming feedback matrices as defined in 25.6.8.13.2 (Compressed Beamforming feedback matrix). The number of elements depends on the number of spatial streams and the number of transmit chains. Otherwise, not present. | Y | N |
| CHAN_MAT | If PSDU LENGTH equals 0, contains a set of compressed beamforming feedback matrices as defined in 25.6.8.13.2 (Compressed Beamforming feedback matrix) based on the channel measured during the training symbols of the received PPDU. The number of elements depends on the number of spatial streams and the number of transmit chains. Otherwise, not present. | N | Y |
| ADD_PPDU | Enumerated type:<br>— ADD-PPDU indicates that this PPDU is immediately followed by another PPDU with no IFS or preamble on the subsequent PPDU.<br>— NO-ADD-PPDU indicates no additional PPDU follows this PPDU. | Y | Y |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 25-1—TXVECTOR and RXVECTOR parameters *(continued)***

| Parameter | Value | TXVECTOR | RXVECTOR |
|---|---|---|---|
| AGGREGATION | Indicates whether the PSDU contains an A-MPDU.<br>Enumerated type:<br>— AGGREGATED indicates this is a packet with A-MPDU aggregation.<br>— NOT_AGGREGATED indicates this is a packet without A-MPDU aggregation. | Y | Y |
| RSSI | The allowed values for the RSSI parameter are in the range from 0 to 255. This parameter is a (#1132)measurement by the PHY of the power observed at the antennas used to receive the current PPDU. RSSI shall be measured during the reception of the PHY preamble. RSSI is intended to be used in a relative manner, and it shall be a monotonically increasing function of the received power. | N | Y |
| REC_MCS | Indicates the MCS that the STA's receiver recommends. | N | O |
| SNR | Contains an array of received SNR measurements for each spatial stream. SNR indications of 8 bits are supported. SNR shall be the sum of the decibel values of SNR per tone divided by the number of tones represented in each stream as described in 9.4.1.47 (VHT Compressed Beamforming Report field). | N | Y |
| STBC | Indicates whether STBC is used.<br>0 indicates no STBC (NSTS=NSS in the Data field).<br>1 indicates STBC is used (NSTS=2NSS in the Data field).<br>This parameter is 0 for a CMMG OFDM MU PPDU. | Y | Y |
| RCPI | Is a measure of the received RF power measured over the preamble of a received frame. Refer to 20.3.10 (Received channel power indicator (RCPI) measurement) for the definition of RCPI. | N | Y |
| TXOP_PS_NOT_ALLOWED | Indicates whether a CMMG AP allows non-AP CMMG STAs in TXOP power save mode to enter doze state during the TXOP.<br>0 indicates that the CMMG AP allows non-AP CMMG STAs to enter doze state during a TXOP.<br>1 indicates that the CMMG AP does not allow non-AP CMMG STAs to enter doze state during a TXOP. | Y | Y |
| PARTIAL_AID | Provides an abbreviated indication of the intended recipient(s) of the PSDU (see 10.19 (Group ID and partial AID in VHT and CMMG PPDUs)).<br>Integer: range from 0 to 511 if UPLINK_INDICATION is 1, and range from 0 to 63 if UPLINK_INDICATION is 0. | Y | Y |
| UPLINK_INDICATION | Set to 1 if the CMMG PPDU is addressed to AP.<br>Set to 0 otherwise (see 10.19 (Group ID and partial AID in VHT and CMMG PPDUs)). | Y | Y |
| COLOR | If UPLINK_INDICATION is 0, set to a value of its choosing within the range from 0 to 7 and shall maintain that value for the duration of the existence of the BSS.<br>Otherwise, not present (see 10.19 (Group ID and partial AID in VHT and CMMG PPDUs)). | Y | Y |

Copyright © 2024 IEEE. All rights reserved.

**Table 25-1—TXVECTOR and RXVECTOR parameters *(continued)***

| Parameter | Value | TXVECTOR | RXVECTOR |
|---|---|---|---|
| CH_BANDWIDTH | Indicates the channel width of the transmitted PPDU:<br>Enumerated type:<br>— CBW540 for 540 MHz<br>— CBW1080 for 1080 MHz | Y | Y |
| DUPLICATE_MODULATION | In TXVECTOR, indicates the PPDU transmitted with CMMG duplicate format.<br>In RXVECTOR, indicates the estimated PPDU transmitted with CMMG duplicate format;<br>— Present if CH_BANDWIDTH equals CBW1080 and the PPDU is transmitted with duplicate format.<br>— Otherwise not present. | O | O |
| DYN_BANDWIDTH | (#1782)In TXVECTOR, if present, indicates whether the transmitter is capable of dynamic bandwidth operation as an RTS originator.<br>In RXVECTOR, if valid, indicates whether the transmitter is capable of dynamic bandwidth operation as an RTS originator (see 10.3.2.9 (CTS and DMG CTS procedure)).<br><br>Enumerated type:<br>— Static if the transmitter is only capable of static bandwidth operation.<br>— Dynamic if the transmitter is capable of dynamic bandwidth operation.<br><br>NOTE—In the RXVECTOR, the validity of this parameter is determined by the MAC based on the contents of the received MPDU. | O | Y |
| BEAMFORMED | Set to 1 if a beamforming steering matrix is applied to the waveform in a CMMG OFDM mode transmission as described in 19.3.11.11.2 (Spatial mapping).<br>Set to 0 otherwise.<br><br>NOTE—When BEAMFORMED is equal to 1, smoothing is not recommended. | Y | O |
| TIME_OF_DEPARTURE_REQUESTED | Enumerated type:<br>— true indicates that the MAC entity requests that the PHY entity measure and report time of departure parameters corresponding to the time when the first frame energy is sent by the transmitting port.<br>— false indicates that the MAC entity requests that the PHY entity neither measure nor report time of departure parameters. | O | N |
| RX_START_OF_FRAME_OFFSET | 0 to $2^{32}$–1. An estimate of the offset (in 100 ps(#7198) units) from the point in time at which the start of the preamble (#14)of the PPDU arrived at the receive antenna port to the point in time at which this primitive is issued to the MAC. | N | Y |
| PPDU_TYPE | Enumerated type:<br>— TRN-R indicates either a PPDU whose Data field is followed by one or more TRN-R subfields, or a PPDU that is requesting TRN-R subfields to be appended to a future response PPDU.<br>— TRN-T indicates a PPDU whose Data field is followed by one or more TRN-T subfields.<br>This parameter(#1878) is reserved if TRN_LEN is 0. | Y | Y |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 25-1—TXVECTOR and RXVECTOR parameters *(continued)***

| Parameter | Value | TXVECTOR | RXVECTOR |
|---|---|---|---|
| BEAM_TRACKING_REQUEST | This parameter indicates whether beam tracking is requested.<br>Enumerated type:<br>— BEAM-TRACKING-REQUESTED or BEAM-TRACKING-NOT-REQUESTED. | Y | Y |
| LAST_RSSI | In the TXVECTOR, LAST_RSSI indicates the received power level of the last PPDU(#3243) with a valid PHY SIG that was received (#319)(#320)a SIFS before transmission of the current packet; otherwise, it is set to 0(#464) (see 10.3.2.3.3 (SIFS)).<br>In the RXVECTOR, LAST_RSSI indicates the value of the LAST_RSSI field from the (#1879)header of the received PPDU(#3243). Valid values are integers in the range from 0 to 15:<br>— Values of 2 to 14 represent power levels (–71+value×2) dBm.<br>— A value of 15 represents power greater than or equal to –42 dBm.<br>— A value of 1 represents power less than or equal to –68 dBm.<br>— A value of 0 indicates that the previous packet was not received (#319)(#320)a SIFS before the current transmission. | Y | Y |
| SPREADING_FACTOR | Indicates the spreading factor used in the (#7168)CMMG control mode:<br>— 0 indicates that the spread factor is 13.<br>— 1 indicates that the spread factor is 7.<br>— 2 indicates that the spread factor is 4.<br>— 3 indicates no spreading. | | |
| Turnaround | Set to 1 or 0 as specified in 10.3.2.3.3 (SIFS). | Y | Y |
| NOTE—In the TXVECTOR and RXVECTOR columns, the following apply:<br>Y = Present<br>N = Not present<br>O = Optional | | | |

## 25.3 Common parameters

### 25.3.1 Introduction

This subclause introduces some common parameters.

### 25.3.2 Common requirements

#### 25.3.2.1 Introduction

This subclause describes the common requirements from all 3 modes: control, SC, and OFDM.

#### 25.3.2.2 Transmit RF delay

The transmit RF delay is defined in 17.3.8.6 (Slot time), and its value is implementation dependent.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

#### 25.3.2.3 Center frequency tolerance

##### 25.3.2.3.1 General

The transmitter center frequency tolerance shall be ± 20 ppm.

##### 25.3.2.3.2 Center frequency convergence

The transmitter center frequency shall converge to within 1 ppm of its final value within 2.5 μs from the start of the (#14)PPDU.

##### 25.3.2.3.3 Symbol clock tolerance

The symbol clock frequency tolerance shall be ± 20 ppm.

The transmit center frequency and the symbol clock frequency shall be derived from the same reference oscillator.

##### 25.3.2.3.4 Transmit rampup and rampdown

The transmit power-on ramp is defined as the time it takes for a transmitter to rise from less than 10% to greater than 90% of the average power to be transmitted in the frame.

The transmit power-on ramp shall be less than 30 ns.

The transmit power-down ramp is defined as the time it takes the transmitter to fall from greater than 90% to less than 10% of the maximum power to be transmitted in the frame.

The transmit power-down ramp shall be less than 30 ns.

##### 25.3.2.3.5 Maximum input requirement

The receiver maximum input level is the maximum power level at the receive antenna(s) of the incoming signal, in dBm, present at the input of the receiver antenna for which the error rate criterion (defined in 25.3.2.3.6 (Receive sensitivity)) is met. A compliant receiver shall have a receiver maximum input level at the receive antenna(s) of at least 10 $\mu W/cm^2$ for each of the modulation formats that the receiver supports.

##### 25.3.2.3.6 Receive sensitivity

The (#14)PER shall be less than 10% for a PSDU length of 4096 octets with the rate-dependent input levels listed in Table 25-2 (Receiver sensitivity in dBm(#7171)).

**Table 25-2—Receiver sensitivity in dBm(#7171)**

| MCS Index | 540 MHz | 1080 MHz |
|---|---|---|
| 0 | –81 | –78 (see NOTE)(#4050) |
| 1 | –74 | –71 |
| 2 | –69 | –66 |
| 3 | –67 | –64 |
| 4 | –61 | –58 |

**Table 25-2—Receiver sensitivity in dBm(#7171) *(continued)***

| MCS Index | 540 MHz | 1080 MHz |
|---|---|---|
| 5 | –59 | –56 |
| 6 | –55 | –52 |
| 7 | –53 | –50 |
| 8 | –51 | –48 |
| 9 | –74 | –71 |
| 10 | –69 | –66 |
| 11 | –66 | –63 |
| 12 | –64 | –61 |
| 13 | –60 | –57 |
| 14 | –57 | –54 |
| 15 | –55 | –52 |
| 16 | –53 | –50 |
| NOTE—The sensitivity is for the largest spreading factor for MCS 0. | | |

### 25.3.3 Timing-related parameters(M118)

Table 25-3 (Timing-related parameters(#7171)(M118)) defines the timing-related parameters for CMMG format.

**Table 25-3—Timing-related parameters(#7171)(M118)**

| Parameter | CBW540 | CBW1080 | Description |
|---|---|---|---|
| $N_{SD}$ | 168 | 336 | Number of complex data numbers per OFDM symbol |
| $N_{SP}$ | 8 | 16 | Number of pilot subcarriers per OFDM symbol |
| $N_{DC}$ | 3 | 3 | Number of DC subcarriers per OFDM symbol |
| $N_{ST}$ | 179 | 355 | Total number of subcarriers per OFDM symbol |
| $N_{SR}$ | 89 | 177 | Highest data subcarrier index per OFDM symbol |
| $F_S$ | 660 MHz | 1320 MHz | OFDM sample rate |
| $T_S$ | $1/F_S$ (~1.515 ns) | $1/F_S$ (~0.758 ns) | OFDM sample time |
| $F_C$ | 440 MHz = 2/3 $F_S$ | 880 MHz = 2/3 $F_S$ | SC chip rate |
| $T_C$ | $1/F_C$ (~2.273 ns) | $1/F_C$ (~1.136 ns) | SC chip time |
| $N_{DFT}$ | 256 | 512 | DFT length |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 25-3—Timing-related parameters(#7171)(M118) *(continued)***

| Parameter | CBW540 | CBW1080 | Description |
|---|---|---|---|
| $\Delta_F$ | $F_S / N_{DFT}$ = 2.578125 MHz | | Subcarrier frequency spacing |
| $T_{DFT}$ | $N_{DFT} \times T_S$ (~387.879 ns) | | IDFT/DFT period |
| $T_{GI}$ | $T_{DFT}/4$ (~96.97 ns) | | Guard interval duration |
| $T_{GIS}$ | $T_{DFT}/8$ (~48.485 ns) | | Short guard interval duration |
| $T_{SYML}$ | $T_{DFT} + T_{GI} = 1.25T_{DFT}$ (~484.8 ns) | | Long GI symbol interval |
| $T_{SYMS}$ | $T_{DFT} + T_{GIS} = 1.125T_{DFT}$ (~436.4 ns) | | Short GI symbol interval |
| $T_{SYM}$ | $T_{SYML}$ or $T_{SYMS}$ depending on the GI used | | Symbol interval |
| $T_{seq}$ | 256 $T_C$ (~581.8 ns) | | ZCZ block duration (see NOTE)(#6037) |
| $T_{CSTF}$ | 50 × 32 × $T_C$ (~3636.8 ns)(#6037) | | Short training field duration for CMMG control mode (see NOTE)(#6037) |
| $T_{STF}$ | 17 × 32 × $T_C$ (~1236.5 ns)(#6037) | | Short training field duration for CMMG SC/OFDM mode (see NOTE)(#6037) |
| $T_{CEF}$ | 4 $T_{seq}$ (~2327.3 ns) | | Channel estimation field duration for CMMG control/SC/ OFDM mode (see NOTE)(#6037) |
| $T_{SIG}$ | 1024 × 13 × $T_C$ (~30258.2 ns)(#6037) | | SIG field duration for CMMG control mode (see NOTE)(#6037) |
| | 4 × (254 + 64) × $T_C$ (~2909.4 ns)(#6037) | | SIG field duration for CMMG SC mode (see NOTE)(#6037) |
| | 4 $T_{SYML}$ (~1939.2 ns)(#6037) | | SIG field duration for CMMG OFDM mode (see NOTE)(#6037) |
| $T_{OSTF}$ | $T_{SYML}$ (~484.8 ns) | | Duration of each OSTF |
| $T_{OCEF}$ | $T_{SYML}$ (~484.8 ns) | | Duration of each OCEF |

(#7171)(#6037)NOTE—Since the construction of the STF, CEF, and SIG field for transmissions over 1080 MHz are based on duplication transmission of the STF, CEF, and SIG field for transmissions over 540 MHz (see 25.3.10 (CMMG duplication transmission on a 1080 MHz channel)), the durations of the STF, CEF, and SIG field for CBW1080 are equivalent to those for CBW540. The durations of the STF and CEF for CMMG control mode, CMMG SC mode, and the durations of the SIG field for CMMG control mode and CMMG SC mode are calculated based on the SC chip time for 540 MHz transmission. The durations of the CMMG OFDM mode SIG field, the CMMG OFDM mode STF (OSTF), and the CMMG OFDM mode CEF (OCEF) are calculated based on the OFDM symbol time for 540 MHz transmission.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Table 25-4 (Frequently used parameters) defines parameters used frequently in Clause 25 (China millimeter-wave multi-gigabit (CMMG) PHY specification).

**Table 25-4—Frequently used parameters**

| Symbol | Explanation |
|---|---|
| $N_{BL}$ | Number of the data blocks for SC transmission. |
| $N_{CBPB}$ | Number of coded bits per block. |
| $N_{CBPS}$ | For OFDM transmission: Number of coded bits per OFDM symbol.<br>For SC transmission: Number of coded bits per constellation symbol. |
| $N_{CBPSS}$ | Number of coded bits per symbol per spatial stream. |
| $N_{DBPS}$ | Number of data bits per symbol. |
| $N_{DSPB}$ | Number of data constellation symbols per block for SC transmission. |
| $N_{UWPB}$ | Length of the UW in each block for SC transmission. |
| $N_{BLS} = N_{DSPB} + N_{UWPB}$ | Number of the symbols in each block for SC transmission. |
| $N_{BPSCS}$ | Number of coded bits per subcarrier per spatial stream. |
| $N_{RX}$ | Number of receive chains. |
| $N_{STS}$ | For pre-CMMG modulated fields, $N_{STS} = 1$(see NOTE).<br>For CMMG modulated fields, $N_{STS}$ is the number of space-time streams. |
| $N_{OCEF}$ | Number of OCEF symbols 25.6.7 (OCEF definition). |
| $N_{SS}$ | Number of spatial streams. |
| $N_{TX}$ | Number of transmit chains. |
| $R$ | $R$ is the coding rate. |

NOTE—Pre-CMMG modulated fields refer to the STF, CEF, and CMMG SIG field, while CMMG modulated fields refer to the OCEF and Data field (see Figure 25-1 (PPDU structure for the CMMG SC mode PPDU with CBW540(#7168)(#7171)(#14)), Figure 25-2 (PPDU structure for the CMMG SC mode PPDU with CBW1080(#7168)(#7171)(#14)), and Figure 25-3 (PPDU structure for the CMMG OFDM mode PPDU(#7168)(#14))).

### 25.3.4 Mathematical conventions in the signal description

#### 25.3.4.1 Notation

$[\mathbf{Q}]_{m,n}$ indicates the element in row $m$ and column $n$ of matrix $\mathbf{Q}$.

#### 25.3.4.2 Subcarrier indices in use

For a 540 MHz (#7168)CMMG OFDM mode PPDU transmission, the 540 MHz is divided into 256 subcarriers. The signal is transmitted on subcarrier –89 to –2 and 2 to 89, with –1, 0, and 1 being the center (DC) subcarriers.

For a 1080 MHz (#7168)CMMG OFDM mode PPDU transmission, the 1080 MHz is divided into 512 subcarriers. The signal is transmitted on subcarrier –177 to –2 and 2 to 177, with –1, 0, and 1 being the center (DC) subcarriers.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 25.3.4.3 Transmitted signal

The transmitted signal is described in complex baseband signal notation. The actual transmitted signal is defined by the complex baseband signal in Equation (25-1).

$$r_{RF}^{i_{TX}} = \mathrm{Re}\left\{ r_{PPDU}^{i_{TX}}(t) \exp(j2\pi f_c t) \right\} \quad (25\text{-}1)$$

where

$r_{PPDU}$ represents the complex baseband signal in transmit chain $i_{TX}$

$f_c$ represents the center frequency of the portion of the transmitted PPDU

The transmitted RF signal is derived by upconverting the complex baseband signal, which consists of several fields. The fields and timing boundaries for various fields are shown in Figure 25-1 (PPDU structure for the CMMG SC mode PPDU with CBW540(#7168)(#7171)(#14)) to Figure 25-3 (PPDU structure for the CMMG OFDM mode PPDU(#7168)(#14)).

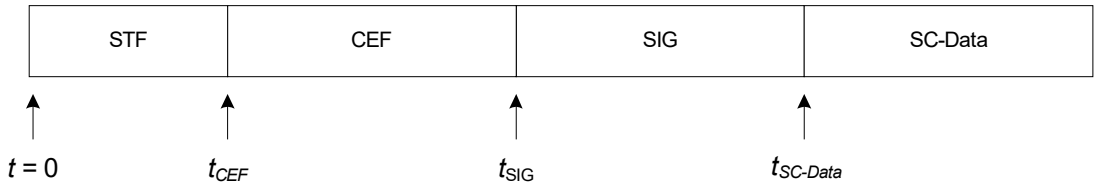

**Figure 25-1—PPDU structure for the CMMG SC mode PPDU with CBW540(#7168)(#7171)(#14)**

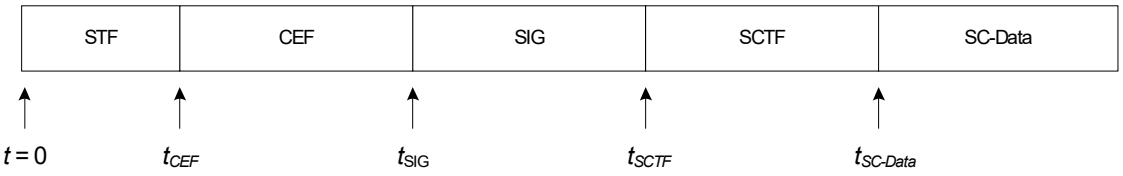

**Figure 25-2—PPDU structure for the CMMG SC mode PPDU with CBW1080(#7168)(#7171)(#14)**

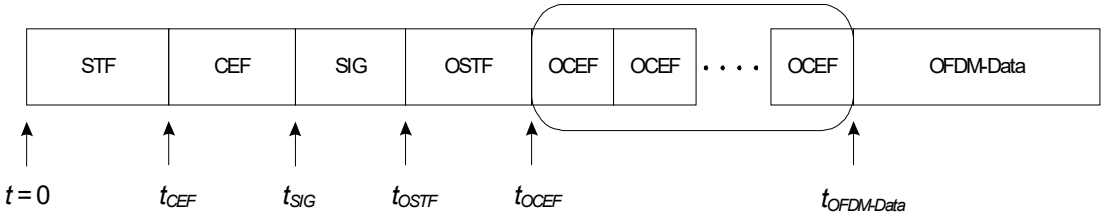

**Figure 25-3—PPDU structure for the CMMG OFDM mode PPDU(#7168)(#14)**

The time offset, $t_{Field}$, determines the starting time of the corresponding field.

For the (#7168)CMMG SC mode transmission with 540 MHz,

$$r_{PPDU}^{i_{TX}}(t) = r_{STF}^{i_{TX}}(t) + r_{CEF}^{i_{TX}}(t - t_{CEF}) + r_{SIG}^{i_{TX}}(t - t_{SIG}) + r_{SC-Data}^{i_{TX}}(t - t_{SC-Data}) \quad (25\text{-}2)$$

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

For the (#7168)CMMG SC mode transmission with 1080 MHz,

$$r^{i_{TX}}_{PPDU}(t) = r^{i_{TX}}_{STF}(t) + r^{i_{TX}}_{CEF}(t - t_{CEF}) + r^{i_{TX}}_{SIG}(t - t_{SIG}) + r^{i_{TX}}_{SCTF}(t - t_{SCTF}) + r^{i_{TX}}_{SC-Data}(t - t_{SC-Data}) \quad (25\text{-}3)$$

For the (#7168)CMMG OFDM mode transmission,

$$r^{i_{TX}}_{PPDU}(t) = r^{i_{TX}}_{STF}(t) + r^{i_{TX}}_{CEF}(t - t_{CEF}) + r^{i_{TX}}_{SIG}(t - t_{SIG}) + r^{i_{TX}}_{MCTF}(t - t_{MCTF}) + r^{i_{TX}}_{OFDM-Data}(t - t_{OFDM-Data}) \quad (25\text{-}4)$$

where

$t_{CEF} = T_{STF}$

$t_{SIG} = t_{CEF} + T_{CEF}$

$t_{SCEF} = t_{SIG} + T_{SIG}$

$T_{OSTF} = t_{SIG} + T_{SIG}$

$t_{OCEF} = t_{OSTF} + T_{OSTF}$

$t_{SC-Data} = t_{SCTF} + T_{SCTF}$

$t_{OFDM-Data} = t_{OCTF} + N_{OCEF} T_{OCEF}$

Each (#7168)CMMG OFDM mode baseband waveform $r_{subfield}(nT_s)$, for the fields above, is defined via the inverse discrete Fourier transform (IDFT) as,

$$r^{i_{TX}}_{subfield}(t) = \frac{1}{\sqrt{N_{Tone} N_{STS}}} w_{Tsubfield}(t) \sum_{k=-N_{SR}}^{N_{SR}} \sum_{m=0}^{N_{STS}-1} [Q_k]_{i_{TX}, m} \gamma_{k, CBW} X_{k, m} \exp((j2\pi k \Delta_F (t - T_{GI} - T_{CS}(m)))) \quad (25\text{-}5)$$

In Equation (25-5) the following notions are used:

| | |
|---|---|
| $n_{Tone}$ | is, for 540 MHz transmission, 176 and, for 1080 MHz transmission, 352 |
| $N_{STS}$ | is the number of the space-time streams |
| $T_{GI}$ | is the guard interval duration used for each OFDM symbol |
| $Q_k$ | is the spatial mapping matrix with (#2259)$N_{TX}$ rows and $N_{STS}$ for the subcarrier $k$ |
| $w_{Tsubfield}$ | is a windowing function. An example function, $w_{Tsubfield}$, is given in 25.3.4.5 (The windowing function) |
| $\gamma_{k, CBW}$ | is defined in 25.3.4.4 (Definition of tone rotation for CMMG OFDM mode transmission(#7168)) |
| $\Delta_F$ | is the subcarrier frequency spacing given in Table 25-3 (Timing-related parameters(#7171)(M118)) |
| $T_{CS}(m)$ | represents the cyclic shift per space-time stream, whose value is defined in Table 25-27 (Cyclic shift values for the Data fields of a CMMG OFDM mode PPDU(#7168)(#404)) |
| $X_{k,m}$ | is the frequency-domain symbol in subcarrier $k$ of space-time stream $m$. Some of the $X_{k,m}$ within $-N_{SR} \le k \le N_{SR}$ have a value of 0, such as the DC tones |

The base band waveform for fields defined by time domain sequence or for single carrier transmission is

$$r_{Field}(nT_C) = x(n) \quad (25\text{-}6)$$

where $x(n)$ is the constellation point $n$.

Conversion from the sampled digital domain to the continuous time domain is beyond the scope of this document. Filtering for pulse shaping such as in GMSK is beyond the scope of this standard.

#### 25.3.4.4 Definition of tone rotation for CMMG OFDM mode transmission(#7168)

The function $\Upsilon_{k,CBW}$ is used to represent a rotation of the tones. $\Upsilon_{k,CBW}$ is determined by the TXVECTOR parameter CH_BANDWIDTH as defined in Table 25-5 (CH_BANDWIDTH and ϒk,CBW).

**Table 25-5—CH_BANDWIDTH and $\Upsilon_{k,CBW}$**

| CH_BANDWIDTH | $\Upsilon_{k,CBW}$ |
|---|---|
| CBW540 | $\Upsilon_{k,540}$ |
| CBW1080 | $\Upsilon_{k,1080}$ |

For a 540 MHz (#7168)CMMG OFDM mode PPDU transmission,

$$\Upsilon_{k,540} = 1 \tag{25-7}$$

For a 1080 MHz (#7168)CMMG OFDM mode PPDU transmission,

$$\Upsilon_{k,1080} = \begin{cases} 1, k < 0 \\ j, k \geq 0 \end{cases} \tag{25-8}$$

#### 25.3.4.5 The windowing function

The windowing function $w_{TField}(nT_S)$ is used to smooth the transition between adjacent fields in the (#14)PPDU where (#7168)CMMG OFDM mode modulation is employed. No windowing is applied to preamble fields or to SC modulated fields. The windowing function is different from being equivalent to "1" only in the transition region.

An example of a windowing function is given by

$$w_T(t) = \begin{cases} \sin^2\left(\frac{\pi}{2}\left(\frac{1}{2} + \frac{t}{T_R}\right)\right), \frac{-T_R}{2} < t \leq \frac{T_R}{2} \\ 1, \frac{T_R}{2} < t \leq T - \frac{T_R}{2} \\ \sin^2\left(\frac{\pi}{2}\left(\frac{1}{2} - \frac{t}{T_R}\right)\right), T - \frac{T_R}{2} < t \leq T + \frac{T_R}{2} \end{cases} \tag{25-9}$$

The transition region creates an overlap (with length $T_R$) between adjacent fields. The field wave form is extended cyclically to fill the part of the transition region in which it is undefined. If the transition region vanishes (i.e., $T_R$=0), the windowing function degenerates to a rectangular window. The choice of windowing function is implementation dependent, as long as transmit EVM and transmit mask requirements are met.

### 25.3.5 CMMG PHY preamble

#### 25.3.5.1 General

The CMMG PHY preamble is the part of the PHY PPDU that is used for (#14)PPDU detection, AGC, frequency offset estimation, synchronization, indication of transmission mode ((#7168)CMMG Control

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

mode, (#7168)CMMG SC mode, or (#7168)CMMG OFDM mode), indication of transmission bandwidth (540 MHz or 1080 MHz), and channel estimation. The format of the preamble is common to both (#14)SC PPDUs and OFDM PPDUs and consists of a Short Training field followed by a Channel Estimation field. The content of the Short Training field is the same between SC and OFDM (#14)PPDUs (see 25.3.5.2 (CMMG Short Training field)), but the content of the Channel Estimation field is not the same between such (#14)PPDUs (see 25.3.5.3 (CMMG Channel Estimation field)).

NOTE 1—For SC and OFDM MIMO transmission, different transmit antenna transmit a different preamble that is composed of one of the four ZCZ sequences with the order of $Z_{256}^{1}, Z_{256}^{2}, Z_{256}^{3}, Z_{256}^{4}$, such as for the case of one transmit antenna, the preamble sequence is composed of $Z_{256}^{1}$, for the case of two transmit antennas, the preamble sequences are composed of $Z_{256}^{1}$, $Z_{256}^{2}$, respectively.

NOTE 2—For CMMG Control mode and CMMG SC mode preambles, all fields are transmitted with (#7168)CMMG SC mode transmission. For CMMG OFDM mode preamble, the STFs, the CEFs, and the SIG fields are transmitted with (#7168)CMMG SC mode transmission. For 1080 MHz SC transmission, the STFs, the CEFs, and the SIG fields are transmitted in duplicate format as defined in 25.3.10 (CMMG duplication transmission on a 1080 MHz channel).

### 25.3.5.2 CMMG Short Training field

#### 25.3.5.2.1 STF of CMMG control mode(#7168)

The Short Training field is composed of 50 repetitions of the sequence $Z(n)$ of length 32. The sequences $Z(n)$ is defined in 25.8 (ZCZ sequence).

The waveform for the STF is

$$r_{STF}(nT_C) = Z(n \bmod 32)\exp\left(j\pi\frac{n}{2}\right), n = 0, 1, \ldots, 50 \times 32 - 1 \quad (25\text{-}10)$$

where $T_C$ is (#6037)SC chip time of CBW540(#7171).

#### 25.3.5.2.2 STF of CMMG SC and OFDM modes(#7168)

The Short Training fields of (#7168)CMMG SC and OFDM modes share the same definition. The common Short Training field is composed of 17 repetitions of the sequence $Z(n)$ of length 32. The sequences $Z(n)$ is defined in 25.8 (ZCZ sequence).

The waveform for the Short Training field is

$$r_{STF}(nT_C) = Z(n \bmod 32)\exp\left(j\pi\frac{n}{2}\right), n = 0, 1, \ldots, 17 \times 32 - 1 \quad (25\text{-}11)$$

where $T_C$ is (#6037)SC chip time of CBW540(#7171).

### 25.3.5.3 CMMG Channel Estimation field

#### 25.3.5.3.1 CEF of CMMG control mode(#7168)

The CEF of CMMG control mode is composed of four concatenated $Z(n)$ sequences where each sequence is multiplied by an individual sign assignment. As shown in Figure 25-4 (CMMG Control mode preamble(#7168)), the CEF of (#7168)CMMG control mode is defined as $-Z(n)$, $Z(n)$, $-Z(n)$, $-Z(n)$, where the sequence is defined in 25.8 (ZCZ sequence).

The waveform for the CEF is

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$r_{CEF}(nT_C) = \begin{cases} -Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 0, 1, \ldots, 256-1 \\ Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 256, \ldots, 256\times 2-1 \\ -Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 256\times 2, \ldots, 256\times 3-1 \\ -Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 256\times 3, \ldots, 256\times 4-1 \end{cases} \quad (25\text{-}12)$$

where $T_C$ is (#6037)SC chip time of CBW540(#7171). The (#7168)CMMG control mode preamble is defined in Figure 25-4 (CMMG Control mode preamble(#7168)).

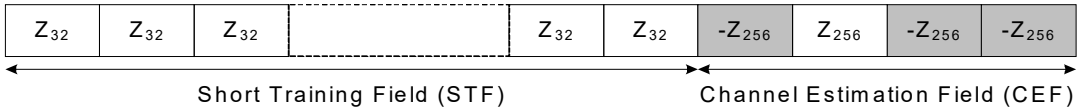

**Figure 25-4—CMMG Control mode preamble(#7168)**

### 25.3.5.3.2 CEF of CMMG SC mode(#7168)

The CEF of (#7168)CMMG SC mode is also composed of four concatenated *Z(n)* sequences but is with different sign assignment patterns. As shown in Figure 25-5 (CMMG SC mode preamble for CBW540(#7171)) and Figure 25-6 (CMMG SC mode preamble for CBW1080(#7171)), the CEF of SC 540 MHz PHY is defined as [–*Z*(*n*), *Z*(*n*), *Z*(*n*), –*Z*(*n*)], and the CEF of SC 1080 MHz PHY is defined as [–*Z*(*n*), –*Z*(*n*), *Z*(*n*), *Z*(*n*)], where the sequence *Z(n)* is defined in 25.8 (ZCZ sequence).

The waveform for the CEF of SC 540 MHz mode is

$$r_{CEF}(nT_C) = \begin{cases} -Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 0, 1, \ldots, 256-1 \\ Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 256, \ldots, 256\times 2-1 \\ Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 256\times 2, \ldots, 256\times 3-1 \\ -Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 256\times 3, \ldots, 256\times 4-1 \end{cases} \quad (25\text{-}13)$$

and the waveform for the CEF of SC 1080 MHz mode is

$$r_{CEF}(nT_C) = \begin{cases} -Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 0, 1, \ldots, 256-1 \\ -Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 256, \ldots, 256\times 2-1 \\ Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 256\times 2, \ldots, 256\times 3-1 \\ Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 256\times 3, \ldots, 256\times 4-1 \end{cases} \quad (25\text{-}14)$$

where $T_C$ is (#6037)SC chip time of CBW540(#7171).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The (#7168)CMMG SC mode preambles are defined in Figure 25-5 (CMMG SC mode preamble for CBW540(#7171)) and Figure 25-6 (CMMG SC mode preamble for CBW1080(#7171)).

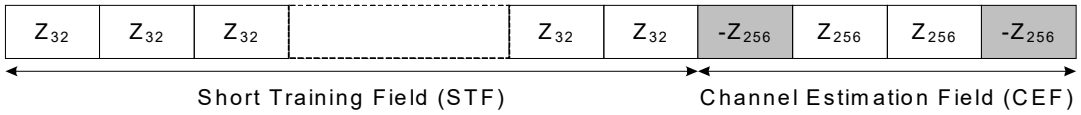

**Figure 25-5—CMMG SC mode preamble for CBW540(#7171)**

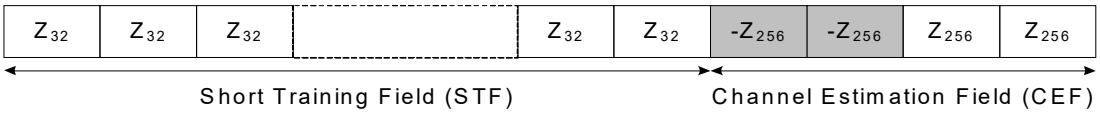

**Figure 25-6—CMMG SC mode preamble for CBW1080(#7171)**

#### 25.3.5.3.3 CEF of CMMG OFDM mode(#7168)

The CEF of (#7168)CMMG OFDM mode is also composed of four concatenated $Z(n)$ sequences but is with different sign assignment patterns. As shown in Figure 25-7 (CMMG OFDM mode preamble for CBW540(#7171)) and Figure 25-8 (CMMG OFDM mode preamble for CBW1080(#7171)), the CEF of OFDM 540 MHz PHY is defined as $[-Z(n), Z(n), Z(n), Z(n)]$, and the CEF of OFDM 1080 MHz PHY is defined as $[-Z(n), -Z(n), -Z(n), Z(n)]$, where the sequence $Z(n)$ is defined in 25.8 (ZCZ sequence).

The waveform for the CEF of OFDM 540 MHz mode is

$$r_{CEF}(nT_C) = \begin{cases} -Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 0, 1, \ldots, 256-1 \\ Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 256, \ldots, 256\times 2-1 \\ Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 256\times 2, \ldots, 256\times 3-1 \\ Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 256\times 3, \ldots, 256\times 4-1 \end{cases} \quad (25\text{-}15)$$

and the waveform for the CEF of OFDM 1080 MHz mode is

$$r_{CEF}(nT_C) = \begin{cases} -Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 0, 1, \ldots, 256-1 \\ -Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 256, \ldots, 256\times 2-1 \\ -Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 256\times 2, \ldots, 256\times 3-1 \\ Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 256\times 3, \ldots, 256\times 4-1 \end{cases} \quad (25\text{-}16)$$

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

where $T_C$ is SC chip time of CBW540(#7171).

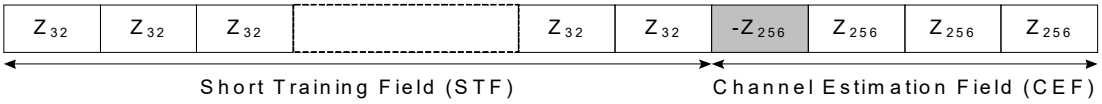

**Figure 25-7—CMMG OFDM mode preamble for CBW540(#7171)**

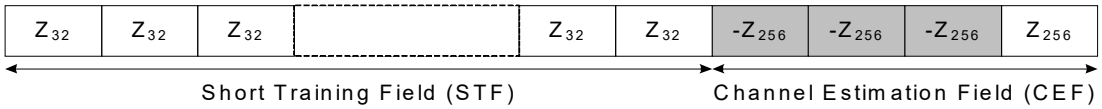

**Figure 25-8—CMMG OFDM mode preamble for CBW1080(#7171)**

### 25.3.6 CRC calculation

The value of cyclic redundancy check (CRC) field is the 1s complement of Equation (25-17).

$$CRC(D) = (M(D) \oplus I(D))D^{K} \bmod G(D) \tag{25-17}$$

where

$m(D) = m_0 D^{N-1} + m_1 D^{N-2} + \ldots + m_{N-1}$

$N$ is the number of bits over which the CRC is generated

$m_i$ is bit $i$ of the input bit sequence

$I(D) = \sum_{i=N-K}^{N-1} D^i$ are initialized values that are added modulo 2 to the first $K$ bits of the input bit sequence

$K$ is the length of CRC sequence: $K = 16$ for CRC of the CMMG SIG, and $K = 8$ for the (#404)Data field

$G(D) = D^{16} + D^{12} + D^5 + 1$ is the CRC generating polynomial of 8 bits

$crc(D) = x_0 D^{15} + x_1 D^{14} + \ldots + x_{14} D + x_{15}$

Figure 25-9 (16-bit CRC calculation) shows the operation of the CRC of 16 bits. First, the shift register is reset to all 1s. The bits are then passed through the XOR operation at the input. When the last bit has entered, the output is generated by shifting the bits out of the shift register, $x_{15}$ first, through an inverter.

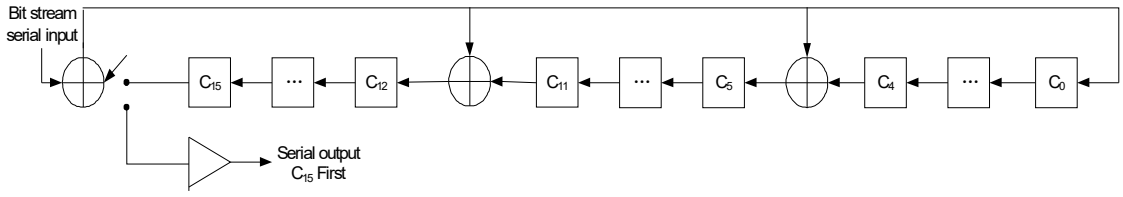

**Figure 25-9—16-bit CRC calculation**

$G(D) = D^8 + D^7 + D^4 + D^3 + D + 1$ is the CRC generating polynomial of 8 bits.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$crc(D) = x_0D^7 + x_1D^6 + \ldots + x_6D + x_7$$

Figure 25-10 (8-bit CRC calculation) shows the operation of the CRC of 8 bits.

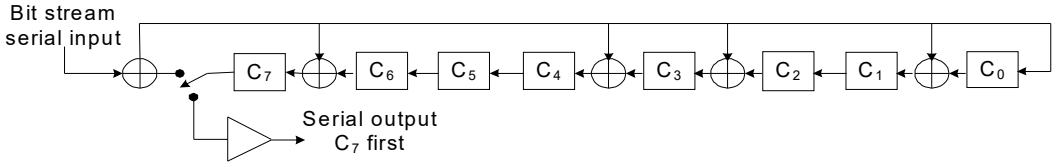

**Figure 25-10—8-bit CRC calculation**

### 25.3.7 Scrambler

The CMMG control mode SIG, CMMG SC/OFDM mode SIG, and the (#404)Data fields following the scrambler initialization field (including data padding bits) shall be scrambled by XORing each bit in turn with a length 127 periodic sequence generated by the polynomial $S(x) = x^7 + x^4 + 1$. The octets of the PSDU and the pad bits shall be placed into a bit stream with bit 0 (LSB) of each octet first and bit 7 of each octet (MSB) last. The generation of the sequence and the XOR operation are defined in Figure 25-11 (Scrambler).

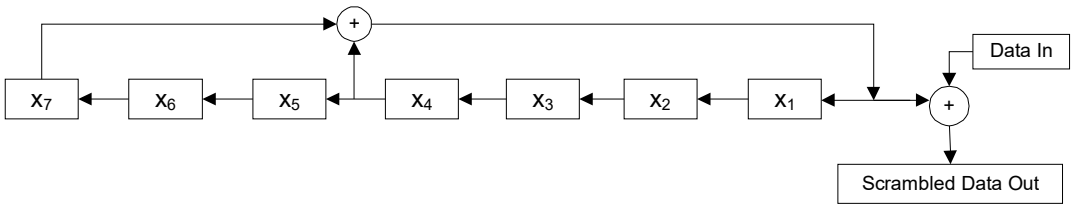

**Figure 25-11—Scrambler**

For each PPDU, the transmitter shall select a nonzero seed value for the scrambler (bits $x_1$ to $x_7$). The seed value should be selected in a pseudo random fashion. The seed value is sent in the Scrambler Initialization field of the PHY header. Each data bit in the (#404)Data field of the PPDU is then XORed with the scrambler output ($x_4$ XOR $x_7$), and the scrambler content shifts once.

### 25.3.8 Common LDPC parity matrices

#### 25.3.8.1 Introduction

Transmission/reception of LDPC with codeword length of 672 bits (expansion factor $z = 42$) is mandatory, and transmission/reception of LDPC with codeword length 2016 bits (expansion factor $z = 126$) is optional.

#### 25.3.8.2 General

The structured LDPC code is defined by a parity check matrix $\mathbf{H}$ of size $(m \times z) \times (n \times z)$, which is determined by a base matrix $\overline{\mathbf{H}}$ of size $m \times n$, an expansion factor $z$, and a base permutation matrix $\mathbf{P}$ of size $z \times z$. The number of information bits is $k = (n - m) \times z$, the number of codeword bits is $nz$, then the coding rate is $r = k/(nz)$. If each element $\overline{h}_{ij}$ in the base matrix $\overline{\mathbf{H}}$ is replaced by zero subblock matrix of size $z \times z$ or the subblock matrix $\mathbf{P}^{\overline{h}_{ij}}$, the parity check matrix $\mathbf{H}$ can be obtained.

The base matrix $\overline{\mathbf{H}}$ is defined as follows:

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$\overline{\mathbf{H}} = \begin{bmatrix} \bar{h}_{00} & \bar{h}_{01} & \dots & \bar{h}_{0(n-1)} \\ \bar{h}_{10} & \bar{h}_{11} & \dots & \bar{h}_{1(n-1)} \\ \dots & \dots & \dots & \dots \\ \bar{h}_{(m-1)0} & \bar{h}_{(m-1)1} & \dots & \bar{h}_{(m-1)(n-1)} \end{bmatrix} \quad (25\text{-}18)$$

The parity check matrix **H** is defined as follows:

$$\mathbf{H} = \begin{bmatrix} \mathbf{P}^{\bar{h}_{00}} & \mathbf{P}^{\bar{h}_{01}} & \dots & \mathbf{P}^{\bar{h}_{0(n-1)}} \\ \mathbf{P}^{\bar{h}_{10}} & \mathbf{P}^{\bar{h}_{11}} & \dots & \mathbf{P}^{\bar{h}_{1(n-1)}} \\ \dots & \dots & \dots & \dots \\ \mathbf{P}^{\bar{h}_{(m-1)0}} & \mathbf{P}^{\bar{h}_{(m-1)1}} & \dots & \mathbf{P}^{\bar{h}_{(m-1)(n-1)}} \end{bmatrix} \quad (25\text{-}19)$$

where, if $\overline{h}_{ij} = -1$, $\mathbf{P}^{\bar{h}_{ij}}$ equals a zero matrix of size $z \times z$; otherwise, $\mathbf{P}^{\bar{h}_{ij}}$ equals the base permutation matrix **P** to $h_{ij}$ power. The base permutation matrix **P** of size $z \times z$ is defined as follows:

$$\mathbf{P} = \begin{bmatrix} 0 & 1 & 0 & \dots & 0 \\ 0 & 0 & 1 & \dots & 0 \\ \dots & \dots & \dots & \dots & \dots \\ 0 & 0 & 0 & \dots & 1 \\ 1 & 0 & 0 & \dots & 0 \end{bmatrix} \quad (25\text{-}20)$$

Table 25-6 (Base matrix prototypes for codeword block length nz bits, subblock size is z bits) defines the base matrix prototypes of the parity-check matrices for a codeword block length *nz* bits, with a subblock size *z* bits.

**Table 25-6—Base matrix prototypes for codeword block length *nz* bits, subblock size is *z* bits**

### 25.3.9 CMMG SIG

#### 25.3.9.1 General

The CMMG SIG field carries information required to interpret PPDUs. The preamble and the CMMG SIG fields are all transmitted using modulation. The structure of the CMMG SIG field is shown in Figure 25-12 (CMMG SIG structure).

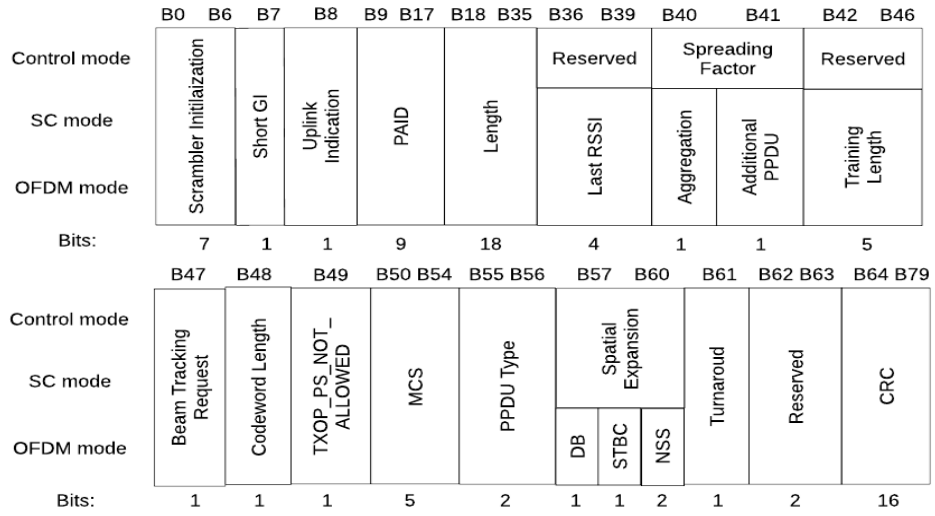

**Figure 25-12—CMMG SIG structure**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The CMMG SIG field contains the fields listed in Table 25-7 (Fields in the CMMG SIG field). The mapping of the fields is also described in Table 25-7 (Fields in the CMMG SIG field).

**Table 25-7—Fields in the CMMG SIG field**

| Bit | Fields | Number of bits | Description |
|---|---|---|---|
| B0–B6 | Scrambler Initialization | 7 | Bits X1-X7 of the initial scrambler state (see 25.3.7 (Scrambler)). |
| B7 | Short GI | 1 | Set to 0 if short guard interval is not used in the Data field.<br>Set to 1 if short guard interval is used in the Data field. |
| B8 | Uplink Indication | 1 | Set to 1 if the PPDU is addressed to an AP. Set to 0 otherwise.<br>(See TXVECTOR parameter UPLINK_INDICATION.) |
| B9–B17 | PAID | 9 | If Uplink Indication is not present or set to 1, B9–B17 are the partial AID to provide an abbreviated indication of the intended recipient(s) of the PSDU (see 10.19 (Group ID and partial AID in VHT and CMMG PPDUs)). If Uplink Indication is equal to 0, B9–B11 are an identifier of the BSS and B12–B17 are the partial AID.<br>(See TXVECTOR parameter COLOR and TXVECTOR parameter PARTIAL_AID.) |
| B18–B35 | Length | 18 | Number of data octets in the PSDU, Range from 0 to 262 143 |
| B36–B39 | Last RSSI | 4 | For (#7168)CMMG SC/OFDM mode:<br>Contains a copy of the parameter LAST_RSSI from the TXVECTOR. When set to 0, this field is reserved and ignored by the receiver.<br>The value is an unsigned integer:<br>— Values of 2 to 14 represent power levels (–71+value×2) dBm.<br>— A value of 15 represents a power greater than or equal to –42 dBm.<br>— A value of 1 represents a power less than or equal to –68 dBm.<br>Value of 0 indicates that the previous (#14)PPDU was not received (#319)(#320)a SIFS before the current transmission.<br>For (#7168)CMMG control mode: Reserved. |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 25-7—Fields in the CMMG SIG field *(continued)***

| Bit | Fields | Number of bits | Description |
|---|---|---|---|
| B40–B41 | Spreading Factor/ Aggregation/Additional PPDU | 2 | For (#7168)CMMG control mode:<br>— Set to 0: spreading by 13<br>— Set to 1: spreading by 7<br>— Set to 2: spreading by 4<br>— Set to 3: no spreading<br>For (#7168)CMMG SC/OFDM mode:<br>Aggregation:<br>— Set to 1 indicate that the (#14)PSDU contains an A-MPDU; otherwise, set to 0.<br>Additional PPDU:<br>— Contains a copy of the parameter ADD_PPDU from the TXVECTOR. A value of 1 indicates that this PPDU is immediately followed by another PPDU with no IFS or preamble on the subsequent PPDU.<br>— A value of 0 indicates that no additional PPDU follows this PPDU. |
| B42–B46 | Training Length | 5 | For (#7168)CMMG SC/OFDM mode:<br>Corresponds to the TXVECTOR parameter TRNLEN.<br>If the Beam Tracking Request field is 0, the Training Length field indicates the length of the training field. The use of this field is defined in 25.7.2.3 (BRP PPDU SIG fields). A value of 0 indicates that no training field is present in this PPDU.<br>If the Beam Tracking Request field is 1 and the PPDU Type field is 10, the Training Length field indicates the length of the training field. If the PPDU Type field is 11, the Training Length field indicates the length of the training field requested for receive training.<br>For (#7168)CMMG control mode: Reserved. |
| B47 | Beam Tracking Request | 1 | Corresponds to the TXVECTOR parameter BEAM_TRACKING_REQUEST.<br>Set to 1 to indicate the need for beam tracking (10.41.7 (Beam tracking)); otherwise, set to 0.<br>The Beam Tracking Request field is reserved when the Training Length field is 0. |
| B48 | Codeword Length | 1 | Set to 0 indicate that the codeword length is 672.<br>Set to 1 indicate that the codeword length is 2016. |
| B49 | TXOP_PS_NOT_ALLOWED | 1 | Set to 0 by CMMG AP if it allows non-AP CMMG STAs in TXOP power save mode to enter doze state during a TXOP.<br>Set to 1 otherwise.<br>The bit is reserved and set to 1 in CMMG PPDUs transmitted by a non-AP CMMG STA. |
| B50–B54 | MCS | 5 | MCS index (see 25.15 (Parameters for CMMG-MCSs)). |

**Table 25-7—Fields in the CMMG SIG field *(continued)***

| Bit | Fields | Number of bits | Description |
|---|---|---|---|
| B55–B56 | PPDU Type | 2 | When the Training Length field is nonzero, corresponds to the TXVECTOR parameter PPDU_TYPE.<br>— PPDU Type = 11 indicates either a (#14)PPDU whose Data field is followed by one or more TRN-R subfields, or a (#14)PPDU that is requesting TRN-R subfields to be appended to a future response (#14)PPDU.<br>— PPDU Type = 10 indicates a (#14)PPDU whose Data field is followed by one or more TRN-T subfields.<br>When the Training Length field is zero and PPDU Type = 01, indicates that PPDU is a sounding PPDU.<br>This field is reserved when the Training Length field is zero and PPDU Type = 00. |
| B57–B60 | Spatial Expansion | 4 | For (#7168)CMMG control/SC mode:<br>Index into the corresponding spatial expansion method defined in Table 25-15 (Constellation mapper output to spatial mapper input). |
| | DB | 1 | For (#7168)CMMG OFDM mode:<br>If the PPDU is transmitted on 1080 MHz channel:<br>Set DB to 1 for allowing dynamic bandwidth.<br>Set to 0 for not allowing dynamic bandwidth.<br>Otherwise set to 0 (Reserved).<br>For (#7168)CMMG control and SC modes: Reserved. |
| | STBC | 1 | For (#7168)CMMG OFDM mode:<br>Set to 1 if space-time block coding is used; otherwise, set to 0. |
| | NSS | 2 | For OFDM mode:<br>Set to 0 for 1 spatial stream.<br>Set to 1 for 2 spatial streams.<br>Set to 2 for 3 spatial streams.<br>Set to 3 for 4 spatial streams. |
| B61 | Turnaround | 1 | As defined in Table 25-1 (TXVECTOR and RXVECTOR parameters). |
| B62–B63 | Reserved | 2 | Reserved. |
| B64–B79 | CRC | 16 | CMMG SIG check sequence. Definition of this field calculation is in 25.3.6 (CRC calculation). |
| NOTE—A value of 0 in the CMMG Length field indicates a PPDU that does not include a (#404)Data field, i.e., NDP. NDP transmissions are used for sounding purposes only (see 10.35.2 (Transmission of an HT NDP)). The (#14)NDP ends after the last CMMG OCEF or the CMMG SIG. | | | |

Reserved bits are set to 0 by the transmitter and shall be ignored by the receiver.

All numeric fields are transmitted in unsigned format, LSB first.

#### 25.3.9.2 Encoding of SIG

The scrambled SIG sequence consists of 80 bits, shown as $x = (x_0, x_1, x_2, \ldots, x_{79})$ and encoded with LDPC of rate-1/2 and length 672, as follows:

a) The scrambled SIG sequence is padded with 4 0s bits to create 84 bits. The 84-bit sequence include two contiguous subsequences with length of 42 bits, shown as $[[0, 0, 0, x_0, \ldots, x_{37}], [x_{38}, \ldots, x_{79}]]$, and the two subsequences are repeated once, respectively, to obtain 168 bits, such as $\mathbf{a}' = [[0]_{1\times 4}, x_0, \ldots, x_{37}, [0]_{1\times 4}, x_0, \ldots, x_{37}, x_{38}, \ldots, x_{79}, x_{38}, \ldots, x_{79}]$. Then, the repeated data sequence is padded with 168 zero bits to create 336 bits.

b) Then, using rate-1/2 LDPC base matrix and setting $\overline{h}_{26} = -1$, the 336-bit sequence is added with parity bits $[p_0, \ldots, p_{335}]$ to create LDPC codeword, shown as $\mathbf{c} = [[0]_{1\times 168}, \mathbf{a}', [p_0, \ldots, p_{335}]]$, such that $\mathbf{H} \times \mathbf{c}^{\mathrm{T}} = \mathbf{0}$, where $\mathbf{H}$ is revised LDPC parity check matrix.

The basic code is $\mathbf{c}' = [x_0, x_1, \ldots, x_{79}, p_0, p_1, \ldots, p_{335}]$. Using rate-matching to obtain transmitting sequence of 1024 bits: $S = [\mathbf{c}', \mathbf{c}', \mathbf{c}'(0, \ldots, 191)]$.

### 25.3.10 CMMG duplication transmission on a 1080 MHz channel

The STFs, the CEFs, and the SIG fields that are transmitted using SC modulation are specified at the SC chip rate $F_C$ equal to 440 MHz. For transmission on the 1080 MHz channel, the signal is resampled with a 2 rate change, applied appreciate phase rotation for each 540 MHz subband, and then summed to form the transmitted signal.

Let $r(nT_C) = r_{STF}(nT_C) + r_{CEF}(nT_C - t_{CEF}) + r_{SIG}(nT_C - t_{SIG})$, where $T_C$ is the SC chip duration for 540 MHz channel bandwidth and $r_{CEF}$ is described in 25.3.5 (CMMG PHY preamble).

Then

$$r^{(1)}\left(n\frac{T_C}{2}\right) = \begin{cases} r\left(n\frac{T_C}{2}\right), n = 0, 2, 4, \ldots \\ 0, otherwise \end{cases} \tag{25-21}$$

$$r^{(2)}\left(n\frac{T_C}{2}\right) = \sum_{k=0}^{K-1} r^{(1)}\left((n-k)\frac{T_C}{2}\right) h_{Filt}(k), n = 0, 1, 2, \ldots \tag{25-22}$$

$$\bar{r}\left(n\frac{T_C}{2}\right) = r^{(2)}\left(\left(n + \frac{K-1}{2}\right)\frac{T_C}{2}\right), n = 0, 1, 2, \ldots \tag{25-23}$$

where $K$ is the length of the filter defined in at chip rate 880 MHz whose definition is out of scope of this standard. The transmitted signal is given as

$$\bar{r}\left(n\frac{T_C}{2}\right) = \bar{r}\left(n\frac{T_C}{2}\right) \cdot \frac{1}{\sqrt{2}} e^{-j\pi Bn\frac{T_C}{2}} + \bar{r}\left(n\frac{T_C}{2}\right) \cdot \frac{1}{\sqrt{2}} e^{j\pi Bn\frac{T_C}{2}}$$

$$\bar{r}\left(n\frac{T_C}{2}\right) = \bar{r}\left(n\frac{T_C}{2}\right) \cdot \frac{1}{\sqrt{2}} e^{-j\pi Bn\frac{T_C}{2}} + \bar{r}\left(n\frac{T_C}{2}\right) \cdot \frac{1}{\sqrt{2}} e^{j\pi Bn\frac{T_C}{2}} \tag{25-24}$$

where $B$ = 540 MHz.

This is an unapproved IEEE Standards Draft, subject to change.

### 25.3.11 $h_{Filt}$ definition

The filter $h_{Filt}$ is defined by the following coefficients (from $h_0$ to $h_{70}$):

[1,–6,–5,3,8,0,–8,–4,6,8,–4,–13, –2,16,14,–9,–23,–4,23,15, –20,–27,20,57,4,–99, –102,70,247,144,–264, –558,–175,991,2327,2917,2327,991,–175,–558,–264,144,247,70,–102, –99,4,57,20,–27,–20, 15,23,–4, –23,–9,14,16,–2,–13,–4,8,6,–4,–8,0,8,3,–5,–6,1].

Normalized to have a norm of $\sqrt{3}$ so that $h_{Filt}(k) = \frac{\sqrt{3}h_k}{\sqrt{\sum_{l=0}^{70}|h_l|^2}}$.

### 25.3.12 Encoding of Data field

The scrambled Data field is encoded with LDPC codeword length of $n$ bits, information length of $k$ bits, and expansion factor of $z$ as follows:

a) $L_{DPCW} = k - 8$ is the maximal number of data bits in each LDPC codeword. The number of LDPC codeword is calculated as

$$N_{CW} = \lceil Length \times 8 / L_{DPCW} \rceil .$$

b) The number of data bits in the $i^{th}$ LDPC codeword is

$$L_i = \begin{cases} L_{DPCW1}, i = 0, 1, \ldots, N_{CW1} - 1 \\ L_{DPCW1} - 1, i = N_{CW1}, N_{CW1} + 1, \ldots, N_{CW} - 1 \end{cases}$$

where

$$L_{DPCW1} = \lceil Length \times 8 / N_{CW} \rceil$$

$$N_{CW1} = \mathrm{mod}((Length \times 8), (L_{DPCW1} - 1))$$

c) The (#404)Data field is broken into $N_{CW}$ blocks of data word $\mathbf{b}_i$, $i = 0, 1, \ldots, N_{CW}–1$. Each data word is added with 8-bit CRC sequence, see 25.3.6 (CRC calculation), then padded with $f_i = k–L_i– 8$ zero bits to create $k$ bits, such as $\mathbf{b'}_i = (0, \ldots, 0, \mathbf{b}_i, crc_0^i, \ldots, crc_7^i)$.

d) For each data word, $n–k$ parity bits are added to create the LDPC codeword $\mathbf{d}_i = (\mathbf{b'}_i, p_0^i, p_1^i, \ldots, p_{(n-k-1)}^i)$, such that $\mathbf{H} \times \mathbf{d}_i^T = \mathbf{0}$.

e) (#14)Data field encoding: The $j^{th}$ bit set that is composed of all the $j^{th}$ bits of $N_{CW}$ LDPC codeword is encoded with 1-bit parity check to create a parity bit $T_j$, $j = 0, 1, \ldots, n–1$. All the parity bits $T_j$ ($j = 0, 1, \ldots, n–1$) are combined into a parity data word $\mathbf{d}_{N_{CW}}$ with length of $n$ bits. That is, $\mathbf{d}_{N_{CW}} = \mathbf{d}_0 \oplus \mathbf{d}_1 \ldots \oplus \mathbf{d}_{(N_{CW}-1)}$.

f) Bits selection parameter: the punctured-bit index set of $i^{th}$ codeword that are not belong to padding bits are $\mathbf{S}_i$ ($i = 0, 1, \ldots, N_{CW}–1$), and the punctured-bit index set of parity data word $\mathbf{d}_{N_{CW}}$ is $\bar{\mathbf{S}}_{N_{CW}}$. The intersection of any two different sets of $\bar{\mathbf{S}}_i$ ($i = 0, 1, \ldots, N_{CW}$) is empty set. The length of $\bar{\mathbf{S}}_i$ is $e_i$ ($i = 0,\ldots, N_{CW}$), such as: (where $n' = n - f_0$ ).

1) if $N_{CW} = 1$: $e_0 = 0$, $e_1 = n'$ ;

2) if $1 < N_{CW} \le 15$ : $e_i = z$, $i = 0, 1, \ldots N_{CW}–1$, $e_{N_{CW}} = n' - \sum_{i=0}^{N_{CW}-1} e_i$ ;

3) if $N_{CW} > 15$:

$$e_i = \begin{cases} a + 1, i = 0, 1, \ldots, g - 1 \\ a, i = g, g + 1, \ldots, N_{CW} \end{cases} ,$$

where $a = \lfloor n'/(N_{CW} + 1) \rfloor$ , $g = n' - a \times (N_{CW} + 1)$ .

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

g) Bits selection: the first element of $\bar{\mathbf{S}}_i$ is equal to the last element of $\bar{\mathbf{S}}_{(i-1)}$ plus 1, such as,

$$\bar{\mathbf{S}}_i = \left[f_0 + \sum_{j=0}^{i-1} e_j, f_0 + \sum_{j=0}^{i-1} e_j + 1, \ldots, f_0 + \sum_{j=0}^{i} e_j - 1\right],$$

where $f_0$ is the length of padding bits for the 0th codeword. Remove the zero padding bits and the punctured bits from $\mathbf{d}_i$ to obtain codeword $\mathbf{c}_i$, where $i = 0, 1, \ldots, N_{CW}-1$. The punctured-bit index set of parity data word $\mathbf{d}_{N_{CW}}$is

$$\bar{\mathbf{S}}_{N_{CW}} = \left[f_0 + \sum_{j=0}^{N_{CW}-1} e_j, f_0 + \sum_{j=0}^{N_{CW}-1} e_j + 1, \ldots, f_0 + \sum_{j=0}^{N_{CW}} e_j - 1\right].$$

Remove the padding-bit-generated bits and the punctured bits from $\mathbf{d}_{N_{CW}}$ to obtain $\mathbf{c}_{N_{CW}}$, where the padding-bit-generated bits are totally generated from the zero padding bits.

**Example of (#404)Data field encoding:**

The (#404)Data field contains *Length* = 512 octets. The parameter of LDPC: $n = 672$, $k = 336$, $R = 1/2$, $z = 42$.

a) $L_{DPCW} = k - 8 = 328$, the number of LDPC codeword: $N_{CW} = \lceil Length \times 8 / L_{DPCW} \rceil = 13$;

b) $L_{DPCW1} = \lceil Length \times 8 / N_{CW} \rceil = 316$, $N_{CW1} = \mathrm{mod}((Length \times 8), (L_{DPCW1} - 1)) = 1$,

$$L_i = \begin{cases} 316, i = 0 \\ 315, i = 1, 2, \ldots, 12 \end{cases};$$

that is, the number of data bits in the *0*th LDPC codeword is 316, and the 1st–12th LDPC codeword is 315.

c) The (#14)Data field is broken into $N_{CW} = 13$ blocks of data word. Each data word is added with 8 bits *CRC* sequence, see 25.3.6 (CRC calculation). Then padded with zero bits: the *0*th data word is padded with 12 bits and the 1st-12th data word are padded with 13 bits.

d) All the data words are encoded to obtain LDPC codeword $\mathbf{d}_i = (\mathbf{b}'_i, p_0^i, p_1^i, \ldots, p_{(n-k-1)}^i)$, $i = 0, 1, \ldots, 12$.

e) (#14)Data field encoding: Encoded with 1-bit parity check to create $\mathbf{d}_{13}$, length of 672 bits.

f) Bits selection parameter: because of $(N_{CW} = 13) \le 15$, $e_i = 42$, $i = 0, 1, \ldots, 12$, and $n' = n - f_0 = 672 - 12 = 660$, $e_{13} = 660 - \sum_{i=0}^{12} e_i = 114$.

Bits selection: Remove the zero padding bits [0, 1, …, 11] and the punctured bits $\bar{\mathbf{S}}_0 = [12, 13, \ldots, 53]$ from $\mathbf{d}_0$ to obtain codeword $\mathbf{c}_0$ with length of 618 bits; Remove the zero padding bits [0, 1, …, 12] and the punctured bits $\bar{\mathbf{S}}_1 = [54, 55, \ldots, 95]$ from $\mathbf{d}_1$ to obtain codeword $\mathbf{c}_1$ with length of 617 bits; the same operating to obtain $\mathbf{c}_2$, …, $\mathbf{c}_{12}$. Remove the padding-bit-generated bits [0, 1, …, 11] and the punctured bits $\bar{\mathbf{S}}_{13} = [558, 559, \ldots, 671]$ from $\mathbf{d}_{13}$ to obtain codeword $\mathbf{c}_{13}$ with length of 546 bits.

### 25.3.13 Received channel power indicator (RCPI) measurement

The RCPI is a measure of the received RF power in the selected channel for a received frame. This parameter shall be a (#1132)measurement by the PHY of the received RF power in the channel measured over the (#2011)STF or the CEF field of the received (#3474)PPDU.

RCPI shall equal the received RF power (#2011)in dBm with an accuracy of ± 5 dB (95% confidence interval) within the specified dynamic range of the receiver. The relative error between RF power measurements made within a one(#1154) second interval should be less than ± 1 dB.

This is an unapproved IEEE Standards Draft, subject to change.

## 25.4 CMMG control mode

### 25.4.1 Introduction

Transmission and reception of the CMMG control mode PPDUs are mandatory. The CMMG control mode uses the same chip rate as the CMMG SC mode. The CMMG control mode is transmitted when the TXVECTOR indicates MCS 0. The modulation and coding scheme for the CMMG control mode is shown in Table 25-8 (Modulation and coding scheme for the CMMG control mode).

**Table 25-8—Modulation and coding scheme for the CMMG control mode**

| MCS index | Modulation | Code rate | Data rate |
|---|---|---|---|
| 0 | π/2-BPSK | 1/2 | 25.38 Mb/s for SF 13, 47.14 Mb/s for SF 11,<br>82.5 Mb/s for SF 4, and 330 Mb/s for no spreading |

### 25.4.2 PPDU format

(#3626)The CMMG control mode (#14)PPDU is shown in Figure 25-13 (CMMG control mode PPDU format).

**Figure 25-13—CMMG control mode PPDU format**

### 25.4.3 CMMG preamble transmission

In CMMG control mode preamble is transmitted using SC transmission (see 25.3.5 (CMMG PHY preamble)).

### 25.4.4 CMMG control mode SIG transmission

#### 25.4.4.1 General

The CMMG control mode SIG and data are modulated by π/2-BPSK and are spread by Barker sequences.

#### 25.4.4.2 Generation of CRC bits

The CRC sequence is calculated over bits 0–63 and uses CRC 16-CCITT as described in 25.3.6 (CRC calculation).

#### 25.4.4.3 Scrambler

The operation of the scrambler is defined in 25.3.7 (Scrambler). Bits $x_1, x_2, x_3, x_4, x_5, x_6, x_7$ of the scrambler shift register are initialized using the bits in the scrambler initialization bits from the SIG. The SIG is scrambled starting from bit 7.

#### 25.4.4.4 Encoding

See 25.3.9.2 (Encoding of SIG).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

#### 25.4.4.5 Modulation

The CMMG control mode SIG is modulated with π/2-BPSK modulation, the input bit stream is mapped according to the following equation $\tilde{s}_k = 2 \cdot c_k - 1$ . Each output symbol is then rotated according to the following equation: $s_k = \tilde{s}_k e^{(j\pi k)/2}$ .

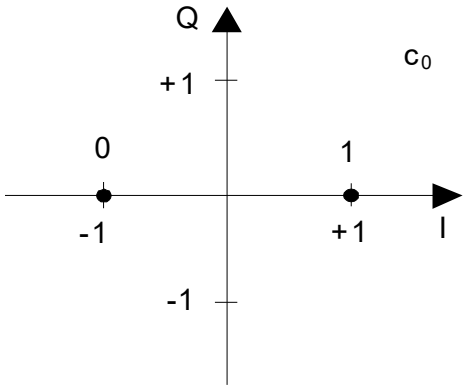

**Figure 25-14—Constellation bit encoding for BPSK**

#### 25.4.4.6 Spreading

The constellation points are spread using the Barker sequence Barker(*L*) defined as follows in Table 25-9 (The Barker(L) sequences), where *L* is the spreading length.

**Table 25-9—The Barker(*L*) sequences**

| Length *L* | Barker(*L*) sequences |
|---|---|
| 4 | +1,+1, –1,+1 |
| 7 | +1, +1, +1, −1, −1,+1, −1 |
| 13 | +1, +1, +1, +1, +1, −1, −1, +1, +1, −1, +1, −1, +1 |

The waveform for the modulated and spread (#404)Data field is

$$r_{DATA}(nT_C) = \left(\text{Barker}(n \bmod L)d\left(\left\lfloor \frac{n}{L} \right\rfloor\right)\right) \times \exp\left(j\pi\frac{n}{2}\right), n = 0, 1, 2, \ldots \quad (25\text{-}25)$$

where $d(k)$ is the modulated constellation point $k$ and $T_C$ is the SC chip time.

For CMMG control mode SIG, the spreading factor is always Barker(13).

### 25.4.5 CMMG control mode Data field

#### 25.4.5.1 General

The Data field consists of the payload data of the PSDU. The PSDU is scrambled, encoded, modulated, and spread as described in the following subclauses.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

#### 25.4.5.2 Scrambler

The operation of the scrambler is defined in 25.3.7 (Scrambler). The scrambling of the (#404)Data field continues the scrambling of the CMMG control mode SIG with no reset.

#### 25.4.5.3 Encoding

Use the LDPC of rate-1/2 and length 672. See 25.3.12 (Encoding of Data field).

#### 25.4.5.4 Modulation

See 25.4.4.5 (Modulation).

#### 25.4.5.5 Spreading

Spreading factor of CMMG control mode (#404)Data field is indicated in CMMG control mode SIG. See 25.4.4.6 (Spreading).

### 25.4.6 CMMG control mode performance requirements

#### 25.4.6.1 Transmit requirements

##### 25.4.6.1.1 Introduction

Transmitter performance requirements of the (#7168)CMMG control mode are defined in 25.4.6.1.2 (Transmit EVM).

##### 25.4.6.1.2 Transmit EVM

The transmit EVM accuracy test shall be performed by instrumentation capable of converting the transmitted signal into a stream of complex samples, with sufficient accuracy in terms of I/Q arm amplitude and phase balance, dc offsets, phase noise, etc. The instrumentation shall perform carrier lock, symbol timing recovery, and amplitude adjustment while making the measurements. The instrumentation shall incorporate a rake receiver or equalizer to reduce error resulting from multipath. If used, the equalizer shall be trained using information in the preamble (STF/CEF). For CMMG control mode EVM, the signal is first despread using the spreading Barker sequence, the EVM is then calculated on the resulting symbols according to Equation (25-26).(#315)

$$EVM = 20\log 10\left(\sqrt{\frac{1}{N_S P_{avg}}\sum_{i=1}^{N_S}[(I_i - I_i^*)^2 + (Q_i - Q_i^*)^2]}\right) \quad (25\text{-}26)$$

where $N_S$ is the number of samples to be measured and $N_S$ shall be 1000, $P_{ave}$ is the average power of the constellation, $(I_i, Q_i)$ is the complex coordinates of the measured symbol $i$, $(I_i^*, Q_i^*)$ is the complex coordinates of the ideal constellation point for the measured symbol $i$.

The test equipment should use a root-raised cosine filter with roll-off factor of 0.25 for the pulse shaping filter when conducting EVM measurement.

The transmit pulse shaping used is left to the implementer.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The relative constellation error (EVM) shall not exceed an MCS dependent value according to Table 25-10 (EVM requirement for CMMG control mode(#7168)).

**Table 25-10—EVM requirement for CMMG control mode(#7168)**

| MCS index | Description | EVM value (dB) |
|---|---|---|
| 0 | (#7168)CMMG Control mode modulation | –6 |

### 25.4.6.2 Receive requirements

#### 25.4.6.2.1 Introduction

Subclause 25.4.6.2.2 (CCA) describes the performance requirement from the CMMG control mode receiver.

#### 25.4.6.2.2 CCA

The start of a CMMG control mode transmission at a receive level greater than the minimum sensitivity for CMMG control mode (–78 dBm) shall cause CCA to indicate busy with a probability > 90% within 3 μs.

## 25.5 CMMG SC mode

### 25.5.1 Introduction

Transmission and reception of CMMG SC mode PPDUs in MCSs 1 to 3 is mandatory. Transmission and reception of CMMG SC mode PPDUs with MIMO may be supported.

### 25.5.2 Transmitter block diagram

Figure 25-15 (Transmitter block diagram for CMMG SC mode SIG field(#7174)(#7170)(#6589)(#7214)) shows the transmit process for the CMMG SC mode SIG transmission. The actual structure of the transmitter is implementation dependent.

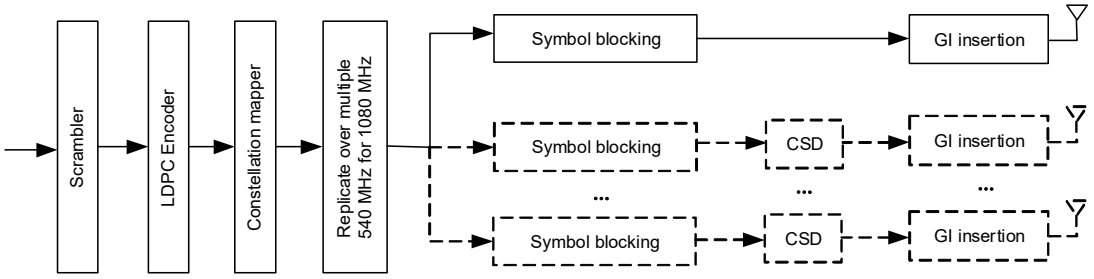

**Figure 25-15—Transmitter block diagram for CMMG SC mode SIG field(#7174)(#7170)(#6589)(#7214)**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Figure 25-16 (Transmitter block diagram for Data fields of a CMMG SC mode PPDU(#14)(#404)) shows the transmit block used to generate the (#404)Data fields of 540 MHz and 1080 MHz using (#7168)CMMG SC mode transmission.

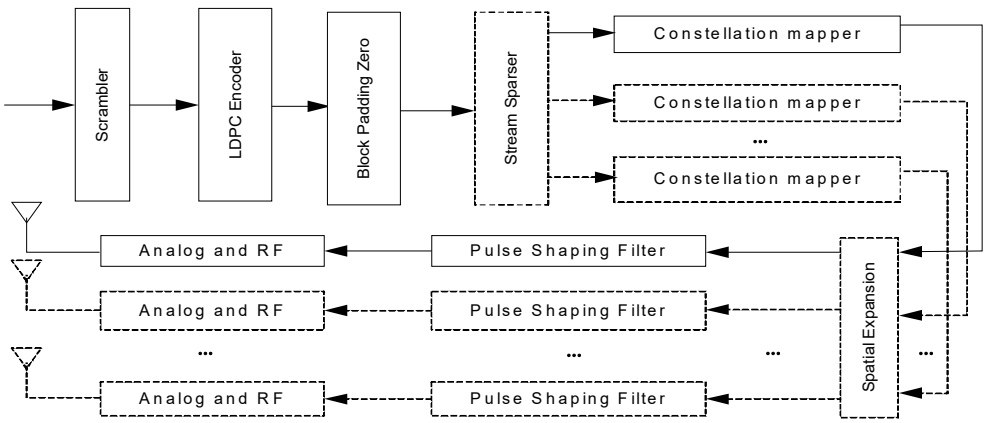

**Figure 25-16—Transmitter block diagram for Data fields of a CMMG SC mode PPDU(#14)(#404)**

NOTE—The operations denoted by the dotted line arrows and dotted line boxes in the above two figures are optional and are applied for SC MIMO transmission.

### 25.5.3 Overview of the PPDU encoding process

#### 25.5.3.1 General

This subclause provides an overview of the CMMG SC mode PPDU encoding process.

#### 25.5.3.2 Construction of CMMG SC mode SIG

The construction of the CMMG SC mode SIG field proceeds as follows:

a) Obtain the parameters from TXVECTOR. Add the reserved bits, append the calculated CRC. The calculation of the CRC of the CMMG SC mode SIG is described in 25.3.6 (CRC calculation).

b) Scrambler: Scramble the CMMG SC mode SIG bits. The scrambler is described in 25.3.7 (Scrambler).

c) LDPC encoder: The scrambled bits are encoded using the LDPC code as described in 25.5.5.4.2 (Encoding).

d) Constellation mapper: BPSK modulate the coded bits as described in 25.5.5.4.3 (Modulation) to form the transmitted symbol blocks of CMMG SC mode SIG.

e) Duplication and phase rotation: Apply the appropriate phase rotations for each 540 MHz subchannel as 25.5.5.4.4 (Duplication).

f) Symbol blocking: Divide the encoded SIG field into symbol block of length 256.

g) CSD: Apply CSD for each transmit chain as described in 25.5.5.4.5 (Symbol blocking, CSD, and GI insertion). This only applies to the CMMG SC mode MIMO mechanism.

h) GI insertion: Prepend a GI for each symbol block of length 256.

i) Pulse filter, Analog, and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

NOTE—Conversion from the sampled digital domain to the continuous time domain is beyond the scope of this document. Filtering for pulse shaping such as in GMSK is beyond the scope of this standard.

#### 25.5.3.3 Construction of CMMG SC mode PPDUs

The construction of the (#404)Data field in a CMMG SC mode PPDU LDPC encoding proceeds as follows:

a) Scrambler: Scramble the PHY padded data.

b) LDPC encoder: The scrambled bits are encoded using the LDPC code as described in 25.3.12 (Encoding of Data field).

c) Blocking Padding Zero: Append the PHY pad bits to the PSDU as described in 25.5.6.4 (Symbol block padding zeros).

d) Stream parser: The output of the LDPC encoder is rearranged into blocks as described in 25.5.6.5 (Stream parser).

e) Constellation mapper: Map to π/2-BPSK, π/2-QPSK, π/2-16-QAM, or π/2-64-QAM constellation points as described in 25.5.6.6 (Constellation mapping).

f) Spatial Expansion: Apply the spatial expansion mechanism according to the combination of the number of the spatial streams and the number of the transmit antennas as described in 25.5.6.7 (Spatial expansion).

g) Pulse filter, Analog, and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit.

### 25.5.4 CMMG SC mode PPDU format

(#6552)The format of a CMMG SC mode PPDU is shown in Figure 25-17 (Format of CMMG SC mode PPDU) where the SCTF field is transmitted for 1080 MHz channel bandwidth.

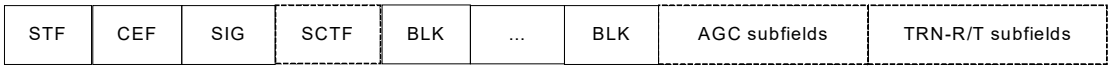

**Figure 25-17—Format of CMMG SC mode PPDU**

NOTE—The SCTF is only transmitted for 1080 MHz channel bandwidth and is composed of a ZCZ sequence of length 512. For MIMO transmission, different transmit antenna transmit a different preamble that is composed of one the four ZCZ sequences with the order of $Z_{512}^{1}, Z_{512}^{2}, Z_{512}^{3}, Z_{512}^{4}$ , such as for the case of one transmit antenna, the preamble sequence is composed of $Z_{512}^{1}$ , for the case of two transmit antennas, the preamble sequences are composed of $Z_{512}^{1}, Z_{512}^{2}$ , respectively.

### 25.5.5 CMMG SC mode SIG transmission

#### 25.5.5.1 SIG field

The CMMG SC mode SIG field carries information required to interpret PPDUs. The preamble and the CMMG SC mode SIG fields all are transmitted with SC mode modulation.

#### 25.5.5.2 Generation of the CRC bits of SIG

The calculation of the CRC of the CMMG SC mode SIG is described in 25.3.6 (CRC calculation).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

#### 25.5.5.3 Scrambler

The operation of the scrambler is defined in 25.3.7. Bits $x_1, x_2, x_3, x_4, x_5, x_6, x_7$ of the scrambler shift register are initialized using the bits in the scrambler initialization bits from the SIG. The CMMG SC mode SIG is scrambled starting from bit 7.

#### 25.5.5.4 Encoding and modulations

##### 25.5.5.4.1 General

The modulation and coding scheme defines the modulation and code rate that is used in the PPDU. The modulation and coding schemes are defined in 25.5.6.6 (Constellation mapping).

##### 25.5.5.4.2 Encoding

See 25.3.9.2 (Encoding of SIG).

##### 25.5.5.4.3 Modulation

See 25.4.4.5 (Modulation).

##### 25.5.5.4.4 Duplication

If the channel bandwidth is 1080 MHz, the modulated SIG symbols are transmitted in duplicate format as defined in 25.3.10 (CMMG duplication transmission on a 1080 MHz channel).

##### 25.5.5.4.5 Symbol blocking, CSD, and GI insertion

The modulated CMMG SC mode SIG symbols are divided into four symbols blocks of length 256. For each block, the cyclic shift values for the CMMG SC mode SIG field of the PPDU for transmit chain $i_{TX}$ out of a total of $N_{TX}$ are defined in Table 25-11 (Cyclic shift values for the CMMG SIG field).

**Table 25-11—Cyclic shift values for the CMMG SIG field**

| $T_{CS}^{i_{TX}}$ values for the CMMG-SIG field | | | | |
|---|---|---|---|---|
| Total number of transmit chains ($N_{TX}$) | Cyclic shift for transmit chain $i_{TX}$ (in units of ns) | | | |
| | 1 | 2 | 3 | 4 |
| 1 | 0 | — | — | — |
| 2 | 0 | $-128T_C$ | — | — |
| 3 | 0 | $-85T_C$ | $-170T_C$ | — |
| 4 | 0 | $-64T_C$ | $-128T_C$ | $-192T_C$ |

After the CSD operations, each group of 256 symbols is prepended by the last 64 symbols that form the cyclic prefix.

### 25.5.6 Data field transmission

#### 25.5.6.1 General

The subclause describes the transmission of the SC (#404)Data field.

#### 25.5.6.2 Scrambler

The operation of the scrambler is defined in 25.3.7 (Scrambler). The scrambling of the Data field continues the scrambling of the CMMG SC mode SIG with no reset for CMMG SC mode transmission.

#### 25.5.6.3 Encoding

See 25.3.12 (Encoding of Data field).

#### 25.5.6.4 Symbol block padding zeros

The number of symbol blocks, $N_{BL}$, is calculated as follows:

$$N_{BL} = m_{SE}\left\lceil \frac{Length \times 8 + (8 + L_{CHECK}) \times N_{CW}}{m_{SE} N_{CBPB}} \right\rceil \quad (25\text{-}27)$$

where $L_{CHECK}$ is the number of LDPC parity bits, $m_{SE}$ values are listed in Table 25-12 (Values of mSE), and $N_{CBPB}$ values are shown in Table 25-13 (Values of NCBPB).

**Table 25-12—Values of $m_{SE}$**

| $N_{SS}$ | $N_{TX}$ | $m_{SE}$ |
|---|---|---|
| 1 | 1 | 1 |
| | 2 | 2 |
| | 3 | 3 |
| | 4 | 4 |
| 2 | 2 | 2 |
| | 3 | 4 |
| | 4 | 4 |
| 3 | 3 | 3 |
| | 4 | 6 |
| 4 | 4 | 4 |

**Table 25-13—Values of $N_{CBPB}$**

| Symbol mapping | $N_{CBPB}$ (540 MHz) | | $N_{CBPB}$ (1080 MHz) | |
|---|---|---|---|---|
| | Long GI | Short GI | Long GI | Short GI |
| π/2-BPSK | 192 | 224 | 384 | 448 |
| π/2-QPSK | 384 | 448 | 768 | 896 |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 25-13—Values of $N_{CBPB}$ *(continued)***

| Symbol mapping | $N_{CBPB}$ (540 MHz) | | $N_{CBPB}$ (1080 MHz) | |
|---|---|---|---|---|
| | Long GI | Short GI | Long GI | Short GI |
| π/2-16-QAM | 768 | 896 | 1536 | 1792 |
| π/2-64-QAM | 1152 | 1344 | 2304 | 2688 |

The number of padding 0s(M118) is given by

$$N_{BPAD} = N_{BL}N_{CBPB} - (Length \times 8 + (8 + L_{CHECK}) \times N_{CW}) \quad (25\text{-}28)$$

The PSDU is concatenated with $N_{BPAD}$ 0s. They are scrambled using the continuation of the scrambler sequence that scrambled the PSDU.

### 25.5.6.5 Stream parser

After coding and puncturing, the data bit streams at the output of the FEC encoder are processed in groups of $N_{CBPB}$. Each of these groups is rearranged into $N_{SS}$ blocks of $N_{CBPSS}$ bits.

The number of bits assigned to a single axis (real or imaginary) of a constellation point in a spatial stream is denoted by Equation (25-29).

$$s = \max\left\{1, \frac{N_{CBPS}}{2}\right\} \quad (25\text{-}29)$$

Consecutive blocks of $s$ bits are assigned to different spatial streams in a round robin fashion.

Bit $i$ at the output of encoder is assigned to input bit $k$ of spatial stream where

$$i = (i_{SS} - 1) \cdot s + N_{SS} \cdot s \cdot \left\lfloor \frac{k}{s} \right\rfloor + k \bmod s \quad (25\text{-}30)$$

where $i_{SS} = 1, 2, \ldots, N_{SS}$, $i = 0, 1, \ldots, N_{CBPB}-1$, $k = 0, 1, \ldots, N_{CBPSS}-1$.

### 25.5.6.6 Constellation mapping

The modulation and coding scheme (MCS) field specifies the modulation and code rate used in the PPDU.

A CMMG STA shall support all equal modulation (EQM) rates for one spatial stream (MCSs 1 to 3). MCSs 4 to 8 are optional.

The coded and padded bit stream is converted into a stream of complex constellation points according to the modulation specified in the MCS table.

In π/2-BPSK modulation, the input bit stream is mapped according to the following equation:

$$\tilde{s}_k = 2 \cdot c_k - 1$$

where $c_k$ is the $k^{\text{th}}$ input coded (or scrambled pad) bit. Each output symbol is then rotated according to the following equation:

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$s_k = \tilde{s}_k e^{(j\pi k)/2}$$

NOTE—With appropriate choice of transmit filtering, π/2-BPSK is equivalent to a precoded pulse-shaped MSK (e.g., GMSK). The precoder is simply $b_{out,k} = b_{in,k} \oplus b_{in,k-1}$, where $b_{in,k}$ is the scrambled input stream, $b_{in,-1}$ is 0, and $b_{out,k}$ is the input to the (G)MSK modulator.

In π/2-QPSK modulation (see Figure 25-18 (QPSK constellation bit encoding)), the input bit stream is mapped according to the following equation:

$$\tilde{s}(k) = \frac{1}{\sqrt{2}}((2c_{2k}-1)+j(2c_{2k+1}-1))\exp\left(-j\frac{\pi}{4}\right)$$

where $k$ is the output symbol index, $k$ = 0, 1, …. Each output symbol is then rotated according to the following equation:

$$s_k = \tilde{s}_k e^{(j\pi k)/2}$$

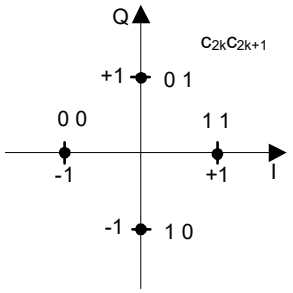

**Figure 25-18—QPSK constellation bit encoding**

In π/2-16-QAM modulation (see Figure 25-19 (16-QAM constellation bit encoding)), the input bit stream is mapped according to the following equation:

$$\tilde{s}_k = \frac{1}{\sqrt{10}}\{(4c_{4k}-2)-(2c_{4k}-1)(2c_{4k+1}-1)+j(4c_{4k+2}-2)-j(2c_{4k+2}-1)(2c_{4k+3}-1)\} \quad (25\text{-}31)$$

where $k$ is the output symbol index, $k$ = 0, 1, …. Each output symbol is then rotated according to the following equation:

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$s_k = \tilde{s}_k e^{(j\pi k)/2}$$

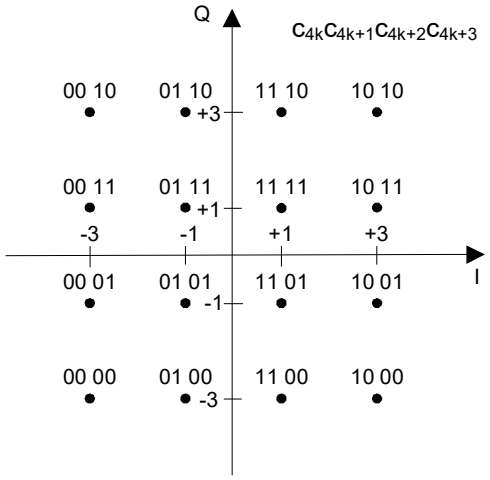

**Figure 25-19—16-QAM constellation bit encoding**

In π/2-64-QAM modulation (see Figure 25-20 (64-QAM constellation bit encoding)), the input bit stream is mapped according to the following equation:

$$\begin{aligned}\tilde{s}_k = {} & \frac{1}{\sqrt{42}}((8c_{6k}-4)-(2c_{6k}-1)(4c_{6k+1}-2)+(2c_{6k}-1)(2c_{6k+1}-1)(2c_{6k+2}-1)) \\ & + j\frac{1}{\sqrt{42}}((8c_{6k+3}-4)-(2c_{6k+3}-1)(4c_{6k+4}-2)+(2c_{6k+3}-1)(2c_{6+4}-1)(2c_{6k+5}-1))\end{aligned} \quad (25\text{-}32)$$

where $k$ is the output symbol index, $k$ = 0, 1, …. Each output symbol is then rotated according to the following equation:

$$s_k = \tilde{s}_k e^{(j\pi k)/2}$$

### 25.5.6.7 Spatial expansion

Each spatial stream is divided into many subblocks that each subblock includes $N_{DSPB}$ constellation symbols. Values of $N_{DSPB}$ and $N_{UWPB}$ are shown in Table 25-14 (Values of NDSPB and NUWPB(#7171)).

**Table 25-14—Values of $N_{DSPB}$ and $N_{UWPB}$(#7171)**

| | $N_{CBPB}$ (CBW540) | | $N_{CBPB}$ (CBW1080) | |
|---|---|---|---|---|
| | **Long GI** | **Short GI** | **Long GI** | **Short GI** |
| $N_{DSPB}$ | 192 | 224 | 384 | 448 |
| $N_{UWPB}$ | 64 | 32 | 128 | 64 |

The spatial stream of complex numbers, $\mathbf{d}_{i,n}$, $i$ = 1, …, $N_{SS}$, $n$ = 0, 1, …, $N_{BL}$–1, is the input to the spatial expansion module, which produces as output the stream of complex numbers $\mathbf{x}_{i_{TXT},n}$, $i_{TXT}$ = 1, …, $N_{TXT}$. The relation between the spatial streams and the output streams is given in Table 25-15 (Constellation map-

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

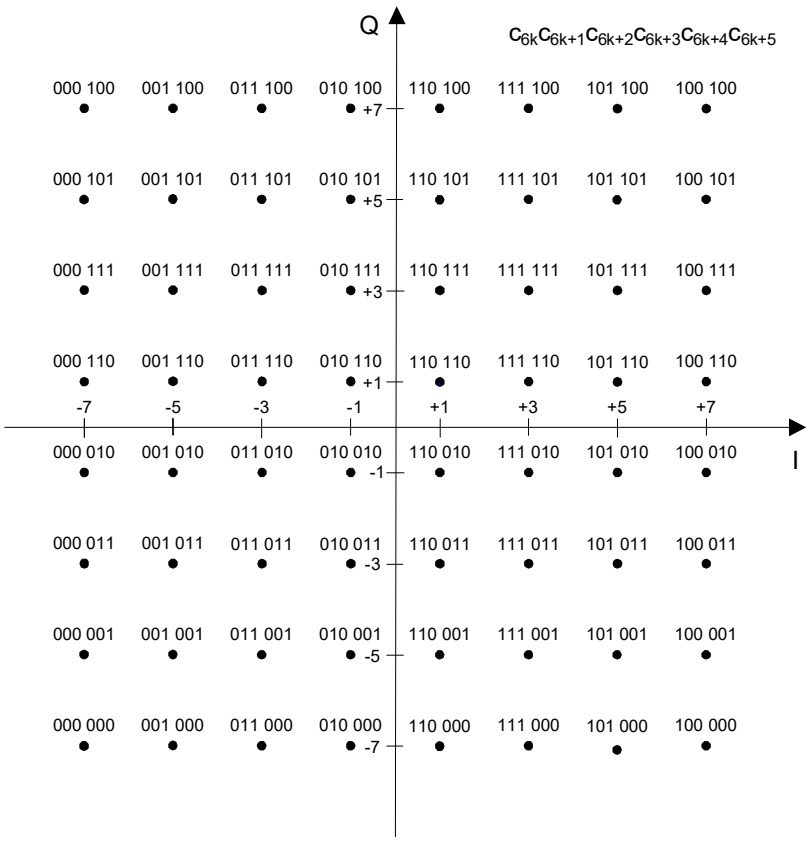

**Figure 25-20—64-QAM constellation bit encoding**

per output to spatial mapper input) where $\mathbf{x}_{i_{TXT},n} = (\tilde{\mathbf{x}}_{i_{TXT},n})^T$, $\tilde{\mathbf{d}}_{i,n} = [\mathbf{d}_{i,n}, \mathbf{0}_{1\times N_{UWPB}}]^T$, $\tilde{\mathbf{u}}_{i_{TXT}} = \left[\mathbf{0}_{1\times N_{DSPB}}, Z_{N_{UWPB}}^{i_{TXT}}\right]^T$, and $\mathbf{Q}_{N_{BLS}}$ is defined as

$$\mathbf{Q}_{N_{BLS}} = \begin{bmatrix} \mathbf{Q}_1 & \mathbf{Q}_2 \\ \mathbf{Q}_3 & \mathbf{Q}_4 \end{bmatrix} \tag{25-33}$$

where $\mathbf{Q}_2 = \mathbf{0}_{N_{DSPB}\times N_{UWPB}}$, $\mathbf{Q}_3 = \mathbf{0}_{N_{UWPB}\times N_{DSPB}}$, and

$$\mathbf{Q}_1 = \begin{bmatrix} 0 & 0 & 0 & \dots & 0 & 0 & 1 \\ 0 & 0 & 0 & \dots & 0 & 1 & 0 \\ \dots & \dots & \dots & \dots & \dots & \dots & \dots \\ 0 & 1 & 0 & \dots & 0 & 0 & 0 \\ 1 & 0 & 0 & \dots & 0 & 0 & 0 \end{bmatrix}_{N_{DSPB}\times N_{DSPB}}, \mathbf{Q}_4 = \begin{bmatrix} 0 & 0 & 0 & \dots & 0 & 0 & 1 \\ 0 & 0 & 0 & \dots & 0 & 1 & 0 \\ \dots & \dots & \dots & \dots & \dots & \dots & \dots \\ 0 & 1 & 0 & \dots & 0 & 0 & 0 \\ 1 & 0 & 0 & \dots & 0 & 0 & 0 \end{bmatrix}_{N_{UWPB}\times N_{UWPB}} \tag{25-34}$$

The starting index for the first symbol for π/2 rotation is 0. If the Additional PPDU field within the SIG field is equal to 0, the same ZCZ sequence guard interval is prepended to the first block transmitted. If the

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Additional PPDU field within the SIG field is equal to 1, the same ZCZ sequence guard interval is prepended to the first block transmitted. See Figure 25-21 (Block transmission).

NOTE 2—* indicates conjugate operation.

#### 25.5.6.8 Duplication transmission

When the TXVECTOR parameter DUPLICATE_MODULATION is present, the transmitted PPDU is a duplicate. The modulated data symbols are duplicated as described in 25.3.10 (CMMG duplication transmission on a 1080 MHz channel).

### 25.5.7 Performance requirements

#### 25.5.7.1 Transmit requirements

#### 25.5.7.1.1 Introduction

Transmitter performance requirements of the (#7168)CMMG SC mode are defined in 25.5.7.1.2 (Transmit EVM).

#### 25.5.7.1.2 Transmit EVM

The transmit EVM accuracy test shall be performed by instrumentation capable of converting the transmitted signal into a stream of complex samples, with sufficient accuracy in terms of I/Q arm amplitude and phase balance, DC offsets, phase noise, etc.

The instrumentation shall perform carrier lock, symbol timing recovery, amplitude adjustment, and equalization while making the measurements. The equalizer shall be trained using information in the CMMG SC mode preamble (STF/CEF). For the CMMG SC mode EVM, measuring samples at the sample rate, the measured symbols should not contain the first and the last hundred symbols of a given (#14)PPDU (ramp up/down). The EVM is calculated according to the formula below(#315):

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$EVM = 20\log 10\left(\sqrt{\left(\frac{1}{N_s P_{avg}}\sum_{i=1}^{N_S}[(I_i - I_i^* - I_0)^2 + (Q_i - Q_i^* - Q_0)^2]\right)}\right)$$

$$EVM = 20\log 10\left(\sqrt{\left(\frac{1}{N_s P_{avg}}\sum_{i=1}^{N_S}[(I_i - I_i^* - I_0)^2 + (Q_i - Q_i^* - Q_0)^2]\right)}\right) \quad (25\text{-}35)$$

where

$N_S$ is the number of samples to be measured and $N_S$ should be 1000

$P_{avg}$ is the average power of the constellation

$(I_i, Q_i)$ is the complex coordinates of the measured symbol $i$

$(I_i^*, Q_i^*)$ is the complex coordinates of the ideal constellation point for the measured symbol $i$

$(I_0, Q_0)$ is the complex DC term chosen to reduce EVM

The test equipment should use a root-raised cosine filter with roll-off factor of 0.25 for the pulse shaping filter when conducting EVM measurement.

The transmit pulse shaping used is left to the implementer.

The relative constellation error (EVM) shall not exceed an MCS dependent value according to Table 25-16 (EVM requirements for CMMG SC mode(#7168)).

**Table 25-16—EVM requirements for CMMG SC mode(#7168)**

| CMMG-MCS indices(#4136) | Modulation | Coding rate | EVM value (dB) |
|---|---|---|---|
| 1 | π/2-BPSK | 1/2 | –7 |
| 2 | π/2-QPSK | 1/2 | –11 |
| 3 | π/2-QPSK | 3/4 | –13 |
| 4 | π/2-16-QAM | 1/2 | –19 |
| 5 | π/2-16-QAM | 3/4 | –21 |
| 6 | π/2-64-QAM | 5/8 | –25 |
| 7 | π/2-64-QAM | 3/4 | –26 |
| 8 | π/2-64-QAM | 13/16 | –28 |

#### 25.5.7.1.3 Time of Departure accuracy

(#8054)The RMS accuracy of the time of departure provided in TIME_OF_DEPARTURE shall be less than or equal to 80 ns.

The Time of Departure accuracy test evaluates TIME_OF_DEPARTURE against aTxPHYTxStartRMS and aTxPHYTxStartRMS against TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH as defined in Annex P with the following test parameters:

— (#385)MULTICHANNEL_SAMPLING_RATE is $440\times10^6$ sample/s for a 540 MHz channel and $880\times10^6$ sample/s for a 1080 MHz channel.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

— (#385)FIRST_TRANSITION_FIELD is Short Training field.
— (#385)SECOND_TRANSITION_FIELD is Channel Estimation field.
— (#385)TRAINING_FIELD is Channel Estimation field.
— TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH is 80 ns

NOTE—The indicated windowing applies to the time of departure accuracy test equipment, and not the transmitter or receiver.

#### 25.5.7.2 Receive requirements

##### 25.5.7.2.1 Introduction

This subclause describes the receiver requirements of the CMMG SC mode.

##### 25.5.7.2.2 CCA

The start of a CMMG SC mode transmission at a receive level greater than the minimum sensitivity for MCS 0 (–81 dBm for 540 MHz, –78 dBm for 1080 MHz) shall cause CCA to indicate busy with a probability > 90% within 1 μs. The receiver shall hold the carrier sense signal busy for any signal 20 dB above the minimum sensitivity for MCS 0.

## 25.6 CMMG OFDM mode

### 25.6.1 Introduction

Transmission and reception of (#7168)CMMG OFDM mode PPDUs are optional.

### 25.6.2 CMMG OFDM mode PPDU format

(#6552)The format of a CMMG OFDM mode PPDU (#14)is shown in Figure 25-22 (Format of the CMMG OFDM mode PPDU).

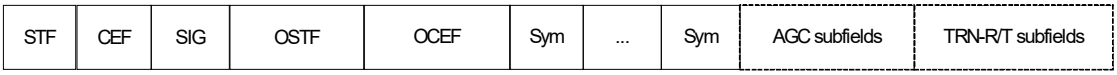

**Figure 25-22—Format of the CMMG OFDM mode PPDU**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 25.6.3 Transmission block diagram

Figure 25-23 (Transmitter block diagram for CMMG OFDM mode SIG fields(#6589)) shows the transmit process for the CMMG OFDM mode SIG transmission. The actual structure of the transmitter is implementation dependent.

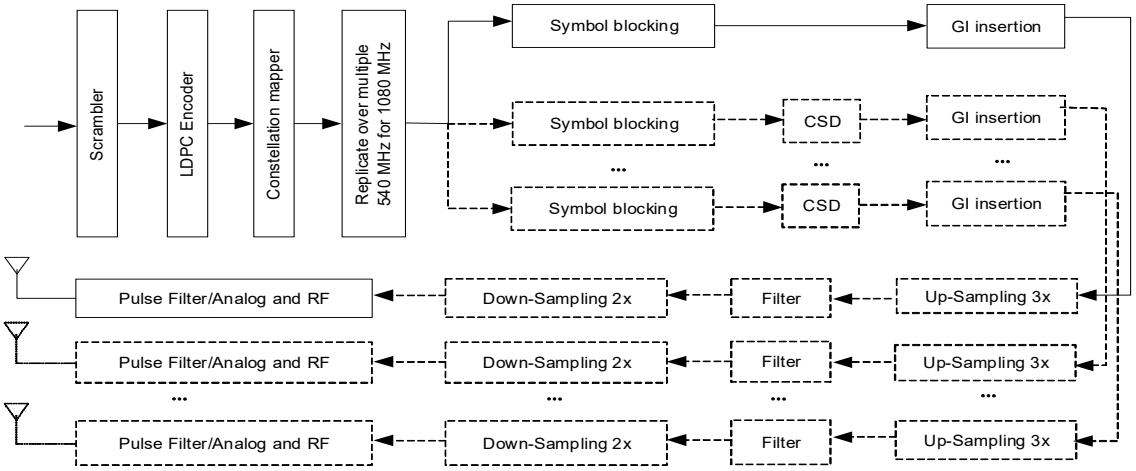

**Figure 25-23—Transmitter block diagram for CMMG OFDM mode SIG fields(#6589)**

Figure 25-24 (Transmitter block diagram for the Data field of CMMG OFDM mode(#404)) shows the transmitter blocks used to generate the Data field of OFDM mode PPDU with LDPC encoding.

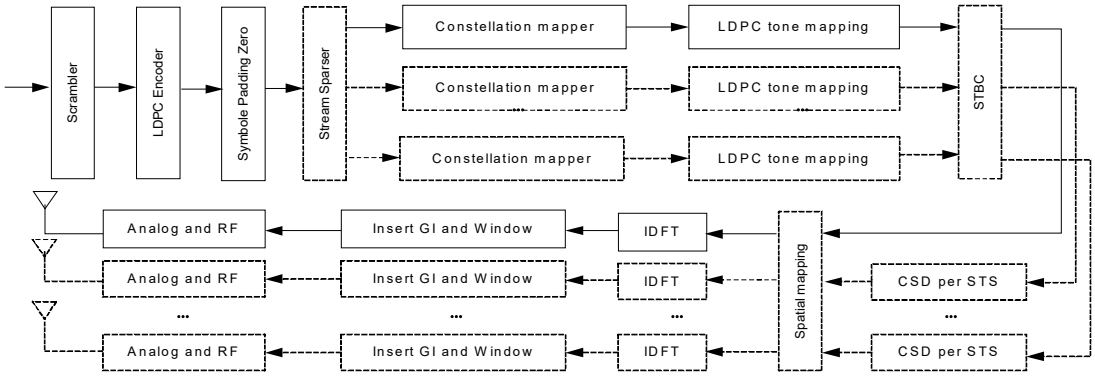

**Figure 25-24—Transmitter block diagram for the Data field of CMMG OFDM mode(#404)**

NOTE—The operation denoted by the dotted line arrows and dotted line boxes in the above two figures are optional and are applied for OFDM MIMO transmission.

### 25.6.4 Overview of CMMG OFDM mode PPDU encoding process

#### 25.6.4.1 General

This subclause provides an overview of the CMMG OFDM mode PPDU encoding process.

#### 25.6.4.2 Construction of CMMG OFDM mode SIG

The construction of the CMMG OFDM mode SIG field proceeds as follows:

a) Obtain the parameters from TXVECTOR. Add the reserved bits, append the calculated CRC. The calculation of the CRC of the CMMG OFDM mode SIG is described in 25.3.6 (CRC calculation).

b) Scrambler: Scramble the CMMG OFDM mode SIG bits. The Scrambler is described in 25.3.7 (Scrambler).

c) LDPC encoder: The scrambled bits are encoded using the LDPC code as described in 25.5.5.4.2 (Encoding).

d) Constellation mapper: BPSK modulate the coded bits as described in 25.5.5.4.3 (Modulation) to form the transmitted symbol blocks of CMMG PHY SIG.

e) Duplication and phase rotation: Apply the appropriate phase rotations for each 540 MHz subchannel as 25.5.5.4.4 (Duplication).

f) CSD: Apply CSD for each transmit chain as described in 25.5.5.4.5 (Symbol blocking, CSD, and GI insertion). This is need only for the CMMG OFDM MIMO mechanism.

g) Symbol blocking and GI insertion: Prepend a GI and generate the transmission symbol block.

h) Upsampling, filtering, and downsampling: Sample rate change in CMMG OFDM mode transmission as described in 25.6.5.4 (Symbol blocking, CSD, and GI insertion). This only applies to the CMMG OFDM mode MIMO mechanism.

i) Pulse filter, Analog, and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit.

NOTE—Conversion from the sampled digital domain to the continuous time domain is beyond the scope of this document. Filtering for pulse shaping such as in GMSK is beyond the scope of this standard.

#### 25.6.4.3 Construction of CMMG OFDM mode PPDU

The construction of the Data field in a (#7168)CMMG OFDM mode PPDU with LDPC encoding proceeds as follows:

a) Scrambler: Scramble the PHY padded data. The scrambler is described in 25.3.7 (Scrambler).

b) LDPC encoder: The scrambled bits are encoded using the LDPC code with the APEP_LENGTH in the TXVECTOR as described in 25.6.8.3 (Encoding).

c) Stream parser: The output of the LDPC encoder is rearranged into blocks as described in 25.6.8.5 (Stream parser).

d) Constellation mapper: Map to BPSK, QPSK, 16-QAM, or 64-QAM constellation points as described in 25.6.8.6 (Subcarrier modulation mapping).

e) LDPC tone mapper: The LDPC tone mapping shall be performed on all LDPC encoded streams as described in 25.6.8.7 (Tone mapping).

f) OFDM symbol padding 0s(M118): Append the CMMG OFDM mode pad bits to the PSDU as described in 25.6.8.4 (OFDM symbol padding 0s(M118)).

g) STBC: Apply STBC as described in 25.6.8.8 (Space-time block coding).

h) Pilot insertion: Insert pilots following the steps described in 25.6.8.9 (Pilot subcarriers).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

i) CSD: Apply CSD for each space-time stream as described in 25.6.8.10 (Cyclic shift diversity (CSD) for CMMG OFDM mode Data fields transmission(#7168)(#404)).

j) Spatial mapping: Apply the **Q** matrix as described in 25.6.8.11 (OFDM modulation).

k) Phase rotation: Apply the appropriate phase rotations for each 540 MHz subchannel as described in 25.3.4.4 (Definition of tone rotation for CMMG OFDM mode transmission(#7168)).

l) IDFT: Compute the inverse discrete Fourier transform.

m) Insert GI and apply windowing: Prepend a GI and apply windowing.

n) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit.

#### 25.6.4.4 Construction of OSTF

The OSTF is defined in 25.6.6 (OSTF definition) and is constructed as follows:

a) Sequence generation: Generate the OSTF in the frequency-domain over the bandwidth indicated by CH_BANDWIDTH as described in 25.6.6 (OSTF definition).

b) Phase rotation: Apply appropriate phase rotation for each 540 MHz subchannel as described in 25.3.4.3 (Transmitted signal) and 25.3.4.4 (Definition of tone rotation for CMMG OFDM mode transmission(#7168)).

c) CSD: Apply CSD for each space-time stream and frequency segment as described in 25.6.8.10 (Cyclic shift diversity (CSD) for CMMG OFDM mode Data fields transmission(#7168)(#404)).

d) Spatial mapping: Apply the **Q** matrix as described in 25.6.8.11 (OFDM modulation).

e) IDFT: Compute the inverse discrete Fourier transform.

f) Insert GI and apply windowing: Prepend a GI (LONG_GI) and apply windowing as described in 25.3.4.3 (Transmitted signal).

g) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 25.3.4.3 (Transmitted signal) and 25.6.6 (OSTF definition) for details.

#### 25.6.4.5 Construction of OCEF

The OCEF is defined in 25.6.7 (OCEF definition) and constructed as follows:

a) Sequence generation: Generate the OCEF sequence in the frequency-domain over the bandwidth indicated by CH_BANDWIDTH as described in 25.6.7 (OCEF definition).

b) Phase rotation: Apply appropriate phase rotation for each 540 MHz subchannel as described in 25.3.4.3 (Transmitted signal) and 25.3.4.4 (Definition of tone rotation for CMMG OFDM mode transmission(#7168)).

c) Matrix mapping: Apply the matrix to the OCEF sequence and apply the matrix to the pilot tones as described in 25.6.7 (OCEF definition).

d) CSD: Apply CSD for each space-time stream and frequency segment as described in 25.6.8.10 (Cyclic shift diversity (CSD) for CMMG OFDM mode Data fields transmission(#7168)(#404)).

e) Spatial mapping: Apply the **Q** matrix as described in 25.6.8.11 (OFDM modulation).

f) IDFT: Compute the inverse discrete Fourier transform.

g) Insert GI and apply windowing: Prepend a GI (LONG_GI) and apply windowing as described in 25.3.4.3 (Transmitted signal).

h) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 25.3.4.3 (Transmitted signal) and 25.6.7 (OCEF definition) for details.

### 25.6.5 CMMG OFDM mode SIG fields

#### 25.6.5.1 SIG fields

See 25.5.5.1 (SIG field) to 25.5.5.4.2 (Encoding).

#### 25.6.5.2 Modulation

See 25.4.4.5 (Modulation).

#### 25.6.5.3 Duplication

If the channel bandwidth is 1080 MHz, the modulated SIG symbols are duplicated as described in 25.3.10 (CMMG duplication transmission on a 1080 MHz channel).

#### 25.6.5.4 Symbol blocking, CSD, and GI insertion

See 25.5.5.4.5 (Symbol blocking, CSD, and GI insertion).

#### 25.6.5.5 Symbol rate change

If the channel bandwidth is 540 MHz, the preamble sequence and the CMMG OFDM mode SIG fields defined in the above subclauses are specified at the SC chip rate ($T_C$). For transmission in the OFDM (nominal) sample rate, the signal is resampled with a 3/2 rate change. The resampling is done by upsampling by a factor of 3, filtering by the filter $h_{Filt}$ defined in 25.3.11 (hFilt definition), and downsampling by a factor of 2 (see equation below). To define the transmission of the preamble when the (#14)PPDU is an OFDM (#14)mode PPDU, the preamble waveform is defined below.

Let $r(nT_C) = r_{STF}(nT_C) + r_{CEF}(nT_C - t_{ce}) + r_{SIG}(nT_C - t_{SIG})$, then

$$r\left(n\frac{T_s}{2}\right) = \begin{cases} r\left(n\frac{T_c}{3}\right), n = 0, 3, 6, \ldots \\ 0, otherwise \end{cases} \quad (25\text{-}36)$$

$$\tilde{r}\left(n\frac{T_s}{2}\right) = \sum_{k=0}^{K-1} r\left((n-k)\cdot\frac{T_s}{2}\right) h_{Filt}(k), n = 0, 1, \ldots \quad (25\text{-}37)$$

$$r(nT_s) = \tilde{r}\left(2n\frac{T_s}{2} - \frac{K-1}{2}\frac{T_s}{2}\right), n = 0, 1, \ldots \quad (25\text{-}38)$$

where $K$ is the length of the filter defined in 25.3.11 (hFilt definition), $\tilde{r}(n=0)$ for $n<0$.

### 25.6.6 OSTF definition

The main purpose of the OFDM Short Training Field (OSTF) is to improve automatic gain control estimation in a MIMO transmission. The duration of the OSTF is $T_{OSTF}$ regardless of the Short GI field setting in CMMG OFDM SIG.

For a 540 MHz transmission, the frequency domain sequence is given by Equation (25-39).

$$OSTF_{-89,\,89} = \{0, \mathbf{a, a, b, a, a, a, b, b, a, b, b, b, a, a, b, a, b, b, a, b, a, a,} 0, 0, 0, 0, \mathbf{b, b, b, b, a, b, b, b, a, a, a, a, b, a, a, a, b, a, b, a, a,} 0, 0\} \quad (25\text{-}39)$$

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

where **a** = [1, 0, 0, 0] and **b** = [–1, 0, 0, 0].

For a 1080 MHz transmission, the frequency domain sequence is given by Equation (25-40).

$$OSTF_{-177,\,177} = \frac{1+j}{\sqrt{2}}\{\,0,\ \mathbf{b, a, a, a, b, b, b, a, a, b, a, a, a, a, b, b, b, b, a, b, a, b, b, b, a,}$$
$$\mathbf{b, b, a, b, a, b, a, a, b, b, a, a, b, a, a, a, b, a, b, 0, 0, 0, 0, a, a, b, b, b, b, b, b, b, a, a,} \qquad (25\text{-}40)$$
$$\mathbf{b, b, a, a, a, a, a, a, b, a, a, a, a, a, b, a, a, a, b, a, b, a, a, a, a, a, a, a, a, b, b,}\ -1,\ 0\,\}$$

where **a** = [1, 0, 0, 0] and **b** = [–1, 0, 0, 0].

The time domain representation of the signal of transmit chain $i_{TXT}$ shall be as specified in Equation (25-41).

$$r^{i_{TX}}_{OSTF}(t) = \frac{w_{T_{OCEF}}(t)}{\sqrt{N_{Tone}N_{STS}}} \sum_{k=-N_{SR}}^{N_{SR}} \sum_{m=1}^{N_{STS}} [Q_k]_{i_{TX},\,m}\ \Upsilon_{k,\,CBW}\, OSTF_k \exp(j2\pi\Delta_F(t - T_{CS}(m))) \qquad (25\text{-}41)$$

where

$N_{Tone}$ is, for 540 MHz transmission, 176, and, for 1080 MHz transmission, 352

$T_{CS}$ is given in Table 25-27 (Cyclic shift values for the Data fields of a CMMG OFDM mode PPDU(#7168)(#404))

$Q_k$ is defined in 25.6.8.13 (Beamforming)

$\Upsilon_{k,\,CBW}$ is defined in 25.3.4.4 (Definition of tone rotation for CMMG OFDM mode transmission(#7168))

### 25.6.7 OCEF definition

The OCEF provides a means for the receiver to estimate the MIMO channel between the set of constellation mapper outputs (or, if STBC is applied, the STBC encoder outputs) and the receive chains. The transmitter provides training for $N_{STS}$ space-time streams (spatial mapper inputs) used for the transmission of the PSDU(s). For each tone, the MIMO channel that can be estimated is a $N_{RX} \times N_{STS}$ matrix. A (#14)PPDU transmission has a preamble that contains OCEF symbols, where the data tones of each OCEF symbol are multiplied by entries belonging to a matrix $\mathbf{P}_{OCEF}$, to enable channel estimation at the receiver. The pilot tones of each OCEF symbol are multiplied by the entries of a matrix $\mathbf{R}_{OCEF}$ defined in the following text. The multiplication of the pilot tones in the OCEF symbol by the $\mathbf{R}_{OCEF}$ matrix instead of the $\mathbf{P}_{OCEF}$ matrix allows receivers to track phase and frequency offset during MIMO channel estimation using the OCEF. The number of OCEF symbols, $N_{OCEF}$, is a function of the number of space-time streams $N_{STS}$ as shown in Table 25-17 (Number of OCEFs required for different numbers of space-time streams). As a result the OCEF consists of one, two, or four symbols.

**Table 25-17—Number of OCEFs required for different numbers of space-time streams**

| $N_{STS}$ | $N_{OCEF}$ |
|---|---|
| 1 | 1 |
| 2 | 2 |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 25-17—Number of OCEFs required for different numbers of space-time streams**

| $N_{STS}$ | $N_{OCEF}$ |
|---|---|
| 3 | 4 |
| 4 | 4 |

In a 540 MHz transmission, let $OCEF_{left}$ and $OCEF_{right}$ be the sequences defined in Equation (25-42) and Equation (25-43), respectively.

$$\begin{aligned} OCEF_{left} = \{&1,-1,-1,1,1,-1,-1,1,1,-1,1,1,1,1,1,1,1,-1,-1,1,-1,1,1,1,\\ &-1,1,1,-1,1,-1,-1,1,1,-1,-1,1,-1,1,1,1,1,1,1,1,-1,-1,1,1,1,\\ &-1,1,1,-1,1,-1,1,-1,-1,-1,1,-1,-1,-1,-1,1,1,-1,-1,-1,-1,-1,\\ &-1,1,-1,-1,-1,1,1,1,1,-1,-1,1,1,-1,1,1\} \end{aligned} \tag{25-42}$$

$$\begin{aligned} OCEF_{right} = \{&-1,1,-1,1,1,-1,1,-1,-1,-1,1,1,1,1,1,-1,-1,-1,1,1,1,1,-1,-1,\\ &-1,-1,-1,-1,-1,1,-1,1,-1,1,1,1,-1,-1,-1,-1,1,1,-1,-1,-1,1,\\ &1,-1,1,1,-1,1,1,1,1,-1,1,-1,-1,-1,1,-1,1,-1,1,-1,1,-1,1,1,\\ &1,1,-1,1,-1,1,-1,-1,1,1,1,-1,1,1,-1,-1,-1,1\} \end{aligned} \tag{25-43}$$

In a 540 MHz transmission, the OCEF sequence transmitted is given by Equation (25-44).

$$OCEF_{-89,89} = \{OCEF_{left}, 0, 0, 0, OCEF_{right}\} \tag{25-44}$$

In a 1080 MHz transmission, let $OCEF_{left}$ and $OCEF_{right}$ be the sequences defined in Equation (25-45) and Equation (25-46), respectively.

$$\begin{aligned} OCEF_{left} = \{&1,-1,1,-1,-1,-1,-1,-1,1,1,-1,-1,1,1,1,1,1,-1,-1,-1,-1,1,\\ &-1,1,-1,1,1,1,1,-1,1,1,-1,-1,1,1,1,-1,1,1,-1,-1,1,-1,-1,-1,\\ &1,-1,1,1,-1,1,1,1,-1,-1,1,-1,-1,-1,-1,-1,1,1,-1,-1,-1,-1,\\ &-1,1,-1,1,1,1,-1,-1,-1,-1,1,1,1,-1,1,1,1,1,-1,-1,1,1,-1,1,1,\\ &1,1,1,-1,-1,-1,1,-1,1,1,-1,1,1,-1,1,1,-1,1,-1,1,1,1,1,-1,1,\\ &1,-1,1,-1,1,1,1,1,1,1,-1,-1,1,-1,-1,-1,1,-1,1,1,-1,1,1,1,-1,\\ &-1,1,-1,1,1,1,1,-1,1,1,1,-1,1,1,1,1,-1,1,-1,-1,-1,1,-1,1,1,1,\\ &-1,-1,-1,-1,-1,-1,1\} \end{aligned} \tag{25-45}$$

$$\begin{aligned} OCEF_{right} = \{&-1,1,-1,-1,1,1,1,-1,1,-1,1,1,1,1,-1,-1,1,1,-1,1,1,-1,-1,-1,\\ &1,1,1,-1,-1,1,-1,-1,-1,1,-1,1,-1,1,-1,1,1,1,-1,1,-1,-1,-1,\\ &-1,1,1,-1,1,-1,1,1,1,-1,1,1,1,1,-1,-1,-1,-1,1,1,1,1,1,-1,1,\\ &-1,1,1,-1,1,-1,-1,1,-1,-1,-1,-1,1,1,1,1,-1,1,1,1,1,1,-1,1,\\ &1,-1,-1,-1,1,-1,-1,-1,1,-1,1,1,1,1,-1,-1,-1,1,1,-1,1,-1,1,\\ &-1,1,-1,-1,-1,-1,-1,-1,1,-1,-1,-1,1,-1,1,1,1,1,1,-1,-1,-1,\\ &1,1,1,-1,-1,-1,1,-1,-1,-1,-1,1,-1,1,-1,1,1,1,1,1,1,-1,1,-1,\\ &1,-1,1,1,1,-1,1,-1,1,-1,1,1\} \end{aligned} \tag{25-46}$$

In a 1080 MHz transmission, the OCEF sequence transmitted is given by Equation (25-47).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$OCEF_{-177,\,177} = \{OCEF_{left},\, 0,\, 0,\, 0,\, OCEF_{right}\} \tag{25-47}$$

The generation of the time domain OCEF symbols per frequency segment is shown in Figure 25-25 (Generation of OCEF symbols per frequency segment) where $A_{OCEF}$ is given in Equation (25-48).

$$A^{k}_{OCEF} = \begin{cases} R_{OCEF}, k \in K_{Pilot} \\ P_{OCEF}, otherwise \end{cases} \tag{25-48}$$

where $K_{Pilot}$ is the set of subcarrier indices for the pilot tones.

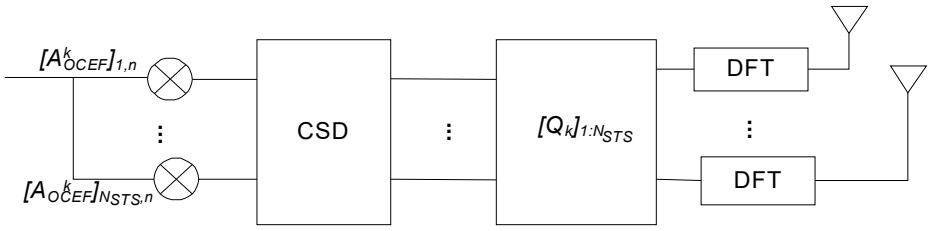

**Figure 25-25—Generation of OCEF symbols per frequency segment**

For a 540 MHz transmission, $K_{Pilot} = \{\pm 11, \pm 33, \pm 55, \pm 77\}$.

For a 1080 MHz transmission, $K_{Pilot} = \{\pm 11, \pm 33, \pm 55, \pm 77, \pm 99, \pm 121, \pm 143, \pm 165\}$.

$\mathbf{R}_{OCEF}$ is a $N_{OCEF} \times N_{OCEF}$ matrix whose elements are defined in Equation (25-49).

$$[R_{OCEF}]_{m,n} = [P_{OCEF}]_{1,n},\ 1 \le m, n \le N_{OCEF} \tag{25-49}$$

$$P_{OCEF} = \begin{bmatrix} 1 & -1 & 1 & 1 \\ 1 & 1 & -1 & 1 \\ 1 & 1 & 1 & -1 \\ -1 & 1 & 1 & 1 \end{bmatrix} \tag{25-50}$$

The time domain representation of the waveform transmitted on transmit chain $i_{TX}$ shall be as described by Equation (25-51).

$$r^{i_{TX}}_{OCEF}(t) = \sum_{n=0}^{N_{OCEF}-1} \frac{w_{T_{OCEF}}(t - nT_{OCEF})}{\sqrt{N_{Tone} N_{STS}}} \left( \sum_{k=-N_{SR}}^{N_{SR}} \sum_{m=1}^{N_{STS}} [Q_k]_{i_{TX},m} [A^{k}_{OCEF}] \Upsilon_{k,CBW} OCEF_k \exp(j2\pi\Delta_F(t - nT_{OCEF} - T_{GI} - T_{CM}(m))) \right) \tag{25-51}$$

where

$N_{Tone}$ is, for 540 MHz transmission, 176, and, for 1080 MHz transmission, 352

$T_{CS}$ is given in Table 25-27 (Cyclic shift values for the Data fields of a CMMG OFDM mode PPDU(#7168)(#404))

$Q_k$ is defined in 25.6.8.13 (Beamforming)

$\Upsilon_{k,CBW}$ is defined in 25.3.4.4 (Definition of tone rotation for CMMG OFDM mode transmission(#7168))

$T_{OCEF}$ is the duration of each OCEF symbol

$A_{OCEF}$ is defined in Equation (25-49)

### 25.6.8 Data fields

#### 25.6.8.1 General

The LDPC encoding process is composed of several steps including determining the number of padding bits, padding with 0s(M118), and the coding of every word.

#### 25.6.8.2 Scrambler

The operation of the scrambler is defined in 25.3.7 (Scrambler). The scrambling of the Data field continues the scrambling of the CMMG OFDM mode SIG with no reset for OFDM transmission.

#### 25.6.8.3 Encoding

See 25.3.12 (Encoding of Data field).

#### 25.6.8.4 OFDM symbol padding 0s(M118)

The number of symbol blocks, $N_{SYM}$, is calculated as

$$N_{SYM} = \left\lceil \frac{Length \times 8 + (8 + L_{CHECK}) \times N_{CW}}{R \cdot lcm\{m_{STBC}N_{CBPS}, L_{CW}\}} \right\rceil \cdot \frac{lcm\{m_{STBC}N_{CBPS}, L_{CW}\}}{N_{CBPS}} \quad (25\text{-}52)$$

where

$L_{CHECK}$ is the number of LDPC parity bits
$lcm\{a,b\}$ denotes the least common multiple of $a$ and $b$
$L_{CW}$ denotes the LDPC code word length
$Length$ is the length of the PSDU defined in the CMMG SIG field
$R$ is the code rate
$N_{CBPS}$ is the number of code bits per symbol as defined in the MCS table
$m_{STBC} = 2$ if STBC is used; else $m_{STBC} = 1$

$$N_{SPAD} = R \times N_{SYM} \times N_{CBPS} - (Length \times 8 + (8 + L_{CHECK}) \times N_{CW}) \quad (25\text{-}53)$$

The PSDU is concatenated with $N_{SPAD}$ 0s(M118). They are scrambled using the continuation of the scrambler sequence that scrambled the PSDU.

#### 25.6.8.5 Stream parser

After coding and puncturing, the data bit streams at the output of the FEC encoder are processed in groups of $N_{CBPS}$. Each of these groups is rearranged into $N_{ss}$ blocks of $N_{CBPSS}$ bits.

The number of bits assigned to a single axis (real or imaginary) of a constellation point in a spatial stream is denoted by Equation (25-54).

$$s = \max\left\{1, \frac{N_{BPSCS}}{2}\right\} \quad (25\text{-}54)$$

Consecutive blocks of $s$ bits are assigned to different spatial streams in a round robin fashion.

Bit $i$ at the output of encoder is assigned to input bit $k$ of spatial stream where

$$i = (i_{SS} - 1) \cdot s + N_{ss} \cdot s \cdot \left\lfloor \frac{k}{s} \right\rfloor + k \mod s \quad (25\text{-}55)$$

where $i_{SS} = 1, 2, \ldots, N_{SS}$, $i = 0, 1, \ldots, N_{CBPS} - 1$, $k = 0, 1, \ldots, N_{CBPSS} - 1$.

#### 25.6.8.6 Subcarrier modulation mapping

The OFDM subcarriers shall be modulated by using BPSK, QPSK, 16-QAM, or 64-QAM, depending on the RATE requested. The encoded and interleaved binary serial input data shall be divided into groups of (1, 2, 4, or 6) bits and converted into complex numbers representing BPSK, QPSK, 16-QAM, or 64-QAM constellation points. The conversion shall be performed according to Gray-coded constellation mappings, illustrated in Figure 25-26 (BPSK, QPSK, 16-QAM, and 64-QAM constellation bit encoding), with the input bit, $B_0$ being the earliest in the stream. The output values, $d$, are formed by multiplying the resulting ($I$+j$Q$) value by a normalization factor $K_{MOD}$, as described in Equation (25-56).

$$d = (I + jQ) \times K_{MOD} \tag{25-56}$$

The normalization factor, $K_{MOD}$, depends on the base modulation mode, as prescribed in Table 25-18 (Modulation-dependent normalization factor). Note that the modulation type can be different from the start to the end of the transmission, as the signal changes from SIGNAL to DATA, as shown in Figure 25-20 (64-QAM constellation bit encoding) and Figure 25-26 (BPSK, QPSK, 16-QAM, and 64-QAM constellation bit encoding). The purpose of the normalization factor is to achieve the same average power for all mappings. In practical implementations, an approximate value of the normalization factor may be used, as long as the device conforms with the modulation accuracy requirements described in 25.6.9.1.2 (Transmit EVM).

**Table 25-18—Modulation-dependent normalization factor**

| Modulation | $K_{MOD}$ |
|---|---|
| BPSK | 1 |
| QPSK | $1/\sqrt{2}$ |
| 16-QAM | $1/\sqrt{10}$ |
| 64-QAM | $1/\sqrt{42}$ |

For BPSK, $B_0$ determines the $I$ value, as illustrated in Table 25-19 (BPSK encoding table). For QPSK, $B_0$ determines the $I$ value, and $B_1$ determines the $Q$ value, as illustrated in Table 25-20 (QPSK encoding table). For 16-QAM, $B_0$ and $B_1$ determine the $I$ value, and $B_2$ and $B_3$ determine the $Q$ value, as illustrated in Table 25-21 (16-QAM encoding table). For 64-QAM, $B_0$, $B_1$, and $B_2$ determine the $I$ value, and $B_3$, $B_4$, and $B_5$ determine the $Q$ value, as illustrated in Table 25-22 (64-QAM encoding table).

**Table 25-19—BPSK encoding table**

### 25.6.8.7 Tone mapping

The LDPC tone mapping shall be performed on all LDPC encoded streams using an LDPC tone-mapping distance parameter, $D_{TM}$. $D_{TM}$ is constant for each bandwidth, and its value for different bandwidths is given in Table 25-23 (Value of tone mapping parameter(#7171)).

**Table 25-23—Value of tone mapping parameter(#7171)**

| Parameter | CBW540 | CBW1080 |
|---|---|---|
| $D_{TM}$ | 6 | 12 |

LDPC tone mapping for LDPC-coded streams is done by permuting the stream of complex numbers generated by the constellation mappers to obtain

$$d''_{t(k),i,n} = d'_{k,i,n} \quad (25\text{-}57)$$

where

$i = 1, 2, \ldots, N_{SS}$

$$t(k) = D_{TM}\left(k \bmod \frac{N_{SD}}{D_{TM}}\right) + \left\lfloor \frac{kD_{TM}}{N_{SD}} \right\rfloor \quad (25\text{-}58)$$

The two consecutively generated complex constellation numbers are transmitted on two data tones that are separated by at least $D_{TM} - 1$ from other data tones.

### 25.6.8.8 Space-time block coding

This subclause defines a set of optional robust transmission techniques that are applicable only when using STBC coding for (#7168)CMMG OFDM mode PPDUs. In this case, $N_{SS}$ spatial streams are mapped to $N_{STS}$ space-time streams. These techniques are based on STBC. When the STBC field in the CMMG SIG is 1, a symbol operation shall occur between the constellation mapper and the spatial mapper as defined in this subclause.

If STBC is applied, the stream of complex numbers $d_{k,i,n}$, $k = 0, 1, \ldots, N_{SD}-1$, $i = 1, 2, \ldots, N_{SS}$, $n = 0, 1, \ldots, N_{SYM}-1$, is the input to the STBC encoder, which produces as output the stream of complex numbers $\tilde{d}_{k,i_{STS},n}$, $k = 0, 1, \ldots, N_{SD}-1$, $i_{STS} = 1, 2, \ldots, N_{STS}$, $n = 0, 1, \ldots, N_{SYM}-1$. For given values of $k$ and $i$, STBC processing operates on the complex modulation symbols in sequential pairs of OFDM symbols so that the values of $\tilde{d}_{k,2i-1,2m}$ and $\tilde{d}_{k,2i,2m}$ depend on $\tilde{d}_{k,2i,2m}$ and $d_{k,i,2m+1}$. Also, $\tilde{d}_{k,2i-1,2m+1}$ and $\tilde{d}_{k,2i,2m+1}$ depend on $d_{k,i,2m}$ and $d_{k,i,2m+1}$. This is defined in Table 25-24 (Constellation mapper output to spatial mapper input for STBC).

If STBC is not applied, $d_{k,i,n} = \tilde{d}_{k,i,n}$ and $N_{STS} = N_{SS}$.

NOTE—When STBC is applied, an odd number of space-time streams is not allowed, and $N_{STS} = 2N_{SS}$.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 25-24—Constellation mapper output to spatial mapper input for STBC**

| $N_{STS}$ | $N_{SS}$ | $i_{STS}$ | $\tilde{d}_{k,i_{STS},2m}$ | $\tilde{d}_{k,i_{STS},2m+1}$ |
|---|---|---|---|---|
| 2 | 1 | 1 | $d_{k,1,2m}$ | $d_{k,1,2m+1}$ |
| | | 2 | $-d^*_{k,1,2m+1}$ | $d^*_{k,1,2m}$ |
| 4 | 2 | 1 | $d_{k,1,2m}$ | $d_{k,1,2m+1}$ |
| | | 2 | $-d^*_{k,1,2m+1}$ | $d^*_{k,1,2m}$ |
| | | 3 | $d_{k,2,2m}$ | $d_{k,2,2m+1}$ |
| | | 4 | $-d^*_{k,2,2m+1}$ | $d^*_{k,2,2m}$ |

### 25.6.8.9 Pilot subcarriers

For a 540 MHz transmission, eight pilot tones shall be inserted in subcarriers {± 77, ± 55, ± 33, ± 11}. The pilot mapping $P_n^k$ for subcarrier $k$ for symbol $n$ shall be as specified in Equation (25-59).

$$\begin{aligned} P_n^k \in \{-77,-55,-33,-11,11,33,55,77\} &= \{\Psi_{n \bmod 8}, \Psi_{(n+1) \bmod 8}, \ldots, \Psi_{(n+7) \bmod 8}\} \\ P_n^k \notin \{-77,-55,-33,-11,11,33,55,77\} &= 0 \end{aligned} \quad (25\text{-}59)$$

where $\Psi_m$ is defined in Table 25-25 (Pilot values for 540 MHz transmission(#7171)).

**Table 25-25—Pilot values for 540 MHz transmission(#7171)**

| $\Psi_0$ | $\Psi_1$ | $\Psi_2$ | $\Psi_3$ | $\Psi_4$ | $\Psi_5$ | $\Psi_6$ | $\Psi_7$ |
|---|---|---|---|---|---|---|---|
| 1 | 1 | 1 | –1 | –1 | 1 | 1 | 1 |

For a 1080 MHz transmission, 16 pilot tones shall be inserted in subcarriers –165, –143, –121, –99, –77, –55, –33, –11, 11, 33, 55, 77, 99, 121, 143, 165. The pilot mapping $P_n^k$ for subcarrier $k$ for symbol $n$ shall be as specified in Equation (25-60).

$$\begin{aligned} P_n^k \in \{-165,-143,-121,-99,-77,-55,-33,-11,11,33,55,77,99,121,143,165\} &= \{\Psi_{n \bmod 16}, \Psi_{(n+1) \bmod 16}, \ldots, \Psi_{(n+15) \bmod 16}\} \\ P_n^k \notin \{-165,-143,-121,-99,-77,-55,-33,-11,11,33,55,77,99,121,143,165\} &= 0 \end{aligned} \quad (25\text{-}60)$$

where $\Psi_m$ is defined in Table 25-26 (Pilot values for 1080 MHz transmission(#7171)).

**Table 25-26—Pilot values for 1080 MHz transmission(#7171)**

| $\Psi_0$ | $\Psi_1$ | $\Psi_2$ | $\Psi_3$ | $\Psi_4$ | $\Psi_5$ | $\Psi_6$ | $\Psi_7$ | $\Psi_8$ | $\Psi_9$ | $\Psi_{10}$ | $\Psi_{11}$ | $\Psi_{12}$ | $\Psi_{13}$ | $\Psi_{14}$ | $\Psi_{15}$ |

### 25.6.8.10 Cyclic shift diversity (CSD) for CMMG OFDM mode Data fields transmission(#7168)(#404)

The cyclic shift values defined in this subclause apply to the (#404)Data fields of the PPDU. Cyclic shifts are applied eliminate unintended beamforming when correlated signals are transmitted in multiple space-time streams $T_{CS}(n)$. The cyclic shift value for the (#404)Data fields for space-time stream $n$ out of $N_{STS}$ total space-time streams is shown in Table 25-27 (Cyclic shift values for the Data fields of a CMMG OFDM mode PPDU(#7168)(#404)).

**Table 25-27—Cyclic shift values for the Data fields of a CMMG OFDM mode PPDU(#7168)(#404)**

| $T_{CS}(n)$ values for the Data field of a PPDU | | | | |
|---|---|---|---|---|
| $N_{STS}$ | Cyclic shift for space-time stream $n$ (ns) | | | |
| | 1 | 2 | 3 | 4 |
| 1 | 0 | — | — | — |
| 2 | 0 | $-128T_S$ | — | — |
| 3 | 0 | $-170T_S$ | $-85T_S$ | — |
| 4 | 0 | $-128T_S$ | $-64T_S$ | $-192T_S$ |

### 25.6.8.11 OFDM modulation

The time domain waveform of the Data field of a CMMG OFDM mode PPDU from transmit chain, shall be as defined in Equation (25-61).

$$r_{Data}^{i_{TX}}(t) = \frac{1}{\sqrt{N_{Tone}N_{STS,total}}} \sum_{n=0}^{N_{SYM}-1} w_{T_{SYM}}(t - nT_{SYM}) \sum_{k=-N_{SR}}^{N_{SR}} \sum_{m=1}^{N_{STT}} [Q_K]_{i_{TX},m} \Upsilon_{k,CBW} (\tilde{D}_{k,m,n,CBW} + p_n P_n^k) \exp(j2\pi k\Delta_F(t - nT_{SYM} - T_{GI} - T_{CS}m)) \quad (25\text{-}61)$$

where

$p_n$ is defined in 17.3.5.10 (OFDM modulation)

$N_{Tone}$ is, for 540 MHz transmission, 176 and, for 1080 MHz transmission, 352

$\tilde{D}_{k,m,n,CBW}$ is the transmitted constellation on subcarrier $k$, space-time stream $m$, and Data field OFDM symbol $n$ and is defined in Equation (25-62) to Equation (25-64)

$T_{GI}$ is the (short) guard interval duration and is given in Table 25-3 (Timing-related parameters(#7171)(M118))

$T_{CS}(n)$ is given in 25.6.8.10 (Cyclic shift diversity (CSD) for CMMG OFDM mode Data fields transmission(#7168)(#404))

$P_n^k$ is defined in 25.6.8.9 (Pilot subcarriers)

$\Upsilon_{k,CBW}$ is defined in 25.3.4.4 (Definition of tone rotation for CMMG OFDM mode transmission(#7168))

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

For a 540 MHz transmission,

$$\tilde{D}_{k,m,n,540} = \begin{cases} 0, k = 0, \pm 1, \pm 11, \pm 33, \pm 55, \pm 77 \\ \tilde{d}_{M^r_{540}(k),m,n}, otherwise \end{cases} \quad (25\text{-}62)$$

and $M^r_{540}(k)$ is defined as

$$M^r_{540}(k) = \begin{cases} k+89, -89 \le k \le -78 \\ k+88, -76 \le k \le -56 \\ k+87, -54 \le k \le -34 \\ k+86, -32 \le k \le -12 \\ k+85, -10 \le k \le -2 \\ k+82, 2 \le k \le 10 \\ k+81, 12 \le k \le 32 \\ k+80, 34 \le k \le 54 \\ k+79, 56 \le k \le 76 \\ k+78, 78 \le k \le 89 \end{cases} \quad (25\text{-}63)$$

For a 1080 MHz transmission,

$$\tilde{D}_{k,m,n,1080} = \begin{cases} 0, k = 0, \pm 1, \pm 11, \pm 33, \pm 55, \pm 77, \pm 99, \pm 121, \pm 143, \pm 165 \\ \tilde{d}_{M^r_{1080}(k),m,n}, otherwise \end{cases} \quad (25\text{-}64)$$

and $M^r_{1080}(k)$ is defined as

$$M^r_{1080}(k) = \begin{cases} k+177, -177 \le k \le -166 \\ k+176, -164 \le k \le -144 \\ k+174, -142 \le k \le -122 \\ k+173, -120 \le k \le -100 \\ k+172, -98 \le k \le -78 \\ k+171, -76 \le k \le -56 \\ k+170, -54 \le k \le -34 \\ k+169, -32 \le k \le -12 \\ k+168, -10 \le k \le -2 \\ k+165, 2 \le k \le 10 \\ k+164, 12 \le k \le 32 \\ k+163, 34 \le k \le 54 \\ k+162, 56 \le k \le 76 \\ k+161, 78 \le k \le 98 \\ k+160, 100 \le k \le 120 \\ k+159, 122 \le k \le 142 \\ k+158, 144 \le k \le 164 \\ k+157, 166 \le k \le 177 \end{cases} \quad (25\text{-}65)$$

$\mathbf{Q}_k$ is a spatial mapping/steering matrix with $N_{TX}$ rows and columns $N_{STS}$ for subcarrier $k$. $\mathbf{Q}_k$ may be frequency dependent. Refer to the examples of listed in 19.3.11.11.2 (Spatial mapping) for examples of that could be used for (#7168)CMMG OFDM mode PPDU. Note that implementations are not restricted to the spatial mapping matrix examples listed in 19.3.11.11.2 (Spatial mapping).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 25.6.8.12 Duplication transmission

When the TXVECTOR parameter DUPLICATE_MODULATION is present, the transmitted PPDU is a duplicate. For 1080 MHz, the Data field shall be as defined by Equation (25-66).

$$r_{Data}^{i_{TX}}(t) = \frac{1}{\sqrt{N_{Tone}N_{STS,total}}} \sum_{n=0}^{N_{SYM}-1} w_{T_{SYM}}(t - nT_{SYM}) \sum_{k=-89}^{89} \sum_{m=1}^{N_{STS}} (\tilde{D}_{k,m,n} + p_n P_n^k)([Q_{k-88}]_{i_{TX,m}} \Upsilon_{k,CBW} \exp(j2\pi(k-88)\Delta_F(t - nT_{SYM} - T_{GI} - T_{CS}(m))) + j[Q_{k-88}]_{i_{TX,m}} \Upsilon_{k,CBW} \exp(j2\pi(k+88)\Delta_F(t - nT_{SYM} - T_{GI} - T_{CS}(m))))$$ (25-66)

where

$p_n$ is defined in 17.3.5.10

$N_{Tone}$ is 352

$\tilde{D}_{k,m,n}$ is the transmitted constellation on subcarrier $k$, space-time stream $m$, and Data field OFDM symbol $n$ and is defined in Equation (25-62) to Equation (25-64)

$T_{GI}$ is the (short) guard interval duration and is given in Table 25-3 (Timing-related parameters(#7171)(M118))

$T_{CS}(n)$ is given in 25.6.8.10 (Cyclic shift diversity (CSD) for CMMG OFDM mode Data fields transmission(#7168)(#404))

$P_n^k$ is defined in 25.6.8.9 (Pilot subcarriers)

$\Upsilon_{k,CBW}$ is defined in 25.3.4.4 (Definition of tone rotation for CMMG OFDM mode transmission(#7168))

### 25.6.8.13 Beamforming

#### 25.6.8.13.1 General

CMMG OFDM MIMO beamforming is used by a STA with multiple antennas (the beamformer) to steer signals using knowledge of the channel to improve throughput. With CMMG OFDM MIMO beamforming, all space-time streams in the transmitted signal are intended for reception at a single STA.

For CMMG OFDM MIMO beamforming, the steering matrix $\mathbf{Q}_k$ can be determined from the effective channel $\mathbf{H}_{eff,k}$, or the beamforming feedback matrix, $\mathbf{V}_k$, that is sent back to the beamformer by the beamformee using compressed beamforming feedback matrix format as defined in 25.6.8.13.2 (Compressed Beamforming feedback matrix). The feedback report format is described in 9.6.29.2 (CMMG Compressed Beamforming frame format).

#### 25.6.8.13.2 Compressed Beamforming feedback matrix

Upon receipt of (#2137)an NDP sounding PPDU, the beamformee shall remove the space-time stream CSD in Table 25-27 (Cyclic shift values for the Data fields of a CMMG OFDM mode PPDU(#7168)(#404)) from the measured channel before computing a set of matrices for feedback to the beamformer. The beamforming feedback matrix $\mathbf{V}_k$, found by the beamformee for subcarrier $k$ shall be compressed in the form of angles using the method described in 19.3.12.3.6 (Compressed beamforming feedback matrix). The angles, $\phi(k)$ and $\psi(k)$, are quantized according to Table 9-117 (Quantization of angles).

The beamformee shall generate the beamforming feedback matrices with the number of rows ($N_r$) equal to the $N_{STS}$ of the NDP.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

After receiving the angle information, $\phi(k)$ and $\psi(k)$, the beamformer reconstructs $\mathbf{V}_k$ using Equation (19-79). For CMMG OFDM MIMO beamforming, the beamformer can use this $\mathbf{V}_k$ matrix to determine the steering matrix $\mathbf{Q}_k$. The method used by the beamformer to calculate the steering matrix $\mathbf{Q}_k$ is implementation specific.

The beamformee decides the tone grouping value to be used in the beamforming feedback matrix **V**. A beamformer shall support all tone grouping values and codebook information values.

### 25.6.8.14 CMMG preamble format for sounding PPDU

#### 25.6.8.14.1 General

The MIMO channel measurement takes place in every PPDU as a result of transmitting the OCEFs as part of the PHY preamble. The number of OCEFs transmitted shall be determined by the number of space-time streams transmitted. The use of the same spatial transformation enables the computation of the spatial equalization at the receiver.

When the number of space-time streams, $N_{STS}$, is less than the number of transmit antennas, or less than min($N_{TX}$, $N_{RX}$), sending only $N_{STS}$ OCEFs does not allow the receiver to recover a full characterization of the MIMO channel, even though the resulting MIMO channel measurement is sufficient for receiving the Data field of the CMMG PPDU.

However, there are several cases where it is desirable to obtain as full a characterization of the channel as possible, thus requiring the transmission of a sufficient number of OCEFs to sound the full dimensionality of the channel, which is in some cases $N_{STS}$ and in other cases min($N_{TX}$, $N_{RX}$). These cases of MIMO channel measurement are referred to as MIMO channel sounding. A sounding PPDU may be used to sound available channel dimensions. A sounding PPDU is identified by setting the Not Sounding field in the CMMG SIG to 0. A sounding PPDU may have any allowed number of OCEFs satisfying $N_{OCEFs} \geq N_{STS}$ as shown in Table 25-17 (Number of OCEFs required for different numbers of space-time streams).

#### 25.6.8.14.2 Sounding with an NDP

A STA may sound the channel using (#2137)an NDP (indicated by zero in the Length field in the CMMGSIG field) with the Not Sounding field set to 0. The number of OCEFs is the number implied by the $2^{STBC}$ $N_{ss}$, which shall indicate spatial time streams. The last OCEF of an NDP shall not be followed by a Data field as shown in Figure 25-27 (CMMG NDP format).

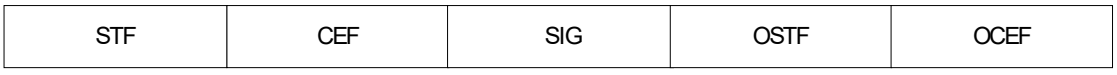

**Figure 25-27—CMMG NDP format**

It is optional for a STA to process an NDP.

#### 25.6.8.14.3 Sounding PPDU for channel quality assessment

In response to an MRQ, sent by STA A to STA B, the responding STA B returns to the requesting STA A an MCS selection that STA B determines to be a suitable MCS for STA A to use in subsequent transmissions to STA B. In determining the MCS, STA B performs a channel quality assessment, which entails using whatever information STA B has about the channel, such as an estimate of the MIMO channel derived from the sounding PPDU that carries the MRQ. To enable this calculation, the MRQ is sent in conjunction with a sounding PPDU.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The STA sending the MRQ (STA A) determines how many OCEFs to send and whether to use an NDP or not, based on the Transmit Beamforming Capabilities field, number of space-time streams used in the PPDU carrying the MRQ, the number of transmit chains it is using ($N_{TX}$), whether the transmit and receive STAs support STBC, and in some cases, the number of receive chains at the responding STA ($N_{RX}$).

The maximum number of available space-time streams is set by the number of transmit and receive chains and the STBC capabilities of the transmitter and receiver, as is shown in Table 25-28 (Maximum available space-time streams). While the number of receive chains at a STA is not communicated in a capabilities indicator, the maximum number of space-time streams supported may be inferred from the STBC capabilities of the receiving STA. When the number of receive chains is known at the transmitter, the number of OCEFs sent to obtain a full channel quality assessment is determined according to the maximum number of space-time streams indicated in Table 25-28 (Maximum available space-time streams). The number of OCEFs to use in conjunction with the indicated number of space-time streams is determined according to Table 25-17 (Number of OCEFs required for different numbers of space-time streams).

**Table 25-28—Maximum available space-time streams**

| $N_{TX}$ | $N_{RX}$ | $N_{STS,max}$ **without STBC** | $N_{STS,max}$ **with STBC** |
|---|---|---|---|
| 1 | 1 | 1 | N/A |
| 2 | 1 | 1 | 2 |
| 4 | 1 | 1 | 2 |
| 4 | 2 | 2 | 4 |

The sounding PPDU may have nonidentity spatial mapping matrix $\mathbf{Q}_k$. For different receiving STAs, $\mathbf{Q}_k$ may vary.

### 25.6.9 Performance requirements

#### 25.6.9.1 Transmit requirements

##### 25.6.9.1.1 Introduction

This subclause describes the performance requirement from the (#7168)CMMG OFDM mode transmitter.

##### 25.6.9.1.2 Transmit EVM

The transmit EVM accuracy test shall be performed by instrumentation capable of converting the transmitted signal into a stream of complex samples, with sufficient accuracy in terms of I/Q arm amplitude and phase balance, DC offsets, phase noise, etc.

The sampled signal shall be processed in a manner similar to an actual receiver, according to the following steps, or an equivalent procedure:

a) (#14)Start of PPDU shall be detected.

b) Transition from short sequences to channel estimation sequences shall be detected, and fine timing (with one sample resolution) shall be established.

c) Frequency offsets shall be estimated and corrected.

d) The (#14)PPDU shall be (Ed)derotated according to estimated frequency offset.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

e) The complex channel response coefficients shall be estimated for each of the subcarriers using information contained in the preamble (STF/CEF and/or OCEF).

f) For each of the OFDM symbols: transform the symbol into subcarrier received values, estimate the phase from the pilot subcarriers, derotate the subcarrier values according to estimated phase, and divide each subcarrier value with a complex estimated channel response coefficient.

g) For each data-carrying subcarrier, compute the Euclidean distance to the ideal location for the symbol, or pilot.

h) Compute the RMS average of all errors in (#14)the Data field of a PPDU. It is given by(#315)

$$EVM = 20\log 10\left(\frac{1}{N_f}\sum_{i=1}^{N_f}\sqrt{\frac{\sum_{j=1}^{N_{SYM}}\left\{\sum_{k\in K}\left[(I(i,j,k)-I^{*}(i,j,k))^{2}+(Q(i,j,k)-Q^{*}(i,j,k))^{2}\right]\right\}}{(N_{ST}-N_{DC})N_{SYM}P_{0}}}\right) \quad (25\text{-}67)$$

where

$N_f$ is the number of PPDUs(#14)

$i$ is the (#14)PPDU index

$k$ is the carrier index

$K$ is the set of pilot and data subcarriers $\{1,2, \ldots, (N_{SR}-1), (N_{SR}+N_{DC}), (N_{SR}+N_{DC}+1),\ldots, N_{ST}\}$

$j$ is the symbol index

$N_{SYM}$ is the number of symbols

$N_{ST}$ is the total number of subcarriers

$I^{*},Q^{*}$ is the ideal constellation point for I and Q, respectively

$P_0$ is the average power of the constellation $(I^{*},Q^{*})$ computed over the $i^{th}$ (#14)PPDU

The measurements shall occur on the OFDM symbols and shall not occur on the other kinds of symbols. The measurement shall be performed on at least 10 (#14)PPDUs with 16 symbols at least in each of them. Random data shall be used.

The EVM RMS error shall not exceed an MCS dependent value as found in Table 25-29 (EVM requirements for OFDM).

**Table 25-29—EVM requirements for OFDM**

| MCS index | Modulation | Coding rate | EVM value (dB) |
|---|---|---|---|
| 9 | BPSK | 1/2 | –7 |
| 10 | QPSK | 1/2 | –11 |
| 11 | QPSK | 3/4 | –13 |
| 12 | 16-QAM | 1/2 | –15 |
| 13 | 16-QAM | 3/4 | –19 |
| 14 | 64-QAM | 5/8 | –22 |
| 15 | 64-QAM | 3/4 | –24 |
| 16 | 64-QAM | 13/16 | –26 |

#### 25.6.9.2 TX flatness

##### 25.6.9.2.1 TX flatness for 540 MHz channel

(#6209)Let $E_i$ denote the constellation energy averaged over OFDM symbols for the subcarrier with index $i$, $E_{avg}$ denote $E_i$ averaged over $i$ equal to –70 to –2 and +2 to +70. When using the (#7168)CMMG OFDM mode and only while transmitting OFDM symbols, $E_i$ with $i$ equal to –70 to –2 and +2 to +70 shall not deviate by more than ± 2 dB from $E_{avg}$. And $E_i$ with $i$ equal to –71 to –89 and (#7157)+71 to +89 shall not deviate by more than +2/–4 dB from $E_{avg}$.

##### 25.6.9.2.2 TX flatness for 1080 MHz channel

(#6209)Let $E_i$ denote the constellation energy averaged over OFDM symbols for the subcarrier with index $i$, $E_{avg}$ denote $E_i$ averaged over $i$ equal to (#7157)–146 to –2 and +2 to +146. When using the (#7168)CMMG OFDM mode and only while transmitting OFDM symbols, $E_i$ with $i$ equal to –146 to –2 and +2 to +146 shall not deviate by more than ± 2 dB from $E_{avg}$. And $E_i$ with $i$ equal to –147 to –177 and +147 to +177 shall not deviate by more than +2/–4 dB from $E_{avg}$.

##### 25.6.9.2.3 Time of Departure accuracy

(#8055)The RMS accuracy of the time of departure provided in TIME_OF_DEPARTURE shall be less than or equal to 80 ns.

The Time of Departure accuracy test evaluates TIME_OF_DEPARTURE against aTxPHYTxStartRMS and aTxPHYTxStartRMS against TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH as defined in Annex P with the following test parameters:

— (#385)MULTICHANNEL_SAMPLING_RATE is $660\times10^6$ sample/s for a 540 MHz channel and $1320\times10^6$ sample/s for a 1080 MHz channel.
— FIRST_TRANSITION_FIELD is Short Training field.
— SECOND_TRANSITION_FIELD is Channel Estimation field.
— TRAINING_FIELD is Channel Estimation field.
— TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH is 80 ns.

NOTE—The indicated windowing applies to the time of departure accuracy test equipment, and not the transmitter or receiver.

#### 25.6.9.3 Receive requirements

##### 25.6.9.3.1 Introduction

Subclause 25.6.9.3.2 (CCA) describes the performance requirement for a (#7168)CMMG OFDM mode receiver.

##### 25.6.9.3.2 CCA

The start of a CMMG OFDM mode or CMMG SC mode transmission at a receive level greater than the minimum sensitivity for MCS 0 (–81 dBm for 540 MHz, –78 dBm for 1080 MHz) shall cause CCA to indicate busy with a probability > 90% within 1 µs.

## 25.7 Analog beamforming PPDU format(#14)

### 25.7.1 TX sector sweep

The (#14)PPDUs sent during TX sector sweep are (#7168)CMMG control mode packets as defined in 25.4 (CMMG control mode).

### 25.7.2 Beam refinement

#### 25.7.2.1 General

Beam refinement is a process where a STA can improve its antenna configuration (or antenna weight vectors) both for transmission and reception. If the SLS beamforming training did not include an RSS, as in the case where both devices have more than one transmit sector per antenna, beam refinement can serve as the first receive antenna configuration training. The procedure of beam refinement is described in 10.41.6.4 (BRP phase execution). In the beam refinement procedure, BRP PPDUs are used to train the receiver and transmitter antenna. There are two types of BRP PPDUs: BRP-RX PPDUs and BRP-TX PPDUs.

— BRP-RX PPDUs are PPDUs that have TRN-R training sequences following the Data field. These (#14)PPDUs enable receiver antenna weight vector training.

— BRP-TX PPDUs are PPDUs that have TRN-T training sequences following the Data field. The transmitting STA may change antenna configuration at the beginning of each sequence. The receiving STA performs measurements on these sequences and sends feedback to the STA that transmits the BRP-TX PPDU.

#### 25.7.2.2 BRP PPDU structure

(#3626)Each BRP PPDU is shown in Figure 25-28 (BRP PPDU structure).

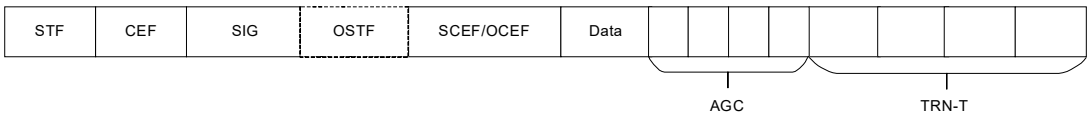

**Figure 25-28—BRP PPDU structure**

#### 25.7.2.3 BRP PPDU SIG fields

The PPDU Type field in a BRP PPDU is defined in Table 25-7 (Fields in the CMMG SIG field).

A value of *N* in the Training Length field indicates that the AGC has 4*N* subfields and that the TRN- R/T field has *N* subfields.

The value *N* in the Training Length field of a BRP-RX PPDU is equal to the value of the L-RX field requested by the intended receiver of the BRP-RX PPDU at a previously received BRP Request field (see 9.5.4 (BRP Request field)).

#### 25.7.2.4 Beam refinement AGC field

The beam refinement AGC fields are composed of 4*N* repetitions of the sequence $[Z^1_{64}\ Z^1_{64}\ Z^1_{64}\ Z^1_{64}\ Z^1_{64}]$ when the (#14)PPDU is transmitted using the (#7168)CMMG control mode in bandwidth 540 MHz, $[Z^2_{64}\ Z^2_{64}\ Z^2_{64}\ Z^2_{64}\ Z^2_{64}]$ when the (#14)PPDU is transmitted using the (#7168)CMMG SC mode in bandwidth 540 MHz, $[Z^3_{64}\ Z^3_{64}\ Z^3_{64}\ Z^3_{64}\ Z^3_{64}]$ when the (#14)PPDU is transmitted using the (#7168)CMMG OFDM mode in bandwidth 540 MHz, $[Z^1_{128}\ Z^1_{128}\ Z^1_{128}\ Z^1_{128}\ Z^1_{128}]$ when the (#14)PPDU is transmitted using the

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

(#7168)CMMG control mode in bandwidth 1080 MHz, $[Z_{128}^{2}\ Z_{128}^{2}\ Z_{128}^{2}\ Z_{128}^{2}\ Z_{128}^{2}]$ when the (#14)PPDU is transmitted using the (#7168)CMMG SC mode in bandwidth 1080 MHz, and $[Z_{128}^{3}\ Z_{128}^{3}\ Z_{128}^{3}\ Z_{128}^{3}\ Z_{128}^{3}]$ when the (#14)PPDU is transmitted using the (#7168)CMMG OFDM mode in bandwidth 1080 MHz. The sequences $Z_{64}^{1}$, $Z_{64}^{2}$, $Z_{64}^{3}$, $Z_{128}^{1}$, $Z_{128}^{2}$, and $Z_{128}^{3}$ are defined in 25.8 (ZCZ sequence). The sequences are transmitted using rotated π/2-QPSK modulation.

In a BRP-TX PPDU, the transmitter may change the TX AWV configuration at the beginning of each AGC subfield. Any transmit signal transients that occur due to this TX AWV configuration change shall completely settle by the end of the first $Z_{64}^{1}$, $Z_{64}^{2}$, or $Z_{64}^{3}$ subsequence in bandwidth 540 MHz and $Z_{128}^{1}$, $Z_{128}^{2}$, or $Z_{128}^{3}$ subsequence in bandwidth 1080 MHz. The set of AWVs used for the AGC subfields should be the same as that used for the TRN-T subfields. In a BRP-RX PPDU, the transmitter shall use the same TX AWV as in the preamble and (#404)Data fields of the (#14)PPDU.

#### 25.7.2.5 Beam refinement TRN-R subfield

The TRN-R subfields enable receiver AWV training. The TRN-R subfields have the form shown in Figure 25-29 (TRN-R subfield definition).

| CEF | $R_1$ | $R_2$ | $R_3$ | $R_4$ | CEF | $R_5$ | $R_6$ | $R_7$ | $R_8$ | ... |
|---|---|---|---|---|---|---|---|---|---|---|

**Figure 25-29—TRN-R subfield definition**

Each subfield CEF matches the Channel Estimation field defined in 25.3.5 (CMMG PHY preamble). The $4N$ subfields $R_1$ to $R_{4N}$ each consist of the sequence $[Z_{256}^{1}\ Z_{256}^{3}\ Z_{256}^{1}\ Z_{256}^{2}\ Z_{256}^{4}\ Z_{256}^{2}]$ in bandwidth 540 MHz and $[Z_{512}^{1}\ Z_{512}^{3}\ Z_{512}^{1}\ Z_{512}^{2}\ Z_{512}^{4}\ Z_{512}^{2}]$ in bandwidth 1080 MHz. The sequences $Z_{256}^{1}$, $Z_{256}^{2}$, $Z_{256}^{3}$, and $Z_{256}^{4}$ are defined in Table 25-33 (The sequence set Zi256, i=1,2,3,4), and $Z_{512}^{1}$, $Z_{512}^{2}$, $Z_{512}^{3}$, and $Z_{512}^{4}$ are defined in Table 25-34 (The sequence set Zi512, i=1,2,3,4) in 25.8 (ZCZ sequence). The sequences are transmitted using rotated π/2-QPSK modulation.

#### 25.7.2.6 Beam refinement TRN-T subfield

The TRN-T subfield enables transmitter AWV training. The TRN-T subfields have the form shown in Figure 25-30 (TRN-T subfield definition).

| CEF | $T_1$ | $T_2$ | $T_3$ | $T_4$ | CEF | $T_5$ | $T_6$ | $T_7$ | $T_8$ | ... |
|---|---|---|---|---|---|---|---|---|---|---|

**Figure 25-30—TRN-T subfield definition**

Each subfield CEF matches the Channel Estimation field defined in 25.3.5 (CMMG PHY preamble). The $4N$ subfields $T_1$ to $T_{4N}$ each consist of the sequence $[Z_{256}^{1}\ Z_{256}^{3}\ Z_{256}^{1}\ Z_{256}^{2}\ Z_{256}^{4}\ Z_{256}^{2}]$ in bandwidth 540 MHz and $[Z_{512}^{1}\ Z_{512}^{3}\ Z_{512}^{1}\ Z_{512}^{2}\ Z_{512}^{4}\ Z_{512}^{2}]$ in bandwidth 1080 MHz. The sequences $Z_{256}^{1}$, $Z_{256}^{2}$, $Z_{256}^{3}$, and $Z_{256}^{4}$ are defined in Table 25-33 (The sequence set Zi256, i=1,2,3,4), and $Z_{512}^{1}$, $Z_{512}^{2}$, $Z_{512}^{3}$, and $Z_{512}^{4}$ are defined in Table 25-34 (The sequence set Zi512, i=1,2,3,4) in 25.8 (ZCZ sequence). The sequences are transmitted using rotated π/2-QPSK modulation. When transmitting the CEF subfield, the transmitter shall use the same AWV as in the preamble and (#404)Data fields of the (#14)PPDU. Any transmit signal transients that occur due to TX AWV configuration changes between subfields shall settle by the end of the first 64 samples of the subfield.

#### 25.7.2.7 Channel measurement

The good autocorrelation properties of the ZCZ sequences enable reconstructing part of the impulse response of the channel between the transmitter and the receiver. The receiver should find the tap with largest amplitude in the channel during the CEF of the BRP-RX. It selects thereafter the set of taps that is measured around the tap with the largest amplitude, according to the value of dot11ChanMeasFBCKNtaps. It can select a contiguous set of taps or select a noncontiguous set of taps and include the tap delays subfield as part of the subfield measurement. It then measures the phase and amplitude of the corresponding channel taps in each of the TRN-T subfield repetition (except for those using the CEF AWV configuration). The beam refinement feedback subfield $k$–1 is the relative amplitude and phase of this tap in the $k$'th repetition compared to this tap in the first TRN-T subfield.

#### 25.7.2.8 BRP resampling in a CMMG OFDM mode PPDU(#7168)(#14)

The BRP AGC field, the CEF, and Tn/Rn field are specified at the SC chip rate ($T_c$). When appended to an OFDM (#14)mode PPDU, the signal is resampled as defined in 25.3.10 (CMMG duplication transmission on a 1080 MHz channel).

## 25.8 ZCZ sequence

The following ZCZ sequences set is used in the STF, the CEF, the SCTF, and the Unique Word (UW). These are 5 ZCZ sequences sets, namely, $Z_{32}^{i}$, $Z_{64}^{i}$, $Z_{128}^{i}$, $Z_{256}^{i}$, and $Z_{512}^{i}$, with $i$ = 1, 2, 3, 4where the subscript denotes the length of the sequences and the superscript denotes the index of the ZCZ sequence. The sets are generated using the following recursive procedure, illustrated as in Figure 25-31 (Generation of ZCZ sequences set).

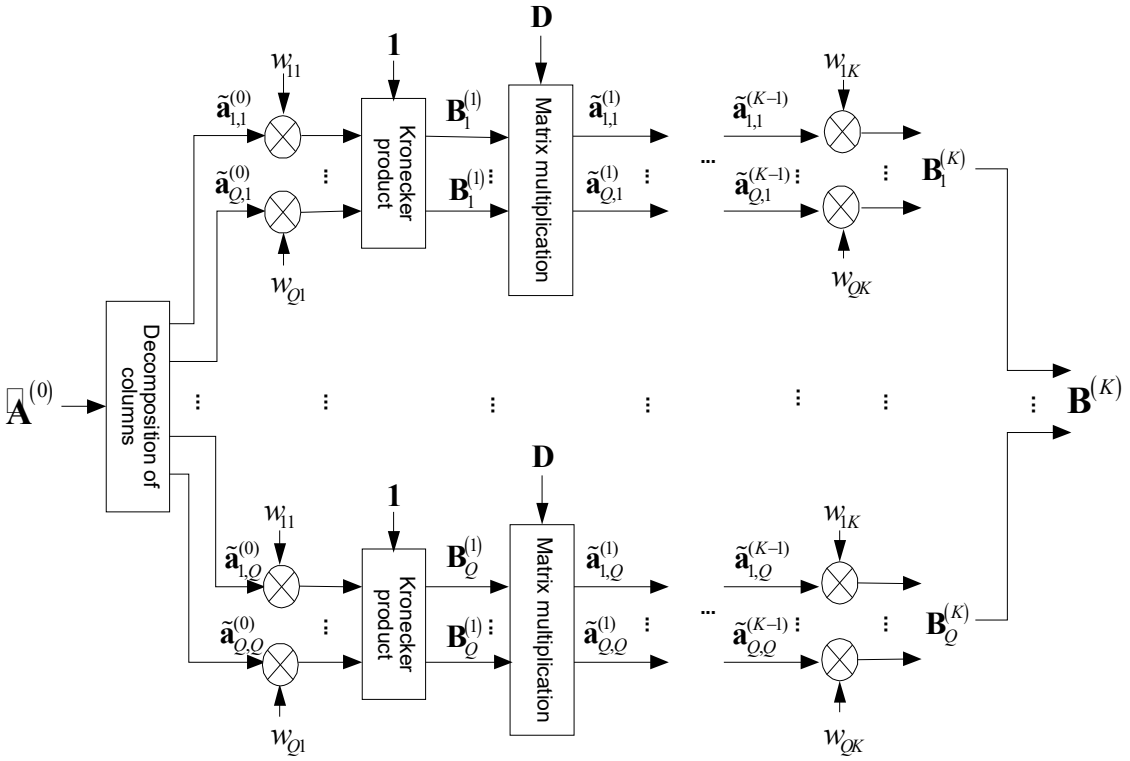

**Figure 25-31—Generation of ZCZ sequences set**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$\tilde{\mathbf{A}}^{(0)}$, $\mathbf{B}^{(k)}$, and $\tilde{\mathbf{A}}^{(k)}$ used in Figure 25-31 (Generation of ZCZ sequences set) are defined as follows, respectively.

$$\tilde{\mathbf{A}}^{(0)} = \begin{bmatrix} \tilde{\mathbf{a}}_{1,1}^{(0)} & \cdots & \tilde{\mathbf{a}}_{1,Q}^{(0)} \\ \cdots & \cdots & \cdots \\ \tilde{\mathbf{a}}_{Q,1}^{(0)} & \cdots & \tilde{\mathbf{a}}_{Q,Q}^{(0)} \end{bmatrix} \tag{25-68}$$

$$\mathbf{B}^{(k)} = \begin{bmatrix} w_{1,k}\mathbf{I}_{Q^{k-1}L} & \mathbf{0}_{Q^{k-1}L} & \cdots & \mathbf{0}_{Q^{k-1}L} \\ \mathbf{0}_{Q^{k-1}L} & w_{2,k}\mathbf{I}_{Q^{k-1}L} & \cdots & \mathbf{0}_{Q^{k-1}L} \\ \cdots & \cdots & \cdots & \cdots \\ \mathbf{0}_{Q^{k-1}L} & \mathbf{0}_{Q^{k-1}L} & \cdots & w_{Q,k}\mathbf{I}_{Q^{k-1}L} \end{bmatrix} \tilde{\mathbf{A}}^{(k-1)}, \tilde{\mathbf{A}}^{(k)} = \mathbf{D}(\mathbf{1} \otimes \mathbf{B}^{(k)}) \tag{25-69}$$

where

| | |
|---|---|
| $\tilde{\mathbf{a}}_{i,j}^{(0)}, i = 1, ..., Q, j = 1, ..., Q$ | denotes the initial sequence |
| $Q$ | is the number of ZCZ sequences |
| $\mathbf{I}_{Q^{k-1}L}$ | denotes the identity matrix of size $Q^{k-1}L \times Q^{k-1}L$ |
| $L$ | denotes the length of the initial sequence |
| $\mathbf{0}_{Q^{k-1}L}$ | denotes all zero matrix of size $Q^{k-1}L \times Q^{k-1}L$ |
| $w_{i,j}, i = 1, \ldots, Q, j = 1, \ldots, K$ | are elements of the coefficient matrix $\mathbf{W}$ of size $Q \times K$ |
| $K$ | is the number of the iterations |
| $\mathbf{D} = Diag(f_{1,1}\mathbf{I}_{Q^{k-1}L}, ..., f_{1,Q}\mathbf{I}_{Q^{k-1}L}, ..., f_{Q,1}\mathbf{I}_{Q^{k-1}L}, ..., f_{Q,Q}\mathbf{I}_{Q^{k-1}L})$ | with $Diag(\upsilon)$ denoting the diagonal matrix with diagonal element $\upsilon$ |
| $f_{i,j}, i = 1, \ldots, Q, j = 1, \ldots, Q$ | are elements of the Discrete Fourier Transform (DFT) matrix $\mathbf{F}_Q$ of size $Q \times Q$ |
| $\mathbf{1}$ | denotes all 1 column vector |
| $\otimes$ | denotes Kronecker product |

Note that $M = \{e^{(j2\pi\theta)/Q}\}_{\theta=0}^{Q-1}$, the elements of $\tilde{\mathbf{A}}^{(0)}$ belongs to $M$, and $w_{i,k} \in M, i = 1, ..., Q$.

When $\tilde{\mathbf{A}}^{(0)}$, $\mathbf{F}_4$, and $\mathbf{W}$ are given by Equation (25-70), the generated ZCZ sequence set $Z_{32}^i$ is listed in Table 25-30 (The sequence set Zi32, i=1,2,3,4) where 0, 1, 2, and 3 denote +1,+$j$,–1,–$j$.

$$\tilde{\mathbf{A}}^{(0)} = \begin{bmatrix} (-1,-1)^T & (-1,1)^T & (-1,-1)^T & (-1,1)^T \\ (-1,-1)^T & (-1,1)^T & (1,1)^T & (1,-1)^T \\ (-1,1)^T & (-1,-1)^T & (-1,1)^T & (-1,-1)^T \\ (-1,1)^T & (-1,-1)^T & (1,-1)^T & (1,1)^T \end{bmatrix}, \mathbf{F}_4 = \begin{bmatrix} 1 & 1 & 1 & 1 \\ 1 & j & -1 & -j \\ 1 & -1 & 1 & -1 \\ 1 & -j & -1 & j \end{bmatrix}, \mathbf{W} = \begin{bmatrix} 1 \\ -j \\ -1 \\ 1 \end{bmatrix} \tag{25-70}$$

When $\tilde{\mathbf{A}}^{(0)}$, $\mathbf{F}_4$, and $\mathbf{W}$ are given by Equation (25-71), the generated ZCZ sequence set $Z_{64}^i$ is listed in Table 25-31 (The sequence set Zi64, i=1,2,3,4) where 0, 1, 2, and 3 denote +1,+$j$,–1,–$j$.

$$\tilde{\mathbf{A}}^{(0)} = \begin{bmatrix} 1 & 1 & 1 & 1 \\ 1 & j & -1 & -j \\ 1 & -1 & 1 & -1 \\ 1 & -j & -1 & j \end{bmatrix}, \mathbf{F}_4 = \begin{bmatrix} 1 & 1 & 1 & 1 \\ 1 & j & -1 & -j \\ 1 & -1 & 1 & -1 \\ 1 & -j & -1 & j \end{bmatrix}, \mathbf{W} = \begin{bmatrix} -j & -1 \\ -1 & j \\ j & -j \\ -1 & -j \end{bmatrix} \tag{25-71}$$

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

When $\tilde{\mathbf{A}}^{(0)}$, $\mathbf{F}_4$, and $\mathbf{W}$ are given by Equation (25-72), the generated ZCZ sequence set $Z_{128}^i$ is listed in Table 25-32 (The sequence set Zi128, i=1,2,3,4) where 0, 1, 2, and 3 denote +1,+*j*,–1,–*j*.

$$\tilde{\mathbf{A}}^{(0)} = \begin{bmatrix} (-1,-1)^T & (-1,1)^T & (-1,-1)^T & (-1,1)^T \\ (-1,-1)^T & (-1,1)^T & (1,1)^T & (1,-1)^T \\ (-1,1)^T & (-1,-1)^T & (-1,1)^T & (-1,-1)^T \\ (-1,1)^T & (-1,-1)^T & (1,-1)^T & (1,1)^T \end{bmatrix}, \mathbf{F}_4 = \begin{bmatrix} 1 & 1 & 1 & 1 \\ 1 & j & -1 & -j \\ 1 & -1 & 1 & -1 \\ 1 & -j & -1 & j \end{bmatrix}, \mathbf{W} = \begin{bmatrix} j & j \\ 1 & -j \\ -j & -j \\ -j & j \end{bmatrix} \quad (25\text{-}72)$$

When $\tilde{\mathbf{A}}^{(0)}$, $\mathbf{F}_4$, and $\mathbf{W}$ are given by Equation (25-73), the generated ZCZ sequence set $Z_{256}^i$ is listed in Table 25-33 (The sequence set Zi256, i=1,2,3,4) where 0, 1, 2, and 3 denote +1,+*j*,–1,–*j*.

$$\tilde{\mathbf{A}}^{(0)} = \begin{bmatrix} 1 & 1 & 1 & 1 \\ 1 & j & -1 & -j \\ 1 & -1 & 1 & -1 \\ 1 & -j & -1 & j \end{bmatrix}, \mathbf{F}_4 = \begin{bmatrix} 1 & 1 & 1 & 1 \\ 1 & j & -1 & -j \\ 1 & -1 & 1 & -1 \\ 1 & -j & -1 & j \end{bmatrix}, \mathbf{W} = \begin{bmatrix} 1 & -1 & -j & -j \\ -1 & j & -j & -j \\ -j & -1 & -j & 1 \\ j & -j & -1 & j \end{bmatrix} \quad (25\text{-}73)$$

When $\tilde{\mathbf{A}}^{(0)}$, $\mathbf{F}_4$, and $\mathbf{W}$ are given by Equation (25-74), the generated ZCZ sequence set $Z_{512}^i$ $Z_{512}^i$ is listed in Table 25-34 (The sequence set Zi512, i=1,2,3,4) where 0, 1, 2, and 3 denote +1,+*j*,–1,–*j*, respectively.

$$\tilde{\mathbf{A}}^{(0)} = \begin{bmatrix} (-1,-1)^T & (-1,1)^T & (-1,-1)^T & (-1,1)^T \\ (-1,-1)^T & (-1,1)^T & (1,1)^T & (1,-1)^T \\ (-1,1)^T & (-1,-1)^T & (-1,1)^T & (-1,-1)^T \\ (-1,1)^T & (-1,-1)^T & (1,-1)^T & (1,1)^T \end{bmatrix}, \mathbf{F}_4 = \begin{bmatrix} 1 & 1 & 1 & 1 \\ 1 & j & -1 & -j \\ 1 & -1 & 1 & -1 \\ 1 & -j & -1 & j \end{bmatrix}, \mathbf{W} = \begin{bmatrix} 1 & -j & -j & -j \\ j & -j & j & -j \\ j & j & -j & -1 \\ -j & -j & 1 & -j \end{bmatrix} \quad (25\text{-}74)$$

## 25.9 Regulatory requirements

Wireless LANs (WLANs) implemented in accordance with this standard are subject to equipment certification and operating requirements established by regional and national regulatory administrations. The PHY specification establishes minimum technical requirements for interoperability, based upon established regulations at the time this standard was issued. These regulations are subject to revision or may be superseded.

## 25.10 Channelization

A CMMG channel is specified by the two PLME MIB fields specified in Table 25-35 (Fields to specify CMMG channels).

**Table 25-35—Fields to specify CMMG channels**

| Field | Meaning |
|---|---|
| dot11CMMGCurrentChannelWidth | Channel width. Possible values represent 540 MHz and 1080 MHz channels. |
| dot11CMMGCurrentChannelCenterFrequencyIndex | For a 540 MHz or 1080 MHz channel, denotes the channel center frequency. |

If dot11CMMGCurrentChannelWidth indicates a 540 MHz channel, the channel center frequency is given by Equation (25-75) (see Figure 25-32 (Channelization for CBW540(#7171))).

$$f(n)\ [GHz] = \quad (25\text{-}75)$$

$$\begin{cases} 42.66 + 0.54 \times (\text{dot11CMMGCurrentChannelCenterFrequencyIndex} - 1),\ 1 \le \text{dot11CMMGCurrentChannelCenterFrequencyIndex} \le 8 \\ 47.52 + 0.54 \times (\text{dot11CMMGCurrentChannelCenterFrequencyIndex} - 9),\ \text{dot11CMMGCurrentChannelCenterFrequencyIndex} = 9, 10 \end{cases}$$

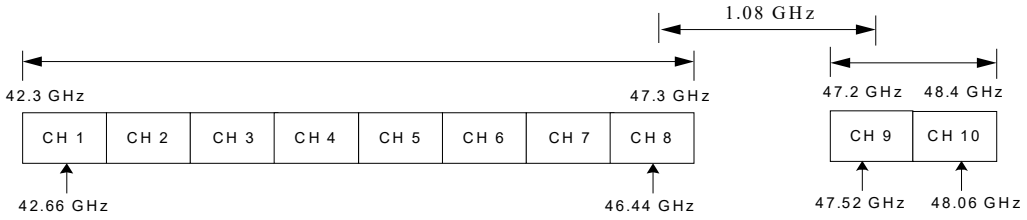

**Figure 25-32—Channelization for CBW540(#7171)**

If dot11CMMGCurrentChannelWidth indicates a 1080 MHz channel, the channel center frequency is given by Equation (25-76) (see Figure 25-33 (Channelization for CBW1080(#7171))).

$$f(n)\ [GHz] = \quad (25\text{-}76)$$

$$\begin{cases} 42.93 + 1.08 \times (\text{dot11CMMGCurrentChannelCenterFrequencyIndex} - 1),\ 1 \le \text{dot11CMMGCurrentChannelCenterFrequencyIndex} \le 4 \\ 47.79,\ \text{dot11CMMGCurrentChannelCenterFrequencyIndex} = 5 \end{cases}$$

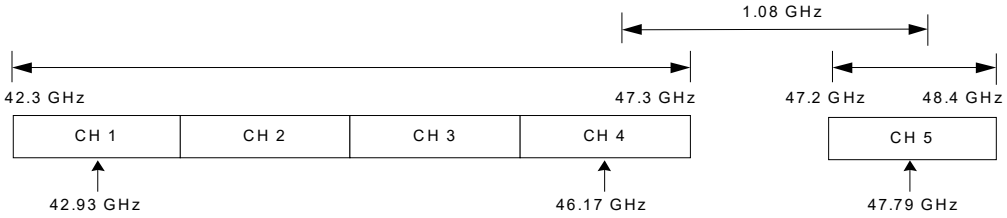

**Figure 25-33—Channelization for CBW1080(#7171)**

## 25.11 Transmit spectrum mask

For a 540 MHz or 1080 MHz mask PPDU, the interim transmit spectral mask shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth of 470 MHz or 940 MHz, –17 dBr at 330 MHz or 660 MHz frequency offset, –22 dBr at 1350 MHz or 2670 MHz frequency offset, and –30 dBr at 1530 MHz or 3060 MHz frequency offset and above. The interim transmit spectral mask for frequency offsets in between 235 MHz or 470 MHz and 330 MHz or 660 MHz, in between 330 MHz or 660 MHz and 1350 MHz or 2700 MHz, and in between 1350 MHz or 2700 MHz and 1530 MHz or 3060 MHz shall be linearly interpolated in dB domain from the requirements for 235 MHz, 330 MHz, 1350 MHz, and 1530 MHz frequency offsets. The transmit spectrum shall not exceed the maximum of the interim transmit spectral mask.

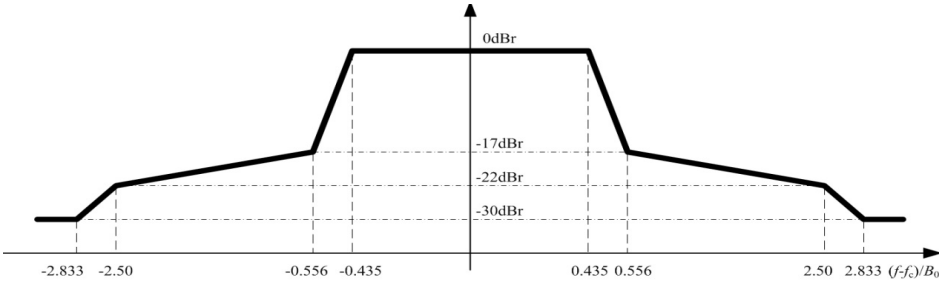

**Figure 25-34—Example transmit spectral mask for a PPDU**

## 25.12 PHY transmit procedure

### 25.12.1 PHY transmit procedure for a CMMG SC mode transmission

The PHY transmit procedure for a CMMG SC mode transmission is shown in Figure 25-35 (PHY transmit procedure for a CMMG SC mode transmission(#213)). In order to transmit data, a PHY-TXSTART.request primitive shall be enabled so that the PHY entity shall be in the transmit state. Further, the PHY shall be set to operate at the appropriate frequency through station management via the PLME, as specified in 25.14 (CMMG PLME). Other transmit parameters, such as MCS and transmit power, are set via the PHY SAP with the PHYTXSTART.request (TXVECTOR) primitive, as described in Table 25-1 (TXVECTOR and RXVECTOR parameters).

The PHY shall then issue a PHY-TXSTART.request primitive, and transmission of the PHY preamble shall start, based on the parameters passed in the PHY-TXSTART.request primitive. The PHY shall calculate the length of the (#14)PPDU according the MCS and the length specified in the PHY-TXSTART.request primitive, adding padding bits if necessary.

The PHY continues with the scrambling, encoding, and transmission of the CMMG-SIG-A according to the PHY-TXSTART.request(TXVECTOR) primitive parameters. The PHY proceeds with PSDU transmission through a series of data octet transfers from the MAC. The data are encoded as described in 25.5.6.3 (Encoding). The encoded data are then modulated as described in 25.5.6.6 (Constellation mapping), depending on the MCS requested in the PHY_TXSTART.request primitive. Transmission can be prematurely terminated by the MAC through the PHY-TXEND.request primitive. PHY-TXSTART shall be disabled by receiving a PHY-TXEND.request primitive.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Transmission of the PSDU is completed with the transmission of the last bits of the (encoded) PSDU. If no TRN-T/R fields are specified in the PHY-TXSTART.request primitive, the PHY shall issue a PHY-TXEND.confirm primitive after the transmission of the last bits. If TRN-T and TRN-R fields are requested in the PHY-TXSTART.request primitive, the transmission continues with the transmission of AGC subfields and TRN-T/R subfields. The PHY issues the PHY-TXEND.confirm primitive to the MAC after the transmission of the last TRN-T/R subfield. The (#14)PPDU transmission shall be completed, and the PHY entity shall enter the receive state (i.e., PHYTXSTART shall be disabled). Each PHY-TXEND.request primitive is acknowledged with a PHY-TXEND.confirm primitive from the PHY.

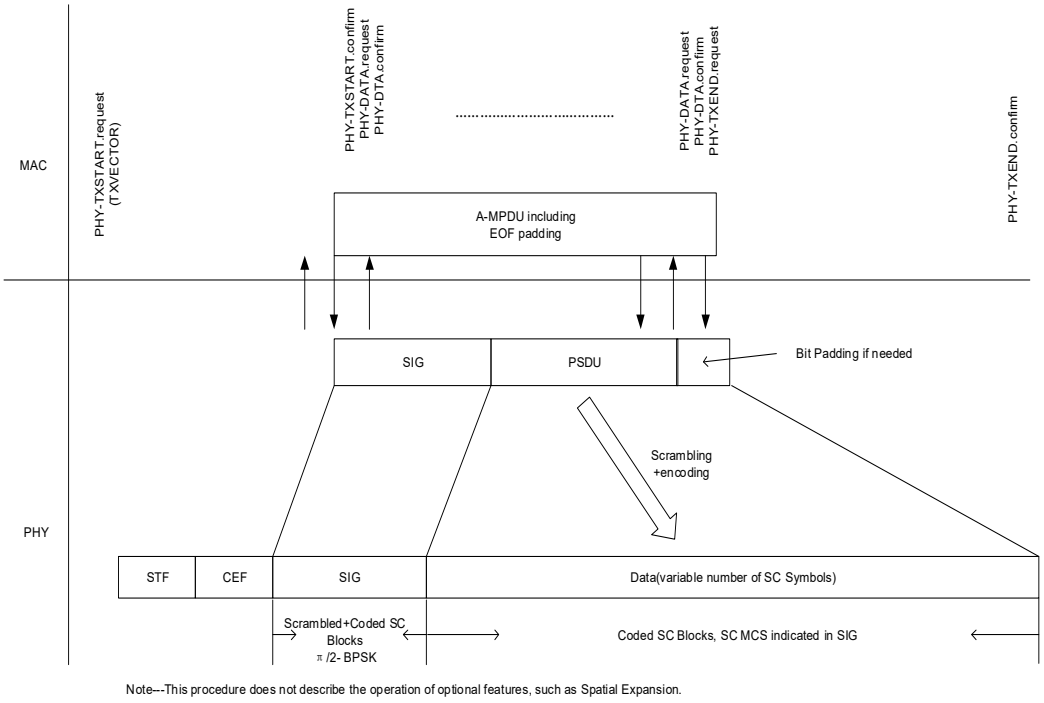

**Figure 25-35—PHY transmit procedure for a CMMG SC mode transmission(#213)**

### 25.12.2 PHY transmit procedure for a CMMG OFDM mode transmission

The PHY transmit procedure for a CMMG OFDM transmission is shown in Figure 25-36 (PHY transmit procedure for a CMMG OFDM mode transmission(#213)). In order to transmit data, a PHY-TXSTART.request primitive shall be enabled so that the PHY entity shall be in the transmit state. Further, the PHY shall be set to operate at the appropriate frequency through station management via the PLME, as specified in 25.14 (CMMG PLME). Other transmit parameters, such as MCS and transmit power, are set via the PHY SAP with the PHYTXSTART.request(TXVECTOR) primitive, as described in Table 25-1 (TXVECTOR and RXVECTOR parameters).

The PHY shall then issue a PHY-TXSTART.request primitive, and transmission of the PHY preamble shall start, based on the parameters passed in the PHY-TXSTART.request primitive. The PHY shall calculate the length of the packet according the MCS and the length specified in the PHY-TXSTART.request primitive, adding padding bits if necessary.

The PHY continues with the scrambling, encoding, and transmission of the CMMG SIG according to the PHY-TXSTART.request(TXVECTOR) primitive parameters. The PHY proceeds with PSDU transmission through a series of data octet transfers from the MAC. The data are scrambled and encoded as described

This is an unapproved IEEE Standards Draft, subject to change.

in 25.6.8.2 (Scrambler) and 25.6.8.3 (Encoding), respectively. The encoded data are then modulated as described in 25.6.8.6 (Subcarrier modulation mapping), depending on the MCS requested in the PHY-TXSTART.request primitive. Transmission can be prematurely terminated by the MAC through the PHY-TXEND.request primitive. PHY-TXSTART shall be disabled by receiving a PHY-TXEND.request primitive.

Transmission of the PSDU is completed with the transmission of the last bits of the (encoded) PSDU. If no TRN-T/R fields are specified in the PHY-TXSTART.request primitive, the PHY shall issue a PHY-TXEND.confirm primitive after the transmission of the last bits. If TRN-T and TRN-R fields are requested in the PHY-TXSTART.request primitive, the transmission continues with the transmission of AGC subfields and TRN-T/R subfields. The PHY issues the PHY-TXEND.confirm primitive to the MAC after the transmission of the last TRN-T/R subfield. The (#14)PPDU transmission shall be completed, and the PHY entity shall enter the receive state (i.e., PHYTXSTART shall be disabled). Each PHY-TXEND.request primitive is acknowledged with a PHY-TXEND.confirm primitive from the PHY.

A typical state machine implementation of the transmit PHY for a (#7168)CMMG OFDM mode transmission is provided in Figure 25-37 (Typical Tx state machine(#8150)). This state machine does not describe the operation of optional features, such as STBC.

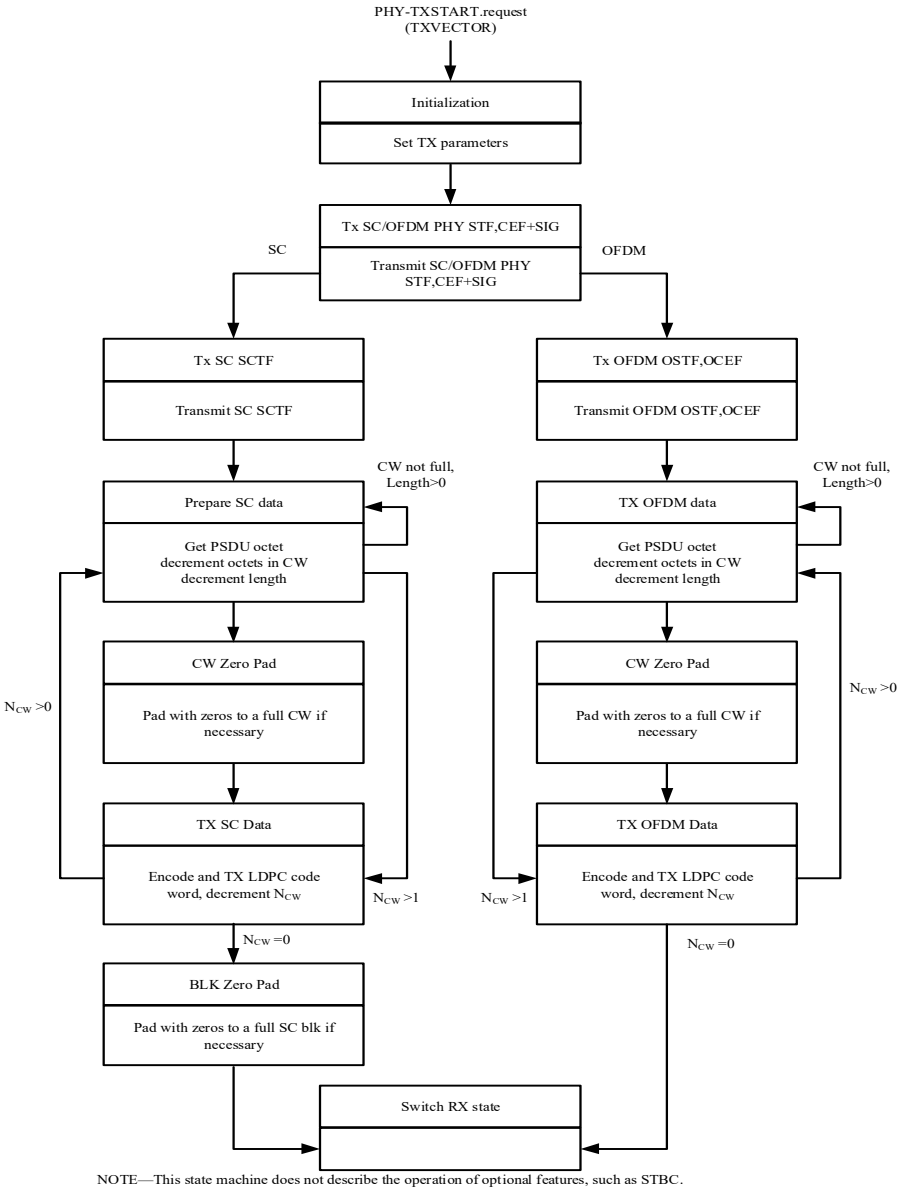

**Figure 25-37—Typical Tx state machine(#8150)**

## 25.13 Receive procedure

A typical PHY receive procedure is shown in Figure 25-39 (Typical Rx state machine(#14)(#1574)(#6313)) for a CMMG SC mode transmission.

Upon receiving the transmitted PHY preamble overlapping the primary 540 MHz channel, the PHY measures a receive signal strength. This activity is indicated by the PHY to the MAC via a PHY-CCA.indication primitive. A PHY-CCA.indication (BUSY, channel-list) primitive is also issued as an

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

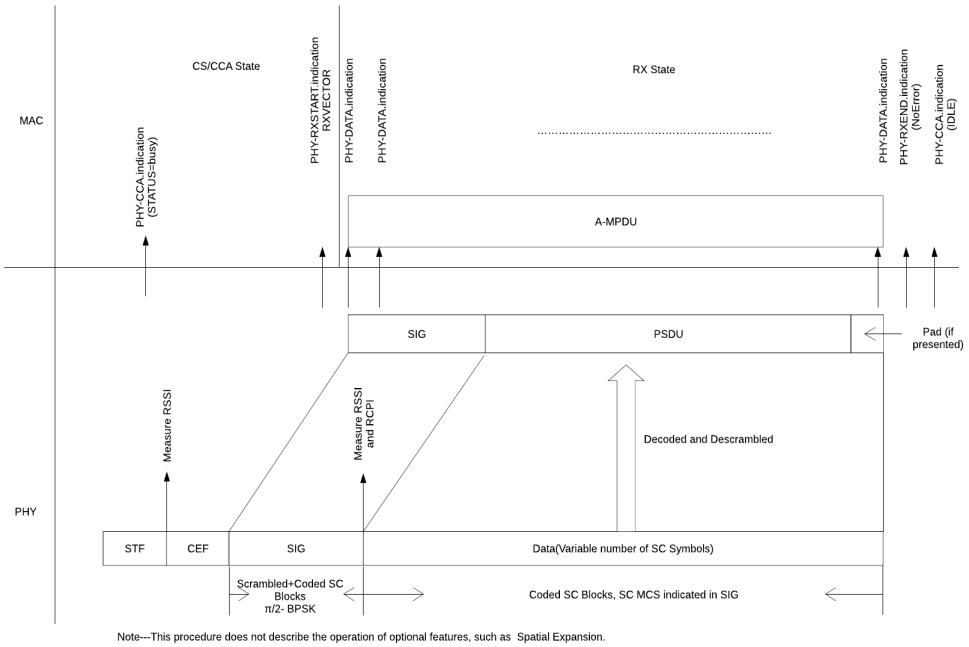

**Figure 25-38—PHY receive procedure for a CMMG SC mode transmission**

initial indication of reception of a signal as specified in 25.6.9.3.2 (CCA). The channel-list parameter of the PHY-CCA.indication primitive is absent when the operating channel width is 540 MHz. The channel-list parameter is present and includes the entry primary when the operating channel width is 1080 MHz.

After the PHY-CCA.indication(BUSY) primitive is issued, the PHY entity shall use the following ZCZ sequences of length 256 for synchronization and channel estimation. If the CE field indicated a(#1424) (#7168)CMMG SC mode, the receiver is capable of receiving (#7168)CMMG SC mode. The PHY shall decode the CMMG SIG and determine the MCS, length, and other parameters needed for the demodulation of (#14)the remainder of the PPDU.

Subsequently, if dot11TimingMsmtActivated is true, a PHY-RXSTART.indication(RXVECTOR) primitive shall be issued, and the RX-START_OF_FRAME_OFFSET parameter within the RXVECTOR shall be forwarded (see 25.2.2 (TXVECTOR and RXVECTOR parameters)).

NOTE—The RX_START_OF_FRAME_OFFSET value is used (#3049)to estimate when the start of the preamble for the incoming (#14)PPDU was detected on the medium at the receive antenna connector.

(#14)At the end of the Data field, the PHY shall indicate PHY-RXEND.indication(No_Error) primitive to the MAC. If the CMMG SIG indicated the presence of the training field, the PHY shall continue to receive these training fields (#14)after the Data field and measure the channel. After the end of the training fields, the PHY shall generate a PHY-CCA.indication(IDLE) primitive.

In the case of signal loss before the decoding of the CMMG SIG or in the case of an invalid header, the PHY shall not generate a PHY-CCA.indication(IDLE) primitive until the received level drops below a value that is 20 dB higher than the receiver sensitivity of MCS 1. In the case of signal loss after decoding of a valid CMMG SIG, the PHY shall not generate a PHY-CCA.indication(IDLE) primitive until the expected end of the packet, including the AGC and TRN fields.

## 25.14 CMMG PLME

### 25.14.1 PLME SAP layer management primitive(#6320)

Table 25-36 (CMMG PHY MIB attributes) lists the MIB attributes that may be accessed by the PHY entities and the intralayer of higher level LMEs. These attributes are accessed via the PLME-GET, PLME-SET, PLME-RESET, and PLME-CHARACTERISTICS primitives defined in 6.7 (PLME SAP interface).

### 25.14.2 PHY MIB

CMMG PHY MIB attributes are defined in Annex C with specific values defined in Table 25-36 (CMMG PHY MIB attributes). The (#4177)Operational semantics column in Table 25-36 (CMMG PHY MIB attributes) contains two types: static and dynamic.

— Static MIB attributes are fixed and cannot be modified for a given PHY implementation.

— Dynamic MIB attributes are interpreted according to the MAX-ACCESS field of the MIB attribute.

When MAX-ACCESS is read-only, the MIB attribute value may be updated by the PLME and read from the MIB attribute by management entities. When MAX-ACCESS is read-write, the MIB attribute may be read and written by management entities but shall not be updated by the PLME.

**Table 25-36—CMMG PHY MIB attributes**

| Managed object | Default value/ range | Operational semantics |
|---|---|---|
| **dot11PHYOperationTable** | | |
| dot11PHYType | cmmg(13) | Static |

### 25.14.3 TXTIME calculation

The value of the TXTIME parameter returned by the PLME-TXTIME.confirm primitive shall be calculated for a(#1424) (#7168)CMMG SC mode PPDU using Equation (25-77) and for a (#7168)CMMG OFDM mode PPDU using Equation (25-78).

$$TXTIME = T_{STF} + T_{CEF} + T_{SIG} + T_{SCTF} + N_{BL} \times T_{BLK} \quad (25\text{-}77)$$

$$TXTIME = T_{STF} + T_{CEF} + T_{SIG} + T_{OSTF} + N_{OCEF} T_{OCEF} + N_{SYM} \times T_{SYM} \quad (25\text{-}78)$$

where $T_{STF}$, $T_{CEF}$, $T_{SIG}$, $T_{SCTF}$, $T_{OSTF}$, and $T_{OCEF}$ are defined in Table 25-3 (Timing-related parameters(#7171)(M118)).

For an NDP, there is no Data field, and $N_{SYM} = 0$.

For a(#1424) (#7168)CMMG SC mode PPDU, the total number of data blocks in the Data field, $N_{BL}$, is given by Equation (25-27).

### 25.14.4 PHY characteristics

(#2123)The CMMG PHY characteristics, provided through the PLME-CHARACTERISTICS service primitive, are shown in Table 25-37 (CMMG PHY characteristics). The definitions for these characteristics are given in 6.7.4 (PLME-CHARACTERISTICS.confirm).

**Table 25-37—CMMG PHY characteristics**

| PHY parameter | Value |
|---|---|
| aRIFSTime | 1 μs |
| aSIFSTime | 3 μs |
| aRxRFDelay | Implementation dependent |
| aRxPHYDelay | Implementation dependent |
| aRxTxTurnaroundTime | 1 μs |
| aCCATime | 3 μs |

| aPSDUMaxLength | 262 143 octets |
| aSCBlockSize | 256 for 540 MHz<br>512 for 1080 MHz |

## 25.15 Parameters for CMMG-MCSs

### 25.15.1 General

The rate-dependent parameters for 540 MHz and 1080 MHz are given in 25.15.2 (Parameters for CMMG-MCSs with CMMG SC mode transmission(#7168)) and 25.15.3 (Parameters for CMMG-MCSs with CMMG OFDM mode transmission(#7168)). Support for short GI is optional in all cases. Support for CMMG-MCSs 4 to 16 is optional in all cases. A CMMG STA shall support single spatial stream CMMG-MCSs within the range CMMG-MCS 0 to 3 for 540 MHz channel widths for which it has indicated support

This is an unapproved IEEE Standards Draft, subject to change.

regardless of the Tx or Rx Highest Supported Long GI Data Rate subfield values in the Supported CMMG-MCS and NSS Set field. When more than one spatial stream is supported, the Tx or Rx Highest Supported Long GI Data Rate subfield values in the Supported CMMG-MCS and NSS Set field may result in a reduced CMMG-MCS range (cut-off) for $N_{SS}$ = 2, 3, 4. Support for 540 MHz with $N_{SS}$ = 1 and SC transmission is mandatory. Support for 540 MHz and 1080 MHz with $N_{SS}$ = 2, 3, 4 and SC transmission is optional. Support for 540 MHz and 1080 MHz with OFDM transmission is optional.

### 25.15.2 Parameters for CMMG-MCSs with CMMG SC mode transmission(#7168)

The related parameters for different modulation are summarized in Table 25-38 (CMMG SC MCSs for mandatory 540 MHz, Nss=1) to Table 25-41 (CMMG SC MCSs for optional 540 MHz, Nss=4 (Optional)) for 540 MHz channel bandwidth with (#7168)CMMG SC mode transmission.

**Table 25-38—CMMG SC MCSs for mandatory 540 MHz, $N_{ss}$=1**

| MCS index | Modulation | *R* | $N_{CBPS}$ | Data rate (Mb/s) | |
|---|---|---|---|---|---|
| | | | | Long GI | Short GI |
| 1 | π/2-BPSK | 1/2 | 1 | 165.00 | 192.50 |
| 2 | π/2-QPSK | 1/2 | 2 | 330.00 | 385.00 |
| 3 | π/2-QPSK | 3/4 | 2 | 495.00 | 577.50 |

# 26. High-efficiency (HE) MAC specification(11ax)

## 26.1 Introduction

An HE STA (#7024)has a MAC and MLME that comprises the functions defined in Clause 26 (High-efficiency (HE) MAC specification(11ax)) as well as the functions defined in Clause 10 (MAC sublayer functional description), the MLME functions defined in Clause 11 (MLME), and the security functions defined in Clause 12 (Security), except when the functions in Clause 26 (High-efficiency (HE) MAC specification(11ax)) supersede the functions in Clause 10 (MAC sublayer functional description) or Clause 11 (MLME).

(#7024)A frame successfully transmitted by a non-AP STA in response to a Basic Trigger frame is a successful frame exchange sequence(#109) initiated by the STA as referred to in Clause 11 (MLME) and Clause 12 (Security).

## 26.2 HE channel access

### 26.2.1 TXOP duration-based RTS/CTS

In an HE BSS, the use of RTS/CTS can be TXOP duration based or PSDU length based. An HE AP may configure a non-AP HE STA to use the TXOP duration-based RTS/CTS exchanges to help mitigate interference in dense environments.

An HE AP may set the TXOP Duration RTS Threshold subfield in the HE Operation Parameters field in the HE Operation element it transmits to a value between 1 and 1022 to enable TXOP duration-based RTS/CTS exchanges of its associated STAs. The AP may set the TXOP Duration RTS Threshold field to 1023 to disable TXOP duration-based RTS/CTS exchanges of its associated STAs. In Beacon and Probe Response frames, the AP may set the TXOP Duration RTS Threshold field to 0 to make no changes to TXOP duration-based RTS/CTS exchanges of its associated STAs.

If the TXOP Duration RTS Threshold subfield in the HE Operation Parameters field in the most recently received HE Operation element sent by the AP with which a non-AP HE STA is associated is equal to a nonzero value, then the non-AP HE STA shall set dot11TXOPDurationRTSThreshold to the value of the TXOP Duration RTS Threshold subfield. Otherwise, the non-AP HE STA shall not update dot11TXOPDurationRTSThreshold.

The TXOP duration-based RTS/CTS exchange is disabled at a non-AP HE STA if dot11TXOPDurationRTSThreshold is 1023. The TXOP duration-based RTS/CTS exchange is enabled at a non-AP HE STA when dot11TXOPDurationRTSThreshold is less than 1023.

A non-AP HE STA shall use an RTS/CTS exchange to initiate a TXOP if TXOP duration-based RTS/CTS exchange is enabled at a non-AP HE STA and the following conditions are met:

— The STA intends to transmit individually addressed frames to the HE AP or to a TDLS peer STA
— The TXOP duration is greater than or equal to 32 μs × dot11TXOPDurationRTSThreshold

Otherwise, the non-AP HE STA follows the rules defined in 10.3.1 (General).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 26.2.2 Intra-BSS and inter-BSS PPDU classification

A STA shall classify a received PPDU as an inter-BSS PPDU if at least one of the following conditions is true:

— (#1023)The BSS color is not disabled (see 26.17.3.3 (Disabling BSS color)) and the(#8140) RXVECTOR parameter BSS_COLOR is not 0 and is not the BSS color of the BSS of which the STA is a member.

— The PPDU is a VHT PPDU with RXVECTOR parameter PARTIAL_AID not equal to the BSSID[39:47] of the BSS in which the STA is associated or any of the other BSSs in the same multiple BSSID set or co-hosted BSSID set to which its BSS belongs and the RXVECTOR parameter GROUP_ID is 0.

— The PPDU is a VHT PPDU with RXVECTOR parameter PARTIAL_AID[5:8] not equal to the 4 LSBs of the BSS color announced by the BSS of which the STA whose dot11PartialBSSColorImplemented is equal to true is a member and RXVECTOR parameter GROUP_ID equal to 63 when the Partial BSS Color field in the most recent HE Operation element is 1.

— The PPDU is either a VHT MU PPDU or an HE MU PPDU with the RXVECTOR parameter UPLINK_FLAG equal to 0, and the STA is an AP.

— The PPDU carries a frame that has a BSSID field, the value of which is not the BSSID of the BSS in which the STA is associated or any of the other BSSs in the same multiple BSSID set or co-hosted BSSID set to which its BSS belongs or the wildcard BSSID.

— The PPDU carries a frame that does not have a BSSID field but has both an RA field and TA field, neither value of which is equal to the BSSID of the BSS in which the STA is associated or any of the other BSSs in the same multiple BSSID set or co-hosted BSSID set to which its BSS belongs. The Individual/Group bit in the TA field(#3522) is forced to 0 prior to comparison.

A STA shall classify the received PPDU as an intra-BSS PPDU if at least one of the following conditions is true:

— (#1023)The BSS color is not disabled (see 26.17.3.3 (Disabling BSS color)) and the RXVECTOR parameter BSS_COLOR(#1021) is the BSS color of the BSS of which the STA is a member or the BSS color of any (#2152)TDLS direct links to which the STA belongs if the STA is an HE STA associated with a non-HE AP.

— The PPDU is a VHT PPDU with RXVECTOR parameter PARTIAL_AID equal to the BSSID[39:47] of the BSS in which the STA is associated or any of the other BSSs in the same multiple BSSID set or co-hosted BSSID set to which its BSS belongs and the RXVECTOR parameter GROUP_ID equal to 0.

— The PPDU is a VHT PPDU with RXVECTOR parameter PARTIAL_AID[5:8] equal to the 4 LSBs of the BSS color announced by of the BSS of which the STA whose dot11PartialBSSColorImplemented is equal to true is a member, the RXVECTOR parameter GROUP_ID is equal to 63, and the Partial BSS Color field in the most recent HE Operation element is 1.

— The PPDU carries a frame that has an RA, TA, or BSSID field value that is equal to the BSSID of the BSS or the BSSID of any BSS in which the STA is associated or any of the other BSSs in the same multiple BSSID set or co-hosted BSSID set to which its BSS belongs. The Individual/Group bit in the TA field(#3522) is forced to 0 prior to the comparison.

— The PPDU carries a Control frame that does not have a TA field and that has an RA field value that matches the saved TXOP holder address of the BSS or any BSS in which the STA is associated or any of the other BSSs in the same multiple BSSID set or co-hosted BSSID set to which its BSS belongs.

NOTE—See 10.19 for the definition of PARTIAL_AID[5:8] and BSSID[39:47].

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Otherwise, the PPDU cannot be determined as an intra-BSS or inter-BSS PPDU.

If, based on the MAC address information of a frame carried in a received PPDU, the received PPDU satisfies both intra-BSS and inter-BSS conditions, then the received PPDU is classified as an intra-BSS PPDU.

If the received PPDU satisfies the intra-BSS conditions using the RXVECTOR parameter BSS_COLOR and also satisfies the inter-BSS conditions using MAC address information of a frame carried in the PPDU, then the classification made using the MAC address information takes precedence. (#1023)

### 26.2.3 SRG PPDU identification

Identification of SRG and non-SRG PPDUs is used during SRG OBSS PD spatial reuse operation as described in 26.10 (HE spatial reuse operation(#2389)).

A non-AP HE STA that has received a Spatial Reuse Parameter Set element from its associated AP with a value of 1 in the SRG Information Present subfield shall use information provided in the Spatial Reuse Parameter Set element to identify BSSs that are members of the STA's SRG to determine if a received inter-BSS PPDU is an SRG PPDU. An HE AP may use an SRG that is different from the SRG that it transmits to other STAs in Spatial Reuse Parameter Set elements to determine whether a received inter-BSS PPDU is an SRG PPDU.

A received HE PPDU that is an inter-BSS PPDU is an SRG PPDU if the bit in the SRG BSS Color Bitmap field indexed by the value of the RXVECTOR parameter BSS_COLOR is 1(#1124). A received VHT PPDU that is an inter-BSS PPDU is an SRG PPDU if the GROUP_ID parameter of the RXVECTOR has a value of 0 and the bit in the SRG Partial BSSID Bitmap field that corresponds to the (#4317)numeric value of PARTIAL_AID[0:5] of the RXVECTOR is 1(#1124).

A received PPDU that is an inter-BSS PPDU is an SRG PPDU if BSSID information from a frame carried in the PPDU is correctly received and the bit in the SRG Partial BSSID Bitmap field that corresponds to the (#4317)numeric value of BSSID[39:44] is 1.

A VHT PPDU that is an inter-BSS PPDU and that is received with RXVECTOR parameter GROUP_ID equal to 0 is an SRG PPDU if the bit in the SRG Partial BSSID Bitmap field that corresponds to the (#4317)numeric value of bits [39:44] of the RA field of any correctly received frame from the PPDU is 1.

A VHT PPDU that is an inter-BSS PPDU and that is received with RXVECTOR parameter GROUP_ID equal to 63 is an SRG PPDU if the bit in the SRG Partial BSSID Bitmap field that corresponds to the (#4317)numeric value of bits [39:44] of the TA field of any correctly received frame from the PPDU is 1.

An HE SU PPDU, HE ER SU PPDU, or HE MU PPDU that is an inter-BSS PPDU and that is received with the RXVECTOR parameter UPLINK_FLAG equal to 1 is an SRG PPDU if the bit in the SRG Partial BSSID Bitmap field that corresponds to the (#4317)numeric value of bits [39:44] of the RA field of any correctly received frame from the PPDU is 1.

Otherwise, the PPDU is not determined to be an SRG PPDU. A non-AP HE STA that has not received a Spatial Reuse Parameter Set element from its associated AP with a value of 1 in the SRG Information Present subfield shall not classify any received PPDUs as an SRG PPDU. An HE AP that has not transmitted a Spatial Reuse Parameter Set element with a value of 1 in the SRG Information Present subfield may classify received PPDUs as SRG PPDUs using information that it has not transmitted.

### 26.2.4 Updating two NAVs

A non-AP HE STA shall maintain two NAVs, and an HE AP may maintain two NAVs: an intra-BSS NAV and a basic NAV. The intra-BSS NAV is updated by an intra-BSS PPDU. The basic NAV is updated by an inter-BSS PPDU or a PPDU that cannot be classified as intra-BSS or inter-BSS. The mechanism by which a PPDU is classified intra-BSS or inter-BSS is defined in 26.2.2 (Intra-BSS and inter-BSS PPDU classification).

Maintaining two NAVs is beneficial in dense deployment scenarios in which a STA requires protection from frames transmitted by STAs within its BSS, i.e., intra-BSS, and wants to avoid interference from frames transmitted by STAs in a neighboring BSS, i.e., inter-BSS. For example, in a TXOP initiated by the AP with which a STA is associated for an HE TB PPDU transmission, the intra-BSS NAV of the STA is set by the AP to prevent the STA from contending for the channel. The basic NAV of the STA is not updated by transmissions from the AP during the TXOP so that if the basic NAV of the STA is nonzero and the STA receives, from the AP, a Trigger frame with the CS Required subfield equal to 1, the STA does(M118) not respond (see 26.5.2.5 (UL MU CS mechanism)).

The requirements in 10.3.2.1 (CS mechanism) apply to an HE STA maintaining two NAVs, with the exception of the virtual CS indication of medium. For an HE STA maintaining two NAVs, if both the NAV timers are 0, the virtual CS indication is that the medium is idle; if at least one of the two NAV timers is nonzero, the virtual CS indication is that the medium is busy.

The procedure in 10.3.2.9 (CTS and DMG CTS procedure) applies to an HE STA maintaining two NAVs, and the NAV referred by the description in 10.3.2.4 (Setting and resetting the NAV) is the basic NAV.(#2384)

A STA shall update the intra-BSS NAV with the duration information indicated by the received frame in a PSDU (#7220)if all the following conditions are met:

- The frame is identified as intra-BSS according to the rule described in 26.2.2 (Intra-BSS and inter-BSS PPDU classification).
- The indicated duration is greater than the current intra-BSS NAV value.
- The RA of the received frame is not the STA's MAC address; or the STA is not a TXOP holder, and the PPDU carrying the frame does not contain a frame that solicits an immediate response from the STA; or the STA is not a TXOP holder, and the received frame is a Trigger frame.

Otherwise it shall not so update the intra-BSS NAV.(#7220)

A STA shall update the basic NAV with the duration information indicated by the received frame in a PSDU (#7220)if all the following conditions are met:

- The frame is identified as inter-BSS or cannot be identified as intra-BSS or inter-BSS according to the rule described in 26.2.2 (Intra-BSS and inter-BSS PPDU classification).
- The indicated duration is greater than the current basic NAV value.
- The RA of the received frame is not the STA's MAC address.

Otherwise it shall not so update the basic NAV.(#7220)

A STA that is a TXOP holder shall not update the intra-BSS NAV with the duration information indicated by the RXVECTOR parameter TXOP_DURATION.

A STA that is not a TXOP holder shall update the intra-BSS NAV with the duration information indicated by the RXVECTOR parameter TXOP_DURATION for an HE PPDU (#7220)if all the following conditions are met:

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

- The RXVECTOR parameter TXOP_DURATION is not UNSPECIFIED.
- The PPDU that carried information of the RXVECTOR parameter is identified as intra-BSS according to the rule described in 26.2.2 (Intra-BSS and inter-BSS PPDU classification).
- The STA does not receive a frame with a Duration field in the PPDU.
- The duration information indicated by the RXVECTOR parameter TXOP_DURATION is greater than the current intra-BSS NAV of the STA.

Otherwise it shall not so update the intra-BSS NAV.(#7220)

A STA shall update the basic NAV with the duration information indicated by the RXVECTOR parameter TXOP_DURATION for an HE PPDU (#7220)if all the following conditions are met:

- The RXVECTOR parameter TXOP_DURATION is not UNSPECIFIED.
- The PPDU that carried information for the RXVECTOR parameter is identified as inter-BSS or cannot be identified as intra-BSS or inter-BSS according to the rule described in 26.2.2 (Intra-BSS and inter-BSS PPDU classification).
- The STA does not receive a frame with a Duration field in the PPDU.
- The duration information indicated by the RXVECTOR parameter TXOP_DURATION is greater than the current basic NAV of the STA.

Otherwise it shall not so update the basic NAV.(#7220)

NOTE 1—If a PS-Poll frame is received in an HE SU PPDU, HE ER SU PPDU, or HE MU PPDU, then the RXVECTOR parameter TXOP_DURATION does not indicate duration information (see 26.11.5 (TXOP_DURATION)).

NOTE 2—If a STA receives an HE PPDU with the duration information indicated by both a frame with a Duration field and the RXVECTOR parameter TXOP_DURATION, then the duration information indicated by the RXVECTOR parameter TXOP_DURATION is ignored.

NOTE 3—The additional rules of NAV consideration for a STA that is solicited for an immediate response are described in 10.3.2.9 (CTS and DMG CTS procedure), 10.3.2.11 (Acknowledgment procedure), and 26.5.2.5 (UL MU CS mechanism).

A PHY-CCARESET.request primitive shall be issued if one of the following condition is met:

- One NAV is reset, and the other NAV timer is 0.
- Both NAVs are reset simultaneously.

The NAVs (if any) are updated at the expected end of the PPDU as defined in 10.3.2.4 (Setting and resetting the NAV).

An HE STA that used information from an RTS or MU-RTS Trigger frame as the most recent basis to update its NAV may reset the NAV that is updated by the RTS or MU-RTS Trigger frame if no (#3038)PHY-RXEARLYSIG.indication or PHY-RXSTART.indication primitive is received from the PHY during a period with a duration of 2 × aSIFSTime + CTS_Time + aRxPHYStartDelay + 2 × aSlotTime starting when the MAC receives a PHY-RXEND.indication primitive corresponding to the detection of the RTS or MU-RTS Trigger frame (see 10.3.2.4 (Setting and resetting the NAV) for the definition of CTS_Time).

### 26.2.5 Truncation of TXOP

A non-AP HE STA that is not associated with an HE AP shall interpret the reception of a CF-End frame as a NAV reset, i.e., it resets its maintained NAV to 0 at the end of the PPDU containing this frame.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

An HE AP that maintains one NAV (see 10.3.2.1 (CS mechanism)) and receives a CF-End frame should reset the NAV, unless either of following conditions is met:

— The received CF-End frame is carried in an inter-BSS PPDU, and the most recently updated NAV was due to a frame carried in an intra-BSS PPDU (see 26.2.2 (Intra-BSS and inter-BSS PPDU classification)).

— The received CF-End frame is carried in an intra-BSS PPDU, and the most recently updated NAV was due to a frame carried in an inter-BSS PPDU (see 26.2.2 (Intra-BSS and inter-BSS PPDU classification)).

An HE STA that maintains two NAVs (see 26.2.4 (Updating two NAVs)) and receives a CF-End frame should reset the basic NAV if the received CF-End frame is carried in an inter-BSS PPDU and reset the intra-BSS NAV if the received CF-End frame is carried in an intra-BSS PPDU.

An HE STA that maintains two NAVs may reset both NAVs if the received CF-End frame is carried in an intra-BSS PPDU and the basic NAV was updated due to a frame carried in a PPDU that cannot be identified as either an inter-BSS PPDU or intra-BSS PPDU.

An HE STA that receives a CF-End frame and resets all its maintained NAV(s) can start contending for the medium without further delay.

### 26.2.6 MU-RTS Trigger/CTS frame exchange sequence procedure(#109)

#### 26.2.6.1 General

The MU-RTS Trigger/CTS frame exchange sequence(#109) procedure allows an AP to initiate a TXOP and protect the TXOP frame exchange sequences(#109). An AP may transmit an MU-RTS Trigger frame to solicit simultaneous CTS frame (#1926)transmissions from one or more non-AP STAs.

Figure 26-1 (Example of MU-RTS/CTS/DL MU PPDU/Acknowledgment Response and NAV setting(11ax)) shows an example of the exchange of MU-RTS and simultaneous CTS responses to protect the DL MU PPDU and the acknowledgment responses.

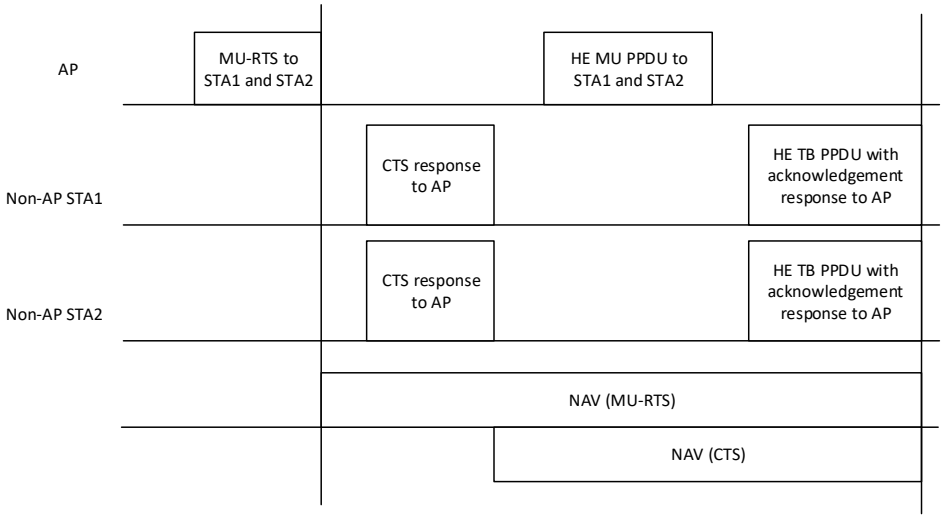

**Figure 26-1—Example of MU-RTS/CTS/DL MU PPDU/Acknowledgment Response and NAV setting(11ax)**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Figure 26-2 (Example of MU-RTS/CTS/Trigger/HE TB PPDU/Multi-STA BlockAck and NAV setting(11ax)) shows an example of the exchange of MU-RTS and simultaneous CTS responses to protect the HE TB PPDU and Multi-STA BlockAck frame.

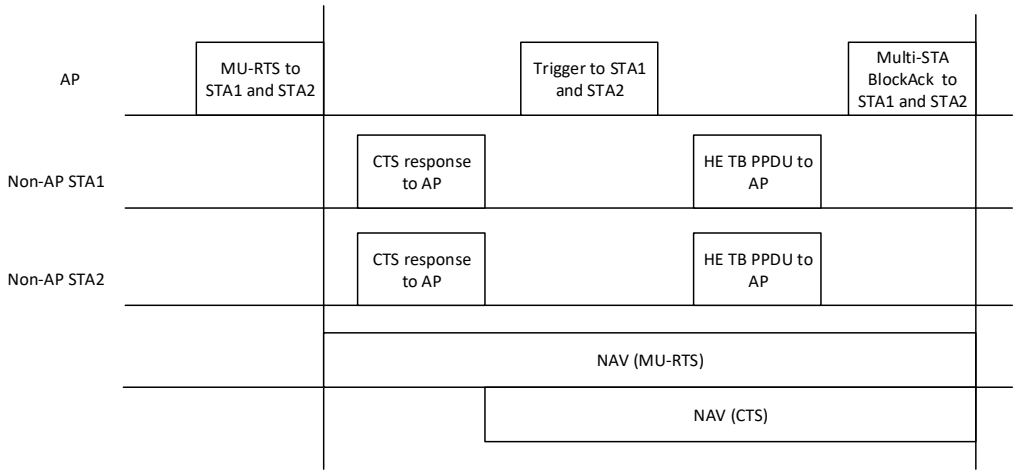

**Figure 26-2—Example of MU-RTS/CTS/Trigger/HE TB PPDU/Multi-STA BlockAck and NAV setting(11ax)**

### 26.2.6.2 MU-RTS Trigger frame transmission

In each 20 MHz channel occupied by the PPDU that contains an MU-RTS Trigger frame, the transmitter of the MU-RTS Trigger frame shall request at least one non-AP STA to send a CTS frame(#1926) that occupies the 20 MHz channel. The transmitter of an MU-RTS Trigger frame shall not request a non-AP STA to send a CTS frame(#1926) in a 20 MHz channel that is not occupied by the PPDU that contains the MU-RTS Trigger frame.

After transmitting an MU-RTS Trigger frame, the AP shall wait for a CTSTimeout interval of aSIFSTime + aSlotTime + aRxPHYStartDelay that begins when the MAC receives the PHY-TXEND.confirm primitive for the transmitted MU-RTS Trigger frame. If the MAC does not receive a (#3038)PHY-RXEARLYSIG.indication or PHY-RXSTART.indication primitive during the CTSTimeout interval, the AP shall conclude that the transmission of the MU-RTS Trigger frame has failed, and, if the MU-RTS Trigger frame initiated a TXOP, the AP shall invoke its backoff procedure. If the MAC receives a (#3038)PHY-RXEARLYSIG.indication or PHY-RXSTART.indication primitive during the CTSTimeout interval, then the MAC shall wait for the corresponding PHY-RXEND.indication primitive to determine whether the MU-RTS Trigger frame transmission was successful. The receipt of a CTS frame from any non-AP STA addressed by the MU-RTS Trigger frame before the PHY-RXEND.indication primitive shall be interpreted as the successful transmission of the MU-RTS Trigger frame, permitting the frame exchange sequence to continue. The receipt of any other type of frame shall be interpreted as a failure of the MU-RTS Trigger frame transmission. In this instance, the AP may process the received frame and, if the MU-RTS Trigger frame initiated a TXOP, shall invoke its backoff procedure at the PHY-RXEND.indication primitive.

NOTE—If an AP transmits an MU-RTS Trigger frame in an already initiated TXOP and the MU-RTS Trigger frame transmission fails, then the AP might perform a PIFS recovery as described in 10.23.2.8 (Multiple frame exchange sequences in an EDCA TXOP(#109)) or invoke the backoff procedure described in 10.23.2.2 (EDCA backoff procedure).

An MU-RTS Trigger frame shall not be carried in a VHT MU PPDU or an HE MU PPDU.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 26.2.6.3 CTS frame sent in response to an MU-RTS Trigger frame(#1926)

If a non-AP STA receives an MU-RTS Trigger frame, the non-AP STA shall commence the transmission of a CTS frame(#1926) at the SIFS time boundary after the end of a received PPDU when all the following conditions are met:

— The MU-RTS Trigger frame has one of the User Info fields addressed to the non-AP STA. The User Info field is addressed to a non-AP STA if the AID12 subfield is equal to the 12 LSBs of the AID of the STA and the MU-RTS Trigger frame is sent by the AP with which the non-AP STA is associated or by the AP corresponding to the transmitted BSSID if the non-AP STA is associated with an AP corresponding to a nontransmitted BSSID and has indicated support for receiving Control frames with TA field set to the transmitted BSSID by setting the Rx Control Frame To MultiBSS subfield to 1 in the HE Capabilities element that the non-AP STA transmits.

— The UL MU CS condition indicates that the medium is idle (see 26.5.2.5 (UL MU CS mechanism)).

Otherwise, the non-AP STA shall not send a CTS frame(#1926).

NOTE 1—The RU Allocation subfield in the User Info field addressed to the non-AP STA indicates whether the CTS frame(#1926) is to be sent on the primary 20 MHz channel, primary 40 MHz channel, primary 80 MHz channel, 160 MHz channel, or 80+80 MHz channel as described in 9.3.1.22.5 (MU-RTS Trigger frame format).

NOTE 2—A combination of virtual CS and ED-based CCA during the SIFS after the PPDU containing the MU-RTS Trigger frame is used to determine the state of the medium (see 26.5.2.5 (UL MU CS mechanism)).

The CTS frame sent in response to an MU-RTS Trigger frame shall be carried in a non-HT or non-HT duplicate PPDU (see Clause 17) with a 6 Mb/s rate and with the TXVECTOR parameter SCRAMBLER_INITIAL_VALUE set to the same value as the RXVECTOR parameter SCRAMBLER_INITIAL_VALUE of the PPDU carrying the MU-RTS Trigger frame. The PPDU carrying the CTS frame shall be transmitted on the 20 MHz channels indicated in the RU Allocation subfield of the User Info field of the MU-RTS Trigger frame.

NOTE 3—A bandwidth signaling TA is not used in an MU-RTS Trigger frame or a CTS frame (#1926)sent in response to an MU-RTS Trigger frame (see 9.3.1.22 (Trigger frame format(11ax)) and 9.3.1.3 (CTS frame format)). As a result, the TXVECTOR parameter CH_BANDWIDTH_IN_NON_HT is not present when transmitting an MU-RTS Trigger frame or CTS frame (#1926)sent in response to an MU-RTS Trigger frame(#602).

The Power Management and More Data subfields in a CTS frame sent in response to an MU-RTS Trigger frame shall be set to 0.

NOTE 4—Other subfields of the Frame Control field of the CTS frames sent in response to an MU-RTS Trigger frame are set as described in Figure 9-37 (Frame Control field subfield values within Control frames carried in a non-S1G PPDU).

Figure 26-3 (Example of MU-RTS Trigger frame soliciting CTS frame transmissions on primary 40 MHz channel(#1926)(11ax)) shows an example of the exchange of an MU-RTS Trigger frame and simultaneous CTS frame (#1926)transmissions on the primary 40 MHz channel. In this example, MU-RTS Trigger frame is transmitted in a 40 MHz non-HT duplicate PPDU on the primary 40 MHz channel. Further, the MU-RTS Trigger frame requests non-AP STA1 to transmit a CTS frame(#1926) in a non-HT PPDU on the primary 20 MHz channel and non-AP STA2 to transmit a CTS frame(#1926) in a 40 MHz non-HT duplicate PPDU on the primary 40 MHz channel.

A non-AP STA that transmits a CTS frame in response to an MU-RTS Trigger frame shall follow the (M118)precorrection requirements defined in 27.3.15.3 (Precorrection accuracy requirements(M118)).

NOTE 5—The AP Tx Power and UL Target Receive Power fields in an MU-RTS Trigger frame are reserved, and there is no power (M118)precorrection requirement for the CTS frame sent in response to an MU-RTS Trigger frame (i.e., the AP that sends the MU-RTS frame does not specify the transmission power of the solicited CTS frame).

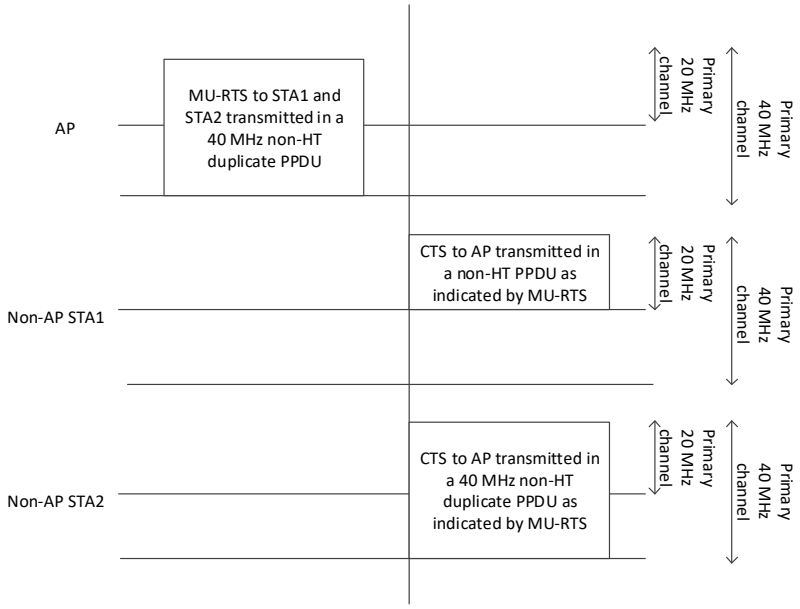

**Figure 26-3—Example of MU-RTS Trigger frame soliciting CTS frame transmissions on primary 40 MHz channel(#1926)(11ax)**

### 26.2.7 EDCA operation using MU EDCA parameters

An HE AP shall set the QoS Info field of an MU EDCA Parameter Set element (if present) to the same value as the QoS Info field of an EDCA Parameter Set element (if present). An HE AP may change the MU EDCA parameters by including the MU EDCA Parameter Set element with updated MU EDCA parameters in the Beacon frames and Probe Response frames it transmits. The EDCA Parameter Set Update Count subfield in the QoS Info field of the EDCA Parameter Set element and MU EDCA Parameter Set element is incremented every time any EDCA parameters or MU EDCA parameters change.

A non-AP HE STA shall update the dot11EDCATable and dot11MUEDCATable that correspond to fields in an EDCA Parameter Set element or an MU EDCA Parameter Set element within an interval of time equal to one beacon interval after receiving an updated EDCA or MU EDCA parameter set from its associated AP. When updating its MIB attributes, an HE STA stores the value of the EDCA Parameter Set Update Count subfield in the QoS Info field of the received EDCA Parameter Set element or MU EDCA Parameter Set element.

A non-AP HE STA shall use the EDCA Parameter Set Update Count subfield in the QoS Capability element of Beacon frames, where present, to determine whether the STA is using the current EDCA (and optionally MU EDCA) (#1660)parameters. If the EDCA Parameter Set Update Count subfield value is different from the value that has been stored, the STA shall query the updated EDCA (and any MU EDCA) (#1660)parameters by sending a Probe Request frame to the AP.

NOTE 1—If the QoS Capability element is present in a Beacon frame, the EDCA Parameter Set element and the MU EDCA Parameter Set element are not present. In this case, the only way for an HE STA to obtain the updated parameters is to send a Probe Request frame to the AP.

A non-AP HE STA that receives a Basic Trigger frame that contains a User Info field addressed to the STA shall update its CWmin[AC], CWmax[AC], AIFSN[AC], and MUEDCATimer[AC] state variables to the values contained in the dot11MUEDCATable, for all the ACs from which at least one QoS Data frame was transmitted successfully in an HE TB PPDU in response to the Trigger frame. A QoS Data frame is

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

transmitted successfully by the STA in an HE TB PPDU for an AC if it requires immediate acknowledgment and the STA receives an immediate acknowledgment for that frame, or if the QoS Data frame does not require immediate acknowledgment.

The MUEDCATimer[AC] state variable is updated with the value contained in the MU EDCA Timer subfield of the MU EDCA Parameter Set element. The backoff counter maintenance corresponding to the updated state variables shall follow the rules in 10.23.2.2 (EDCA backoff procedure), except that if AIFSN[AC] is 0, then the EDCAF corresponding to that AC shall be suspended until the MUEDCATimer[AC] reaches 0 or is reset to 0. The updated MUEDCATimer[AC] shall start at the end of the immediate response if the transmitted HE TB PPDU contains at least one QoS Data frame for that AC that requires immediate acknowledgment, and shall start at the end of the HE TB PPDU if the transmitted HE TB PPDU does not contain any QoS Data frames for that AC that require immediate acknowledgment.

In a non-AP HE STA, each MUEDCATimer[AC] shall uniformly count down without suspension to 0 when its value is nonzero.

NOTE 2—A non-AP STA that sends a frame to the AP with an OM Control subfield containing a value of 1 in the UL MU Disable subfield or a value of 0 in the UL MU Disable subfield and a value of 1 in the UL MU Data Disable subfield does not participate in UL MU operation. As such it is exempt from updating its EDCA access parameters to the values contained in the MU EDCA Parameter Set element as defined in this subclause.

NOTE 3—A non-AP STA does not update its state variables to the values contained in the MU EDCA Parameter Set element if any of the following applies:

a) The Trigger frame addressed to the STA is not a Basic Trigger frame.
b) The STA does not include QoS Data frames in the HE TB PPDU response sent in response to the Basic Trigger frame.
c) The STA transmits the HE TB PPDU in response to a Basic Trigger frame following the rules defined in 26.5.4 (UL OFDMA-based random access (UORA)).

NOTE 4—The TXOP limits are not updated by the procedure defined in this subclause, but by the procedure in 10.23.2.9 (TXOP limits).

A non-AP STA that sends frames that are not addressed to its associated AP may use the EDCA parameters(#1660) that are contained in the most recently received EDCA Parameter Set element sent by the AP with which the STA is associated or the default EDCA parameters(#1660) (see Table 9-194 (Default EDCA Parameter Set element (#1660)parameters if dot11OCBActivated is false and the STA is a non-sensor STA(#251))), following the rules in 10.2.3.2 (HCF contention based channel access (EDCA)).

If the MUEDCATimer[AC] of a non-AP HE STA reaches 0, either by counting down or due to a reset following the reception of an MU EDCA Reset frame, the STA shall update CWmin[AC], CWmax[AC], and AIFSN[AC] to the values that are contained in the most recently received EDCA Parameter Set element sent by the AP with which the STA is associated.

A non-AP HE STA that sends a frame with an OM Control subfield with the UL MU Disable subfield set to 1 or with the UL MU Disable subfield set to 0 and the UL MU Data Disable subfield set to 1 as defined in 26.9.3 (Transmit operating mode (TOM) indication) may set the MUEDCATimer[AC] for all ACs to 0 on receiving an immediate acknowledgment from the OMI responder. The STA continues the current EDCA backoff procedure without modifying the QSRC[AC](#3781) or the backoff counter for the associated EDCAF, regardless of whether the MUEDCATimer[AC] has reached zero, until the STA invokes a new EDCA backoff procedure. The STA follows the rules defined in 10.23.2.2 (EDCA backoff procedure) for updating CWmin, CWmax, and AIFSN for that AC.

A non-AP HE STA that receives an individually addressed MU EDCA Reset frame from its associated AP may reset the MUEDCATimer[AC] to 0 for an AC if the bit corresponding to that AC in the Affected ACs subfield is equal to 1 when the MUEDCATimer[AC] of the STA is not equal to 0. The STA may invoke a

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

new EDCA backoff procedure after the MUEDCATimer[AC] is reset for that AC and after CWmin[AC], CWmax[AC], and AIFSN[AC] are updated for that AC, as per this subclause, in response to the MUEDCATimer[AC] reset.

### 26.2.8 Multiple frame exchange sequences in an EDCA TXOP in the 6 GHz band(#109)

A STA that operates in the 6 GHz band and transmits multiple frames shall follow the rules defined in 10.23.2.7 (Sharing an EDCA TXOP) with the exceptions described in this subclause.

NOTE 1—In the 6 GHz band, the TXOP field in the HE-SIG-A field can be understood by all STAs. The TXOP field provides TXOP protection equivalent to non-HT duplicate RTS/CTS.

In a TXOP without non-HT duplicate PPDUs, if the TXOP is protected by the TXOP field in the HE-SIG-A field of the first HE PPDU in the TXOP, i.e., the TXOP field is not set to UNSPECIFIED, the TXOP holder shall set the TXVECTOR parameter CH_BANDWIDTH of the subsequent PPDUs in the TXOP to indicate a bandwidth that is the same or narrower than the bandwidth indicated by the CH_BANDWIDTH parameter of the first HE PPDU in the TXOP.

NOTE 2—Frame exchange sequences(#109) in a TXOP that is protected by RTS/CTS follow the rules in 10.23.2.8 (Multiple frame exchange sequences in an EDCA TXOP(#109)).

Additionally, if the first HE PPDU whose TXOP field in the HE-SIG-A field is not set to UNSPECIFIED is a DL HE MU PPDU with preamble puncture, then the TXOP holder shall use the 20 MHz channels for the non-initial PPDU that are within the set of 20 MHz channels where pre-HE modulated fields of the first HE PPDU whose TXOP field in the HE-SIG-A field is not set to UNSPECIFIED are located.

Within an obtained TXOP that does not include HE PPDUs whose TXOP field in the HE-SIG-A field is not UNSPECIFIED nor non-HT duplicate PPDUs, the TXOP holder shall set the TXVECTOR parameter CH_BANDWIDTH of a non-initial PPDU to be equal to or less than the TXVECTOR parameter CH_BANDWIDTH of the preceding PPDU that was transmitted in the same TXOP, subject to the following constraints:

— If the preceding PPDU is a DL HE MU PPDU with preamble puncture, the TXOP holder shall set the TXVECTOR parameter CH_BANDWIDTH of the non-initial PPDU to a value whose corresponding 20 MHz channels are within a set of 20 MHz channels where pre-HE modulated fields of the preceding PPDU are located.

— If the non-initial PPDU is a DL HE MU PPDU with preamble puncture, the TXOP holder shall set the TXVECTOR parameter RU_ALLOCATION of the non-initial PPDU to a value whose corresponding RU is within a set of 20 MHz channels where pre-HE modulated fields of the preceding PPDU are located.

## 26.3 Fragmentation and defragmentation

### 26.3.1 General

An HE STA shall follow the fragmentation procedures defined in (#1234)10.2.7 (Fragmentation/ defragmentation overview)(#3092), 10.4 (MSDU, (11ax)A-MSDU, and MMPDU fragmentation), and 10.5 (MSDU, (11ax)A-MSDU, and MMPDU defragmentation), except that some of the rules are relaxed as defined in the subclauses of 26.3 (Fragmentation and defragmentation). Dynamic fragmentation provides further flexibility in aggregating data to fit in a constrained PPDU duration (see 26.5 (MU operation)).

Subclauses (#1235)10.2.7 (Fragmentation/defragmentation overview) and 10.4 (MSDU, (11ax)A-MSDU, and MMPDU fragmentation) define the procedure to generate uniformly fragmented MSDUs or MMPDUs,

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

where the length of each fragment is the same, except for the last fragment. These fragments are not included in an A-MPDU under HT-immediate block ack agreements.

An HE STA can negotiate the use of different levels of dynamic fragmentation:

- Level 1: support for one dynamic fragment that is a non-A-MPDU; no support for dynamic fragments in an A-MPDU that does not contain an S-MPDU.
- Level 2: support for dynamic fragments in an A-MPDU that does not contain an S-MPDU, subject to the following conditions:
  - No more than one dynamic fragment of any given MSDU or A-MSDU in the A-MPDU; this dynamic fragment is sent under a block ack agreement.
  - No more than one MPDU that is a dynamic fragment of an MMPDU in the A-MPDU (see 26.6.2 (A-MPDU padding in an HE PPDU) and 26.6.3 (Multi-TID A-MPDU and ack-enabled single-TID A-MPDU)).
- Level 3: support for dynamic fragments in an A-MPDU that does not contain an S-MPDU, subject to the following conditions:
  - No more than four dynamic fragments of any given MSDU or A-MSDU in the A-MPDU; these dynamic fragments are sent under a block ack agreement.
  - No more than one MPDU that is a dynamic fragment of an MMPDU in the A-MPDU (see 26.6.2 (A-MPDU padding in an HE PPDU) and 26.6.3 (Multi-TID A-MPDU and ack-enabled single-TID A-MPDU)).

NOTE 1—An HE STA that is operating in level 2 or level 3 also supports transmitting and receiving level 1 dynamic fragments.

NOTE 2—Under level 2, there might be multiple Data frames that are dynamic fragments, but these have different sequence numbers and/or UPs.

This subclause defines the procedure for generating nonuniformly fragmented MSDUs, A-MSDUs, or MMPDUs, where the length of each fragment is not necessarily the same. The length of the first fragment shall be greater than or equal to the minimum fragment size indicated in the Minimum Fragment Size subfield in the HE Capabilities Information field in the HE Capabilities element sent by the recipient STA. If the length of the MSDU, A-MSDU, or MMPDU is less than the minimum fragment size, then the MSDU, A-MSDU, or MMPDU shall not be fragmented. The fragments generated with dynamic fragmentation are referred to as dynamic fragments.

These procedures allow the inclusion of one dynamic fragment that is a non-A-MPDU in level 1, level 2, and level 3 and allow the inclusion of one or more dynamic fragments within an A-MPDU that contains one or more MPDUs in level 2 and level 3.

An HE STA follows the rules defined in 26.3.2 (Dynamic fragmentation) for generating these fragments and the rules defined in 26.3.3 (Dynamic defragmentation) for defragmenting of the received dynamic fragments. In 26.3.2 (Dynamic fragmentation) and 26.3.3 (Dynamic defragmentation), the HE STA follows the fragmentation level that is indicated in the Dynamic Fragmentation Support subfield in the HE MAC Capabilities Information field in the HE Capabilities element it transmits, unless an ADDBA Extension element is included in the ADDBA Request and ADDBA Response frames exchanged during the block ack setup procedure. In this case, the HE STA follows the fragmentation level that is indicated in an ADDBA Extension element in the ADDBA Response frame it receives (see 26.3.3.1 (General)) during the block ack setup procedure.

An HE STA shall set the HE Fragmentation Operation subfield in the ADDBA Extension element, if present, in the ADDBA Request or ADDBA Response frame to a value that is less than or equal to the value of the Dynamic Fragmentation Support subfield in the HE Capabilities element it transmits.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

An HE STA shall set the HE Fragmentation Operation subfield in the ADDBA Extension element, if present, in the ADDBA Response frame to a value that is less than or equal to the value of HE Fragmentation Operation subfield in the ADDBA Extension element, if present, in the received ADDBA Request frame.

### 26.3.2 Dynamic fragmentation

#### 26.3.2.1 General

With level 1 and level 2 dynamic fragmentation, the following apply:

— An originator STA transmitting one or more dynamic fragments shall solicit an immediate response from the recipient STA for each of the fragments.

— The originator STA shall transmit the fragments in order as defined in 10.4 (MSDU, (11ax)A-MSDU, and MMPDU fragmentation).

With level 3 dynamic fragmentation, not all dynamic fragments require an immediate response, and dynamic fragments are not required to be sent in order.

An HE STA may transmit dynamic fragments of an A-MSDU, provided the A-MSDU Fragmentation Support subfield in the HE Capabilities element transmitted by the recipient is 1.

The originator STA shall not transmit concurrently the dynamic fragments of a number of outstanding MSDUs and A-MSDUs (if supported) to the same recipient STA that is greater than $N_{max}$, where $N_{max}$ for MSDUs and A-MSDUs (if supported) is calculated based on the Maximum Number of Fragmented MSDUs/A-MSDUs subfield in the HE Capabilities element transmitted by the recipient STA. The term *outstanding* refers to an MPDU containing all or part of an MSDU, A-MSDU, or MMPDU for which transmission has been started and for which delivery of the MSDU, A-MSDU, or MMPDU has not yet been completed (i.e., an acknowledgment of the final fragment has not been received and the MSDU, A-MSDU, or MMPDU has not been discarded due to retries, lifetime, or some other reason).

NOTE—Dynamic fragments of outstanding MMPDUs are not counted in the check against the $N_{max}$ limit.

An originator STA may retransmit the full MSDU, A-MSDU, or MMPDU if all the previously transmitted dynamic fragments of that MSDU, A-MSDU, or MMPDU have explicitly failed at the receiving STA. An originator STA may retransmit a failed fragment if one or more of the previously transmitted fragments of that MSDU, A-MSDU, or MMPDU have explicitly failed at the receiving STA (see the next paragraph for a definition of the term *explicitly failed*). The frame body length and contents of the retransmitted fragment shall be the same as the initially transmitted fragment and shall remain fixed for the lifetime of the MSDU, A-MSDU, or MMPDU at that STA, except when the frame is not encrypted, all the fragments preceding the initial transmitted fragment were received, and all the fragments following the initial transmitted fragment either have explicitly failed or have not been transmitted. In such cases, the frame body length and contents of the retransmitted fragment may be different from the initially transmitted fragment.

A fragment has explicitly failed at the receiving STA if the originator STA receives an immediate response that contains the following:

— A valid first MPDU that is not an Ack frame, Compressed BlockAck frame, or Multi-STA BlockAck frame, of which all the preceding pre-EOF MPDU delimiters are received.

— A Multi-STA BlockAck frame that does not contain a BA Information field with TID equal to that of the fragment.

— A Compressed BlockAck frame or Multi-STA BlockAck frame that contains a BA Information field with TID equal to that of the fragment, but does not acknowledge receipt of the fragment.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

An originator STA shall not transmit to a recipient STA an MPDU that is not carried in an A-MPDU or an A-MPDU that carries dynamic fragments that do not satisfy the conditions in 26.3.2.2 (Level 1 dynamic fragmentation), 26.3.2.3 (Level 2 dynamic fragmentation), and 26.3.2.4 (Level 3 dynamic fragmentation).

### 26.3.2.2 Level 1 dynamic fragmentation

An originator STA may transmit one dynamic fragment of an MSDU, A-MSDU (if supported by the recipient), or MMPDU that is a non-A-MPDU and that is not sent under a block ack agreement to a recipient STA using level 1 dynamic fragmentation if the Dynamic Fragmentation Support subfield in the HE MAC Capabilities Information field in the HE Capabilities element received from the recipient STA is 1, 2, or 3.

An originator STA may transmit a fragmented MSDU or A-MSDU (if supported by the recipient) under a block ack agreement to a recipient STA using level 1 dynamic fragmentation, provided the following condition is met: the Dynamic Fragmentation Support subfield in the HE Capabilities element received from the recipient STA is 1, 2, or 3; and for the block ack agreement associated with the TID of the MSDU or A-MSDU, the HE Fragmentation Operation subfield is 1 if the ADDBA Extension element is present in the ADDBA Response frame received from the recipient STA.

### 26.3.2.3 Level 2 dynamic fragmentation

An originator STA may transmit fragmented MSDUs or A-MSDU (if supported by the recipient) under a block ack agreement to a recipient STA using level 2 dynamic fragmentation, provided one of the following conditions is met:

— The Dynamic Fragmentation Support subfield in the HE Capabilities element received from the recipient STA is 2; and for the block ack agreement associated with the TID of the MSDU or A-MSDU, the HE Fragmentation Operation subfield is 2 if the ADDBA Extension element is present in the ADDBA Response frame received from the recipient STA.

— The Dynamic Fragmentation Support subfield in the HE Capabilities element received from the recipient STA is 3; and for the block ack agreement associated with the TID of the MSDU or A-MSDU, the ADDBA Extension element is present, and the HE Fragmentation Operation subfield is 2 in the ADDBA Response frame received from the recipient STA.

An originator STA may transmit to a recipient STA the following:

— One dynamic fragment of an MSDU, A-MSDU (if supported by the recipient), or MMPDU that is a non-A-MPDU using level 1 dynamic fragmentation.

— Up to one dynamic fragment of an MSDU or A-MSDU (if supported by the recipient) for each MSDU or A-MSDU and up to one dynamic fragment of an MMPDU in an A-MPDU where the A-MPDU contains at least one dynamic fragment using level 2 dynamic fragmentation; the dynamic fragment of an MSDU or A-MSDU shall be sent under a block ack agreement.

NOTE—The originator STA follows the rules in 10.12.8 (Transport of S-MPDUs) for generating the S-MPDU, the rules in 10.25.6.7 (Originator's behavior) for generating the A-MPDU, and the rules in 26.6.3 (Multi-TID A-MPDU and ack-enabled single-TID A-MPDU) for generating a multi-TID A-MPDU that can contain the fragment of the MMPDU.

### 26.3.2.4 Level 3 dynamic fragmentation

An originator STA may transmit fragmented MSDUs or A-MSDU (if supported by the recipient) under a block ack agreement or fragmented MMPDU to a recipient STA using level 3 dynamic fragmentation, provided the following conditions are met:

— The Dynamic Fragmentation Support subfield in the HE Capabilities element received from the recipient STA is 3.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

— For the block ack agreement associated with the TID of the MSDU or A-MSDU, the HE Fragmentation Operation subfield is 3 if the ADDBA Extension element is present in the ADDBA Response frame received from the recipient STA.

Level 3 fragmentation allows multiple fragments of an MSDU or A-MSDU included in the same A-MPDU, reducing the fragments' transmission delay.

An originator STA may transmit to a recipient STA the following:

— One dynamic fragment of an MSDU, A-MSDU (if supported by the recipient), or MMPDU that is a non-A-MPDU using level 1 dynamic fragmentation.
  — The originator STA shall follow the rules defined in 10.12.8 (Transport of S-MPDUs) for generating the S-MPDU.
— Up to four dynamic fragments of an MSDU or A-MSDU (if supported by the recipient) for each MSDU or A-MSDU and up to one dynamic fragment of an MMPDU in an A-MPDU, where the A-MPDU contains at least one dynamic fragment using level 3 dynamic fragmentation; the dynamic fragment of an MSDU or A-MSDU shall be sent under block ack agreement.
  — The originator STA shall set the Fragment Number subfield of each MPDU to a value less than 4.
  — The originator STA shall follow the rules defined in 10.25.6.7 (Originator's behavior) for generating the A-MPDU with the exception that the A-MPDU shall contain MPDUs whose range of the Sequence Number subfields does not exceed $B_L$ / 4, where $B_L$ is the length of the Block Ack Bitmap field of the Compressed BlockAck or Multi-STA BlockAck frame that corresponds to a TID of a transmitted fragment (see 10.25.6 (HT-immediate block ack extensions) and 26.4 (HE acknowledgment procedure)).
  — The originator STA shall ensure that $WinSize_O$ does not exceed $B_L$ / 4, where $B_L$ is the length of the Block Ack Bitmap field of the Compressed BlockAck or Multi-STA BlockAck frame that corresponds to a TID of a transmitted fragment (see 10.25.6 (HT-immediate block ack extensions) and 26.4 (HE acknowledgment procedure)).

### 26.3.3 Dynamic defragmentation

#### 26.3.3.1 General

An HE STA shall set the Dynamic Fragmentation Support subfield in the HE MAC Capabilities Information field in the HE Capabilities element it transmits to 0 if it does not support dynamic fragments. Otherwise, the HE STA shall set the Dynamic Fragmentation Support subfield as follows:

— Set to 1, 2, or 3 if the STA supports reception of dynamic fragments following the procedure defined in 26.3.2.2 (Level 1 dynamic fragmentation).
— Set to 2 or 3 if the STA supports reception of dynamic fragments following the procedure defined in 26.3.2.3 (Level 2 dynamic fragmentation).
— Set to 3 if the STA supports reception of dynamic fragments following the procedure defined in 26.3.2.4 (Level 3 dynamic fragmentation).

An HE STA shall set dot11HEDynamicFragmentationLevel to the value of Dynamic Fragmentation Support subfield in the HE Capabilities element it transmits if it supports reception of dynamic fragments.

If a fragment is sent under level 1, level 2, or level 3 fragmentation, it belongs to dynamic fragment.

Defragmentation of dynamic fragments shall follow the rules defined in 10.5 (MSDU, (11ax)A-MSDU, and MMPDU defragmentation) with the following exceptions:

— The recipient STA shall support the concurrent reception of dynamic fragments of a number of *outstanding* MSDUs and A-MSDUs when supported from the same transmitting STA that is equal

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

to $N_{max}$, where $N_{max}$ for MSDUs and A-MSDUs (if supported) is obtained from the Maximum Number Of Fragmented MSDUs/A-MSDUs Exponent subfield in the HE Capabilities element transmitted by the STA. The term *outstanding* refers to an MPDU containing all or part of an MSDU or A-MSDU for which transmission has been started and for which delivery of the MSDU or A-MSDU has not yet been completed (i.e., an acknowledgment of the final fragment has not been received and the MSDU, A-MSDU, or MMPDU has not been discarded due to retries, lifetime, or some other reason). The recipient STA shall support the concurrent reception of dynamic fragments of one outstanding MMPDU from a transmitting STA.

— The recipient STA may be subject to the receive timer rules for each of the MSDUs, A-MSDUs, and MMPDUs defined in 10.5.

— (#2128)The A-MSDU Present subfield of all QoS Data frames containing fragments of a given MSDU (not in an A-MSDU) or of a given A-MSDU shall be the same.

A STA that has dot11AMSDUFragmentationOptionImplemented true shall set the A-MSDU Fragmentation Support subfield in the HE Capabilities element to 1. Otherwise, the STA shall set the A-MSDU Fragmentation Support subfield in the HE Capabilities element to 0.

#### 26.3.3.2 Level 1 dynamic defragmentation

Upon reception of a non-A-MPDU or A-MPDU that carries a dynamic fragment, the recipient STA responds with an Ack frame or a Multi-STA BlockAck frame if the received fragment is contained in an MPDU that solicits an immediate response. The receiver STA shall follow the rules defined in 10.3.2.11 (Acknowledgment procedure) for generating the Ack frame for the soliciting dynamic fragment that is an MPDU or carried in an S-MPDU or ack-enabled single-TID A-MPDU and the rules defined in 26.4 (HE acknowledgment procedure) for generating the Multi-STA BlockAck frame that contains the acknowledgment for the soliciting S-MPDU that carries one dynamic fragment and carried in an HE TB PPDU, ack-enabled single-TID A-MPDU or ack-enabled multi-TID A-MPDU.

#### 26.3.3.3 Level 2 dynamic defragmentation

Upon reception of a non-A-MPDU that is a dynamic fragment or A-MPDU that carries one or more dynamic fragments, the recipient STA responds with one of the following frames:

— An Ack frame or Multi-STA BlockAck frame if the received fragment is a non-A-MPDU or contained in an A-MPDU and solicits the immediate response. The recipient STA shall follow the rules defined in 10.3.2.11 (Acknowledgment procedure) for generating the Ack frame for the soliciting dynamic fragment that is an MPDU or carried in an S-MPDU or ack-enabled single-TID A-MPDU and the rules defined in 26.4 (HE acknowledgment procedure) for generating the Multi-STA BlockAck frame that contains the acknowledgment for the soliciting S-MPDU carried in an HE TB PPDU, ack-enabled single-TID A-MPDU, or ack-enabled multi-TID A-MPDU.

— A Compressed BlockAck frame or Multi-STA BlockAck frame if the received fragments of an MSDU or A-MSDU (if any) (up to one fragment for each MSDU or A-MSDU) are contained in an A-MPDU that contains an MPDU that solicits an immediate response. The recipient STA shall follow the rules defined in 10.25.6.5 (Generation and transmission of BlockAck frames by an HT STA, DMG STA, or S1G STA) for generating the BlockAck frame and the rules in 26.4 (HE acknowledgment procedure) for generating the Multi-STA BlockAck frame, except that the STA shall:

  — Set to 0 the LSB of the Fragment Number subfield in the Block Ack Starting Sequence Control subfield of the Compressed BlockAck frame or Multi-STA BlockAck frame that corresponds to a TID of a received fragment that is sent under a block ack agreement.

  — Set to 1 each bit of the Block Ack Bitmap field that corresponds to a Sequence Number subfield and TID subfield of a received fragment that is sent under a block ack agreement contained in the soliciting A-MPDU that is not an S-MPDU.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

— The STA shall update the corresponding block acknowledgment record for an MSDU or A-MSDU for which fragments are received only if that MSDU or A-MSDU is successfully reconstructed (see 10.5). Otherwise, the STA shall not update the block ack record for that MSDU or A-MSDU.

NOTE—The recipient STA sets the bits of the Block Ack Bitmap field that correspond to a Sequence Number and TID subfield of an MPDU that is not a fragment as defined in 10.25.6.5 (Generation and transmission of BlockAck frames by an HT STA, DMG STA, or S1G STA).

A recipient STA shall discard any fragments of incomplete MSDUs or A-MSDUs that have been received during an HT-immediate block ack session for a TID if it receives a BlockAckReq frame from the originator STA for that TID if the fragments have a Sequence Number field value that is less than the value of the Starting Sequence Number field of the BlockAckReq frame or have a sequence number that is less than (#6310)$WinStart_B$ (see 10.25.6.6 (Receive reordering buffer control operation)). The comparison of the two values is performed circular modulo 4096 as described in 10.25.1 (Introduction).

### 26.3.3.4 Level 3 dynamic defragmentation

Upon reception of a non-A-MPDU that is a dynamic fragment or A-MPDU that carries one or more dynamic fragments, the recipient STA responds with one of the following frames:

— An Ack frame or a Multi-STA BlockAck frame if the received fragment is a non-A-MPDU or contained in an A-MPDU that solicits the immediate response. The recipient STA shall follow the rules defined in 10.3.2.11 for generating the Ack frame for the soliciting dynamic fragment that is a MPDU or carried in an S-MPDU or ack-enabled single-TID A-MPDU and the rules defined in 26.4 (HE acknowledgment procedure) for generating the Multi-STA BlockAck frame that contains the acknowledgment for the soliciting S-MPDU carried in an HE TB PPDU, ack-enabled single-TID A-MPDU, or ack-enabled multi-TID A-MPDU.

— A Compressed BlockAck frame or Multi-STA BlockAck frame if the received fragments of an MSDU or A-MSDU (if any) corresponding to a TID (one or more fragments for each MSDU or A-MSDU) are contained in an A-MPDU where at least one received MPDU's Fragment Number field corresponding to the same TID as the received fragments is of nonzero value that solicits the immediate response. The recipient STA shall follow the rules in 10.25.6.5 (Generation and transmission of BlockAck frames by an HT STA, DMG STA, or S1G STA) for generating the BlockAck frame and the rules in 26.4 (HE acknowledgment procedure) for generating the Multi-STA BlockAck frame, except that the STA shall

  — Set to 1 the LSB of the Fragment Number subfield in the Block Ack Starting Sequence Control subfield of the Compressed BlockAck frame or Multi-STA BlockAck frame that corresponds to a TID of a received fragment that is sent under a block ack agreement.

  — Set to 1 each bit in position $B$ of the Block Ack Bitmap field that corresponds to a received fragment that is sent under a block ack agreement and shall set it to 0 otherwise, with $B$ calculated as $B = 4 \times (SN - SSN) + FN$, where the operations on the sequence numbers are performed modulo 4096.
  *SN* is the value of the Sequence Number subfield of an MPDU containing the fragment for which the receive status is indicated.
  *SSN* is the value of the Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield of the BlockAck frame.
  *FN* is the value in the Fragment Number subfield.

— A Compressed BlockAck frame or Multi-STA BlockAck frame if the received fragments of an MSDU or A-MSDU (if any) corresponding to a TID (one or more fragments for each MSDU or A-MSDU) are contained in an A-MPDU where all the received MPDUs' Fragment Number fields corresponding to the same TID as the received fragments are of zero value that solicits the immediate response. The recipient STA shall follow the rules in 10.25.6.5 (Generation and transmission of BlockAck frames by an HT STA, DMG STA, or S1G STA) for generating the

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

BlockAck frame and the rules in 26.4 (HE acknowledgment procedure) for generating the Multi-STA BlockAck frame, except that the STA shall

- Set to 0 the LSB of the Fragment Number subfield in the Block Ack Starting Sequence Control subfield of the Compressed BlockAck frame or Multi-STA BlockAck frame that corresponds to a TID of a received fragment that is sent under a block ack agreement.
- Set to 1 each bit of the Block Ack Bitmap field that corresponds to a Sequence Number subfield and TID subfield of a received fragment that is sent under a block ack agreement contained in the soliciting A-MPDU that is not an S-MPDU.

— The STA shall update the corresponding block acknowledgment record for an MSDU or A-MSDU for which fragments are received only if that MSDU or A-MSDU is successfully reconstructed (see 10.5 (MSDU, (11ax)A-MSDU, and MMPDU defragmentation)). Otherwise, the STA shall not update the block ack record for that MSDU or A-MSDU.

NOTE—The recipient STA sets the bits of the Block Ack Bitmap field that correspond to a Sequence Number and TID subfield of an MPDU that is not a fragment as defined in 10.25.6.5 (Generation and transmission of BlockAck frames by an HT STA, DMG STA, or S1G STA).

The recipient STA shall discard any fragments of incomplete MSDUs or A-MSDUs that have been received during an HT-immediate block ack session for a TID if it receives a BlockAckReq frame from the originator STA for that TID and the fragments have a Sequence Number field value that is less than the value of the Starting Sequence Number field of the BlockAckReq frame or have a sequence number that is less than (#6310)$WinStart_B$ (see 10.25.6.6 (Receive reordering buffer control operation)). The comparison of the two values is performed circular modulo 4096 as described in 10.25.1 (Introduction).

## 26.4 HE acknowledgment procedure

### 26.4.1 Overview

The HE acknowledgment procedure builds on the features defined for HT-immediate block ack (see 10.25.6 (HT-immediate block ack extensions)), with the following extensions:

- Support for a Multi-STA BlockAck frame
- Support for a MU-BAR Trigger frame
- Support for a Multi-TID BlockAckReq frame
- Support for BlockAck Bitmap field lengths of 32, 64, 128, and 256
- Acknowledging QoS Data frames with two or more TIDs using a Multi-STA BlockAck frame
- Acknowledging QoS Data frames with one or more TIDs and a Management frame using a Multi-STA BlockAck frame
- Acknowledging all MPDUs in a PPDU using a variant of the Multi-STA BlockAck frame
- Acknowledging MPDUs from multiple associated STAs using a single Multi-STA BlockAck frame
- Acknowledging MPDUs from multiple unassociated STAs with a single Multi-STA BlockAck frame

An HE STA shall be able to respond with Compressed BlockAck frames if HT-immediate block ack is supported in the role of recipient (see 10.25.6.1 (Introduction to HT-immediate block ack extensions)). An HE STA shall be able to respond with a Multi-STA BlockAck frame if multi-TID A-MPDU operation (26.6.3 (Multi-TID A-MPDU and ack-enabled single-TID A-MPDU)) is supported in the role of recipient.

A non-AP HE STA that is associated with an AP and that sends a Multi-STA BlockAck frame shall set the AID11 subfield in the Per AID TID Info field of the Multi-STA BlockAck frame to 0 and the RA field to the MAC address of the intended recipient. A non-AP HE STA that is not associated with an AP shall not send a Multi-STA BlockAck frame.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

An HE AP that sends a Multi-STA BlockAck frame where the Per AID TID Info fields are addressed to more than one STA shall set the RA field to the broadcast address. An HE AP that sends a Multi-STA BlockAck frame where the Per AID TID Info fields are all addressed to a single recipient STA and that is sent in response to an HE TB PPDU may set the RA field of the Multi-STA BlockAck frame either to the address of the recipient STA or to the broadcast address. An HE AP that sends a Multi-STA BlockAck frame where the Per AID TID Info fields are all addressed to a single recipient STA and that is not sent in response to an HE TB PPDU shall set the RA field of the Multi-STA BlockAck frame to the address of the recipient STA.

An HE AP that sends a Multi-STA BlockAck frame to an associated STA shall set the AID11 subfield in the Per AID TID Info field of the Multi-STA BlockAck frame to the 11 LSBs of the AID of the intended STA. An HE AP that sends a Multi-STA BlockAck frame to an unassociated STA shall set the AID11 subfield in the Per AID TID Info field of the Multi-STA BlockAck frame to 2045.

An HE STA that transmits a Multi-STA BlockAck frame shall use a rate, HT-MCS, <VHT-MCS, NSS> tuple, or <HE-MCS, NSS> tuple that is supported by all recipient STAs.

An HE STA that receives a Multi-STA BlockAck frame that is a response to frames requiring acknowledgment shall examine the Per AID TID Info field received in the Multi-STA BlockAck frame and shall process each Per AID TID Info field using the procedure defined in 26.4.2 (Acknowledgment context in a Multi-STA BlockAck frame).

A non-AP HE STA that receives a Multi-STA BlockAck frame that is a response to frames requiring acknowledgment but that do not belong to an established block ack agreement shall examine each Per AID TID Info field received in the Multi-STA BlockAck frame as follows:

— If the Ack Type field is 1 and the TID field is less than 8, then the Per AID TID Info field indicates the acknowledgment of a tagged MPDU that is a QoS Data frame with the indicated TID. The BA Information field is addressed to the STA if the AID of the BA Information field contains the STA's AID(#2385).

— If the Ack Type field is 1 and the TID field is 15, then the Per AID TID Info field indicates the acknowledgment of a tagged MPDU that is a Management frame that solicits acknowledgment or a PS-Poll frame. The BA Information field is addressed to the STA if the AID of the BA Information field contains the STA's AID(#2385).

— If the Ack Type field is 0, the AID field is 2045, and the TID field is 15, then the Per AID TID Info field indicates the acknowledgment of a tagged MPDU that is a Management frame soliciting immediate acknowledgment. The RA field in the Per AID TID Info field is the MAC address of an unassociated STA for which the Per AID TID Info subfield is intended. The BA Information field is addressed to the STA if the RA field of the BA Information field contains the STA's MAC address(#2385).

(#2385)If the BA Information field is addressed to the STA, it is processed according to the procedure defined in 26.4.2 (Acknowledgment context in a Multi-STA BlockAck frame).

An HE AP with dot11MultiBSSIDImplemented equal to true shall not send to a non-AP STA that is associated with an AP corresponding to a nontransmitted BSSID in the multiple BSSID set a Multi-STA BlockAck frame with the TA field set to the transmitted BSSID, unless the HE AP has received from the non-AP STA an HE Capabilities element with the Rx Control Frame To MultiBSS subfield in HE MAC Capabilities Information field equal to 1.

An AP that transmits a Multi-STA BlockAck frame addressed to HE STAs shall set the TA field of the frame to the MAC address of the AP, unless dot11MultiBSSIDImplemented is true and the Multi-STA BlockAck frame is directed to STAs from at least two different BSSs of the multiple BSSID set. In this case, the AP shall set the TA field of the frame to the transmitted BSSID.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

NOTE—An AP sets the TA field of the Multi-STA BlockAck frame that is not carried in HE MU PPDU to the transmitted BSSID when the TXOP is obtained from the transmitted BSSID (see 10.23.2.4 (Obtaining an EDCA TXOP)).

An HE STA that transmits a Multi-TID BlockAckReq frame in a PPDU that is not an HE TB PPDU shall set the TID Value subfields in the Per TID Info subfields of the BAR Information field of the Multi-TID BlockAckReq frame to TIDs that correspond to ACs that have the same or higher priority as the primary AC. An HE STA that transmits a Multi-TID BlockAckReq frame in an HE TB PPDU may set each of the TID Value subfields in the Per TID Info subfields of the BAR Information field of the Multi-TID BlockAckReq frame to a TID that corresponds to any AC.

An HE STA that transmits a BlockAckReq frame in an HE TB PPDU may set the TID subfield in the AID TID Info field in the BAR Information field of the BlockAckReq frame to a TID that corresponds to any AC.

### 26.4.2 Acknowledgment context in a Multi-STA BlockAck frame

A recipient of an A-MPDU shall set the Ack Type subfield and TID subfield in the Per AID TID Info field of the Multi-STA BlockAck frame sent as a response depending on the acknowledgment context as follows:

- An HE AP that receives, prior to association, an A-MPDU that includes one tagged MPDU that is a Management frame soliciting an acknowledgment but does not include any other MPDUs may generate a Multi-STA BlockAck frame using the procedure defined in the (M118)*preassociation ack context* [described in item b) below in this subclause].
- An HE STA that receives an A-MPDU that does not include a tagged MPDU but does include one or more untagged MPDUs that are QoS Data frames with Normal Ack or Implicit BAR ack policy belonging to the same block ack agreement may generate a Multi-STA BlockAck frame as follows:
  - If all MPDUs in the A-MPDU are received successfully, then the recipient may follow the procedure defined in the *all ack context* [described in item a) below in this subclause].
  - Otherwise, the recipient shall follow the procedure defined in the *block ack context* [described in item d) below in this subclause].
- If an HE STA supports ack-enabled aggregation by setting the Ack-Enabled Aggregation Support subfield in the HE MAC Capabilities Information field to 1 and if the A-MPDU includes a tagged MPDU that is a Management frame that solicits acknowledgment and includes one or more MPDUs (either tagged MPDUs or untagged MPDUs) that are QoS Data frames with Normal Ack or Implicit BAR ack policy, then the recipient shall generate Multi-STA BlockAck frame as follows:
  - If all the MPDUs in the A-MPDU are received successfully, then the recipient may follow the procedure defined in the all ack context.
  - Otherwise:
    - For the MPDU that is a Management frame, the recipient shall create a Per AID TID info field using the procedure defined in the *ack context* [described in item c) below in this subclause] with the TID value set to 15.
    - For the tagged MPDUs that are QoS Data frames, the recipient shall create a Per AID TID info field using the procedure defined in the ack context with the TID set to the TID of the QoS Data frame.
    - For the untagged MPDUs that are QoS Data frames, the recipient shall create a Per AID TID info field using the procedure defined in block ack context with the TID set to the TID of the QoS Data frame.
- If an HE STA supports multi-TID aggregation and the A-MPDU does not include a tagged MPDU but does include untagged MPDUs that are QoS Data frames with Implicit BAR ack policy and belonging to more than one block ack agreement, then the recipient shall generate a Multi-STA BlockAck frame as follows:

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

- If all MPDUs in the A-MPDU are received successfully, then the recipient may follow the procedure defined in the all ack context.
- Otherwise, for each TID included the received A-MPDU, the recipient shall create a per AID TID info field using the procedure defined in the block ack context with the TID set to the TID of the QoS Data frame.

NOTE—A STA indicates the maximum number of Per AID TID Info fields with the same AID excluding the one for a Management frame that it can include in the Multi-STA BlockAck frame in the Multi-TID Aggregation Rx Support field in the HE Capabilities element it transmits.

The procedures for the different acknowledgment contexts for generating a Multi-STA BlockAck frame are defined as follows:

a) *All ack context:* If the originator had set the All Ack Support subfield in the HE Capabilities element to 1, then the recipient may set the Ack Type field to 1 and the TID subfield to 14 to indicate the reception of all the MPDUs carried in the eliciting A-MPDU or multi-TID A-MPDU. Otherwise, the recipient shall not set the Ack Type field to 1 and the TID subfield to 14. The Multi-STA BlockAck frame shall contain only one Per AID TID Info field addressed to an originator in the Multi-STA BlockAck frame. The recipient determines that all the MPDUs carried in the eliciting A-MPDU were received if there were no MPDU delimiter CRC errors and no MPDU FCS errors in that A-MPDU.

b) (M118)*Preassociation ack context:* A recipient receiving a Management frame from an unassociated STA that requires an acknowledgment shall set the Ack Type field to 0, AID subfield to 2045, and TID field to 15 in the Per AID TID Info field and set the RA field of the Per AID TID Info field to the intended recipient's MAC address to indicate the reception of that Management frame.

c) *Ack context:* A recipient that sets the Ack-Enabled Aggregation Support subfield in the HE Capabilities element to 1 and that receives a tagged MPDU soliciting acknowledgment shall set the Ack Type field to 1 and, if the tagged MPDU is a QoS Data frame, set the TID field to the TID of the QoS Data frame or, if the tagged MPDU is a Management frame or PS-Poll frame, set the TID field to 15.

   If a received A-MPDU contains more than one tagged MPDU that solicits an immediate acknowledgment, then the Multi-STA BlockAck frame shall contain multiple Per AID TID Info fields, with Ack Type field equal to 1, one for each such received tagged MPDU requesting an acknowledgment.

   The TID field is set to the TID of the QoS Data or QoS Null frame that is being acknowledged and set to 15 for a (#4258)PS-Poll frame or Management frame that is being acknowledged.

d) *Block ack context:* The recipient shall set the Ack Type field to 0 and the TID field of a Per AID TID Info field to the TID value of MPDUs requesting block acknowledgment that are carried in the eliciting A-MPDU or multi-TID A-MPDU.

   The Multi-STA BlockAck frame may contain multiple occurrences of these Per AID TID Info fields addressed to an originator, one for each MPDU that is requesting block acknowledgment. In such cases, the Block Ack Starting Sequence Control and Block Ack Bitmap fields shall be set according to 10.25.6 for each block ack session and according to 26.3 (Fragmentation and defragmentation) for each block ack session with dynamic fragmentation.

   The allowed values for the TID field in this context are 0 to 7 (for indicating block acknowledgment of QoS Data frames).

   Variable bitmap lengths may be included in the Per AID TID Info field when the originator and recipient negotiate their use as defined in 26.4.3 (Negotiation of block ack bitmap lengths).

The Ack Type subfield(s) in a Multi-STA BlockAck frame shall be set to 0 if the Multi-STA BlockAck frame is sent in response to an MU-BAR Trigger frame.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Upon receipt of a Multi-STA BlockAck frame, the originator shall examine each Per AID TID Info field and shall perform the following operations:

— If the AID subfield is 0 for an AP originator or the non-AP STA's AID for a non-AP STA originator, the Ack Type field is 0, and the TID field is less than 8, then the (#4200)Block Ack Starting Sequence Control, TID, and Block Ack Bitmap fields of the Per AID TID Info field are processed according to 10.25.6 (HT-immediate block ack extensions), 26.3 (Fragmentation and defragmentation), and 26.4.4 (Per-PPDU acknowledgment selection rules).

— If the AID subfield is 2045, the Ack Type field is 0, and the TID field is 15, then the Per AID TID Info field indicates the acknowledgment of a single Management frame sent by the unassociated STA as defined by the acknowledgment context.

— If the AID subfield is 0 for an AP originator or the non-AP STA's AID for a non-AP STA originator, the Ack Type field is 1, and the TID is less than or equal to 7 or is equal to 15, then the Per AID TID Info field indicates the acknowledgment of an tagged MPDU that is a QoS Data frame identified by the value of the TID, a Management frame, or a PS-Poll frame.

— If the AID subfield is 0 for an AP originator or the non-AP STA's AID for a non-AP STA originator, the Ack Type field is 1, and the TID subfield of AID TID Info field is 14, then the Per AID TID Info field indicates the acknowledgment of all MPDUs carried in the eliciting A-MPDU as defined by the acknowledgment context.

If an associated non-AP STA that does not support the UORA procedure receives a Multi-STA BlockAck frame in response to an eliciting frame, and if the Multi-STA BlockAck frame contains a Per AID TID Info subfield with the AID11 subfield set to 2045, then the STA shall ignore this Per AID TID Info subfield, and shall continue to parse the following Per AID TID Info subfields (if any).

### 26.4.3 Negotiation of block ack bitmap lengths

Both the Compressed BlockAck frame and Multi-STA BlockAck frame allow different Block Ack Bitmap subfield lengths. The length of the Block Ack Bitmap subfield is indicated in the Fragment Number subfield of the Block Ack Starting Sequence Control field as defined in 9.3.1.8 (BlockAck frame format). The allowed Block Ack Bitmap lengths for each of the negotiated buffer sizes are defined in Table 26-1 (Negotiated buffer size and Block Ack Bitmap subfield length(11ax)).

**Table 26-1—Negotiated buffer size and Block Ack Bitmap subfield length(11ax)**

| Negotiated buffer size | Block Ack Bitmap subfield length in a Compressed BlockAck frame (bits) | Block Ack Bitmap subfield length in a Multi-STA BlockAck frame (bits) |
|---|---|---|
| 1–64 | 64 | 32 or 64 |
| 65–128 | 64 or 256 | 32, 64, or 128 |
| 129–256 | 64 or 256 | 32, 64, 128, or 256 |
| NOTE—A 32-bit Block Ack Bitmap subfield length is not allowed, unless the originator has set the 32-bit BA Bitmap Support field in the HE MAC Capabilities Information field in the HE Capabilities element to 1. | | |

An HE STA that transmits a Compressed BlockAck frame or a Multi-STA BlockAck frame shall use a Block Ack Bitmap subfield length identified in Table 26-1 (Negotiated buffer size and Block Ack Bitmap subfield length(11ax)) for the negotiated buffer size of the block ack agreement to which the BA Information field corresponds.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The recipient is allowed to respond with a Block Ack Bitmap subfield in the BA Information field that is less than the maximum allowed Block Ack Bitmap for the negotiated buffer size. The length of the Block Ack Bitmap subfield in a Compressed BlockAck frame or a Multi-STA BlockAck frame may be less than the maximum allowed Block Ack Bitmap but shall be sufficient to include the recipient's scoreboard state for MPDUs beginning with the MPDU for which the Sequence Number subfield value is $WinStart_R$ and ending with a successfully received MPDU for which the Sequence Number subfield is less than or equal to $WinEnd_R$.

The recipient shall not include in the Buffer Size field of an ADDBA Response frame a value that would cause the BlockAck Bitmap length of its block ack responses to exceed the BlockAck Bitmap length that is derived by the Buffer Size field of the ADDBA Request frame sent by the originator. When the Buffer Size field in the ADDBA Request frame is 0, the Buffer Size field of an ADDBA Response frame is in the range 1 to 64.

NOTE 1—Refer to Block Ack Bitmap subfield length identified in Table 26-1 (Negotiated buffer size and Block Ack Bitmap subfield length(11ax)) for the negotiated buffer size of the block ack agreement.

A recipient shall not include in a Multi-STA BlockAck frame a Per AID TID Info field with a 32-bit BlockAck Bitmap field addressed to an originator if the 32-bit BA Bitmap Support field in the HE MAC Capabilities Information field in the HE Capabilities element received from that originator is 0.

NOTE 2—A Multi-STA BlockAck frame might include Per AID TID Info fields with a 32-bit BlockAck Bitmap field addressed to other originators, and the nonsupporting originator needs to able to parse these fields to locate a possible Per AID TID Info field addressed to it.

The originator of a BlockAckReq frame, MU-BAR Trigger frame, GCR MU-BAR Trigger frame, or a A-MPDU that includes QoS Data frames that solicits an immediate BlockAck frame response or Management frame that solicits acknowledgment shall set the Duration field accounting for the largest BlockAck Bitmap length based on negotiated buffer size.

A recipient shall not transmit a Compressed BlockAck frame or a Multi-STA BlockAck frame with the LSB of the Fragment Number subfield set to 1, unless the recipient has received from the originator an HE Capabilities element with the Dynamic Fragmentation Support subfield equal to 3. If the LSB of the Fragment Number subfield of the BlockAck frame is 1, then the Block Ack Bitmap fields are set as defined in 26.3.2.4 (Level 3 dynamic fragmentation).

### 26.4.4 Per-PPDU acknowledgment selection rules

#### 26.4.4.1 General

A STA that transmits a PPDU can solicit different immediate responses for frames contained in the PPDU by using the Ack Policy Indicator subfield of QoS Data or QoS Null frames, the type of the frame, PPDU format, number of TIDs in the A-MPDU, and the EOF/Tag field setting of the A-MPDU delimiter.

#### 26.4.4.2 Responding to an HE SU PPDU or HE ER SU PPDU with an SU PPDU

An HE STA that receives an HE SU PPDU or HE ER SU PPDU carrying an A-MPDU that includes MPDUs, solicits acknowledgment, and does not include a triggering frame shall respond using an SU PPDU as follows:

a) If the A-MPDU includes only one MPDU and the MPDU is a tagged MPDU that either is a QoS Data frame or QoS Null frame with Normal Ack ack policy or is a Management frame that solicits acknowledgment, then the STA shall respond with an Ack frame.

b) If the A-MPDU includes only one MPDU and the MPDU is an EOF MPD that is a PS-Poll frame, the STA shall respond with an Ack frame or a QoS Data frame.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

c) If the HE STA supports ack-enabled aggregation by setting the Ack-Enabled Aggregation Support subfield in the HE MAC Capabilities Information field to 1, and if the A-MPDU includes more than one MPDU, only one of which solicits acknowledgment and the MPDU that solicits acknowledgment is a tagged MPDU that either is a QoS Data frame or a QoS Null frame with Normal Ack ack policy or is a Management frame that solicits acknowledgment, then the HE STA shall respond with an Ack frame.

d) If the A-MPDU does not include a tagged MPDU but does include one or more untagged MPDUs that are QoS Data frames belonging to the same block ack agreement and with the Ack Policy Indicator subfield equal to Implicit BAR for at least one MPDU, then the STA shall respond with a Compressed BlockAck frame as defined in 10.25.6.5 (Generation and transmission of BlockAck frames by an HT STA, DMG STA, or S1G STA). Alternatively, if all the MPDUs carried in the eliciting A-MPDU were received, the STA may respond with a Multi-STA BlockAck frame with Ack Type field set to 1 and the TID field set to 14 as defined in 26.4.2 (Acknowledgment context in a Multi-STA BlockAck frame) if the originator of the A-MPDU has indicated support for the all ack context by setting the All Ack Support subfield in the HE MAC Capabilities Information field to 1.

e) If the HE STA supports ack-enabled aggregation by setting the Ack-Enabled Aggregation Support subfield in the HE MAC Capabilities Information field to 1, and if the A-MPDU includes a Management frame that solicits an acknowledgment and includes one or more QoS Data frames with Normal Ack or Implicit BAR ack policy, then the STA shall respond with a Multi-STA BlockAck frame as defined in 26.4.2 (Acknowledgment context in a Multi-STA BlockAck frame).

f) If the HE STA supports multi-TID aggregation and if the A-MPDU includes two or more QoS Data frames with Implicit BAR ack policy and belonging to more than one block ack agreement, then the STA shall respond with a Multi-STA BlockAck frame as defined in 26.4.2 (Acknowledgment context in a Multi-STA BlockAck frame).

#### 26.4.4.3 Responding to an HE MU PPDU with an SU PPDU

If an AP intends to solicit an immediate response in an SU PPDU, the following apply:

— An AP shall set the Ack Policy Indicator subfield in the QoS Data and QoS Null frames to Normal Ack or Implicit BAR in at most one A-MPDU in the HE MU PPDU (see 10.3.2.10.1 (Dual CTS protection procedure) for an example of this sequence).

— The A-MPDUs in the HE MU PPDU shall not contain a Management frame that solicits acknowledgment.

An HE STA that receives an HE MU PPDU with an A-MPDU that contains MPDUs that solicit acknowledgment and that does not include a triggering frame shall respond using an SU PPDU as follows:

a) If the A-MPDU carries only one MPDU and the MPDU is a tagged MPDU that is either a QoS Data frame or QoS Null frame with Normal Ack ack policy, then the STA shall respond with an Ack frame.

b) If the HE STA supports ack-enabled aggregation by setting the Ack-Enabled Aggregation Support subfield in the HE MAC Capabilities Information field to 1, and if the A-MPDU includes more than one MPDU, only one of which solicits acknowledgment and the MPDU that solicits acknowledgment is a tagged MPDU that is a QoS Data frame or a QoS Null frame with Normal Ack ack policy, then the HE STA shall respond with an Ack frame.

c) If the A-MPDU does not include a tagged MPDU but does include one or more untagged MPDUs that are QoS Data frames belonging to the same block ack agreement and with the Ack Policy Indicator subfield equal to Implicit BAR for at least one MPDU, then the STA shall respond with a Compressed BlockAck frame as defined in 10.25.6.5 (Generation and transmission of BlockAck frames by an HT STA, DMG STA, or S1G STA). Alternatively, if all the MPDUs carried in the eliciting A-MPDU were received, the STA may respond with a Multi-STA BlockAck frame with the Ack Type set to 1 and the TID field set to 14 as defined in 26.4.2 (Acknowledgment context in a

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Multi-STA BlockAck frame) if the originator of the A-MPDU has indicated support for the all ack context by setting the All Ack Support subfield in the HE MAC Capabilities Information field to 1.

d) If the HE STA supports multi-TID aggregation and if the A-MPDU includes two or more QoS Data frames with Implicit BAR ack policy addressed to it and belonging to more than one block ack agreement, then the STA shall respond with a Multi-STA BlockAck frame as defined in 26.4.2 (Acknowledgment context in a Multi-STA BlockAck frame).

NOTE—A control response frame carried in an SU PPDU that is an immediate response to an HE MU PPDU follows the rules defined in 10.6.6.5 (Rate selection for control response frames)

An AP that sends an HE MU PPDU shall not set the Ack Policy Indicator subfield to Normal Ack or Implicit BAR for any of the MPDUs carried in the HE MU PPDU if the PPDU containing a control response would occupy one or more 20 MHz channels where pre-HE modulated fields of the HE MU PPDU are not located.

#### 26.4.4.4 Responding to an HE MU PPDU, HE SU PPDU, or HE ER SU PPDU with an HE TB PPDU

An AP that sends an HE MU PPDU, HE SU PPDU, or HE ER SU PPDU that contains an MPDU that solicits an immediate response carried in an HE TB PPDU shall set the Ack Policy Indicator subfield to HETP Ack for each of the QoS Data frames for which it intends to solicit an immediate response (see 10.3.2.13.2 (Acknowledgment procedure for DL MU PPDU in MU format(11ax))). If a Management frame that solicits acknowledgment is carried in an HE MU PPDU, then the response is carried in an HE TB PPDU. A non-AP STA that receives an HE MU PPDU, HE SU PPDU, or HE ER SU PPDU with an A-MPDU that contains a QoS Data frame with HETP Ack ack policy addressed to it or contains a Management frame that solicits an immediate acknowledgment shall not respond, unless it has also received a triggering frame in the A-MPDU.

A non-AP STA that receives an HE MU PPDU, HE SU PPDU, or HE ER SU PPDU with an A-MPDU that contains one or more MPDUs soliciting acknowledgment and includes a triggering frame shall respond with an HE TB PPDU as follows:

a) If the A-MPDU includes only one MPDU and the MPDU is a tagged MPDU that either is a QoS Data or QoS Null frame with HETP Ack ack policy or is a Management frame that solicits acknowledgment, then the STA shall respond with an Ack frame.

b) If the HE STA supports ack-enabled aggregation by setting the Ack-Enabled Aggregation Support subfield in the HE MAC Capabilities Information field to 1, and if the A-MPDU includes more than one MPDU, only one of which solicits acknowledgment and the MPDU that solicits acknowledgment is a tagged MPDU that either is a QoS Data or QoS Null frame with HETP Ack ack policy or is a Management frame that solicits acknowledgment, then the HE STA shall respond with an Ack frame.

c) If the A-MPDU does not include a tagged MPDU but does include one or more untagged MPDUs that are QoS Data frames belonging to the same block ack agreement and with the Ack Policy Indicator subfield equal to HETP Ack for at least one MPDU, then the STA shall respond with a Compressed BlockAck frame as defined in 10.25.6.5 (Generation and transmission of BlockAck frames by an HT STA, DMG STA, or S1G STA). Alternatively, if all the MPDUs carried in the eliciting A-MPDU were received, the STA may respond with a Multi-STA BlockAck frame with the Ack Type set to 1 and the TID field set to 14 as defined in 26.4.2 (Acknowledgment context in a Multi-STA BlockAck frame) if the originator of the A-MPDU has indicated support for the all ack context by setting the All Ack Support subfield in the HE MAC Capabilities Information field to 1.

d) If the HE STA supports ack-enabled aggregation by setting the Ack-Enabled Aggregation Support subfield in the HE MAC Capabilities Information field to 1, and if the A-MPDU includes a Management frame that solicits an acknowledgment and contains one or more QoS Data frames with HETP Ack or Implicit BAR ack policy, then the STA shall respond with a Multi-STA BlockAck frame as defined in 26.4.2 (Acknowledgment context in a Multi-STA BlockAck frame).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

e) If the HE STA supports multi-TID aggregation and if the A-MPDU includes two or more QoS Data frames with HETP Ack ack policy and belonging to more than one block ack agreement, then the STA shall respond with a Multi-STA BlockAck frame.

#### 26.4.4.5 Responding to an HE TB PPDU with an SU PPDU

A non-AP STA that sends an HE TB PPDU as a response to a Basic Trigger frame shall set the Ack Policy Indicator subfield of the QoS Data frames or QoS Null frames to Normal Ack or Implicit BAR (see 10.3.2.13.3 (Acknowledgment procedure for UL MU transmission(11ax)) for an example of this sequence).

If the HE TB PPDU carries MPDUs only from one STA and if the HE AP intends to send the response in an SU PPDU, then the HE AP shall respond using an SU PPDU as follows:

a) If the A-MPDU includes only one MPDU, and the MPDU is a tagged MPDU that either is a QoS Data frame or QoS Null frame with Normal Ack ack policy or is a Management frame that solicits acknowledgment, then the HE AP shall respond with either an Ack frame or a Multi-STA BlockAck frame with the Ack Type field set to 1.

b) If the HE AP supports ack-enabled aggregation by setting the Ack-Enabled Aggregation Support subfield in the HE MAC Capabilities Information field to 1, and if the A-MPDU includes more than one MPDU, only one of which solicits acknowledgment and the MPDU that solicits acknowledgment is a tagged MPDU that either is a QoS Data or QoS Null frame with Normal Ack ack policy or is a Management frame that solicits acknowledgment, then the HE AP shall respond with an Ack frame or a Multi-STA BlockAck frame with the Ack Type field set to 1.

c) If the A-MPDU does not include a tagged MPDU but does include one or more untagged MPDUs that are QoS Data frames belonging to the same block ack agreement and with Ack Policy Indicator subfield equal to Implicit BAR for at least one MPDU, then the HE AP shall respond with a Compressed BlockAck frame as defined in 10.25.6.5 (Generation and transmission of BlockAck frames by an HT STA, DMG STA, or S1G STA) or a Multi-STA BlockAck frame with the Ack Type field set to 0. Alternatively, if all the MPDUs carried in the eliciting A-MPDU were received, the HE AP may respond with a Multi-STA BlockAck frame with the Ack Type field set to 1 and the TID field set to 14 if the originator of the A-MPDU has indicated support for the all ack context by setting the All Ack Support subfield in the HE MAC Capabilities Information field to 1, as defined in 26.4.2 (Acknowledgment context in a Multi-STA BlockAck frame).

d) If the HE AP supports ack-enabled aggregation by setting the Ack-Enabled Aggregation Support subfield in the HE MAC Capabilities Information field to 1, and if the A-MPDU carries a Management frame that solicits acknowledgment and carries one or more QoS Data frames with Implicit BAR ack policy, then the HE AP shall respond with a Multi-STA BlockAck frame as defined in 26.4.2 (Acknowledgment context in a Multi-STA BlockAck frame).

e) If the HE AP supports multi-TID aggregation and if the A-MPDU includes two or more QoS Data frames with Normal Ack or Implicit BAR ack policy and belonging to more than one block ack agreement, then the HE AP shall respond with a Multi-STA BlockAck frame as defined in 26.4.2 (Acknowledgment context in a Multi-STA BlockAck frame).

If the AP receives HE TB PPDUs from more than one STA, and if the AP intends to send the response in an SU PPDU, then the AP shall respond with a Multi-STA BlockAck frame carried in an SU PPDU that contains the appropriate settings in each Per AID TID Info field addressed to each STA as defined in 26.4.2 (Acknowledgment context in a Multi-STA BlockAck frame).

#### 26.4.4.6 Responding to an HE TB PPDU with an HE MU PPDU

A non-AP STA that sends an HE TB PPDU as a response to a Basic Trigger frame that solicits an immediate response shall set the Ack Policy Indicator subfield to Normal Ack or Implicit BAR for each of the QoS

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Data frames carried in the A-MPDU (see 10.3.2.13.3 (Acknowledgment procedure for UL MU transmission(11ax)) for an example of this sequence).

If an HE AP sends a response to an HE TB PPDU that it received using an HE MU PPDU, then the AP shall respond to each A-MPDU that it received using the following procedure:

a) If the A-MPDU received from a STA includes only one MPDU and the MPDU is a tagged MPDU that either is a QoS Data frame or QoS Null frame with Normal Ack ack policy or is a Management frame that solicits acknowledgment, then the STA shall respond with an Ack frame or a Multi-STA BlockAck frame with the Ack Type field set to 1 carried in the HE MU PPDU.

b) If the HE AP supports ack-enabled aggregation by setting the Ack-Enabled Aggregation Support subfield in the HE MAC Capabilities Information field to 1, and if the A-MPDU includes more than one MPDU, only one of which solicits acknowledgment and the MPDU that solicits acknowledgment is a tagged MPDU that either is a QoS Data frame with Normal Ack ack policy or is a Management frame that solicits acknowledgment, then the HE AP shall respond with an Ack frame or a Multi-STA BlockAck frame with the Ack Type field set to 1 carried in the HE MU PPDU.

c) If the A-MPDU does not include a tagged MPDU but does include one or more untagged MPDUs that are QoS Data frames belonging to the same block ack agreement and with the Ack Policy Indicator subfield equal to Implicit BAR for at least one MPDU, then the HE AP shall respond with a Compressed BlockAck frame as defined in 10.25.6.5 (Generation and transmission of BlockAck frames by an HT STA, DMG STA, or S1G STA) or a Multi-STA BlockAck frame with the Ack Type field set to 0. Alternatively, if all the MPDUs carried in the eliciting A-MPDU were received, the HE AP may respond with a Multi-STA BlockAck frame with the Ack Type field set to 1 and the TID field set to 14 if the originator of the A-MPDU has indicated support for the all ack context by setting the All Ack Support subfield in the HE MAC Capabilities Information field to 1 as defined in 26.4.2 (Acknowledgment context in a Multi-STA BlockAck frame) carried in the HE MU PPDU.

d) If the HE AP supports ack-enabled aggregation by setting the Ack-Enabled Aggregation Support subfield in the HE MAC Capabilities Information field to 1, and if the A-MPDU carries a Management frame that solicits acknowledgment and carries one or more QoS Data frames with Implicit BAR ack policy, then the HE AP shall respond with a Multi-STA BlockAck frame as defined in 26.4.2 (Acknowledgment context in a Multi-STA BlockAck frame) carried in the HE MU PPDU.

e) If the HE AP supports multi-TID aggregation and if the A-MPDU includes two or more QoS Data frames with Implicit BAR ack policy and belonging to more than one block ack agreement, then the HE AP shall respond with a Multi-STA BlockAck frame as defined in 26.4.2 (Acknowledgment context in a Multi-STA BlockAck frame).

In addition, an AP with dot11MultiBSSIDImplemented equal to true may do one of the following:

— For each BSS belonging to the multiple BSSID set for which the AP has received an HE TB PPDU, the AP responds with a Multi-STA BlockAck frame with RA field set to the broadcast address and carried in a DL HE MU PPDU (see 9.3.1.8.6 (Multi-STA BlockAck variant(11ax))). The AP shall set the TXVECTOR parameter STA_ID for the RU carrying the Multi-STA BlockAck frame to the value of the BSSID Index field as defined in 26.11.1 (STA_ID).

— The AP may respond with a Multi-STA BlockAck frame with the TA field set to the transmitted BSSID and carried in a DL HE MU PPDU to acknowledge the STA's transmission, if the recipient non-AP STA is associated with an AP corresponding to a nontransmitted BSSID of the multiple BSSID set and the AP has received an HE Capabilities element from the STA with the Rx Control Frame To MultiBSS subfield equal to 1 (see 9.3.1.8.6 (Multi-STA BlockAck variant(11ax))). The AP shall set the TXVECTOR parameter STA_ID for the RU carrying the Multi-STA BlockAck frame to 2047.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

NOTE—An AP includes at most one Ack or BlockAck frame (group addressed Multi-STA BlockAck frame included) in an A-MPDU as specified in 9.7.3 (A-MPDU contents).

### 26.4.5 HE block acknowledgment request and response rules

An HE AP may solicit BlockAck frame responses from multiple HE STAs using an MU-BAR Trigger frame or GCR MU-BAR Trigger frame. An HE AP shall not send a Multi-TID BlockAckReq (as part of a User Info field addressed to the STA in an MU-BAR Trigger frame or as a BlockAckReq frame) to a STA that has not indicated support for multi-TID A-MPDU. The Block Ack Bitmap length of the block ack sent in response to an eliciting Multi-TID BlockAckReq frame, BlockAckReq frame, GCR MU-BAR Trigger frame, or MU-BAR Trigger frame is determined as defined in 26.4.3 (Negotiation of block ack bitmap lengths).

An HE STA that receives a BlockAckReq frame or an MU-BAR Trigger frame that contains a Compressed BlockAckReq variant in the User Info field addressed to the STA or receives a GCR MU-BAR Trigger frame that contains a Compressed BlockAckReq variant in the Common Info field shall respond with a Compressed BlockAck frame as defined in 10.25.6 (HT-immediate block ack extensions) or a Multi-STA BlockAck frame as defined in 26.4 (HE acknowledgment procedure) with the Starting Sequence Number subfield set to the Starting Sequence Number subfield of the Block Ack (#4200)Starting Sequence Control subfield and the length of the Block Ack Bitmap subfield calculated as defined in 26.4.3 (Negotiation of block ack bitmap lengths).

An HE STA that receives a Multi-TID BlockAckReq frame or an MU-BAR Trigger frame that contains a Multi-TID BlockAckReq variant in the User Info field addressed to the STA or receives a GCR MU-BAR Trigger frame that contains a Multi-TID BlockAckReq variant in the Common Info field shall respond with a Multi-STA BlockAck frame that contains a Per AID TID Info field with a Block Ack Bitmap subfield for each of the TIDs (with values less than 8) contained in the BlockAckReq frame, with the Starting Sequence Number subfield set to the Starting Sequence Number subfield of the Block Ack (#4200)Starting Sequence Control subfield, and with the length of the Block Ack Bitmap subfield calculated as defined in 26.4.3 (Negotiation of block ack bitmap lengths).

A non-AP HE STA that responds to a Compressed BlockAckReq frame, Multi-TID BlockAckReq frame, MU-BAR Trigger frame, or GCR MU-BAR Trigger frame with a Multi-STA BlockAck frame shall set the Ack Type subfield of the Multi-STA BlockAck frame to 0.

## 26.5 MU operation

### 26.5.1 HE DL MU operation

#### 26.5.1.1 General

HE DL MU operation allows an AP to transmit simultaneously to one or more non-AP STAs in DL OFDMA, DL MU-MIMO, or both.

The PSDU on each RU in an HE MU PPDU shall be padded to end at the same time, indicated by the L-SIG field as described in 27.3.11.5 (L-SIG field).

The padding procedure for each A-MPDU in an HE MU PPDU is defined in 26.6.2.2 (A-MPDU padding in an HE SU PPDU, HE ER SU PPDU, and HE MU PPDU).

An AP shall not transmit an HE MU PPDU with an RU that is narrower than the PPDU bandwidth and that is allocated to more than one STA (DL MU-MIMO), unless the AP has received from each STA an HE

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Capabilities element with the Partial Bandwidth DL MU-MIMO subfield in the HE PHY Capabilities Information field equal to 1.

An AP shall not send to a STA an A-MPDU contained in an HE MU PPDU that contains one of the following combinations of frames, unless the AP has received from the STA an HE Capabilities element with the Ack-Enabled Aggregation Support subfield in the HE MAC Capabilities Information field equal to 1:

— A QoS Data frame with HETP Ack ack policy carried in an A-MPDU subframe with the EOF/Tag field set to 1 and a Trigger frame.

— A Management frame carried in an A-MPDU subframe with the EOF/Tag field set to 1, where the Management frame is a Disassociation frame, (Re)Association Response frame, Authentication frame, or Action frame, and a Trigger frame.

(#3777)The AP follows the EDCA procedure in 10.23 (HCF) with the following modifications:

— The definition of transmission success (see 10.23.2.2 (EDCA backoff procedure)) is extended such that if a DL MU PPDU includes a triggering frame and the AP receives an MPDU in response from at least one of the STAs addressed by the triggering frame, then transmission is a success; otherwise the transmission is a failure.

— The aggregation rules in 26.6 (A-MPDU operation in an HE PPDU) supersede the rules in 10.23.2.7 (Sharing an EDCA TXOP).

An AP shall not transmit an HE MU PPDU where the number of OFDM symbols in the HE-SIG-B field is greater than 16 to a non-AP STA with a 20 MHz operating channel width.

#### 26.5.1.2 RU addressing in an HE MU PPDU

The Type and Subtype subfields in the Frame Control field and address type (individually addressed or group addressed) of MPDUs may be different across A-MPDUs in different PSDUs within the same HE MU PPDU.

An AP includes in the TXVECTOR for an HE MU PPDU at least one parameter STA_ID for each RU in the HE MU PPDU as defined in 26.11.1 (STA_ID). The AP shall not include in the TXVECTOR more than one parameter STA_ID with the same value, unless the value is 2046 (indicating an unallocated RU).

An HE AP with dot11MultiBSSIDImplemented equal to false shall not include in an HE MU PPDU anything other than one or more of the following:

— One or more individually addressed RUs, corresponding to the parameter STA_ID equal to the AID(s) of STA(s) associated with the AP, to carry information intended for the STA(s).

— A broadcast RU corresponding to parameter STA_ID equal to 0 to carry information intended for the STAs associated with the AP that are not the recipient of a individually addressed RU.

— A broadcast RU corresponding to parameter STA_ID equal to 2045 to carry information intended for STAs not associated with the AP.

— One or more RUs corresponding to parameter STA_ID equal to 2046 for (#3024)unallocated RUs.

An HE AP with dot11MultiBSSIDImplemented equal to true shall not include in an HE MU PPDU anything other than one or more of the following:

— One or more individually addressed RUs, corresponding to the parameter STA_ID equal to the AID(s) of STA(s) associated with any AP in the multiple BSSID set, to carry information intended for that associated STA.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

- A broadcast RU corresponding to parameter STA_ID equal to 0 to carry information intended for STAs associated with the AP corresponding to the transmitted BSSID and not the recipient of an individually addressed RU.
- A broadcast RU corresponding to parameter STA_ID equal to the BSSID Index of a BSSID in a multiple BSSID set to carry information intended for STAs associated with the AP corresponding to that BSSID and not the recipient of an individually addressed RU.
- A broadcast RU corresponding to parameter STA_ID equal to 2047 to carry information intended for STAs associated with the APs in the multiple BSSID set and not the recipient of an individually addressed RU or another broadcast RU corresponding to parameter STA_ID equal 0 or equal to the BSSID Index of a BSSID in a multiple BSSID set.
- A broadcast RU corresponding to parameter STA_ID equal to 2045 to carry information intended for STAs not associated with any AP in the multiple BSSID set.
- One or more RUs corresponding to parameter STA_ID equal to 2046 for (#3024)unallocated RUs.

A non-AP STA that receives an HE MU PPDU where the RXVECTOR includes a parameter STA_ID that matches the 11 LSBs of the non-AP STA's AID shall disregard any broadcast RU in the HE MU PPDU. A non-AP STA that receives an HE MU PPDU where the RXVECTOR includes a parameter STA_ID that is equal to the BSSID Index of the BSSID of the AP with which the STA is associated (see 9.4.2.72 (Multiple BSSID-Index element)) shall disregard a broadcast RU corresponding to parameter STA_ID equal to 2047.

For an AP with dot11MultiBSSIDImplemented equal to false, the AP shall set the TA and BSSID fields (when present) to the BSSID of the AP's BSS for all the frames carried in a broadcast RU that corresponds to parameter STA_ID equal to 0 or 2045.

For an AP with dot11MultiBSSIDImplemented equal to true, the AP shall set the TA and BSSID fields (when present) to the transmitted BSSID for all the frames carried in a broadcast RU corresponding to parameter STA_ID equal to 0 or 2045 or 2047.

For an AP with dot11MultiBSSIDImplemented equal to true, the AP shall set the TA and BSSID fields (when present) to the BSSID of the corresponding nontransmitted BSSID for the all frames carried in a broadcast RU corresponding to parameter STA_ID equal to the BSSID Index of a nontransmitted BSSID in a multiple BSSID set.

#### 26.5.1.3 RU allocation in an HE MU PPDU

An AP shall not transmit a 40 MHz HE MU PPDU in the 2.4 GHz band with an RU allocated to a 20 MHz operating non-AP HE STA, unless the AP has received from the 20 MHz operating non-AP HE STA an HE Capabilities element with the 20 MHz In 40 MHz HE PPDU In 2.4 GHz Band subfield in the HE PHY Capabilities Information field equal to 1.

An AP shall not transmit a 160 MHz or 80+80 MHz HE MU PPDU with an RU allocated to a 20 MHz operating non-AP HE STA, unless the AP has received from the 20 MHz operating non-AP HE STA an HE Capabilities element with the 20 MHz In 160/80+80 MHz HE PPDU subfield in the HE PHY Capabilities Information field equal to 1.

An AP shall not transmit a 160 MHz or 80+80 MHz HE MU PPDU with an RU allocated to an 80 MHz operating non-AP HE STA, unless the AP has received from the 80 MHz operating non-AP HE STA an HE Capabilities element with the 80 MHz In 160/80+80 MHz HE PPDU subfield in the HE PHY Capabilities Information field equal to 1.

An AP shall follow the RU restriction rules defined in 27.3.2.8 when assigning an RU to a 20 MHz operating non-AP STA in a 40 MHz, 80 MHz, 160 MHz, or 80+80 MHz HE MU PPDU. An AP shall follow the rules in 27.3.2.7 (20 MHz operating non-AP HE STAs) and 27.3.2.9 (80 MHz operating non-AP HE

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

STAs) or the SST subchannel (if applicable) in which the STA is operating (see 26.8.7 (HE subchannel selective transmission)) if allocating RUs to a non-AP STA.

An AP shall not transmit a 40 MHz HE MU PPDU in the 2.4 GHz band with a 242-tone RU allocated to a 20 MHz operating non-AP HE STA, unless the AP has received from the 20 MHz operating non-AP HE STA an HE Capabilities element with B4 of the Supported Channel Width Set subfield of the HE PHY Capabilities Information field equal to 1.

An AP shall not transmit a 40 MHz, 80 MHz, 160 MHz, or 80+80 MHz HE MU PPDU in the 5 GHz band with a 242-tone RU allocated to a 20 MHz operating non-AP HE STA, unless the AP has received from the 20 MHz operating non-AP HE STA an HE Capabilities element with B5 of the Supported Channel Width Set subfield of the HE PHY Capabilities Information field equal to 1.

An HE MU PPDU shall have a sufficient number of RUs allocated to users such that all of the following conditions are satisfied:

a) At least $N \times 4 \times 26$ subcarriers are modulated by the allocated RUs within the entire PPDU, where $N$ is the number of 20 MHz subchannels that are not preamble punctured in the PPDU.
b) For each 20 MHz subchannel $S$ within the bandwidth of the HE MU PPDU, at least $2 \times 26$ subcarriers are modulated by the allocated RUs in the 20 MHz subchannel $S$ if all of the following are true:
    1) At least one RU is allocated in the 20 MHz subchannel $S$.
    2) Transmitter is an AP.
    3) The AP is operating in an operating class for which the behavior limits set listed in Annex E includes the DFS_50_100_Behavior.
    4) The AP has received at least one Beacon frame from OBSS $B$ within the past dot11ObssNbRuToleranceTime in the current operating channel in which any of the following are true:
        i) The Extended Capabilities element is not present.
        ii) The OBSS Narrow Bandwidth RU In OFDMA Tolerance Support field in the Extended Capabilities element is not present.
        iii) The OBSS Narrow Bandwidth RU In OFDMA Tolerance Support field in the Extended Capabilities element is 0.
    5) The 20 MHz subchannel $S$ overlaps with the operating bandwidth of the OBSS $B$.
c) At least one RU is allocated in the primary 20 MHz.

### 26.5.2 UL MU operation

#### 26.5.2.1 General

UL MU operation allows an AP to solicit simultaneous immediate response frames from one or more non-AP HE STAs. A non-AP HE STA shall follow the rules in this subclause for the transmission of response frames in an HE TB PPDU, unless the Trigger frame is an MU-RTS Trigger frame, in which case the response is a CTS frame sent in a non-HT PPDU (see 26.2.6 (MU-RTS Trigger/CTS frame exchange sequence procedure(#109))).

A non-AP STA shall not send a triggering frame.

An HE STA that is a mesh STA shall not transmit and shall not receive HE TB PPDUs.

A non-AP HE STA shall set the TRS Support subfield in the HE Capabilities element it transmits to 1 if its dot11TRSOptionImplemented is true; otherwise, the STA shall set it to 0.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

A non-AP HE STA shall set the UL 2×996-tone RU Support subfield in HE Capabilities element to 1 if it supports receiving a frame that carries a TRS Control subfield that allocates a 2×996-tone RU or a Trigger frame with User Info field addressed to the STA with RU Allocation subfield indicating a 2×996-tone RU.

If a non-AP HE STA supports transmitting an HE TB PPDU that uses UL MU-MIMO within an RU that spans the entire PPDU bandwidth, then the STA shall set dot11HEFullBWULMUMIMOImplemented to true and the Full Bandwidth UL MU-MIMO subfield of the HE PHY Capabilities Information field in the HE Capabilities element it transmits to 1. Otherwise, the HE STA shall set dot11HEFullBWULMUMIMOImplemented to false and the Full Bandwidth UL MU-MIMO subfield to 0.

If a non-AP HE STA with dot11HEFullBWULMUMIMOImplemented equal to true also supports transmitting an HE TB PPDU that uses UL MU-MIMO within an RU that does not span the entire PPDU bandwidth, then the STA shall set dot11HEPartialBWULMUMIMOImplemented to true and the Partial Bandwidth UL MU-MIMO subfield in the HE PHY Capabilities Information field in the HE Capabilities element it transmits to 1. Otherwise, the non-AP HE STA shall set dot11HEPartialBWULMUMIMOImplemented to false and the Partial Bandwidth UL MU-MIMO subfield to 0.

If a non-AP STA has dot11HEDeviceClass equal to ClassA (1), then it indicates Class A in the Device Class subfield in the HE PHY Capabilities Information field in the HE Capabilities element, and the HE TB PPDUs it transmits shall meet the Class A requirements in 27.3.15 (Transmit requirements for PPDUs sent in response to a triggering frame). Otherwise, it indicates Class B in the Device Class subfield in the HE PHY Capabilities Information field in the HE Capabilities element, and the HE TB PPDUs it transmits shall meet the Class B requirements in 27.3.15 (Transmit requirements for PPDUs sent in response to a triggering frame).

A non-AP HE STA with dot11HTVHTTriggerOptionImplemented equal to true shall set the HT And VHT Trigger Frame Rx Support field to 1 in the HE MAC Capabilities Information field in HE Capabilities elements that it transmits. A non-AP HE STA with dot11HTVHTTriggerOptionImplemented equal to false shall set the HT And VHT Trigger Frame Rx Support field to 0.

#### 26.5.2.2 Rules for soliciting UL MU frames

##### 26.5.2.2.1 General

An HE AP shall not allocate an RU for a 40 MHz HE TB PPDU to a 20 MHz operating non-AP HE STA in the 2.4 GHz band, unless the AP has received from the 20 MHz operating non-AP HE STA an HE Capabilities element with the 20 MHz In 40 MHz HE PPDU In 2.4 GHz Band subfield in the HE PHY Capabilities Information field in its HE Capabilities element equal to 1.

An HE AP shall not allocate an RU for an 160 MHz or 80+80 MHz HE TB PPDU to a 20 MHz operating non-AP HE STA, unless the AP has received from the 20 MHz operating non-AP HE STA an HE Capabilities element with the 20 MHz In 160/80+80 MHz HE PPDU in the HE PHY Capabilities Information field equal to 1.

An AP shall not allocate to a 20 MHz operating non-AP HE STA a 242-tone RU for a 40 MHz, 80 MHz, 160 MHz, or 80+80 MHz HE TB PPDU transmission.

An AP shall not transmit a Trigger frame soliciting an HE TB PPDU that uses UL MU-MIMO within an RU that does not span the entire PPDU bandwidth to a non-AP STA from which it has not received an HE Capabilities element with the Partial Bandwidth UL MU-MIMO subfield of the HE PHY Capabilities Information field equal to 1.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

An AP shall not transmit a Trigger frame soliciting an HE TB PPDU that uses UL MU-MIMO within an RU that spans the full bandwidth to a non-AP STA from which it has not received an HE Capabilities element with the Full Bandwidth UL MU-MIMO subfield of the HE PHY Capabilities Information field equal to 1.

An AP shall not send a frame that carries a TRS Control subfield to a non-AP STA that has not set the TRS Support subfield to 1 in the HE MAC Capabilities Information field in the HE Capabilities element it transmits.

An AP shall not send a frame that carries a TRS Control subfield that allocates a 2×996-tone RU to a non-AP STA or a Trigger frame with a User Info field that allocates a 2×996-tone RU to a non-AP STA, unless the AP has received from the non-AP STA an HE MAC Capabilities element with the UL 2×996-tone RU Support subfield in the MAC Capabilities Information field equal to 1.

NOTE 1—An AP does not send a Trigger frame containing a User Info field with AID12 subfield carrying the 12 LSBs of the AID of a non-AP STA or a frame addressed to a non-AP STA that carries a TRS Control subfield if the AP has received from the non-AP STA an OM Control subfield with UL MU Disabled subfield set to 1 and UL MU Data Disable subfield set to 0 (see 26.9.3 (Transmit operating mode (TOM) indication)).

An AP that transmits a PPDU may solicit an HE TB PPDU from one or more non-AP STAs through one of the following mechanisms:

- Including in the PPDU one or more Trigger frames that include one or more User Info fields with one of the following AID12 subfield settings:
  - The AID12 subfield is set to the 12 LSBs of the AID of the non-AP STA if the User Info field is addressed to a STA that is associated with the AP.
  - The AID12 subfield is set to the 12 LSBs of the AID of the non-AP STA if the User Info field is addressed to a STA that is associated with an AP corresponding to a nontransmitted BSSID in a multiple BSSID set to which the AP belongs, the TA field of the Trigger frame is set to the transmitted BSSID, and the non-AP STA has set the Rx Control Frame To MultiBSS subfield in the HE Capabilities element it transmits to 1.
  - The AID12 subfield indicates that one or more contiguous RA-RUs are allocated (see 26.5.4 (UL OFDMA-based random access (UORA))).
- Including in the PPDU one or more individually addressed frames that include a TRS Control subfield and that are carried in one of the following:
  - An S-MPDU that solicits an immediate Ack frame (see 10.12.8 (Transport of S-MPDUs)).
  - An A-MPDU that solicits an immediate BlockAck frame (see 10.25.6.7 (Originator's behavior)).
  - A multi-TID A-MPDU that solicits an immediate Multi-STA BlockAck frame (see 26.6.3 (Multi-TID A-MPDU and ack-enabled single-TID A-MPDU)).

The AP shall follow the rules in 26.3.2 (Dynamic fragmentation) if any MPDUs are fragments.

More than one Trigger frame may be aggregated in an A-MPDU. If more than one Trigger frame is aggregated in an A-MPDU, all of them shall have the same content. An AP may include a frame carrying a TRS Control subfield in an HE MU PPDU, HE SU PPDU, or HE ER SU PPDU.

NOTE 2—The TRS Control subfields within MPDUs carried in an A-MPDU have the same value (see 10.8 (HT Control field operation)).

An A-MPDU shall not include both a Trigger frame and a frame carrying a TRS Control subfield.

An AP shall not transmit a triggering frame if all of the following conditions are satisfied:

- The AP is operating in an operating class for which the behavior limits set listed in Annex E includes the DFS_50_100_Behavior (see Table E-1).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

- The AP has received at least one Beacon frame from OBSS *B* within the past dot11ObssNbRuToleranceTime in the current operating channel in which any of the following is true:
  - The Extended Capabilities element is not present.
  - The OBSS Narrow Bandwidth RU In OFDMA Tolerance Support field in the Extended Capabilities element is not present.
  - The OBSS Narrow Bandwidth RU In OFDMA Tolerance Support field in the Extended Capabilities element is 0.
- The triggering frame allocates at least one 26-tone RU whose location in frequency overlaps with the operating bandwidth of the OBSS *B*.

If a non-AP HE STA operating in an operating class for which the behavior limits set listed in Annex E includes the DFS_50_100_Behavior does not respond to a triggering frame in which the non-AP HE STA is allocated a 26-tone RU, then the AP should not allocate a 26-tone RU to the non-AP HE STA in the next triggering frame.

An AP shall not transmit a Trigger frame with a User Info field addressed to a non-AP STA in an HT or VHT PPDU, unless the AP has received from the non-AP STA an HE Capabilities element with the HT And VHT Trigger Frame Rx Support subfield in HE MAC Capabilities Information field equal to 1.

An AP shall not use the short guard interval for an HT or VHT PPDU that carries a Trigger frame. A Trigger frame shall not be carried in a DSSS or HR/DSSS PPDU. An AP shall not use STBC encoding for a PPDU that carries a triggering frame.

(#2368)An AP shall not set the UL STBC subfield in the Common Info field in a Trigger frame it transmits if any of the RUs allocated in that Trigger frame is assigned to more than 1 user.

#### 26.5.2.2.2 Requirements for allocating resources

An AP that sends a Basic Trigger frame, a BQRP Trigger frame, or a BSRP Trigger frame that is not aggregated with a QoS Data frame with HETP Ack ack policy or with a Management frame that solicits acknowledgment shall allocate sufficient resources for the responding STA indicated by each User Info field for the solicited associated non-AP STA or the UORA response from an associated non-AP STA to send at least one QoS Null frame that carries an HT Control field.

NOTE—An AP that sends a Basic Trigger frame uses an (M118)implementation specific method to decide the amount of resources indicated for UORA allocations.

An AP that solicits an Ack or BlockAck frame carried in an HE TB PPDU from a non-AP STA shall allocate sufficient resources for the non-AP STA to send the expected acknowledgment. If the AP solicits a BlockAck frame, the allocated resource shall be sufficient for the non-AP STA to send the BlockAck frame with Block Ack Bitmap subfields that are the negotiated block ack bitmap length (see 26.4.3 (Negotiation of block ack bitmap lengths)).

An AP that sends a BFRP Trigger frame shall allocate sufficient resources for the HE TB PPDU response from each HE beamformee to include all the solicited feedback, including feedback that is segmented and including an HT Control field in each frame.

#### 26.5.2.2.3 Padding for a triggering frame

An AP transmitting a PPDU that contains a BCC-encoded triggering frame soliciting a response from a non-AP STA shall ensure that the number of bits in the PSDU following the last bit of *SCH* is at least $L_{PAD,MAC}$ as defined in Equation (26-1), which is based on the *MinTrigProcTime* indicated by the non-AP STA (see Table 9-375 (Subfields of the HE MAC Capabilities Information field(11ax))), where *SCH* is either

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

— The User Info field addressed to the STA of the last or only Trigger frame, or

— The last TRS Control subfield in the PSDU.

$$L_{PAD,MAC} = N_{DBPS} m_{PAD} \quad (26\text{-}1)$$

where

$N_{DBPS}$ is defined in Table 17-4 (Modulation-dependent parameters) for a non-HT PPDU, Table 19-7 (Frequently used parameters)for an HT PPDU, Table 21-6 (Frequently used parameters) for a VHT PPDU, and Table 27-16 (Frequently used parameters(11ax)) for an HE PPDU. If the triggering frame is carried in an HE MU PPDU, $N_{DBPS}$ is replaced by $N_{DBPS,u}$ of the target user in Equation (26-1).

$m_{PAD}$ is as follows:

— For a non-HT PPDU, HT PPDU, and VHT PPDU:

$$m_{PAD} = \begin{cases} 0, \text{ if } MinTrigProcTime \text{ is } 0 \\ 2, \text{ if } MinTrigProcTime \text{ is } 8\ \mu s \\ 4, \text{ if } MinTrigProcTime \text{ is } 16\ \mu s \end{cases}$$

— For an HE PPDU:

$$m_{PAD} = \begin{cases} 0, \text{ if } MinTrigProcTime \text{ is } 0 \\ 1, \text{ if } MinTrigProcTime \text{ is } 8 \text{ or } 16\ \mu s \end{cases}$$

An AP transmitting a Trigger frame that contains at least one User Info field with AID12 subfield indicating allocation of one or more contiguous RA-RUs for associated STAs shall ensure that the number of bits following the last bit of *SCH* is at least $L_{PAD,MAC}$ as defined in Equation (26-1), which is based on the largest *MinTrigProcTime* of all associated non-AP STAs, where *SCH* is the last User Info field with AID12 subfield equal to either 0 or 2046.

An AP transmitting a Trigger frame that contains at least one User Info field with AID12 subfield indicating allocation of one or more contiguous RA-RUs for unassociated non-AP STAs should ensure that the number of bits following the last bit of *SCH* is at least $4 \times N_{DBPS}$ for a non-HT PPDU, HT PPDU, or VHT PPDU or $N_{DBPS}$ for an HE PPDU, where S*CH* is the last User Info field with AID12 subfield equal to either 2045 or 2046.

An AP transmitting an NFRP Trigger frame shall ensure that the number of bits following the last User Info field with an AID12 subfield not equal to 4095 is at least $4 \times N_{DBPS}$ for a non-HT PPDU, HT PPDU, or VHT PPDU or $N_{DBPS}$ for an HE PPDU.

An AP may use any type of padding to satisfy the *MinTrigProcTime* requirement of a non-AP STA, such as using the Padding field in a Trigger frame, using post-EOF A-MPDU padding, or aggregating other MPDUs in the A-MPDU.

If a triggering frame is LDPC encoded, then the transmitting AP ensures that $T_{TrigProc}$ meets the following requirements:

— $T_{TrigProc}$ shall be greater than or equal to the *MinTrigProcTime* specified by the non-AP STAs that are the recipients of the Trigger frame.

— For a Trigger frame that contains at least one User Info field with AID12 subfield indicating allocation of one or more contiguous RA-RUs for associated STAs, $T_{TrigProc}$ shall be greater than or equal to the largest *MinTrigProcTime* of all associated non-AP STAs.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

— For a Trigger frame that contains at least one User Info field with AID12 subfield indicating allocation of one or more contiguous RA-RUs for unassociated STAs, $T_{TrigProc}$ should be at least 16 μs.

— For an NFRP Trigger frame, $T_{TrigProc}$ shall be at least 16 μs.

$T_{TrigProc}$ is defined as the duration of PPDU that is after the OFDM symbol containing the last coded bit of the LDPC codeword that encodes the last bit of *SCH* minus $T_{PE,nominal}$ defined in 27.3.13 (Packet extension).

#### 26.5.2.2.4 Allowed settings of the Trigger frame fields and TRS Control subfield

An AP with dot11MultiBSSIDImplemented equal to true shall not send a Trigger frame (other than an NFRP Trigger frame (11az)or Ranging Trigger frame) with the TA field set to the transmitted BSSID to a non-AP STA that is associated with (11az)a nontransmitted BSSID in the multiple BSSID set(11az) unless the AP has received an HE Capabilities element from non-AP STA with the Rx Control Frame To MultiBSS subfield in the HE MAC Capabilities Information field equal to 1. An AP with dot11MultiBSSIDImplemented equal to true may send an NFRP Trigger frame with the TA field set to the transmitted BSSID to a non-AP STA that is associated with(11az) a nontransmitted BSSID in a multiple BSSID set. An AP with dot11MultiBSSIDImplemented equal to true (11az)may send a Ranging Trigger frame, with the TA field set to a transmitted BSSID, (11az)to an ISTA during a TB ranging measurement exchange (11.21.6.4.3 (TB ranging measurement exchange(11az))) when the FTM session was established using a nontransmitted BSSID in the multiple BSSID set {of, associated with} the transmitted BSSID.

An AP that transmits a Trigger frame shall set the TA field of the frame to the MAC address of the AP, except if dot11MultiBSSIDImplemented is true and the Trigger frame is directed to non-AP STAs from at least two different BSSs of a multiple BSSID set. In this case, the AP shall set the TA field of the frame to the transmitted BSSID.

The AP shall set the UL Length subfield of a Trigger frame to the value given by Equation (27-11) with $m = 2$.

If an AP transmits a Trigger frame that allocates an RU that spans the entire HE TB PPDU bandwidth and assigns the RU to more than one non-AP STA (i.e., for UL MU-MIMO) and with the GI And HE-LTF Type subfield of the Common Info field set to indicate either 2x HE-LTF + 1.6 μs GI or 4x HE-LTF + 3.2 μs GI, the AP may set the MU-MIMO HE-LTF Mode subfield in the Common Info field of the Trigger frame to indicate either HE single stream pilot HE-LTF mode or HE masked HE-LTF sequence mode. Otherwise, the AP shall set the MU-MIMO HE-LTF Mode subfield in the Common Info field to indicate HE single stream pilot HE-LTF mode.

An AP that transmits Trigger frames in more than one A-MPDU in an HE MU PPDU shall set each subfield, except the Trigger Type, More TF, CS Required, and Trigger Dependent Common Info subfields, in the Common Info field of the Trigger frame in one A-MPDU to the same value as the corresponding subfield in the Common Info field of the Trigger frames in the other A-MPDUs.

An AP that transmits frames carrying a TRS Control subfield in more than one A-MPDU in an HE MU PPDU shall set the UL Data Symbols and AP Tx Power subfields of the TRS Control subfield in the frames of one A-MPDU to the same value as the corresponding subfields of the TRS Control subfield in the frames of the other A-MPDUs.

An AP that transmits one or more Trigger frames in one or more A-MPDUs and frames carrying a TRS Control subfield in one or more other A-MPDUs in an HE MU PPDU shall set the Common Info field of the Trigger frames and the TRS Control subfields in each A-MPDU as follows:

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

- The UL Length subfield in the Common Info field of the Trigger frames and the UL Data Symbols subfield in the TRS Control subfields indicate the same HE TB PPDU duration.
- The AP Tx Power subfield in the Common Info field of the Trigger frames and the AP Tx Power subfield in the TRS Control subfields indicate the same transmit power.
- In the Common Info field of the Trigger frames:
  - The MU-MIMO HE-LTF Mode and UL STBC subfields are set to 0.
  - The Number Of HE-LTF Symbols And Midamble Periodicity subfield is set to 0.
  - The Doppler subfield is set to 0.
  - The Pre-FEC Padding Factor subfield is set to 0 (i.e., to indicate a pre-FEC padding factor of 4).
  - The UL Length subfield and the PE Disambiguity subfield are set to indicate the PE duration calculated with Equation (27-114) is the default PE duration value, which is indicated by the AP in the Default PE Duration subfield of the HE Operation element it transmits.
  - The UL Spatial Reuse subfield is set to PSR_AND_NON_SRG_OBSS_PD_PROHIBITED.
  - If the TXVECTOR parameters HE_LTF_TYPE and GI_TYPE of the HE PPDU carrying the Trigger frame are either 4xHE-LTF and 3u2s_GI, respectively, or 2xHE-LTF and 1u6s_GI, respectively, then the GI And HE-LTF Type subfield is set to 2. Otherwise, the GI And HE-LTF Type subfield is set to 1.

NOTE 1—A non-AP STA obtains the information required to prepare an HE TB PPDU explicitly and implicitly. Explicit information is obtained in the triggering frame contained in the triggering PPDU. Implicit information is obtained in previously exchanged frames with the AP, e.g., in the BSS Color and the Default PE Duration subfields of the HE Operation element, or from default values specified in 26.5.2.3 (Non-AP STA behavior for UL MU operation).

An AP shall not set any subfields of the Common Info field of a Trigger frame to a value that is not supported by all the recipient non-AP STAs of the Trigger frame and the AP. An AP shall not set any subfields of the User Info field of a Trigger frame to a value that is not supported by the recipient non-AP STA of the User Info field and the AP. An AP shall set the values of the subfields of the Common Info field and User Info field of a Trigger frame such that the combination together would cause the solicited non-AP STA to construct a valid HE TB PPDU. An AP shall not set any subfields of a TRS Control subfield to a value that is not supported by the recipient non-AP STA of the TRS Control subfield and the AP. An AP shall set the values of the subfields of a TRS Control subfield such that the combination together would cause the solicited non-AP STA to construct a valid HE TB PPDU. If an RU is allocated to only one non-AP STA, the Starting Spatial Stream subfield for that non-AP STA shall be set to 0.

NOTE 2—Subclauses 27.3.4 (HE PPDU formats) and 27.3.6.10 (Construction of the Data field in an HE SU PPDU, HE ER SU PPDU, and HE TB PPDU) specify the requirements on each of the other remaining subfields, such that the solicited non-AP STAs each construct a valid HE TB PPDU in response to the Trigger frame.

An AP shall follow the RU restriction rules defined in 27.3.2.8 (RU restrictions for 20 MHz operation) when assigning an RU to a 20 MHz operating non-AP STA for a 40 MHz, 80 MHz, 160 MHz, or 80+80 MHz HE TB PPDU. An AP shall not set the RU Allocation subfield of the User Info field of a triggering frame that is addressed to a non-AP STA to a value such that the RU allocated to the STA lies outside the channel in which the STA is operating (see 27.3.2.6 (Resource allocation for an HE TB PPDU) and 27.3.2.9 (80 MHz operating non-AP HE STAs)) or outside the SST subchannel (if applicable) in which the STA is operating (see 26.8.7 (HE subchannel selective transmission)).

If a Trigger frame is transmitted in the broadcast RU of an HE MU PPDU, then the Trigger frame shall not include any User Info fields addressed to a non-AP STA that is identified as a recipient of another RU or spatial stream of the same HE MU PPDU.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

A TRS Control subfield shall not be included in a group addressed frame.

If an AP transmits one or more Trigger frames or frames carrying a TRS Control subfield, then the frames shall collectively elicit HE TB PPDU responses such that at least one scheduled RU is allocated for each 20 MHz channel occupied by the eliciting PPDU. An AP shall not allocate an RU in any 20 MHz channel that is not occupied by the immediately preceding DL PPDU.

An AP may indicate an unallocated RU in a Trigger frame by including a User Info field with the AID12 subfield set to 2046. The AP shall place any User Info fields with the AID12 subfield set to 2046 after User Info fields with the AID12 subfield set to a value less than 2046.

An AP shall not transmit a Trigger frame that contains more than one User Info field with the same value in the AID12 subfield, unless the value in the AID12 subfield is 0 or greater than 2007. The AP shall place User Info fields with the same value in the AID12 subfield together as a contiguous block in the Trigger frame. The AP shall place User Info fields with the AID12 subfield set to 0 or a value greater than 2007 after User Info fields with the AID12 subfield set to a value in the range 1 to 2007 (if any present).

An AP that transmits an individually addressed Trigger frame shall include only one User Info field in the Trigger frame with the AID12 subfield set to the 12 LSBs of the AID of the non-AP STA addressed by the RA field.

An example of User Info field ordering in a Trigger frame and the relationship to RU locations is shown in Figure 26-4 (Example of User Info field ordering and RU location mapping(11ax)(#3024)).

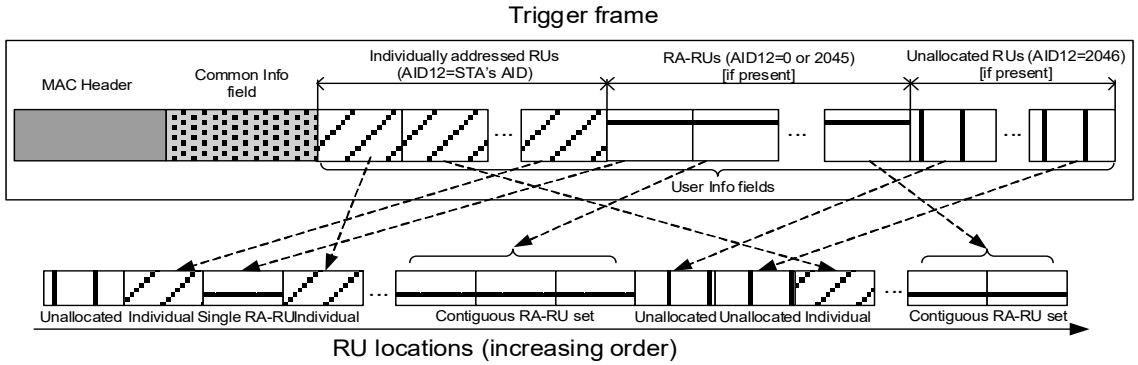

**Figure 26-4—Example of User Info field ordering and RU location mapping(11ax)(#3024)**

An AP that sends a Basic Trigger frame shall set the TID Aggregation Limit subfield of a User Info field that is addressed to a non-AP STA to a value between 0 and 1 plus the value of the Multi-TID Aggregation Tx Support subfield in the HE Capabilities element most recently received from the non-AP STA. A value 0 in the TID Aggregation Limit subfield indicates to the non-AP STA that it shall not solicit any immediate response for the MPDUs that the non-AP STA aggregates in the HE TB PPDU. A value of 7 in the TID Aggregation Limit subfield indicates to the non-AP STA that it may aggregate QoS Data frames from any number of different TID values in the multi-TID A-MPDU. Table 26-2 (Relation between TID Aggregation Limit field, Multi-TID Aggregation Tx Support field, and solicited immediate response(11ax)) provides a summary of the possible combinations.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 26-2—Relation between TID Aggregation Limit field, Multi-TID Aggregation Tx Support field, and solicited immediate response(11ax)**

| AP: TID Aggregation Limit field | Non-AP STA: Multi-TID Aggregation Tx Support field | Non-AP STA: Solicited immediate response? |
|---|---|---|
| 0 | Any value | No |
| 1 | Any value | Yes for at most one TID and/or one Management frame |
| *tal* (0 to *mta* + 1) | *mta* | Yes at most *tal* TIDs and/or at most one Management frame |

Legend:
*tal* is the value in the TID Aggregation Limit field.
*mta* is the value in the Multi-TID Aggregation Tx Support field.

The AP may assign any ACI value defined in Table 9-193 (ACI-to-AC coding) in the Preferred AC subfield in the Trigger Dependent User Info field for an HE STA and identified by the AID12 subfield of the User Info field of a Basic Trigger frame. If the AP does not have a recommendation, then it shall set the Preferred AC subfield to the value 0 (AC_BE).

When transmitting a PPDU carrying a triggering frame, an AP should not apply transmit beamforming to the following:

— Non-HT PPDUs
— Fields prior to the HT-STF field of an HT mixed format PPDU
— Pre-VHT modulated fields of an VHT PPDU
— Pre-HE modulated fields of an HE PPDU

An AP shall transmit an HE PPDU that carries a triggering frame with the TXVECTOR parameter BEAM_CHANGE set to 1.

An AP should set the TID Aggregation Limit subfield in the User Info fields of a Basic Trigger frame to 0 if the CS Required subfield in the Common Info field of the Basic Trigger frame is 0.

An AP shall set the TID Aggregation Limit subfield in the User info fields of a Basic Trigger frame to 0 if the solicited HE TB PPDU is the last PPDU of the TXOP.

NOTE 3—An HE TB PPDU is the last PPDU if the Duration/ID field is equal to 0 in the MPDU(s) contained in the HE TB PPDU.

### 26.5.2.2.5 AP access procedures for UL MU operation

The AP shall follow the EDCA procedure defined in 10.23 (HCF) and the additional rules in this subclause.

If an AP receives an immediate response with at least one frame from at least one non-AP STA solicited by a triggering frame, the frame exchange sequence(#109) is successful.

If an AP does not receive an immediate response with at least one frame from at least one non-AP STA solicited by a PPDU that contains at least one Trigger frame, then the frame exchange sequence(#109) is not successful, and the AP shall follow the backoff procedure in 10.23.2.2 (EDCA backoff procedure).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

An AP may use any AC for sending a PPDU that contains only Trigger frames.

If the PPDU contains frames that are not Trigger frames in addition to a Trigger frame, then the AP follows the MPDU aggregation rules in 26.6 (A-MPDU operation in an HE PPDU), which supersede the rules in 10.23.2.7 (Sharing an EDCA TXOP).

#### 26.5.2.3 Non-AP STA behavior for UL MU operation

##### 26.5.2.3.1 General

A non-AP STA shall not send an HE TB PPDU, unless it is explicitly triggered by an AP in one of the operation modes described in this subclause.

The interframe space between a PPDU that contains a triggering frame and the HE TB PPDU is a SIFS.

A non-AP STA shall not transmit an HE TB PPDU if all of the conditions in 26.5.2.3.2 (Conditions for not responding with an HE TB PPDU) are satisfied. Otherwise, a non-AP STA shall transmit an HE TB PPDU a SIFS after a received PPDU if all of the following conditions are met:

- The received PPDU contains either a Trigger frame (that is not an MU-RTS variant) with a User Info field addressed to the non-AP STA or a frame addressed to the non-AP STA that contains an TRS Control subfield. A User Info field in the Trigger frame is addressed to a non-AP STA if one of the following conditions are met:
  - The AID12 subfield is equal to the 12 LSBs of the AID of the non-AP STA, and the Trigger frame is sent by the AP with which the non-AP STA is associated or by the AP corresponding to the transmitted BSSID if the non-AP STA is associated with an AP corresponding to a nontransmitted BSSID and has indicated support for receiving Control frames with TA field set to the transmitted BSSID by setting the Rx Control Frame To MultiBSS subfield to 1 in the HE Capabilities element that the STA transmits.
  - The AID12 subfield indicates allocation of one or more contiguous RA-RUs for associated STAs, the non-AP STA is associated with the AP that sent the Trigger frame, the non-AP STA supports the UORA procedure, and the conditions in 26.5.4 (UL OFDMA-based random access (UORA)) are satisfied.
  - The AID12 subfield indicates allocation of one or more contiguous RA-RUs for unassociated STAs, the non-AP STA is not associated with the AP that sent the Trigger frame, the non-AP STA supports the UORA procedure, the conditions in 26.5.4 (UL OFDMA-based random access (UORA)) are satisfied, and the resource to which the non-AP STA gains access is sufficient for the non-AP STA to include the pending frame.
- The CS Required subfield in the Trigger frame is 1, and the UL MU CS condition described in 26.5.2.5 (UL MU CS mechanism) indicates the medium is idle; or the CS Required subfield in a Trigger frame is 0; or the response was solicited by a frame containing a TRS Control subfield.
- The UL MU Disable subfield is 0, and the UL MU Data Disable subfield is 0 in the most recent OM Control subfield (if any) sent by the non-AP STA to the AP; or the UL MU Disable subfield is 0, the UL MU Data Disable subfield is 1 in the most recent OM Control subfield (if any) sent by the non-AP STA to the AP, and the frame that is being triggered is an acknowledgment (see 26.9.3 (Transmit operating mode (TOM) indication)).

A non-AP STA addressed by a User Info field in a Trigger frame (i.e., the AID12 subfield is equal to the 12 LSBs of the AID of the non-AP STA) may ignore the remainder of User Info fields in the Trigger frame.

A non-AP STA generates the A-MPDU carried in the HE TB PPDU as defined in 26.5.2.4 (A-MPDU contents in an HE TB PPDU).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

#### 26.5.2.3.2 Conditions for not responding with an HE TB PPDU

A non-AP STA shall not transmit an HE TB PPDU that is not an HE TB feedback NDP if all the following conditions are satisfied:

- The non-AP STA is operating in an operating class for which the behavior limits set listed in Annex E includes the DFS_50_100_Behavior (see Table E-1 (Operating classes in the United States and its territories(#296)).
- The HE TB PPDU would be in response to one of the following:
  - A Trigger frame containing a User Info field with AID12 subfield carrying the 12 LSBs of the AID of the STA.
  - A frame addressed to the non-AP STA that includes a TRS Control subfield.
  - A Trigger frame that allocates at least one RA-RU.
- The RU is a 26-tone RU.
- The non-AP STA has received at least one Beacon frame within the past dot11ObssNbRuToleranceTime from an AP with which the non-AP STA is not associated, and the Beacon frame meets any of the following conditions:
  - The Extended Capabilities element is not present.
  - The OBSS Narrow Bandwidth RU In OFDMA Tolerance Support field in the Extended Capabilities element is not present.
  - The OBSS Narrow Bandwidth RU In OFDMA Tolerance Support field in the Extended Capabilities element is 0.

A non-AP STA may choose to not respond to a Trigger frame that contains one or more subfields in the Common Info field or in the User Info field addressed to or selected by the non-AP STA with values that are not recognized, are not supported, or cannot be satisfied by the non-AP STA.

NOTE—The User Info field in this context corresponds to the one directed to the non-AP STA (i.e., value in the AID12 subfield matches the STA's AID) or the one allocating an RA-RU (single or within a contiguous set) that is selected by the non-AP STA.

A non-AP STA may choose to not respond a TRS Control subfield in a frame addressed to the non-AP STA if the TRS Control subfield contains one or more subfields with values that are not recognized, are not supported, or cannot be satisfied by the non-AP STA.

A non-AP STA shall update the intra-BSS NAV (see 26.2.4 (Updating two NAVs)) based on the duration information of the triggering frame even if it decides to not respond to the frame.

#### 26.5.2.3.3 TXVECTOR parameters for HE TB PPDU response to Trigger frame

A non-AP STA transmitting an HE TB PPDU in response to a Trigger frame that is not an MU-RTS Trigger frame shall set the TXVECTOR parameters as follows (subject to, in the case of an NFRP Trigger frame, the exceptions given in 26.5.7.2 (STA behavior)):

- The FORMAT parameter is set to HE_TB.
- The TRIGGER_METHOD parameter is set to TRIGGER_FRAME.
- The TXOP_DURATION parameter is set as defined in 26.11.5 (TXOP_DURATION).
- The BSS_COLOR parameter is set as follows:
  - If the Trigger frame was received in an HE PPDU, then set to the value of the RXVECTOR parameter BSS_COLOR of the HE PPDU.
  - If the Trigger frame was received in a non-HE PPDU, then set to the value of the active BSS color as defined in 26.11.4 (BSS_COLOR).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

- The L_LENGTH parameter is set to the value indicated by the UL Length subfield in the Common Info field of the Trigger frame.
- The GI_TYPE and HE_LTF_TYPE parameters are set to the value indicated by the GI and HE-LTF Type subfield of the Common Info field of the Trigger frame.
- The NUM_STS parameter is set to the number of space-time streams indicated by the Number Of Spatial Streams subfield of the SS Allocation field of the User Info field and UL STBC subfield in the Common Info field of the Trigger frame. The NUM_STS parameter is set to 1 if the HE TB PPDU is sent on an RA-RU following the UORA procedure.
- The CH_BANDWIDTH parameter is set to the value of the UL BW subfield in the Common Info field of the Trigger frame.
- The HE_LTF_MODE parameter is set to the value indicated by the MU-MIMO HE-LTF Mode subfield of the Common Info field of the Trigger frame if the HE_LTF_TYPE parameter does not indicate 1x HE-LTF and the Trigger frame indicated full-bandwidth MU-MIMO. Otherwise, the parameter is not present.
- The NUM_HE_LTF parameter is set to the value indicated by the Number Of HE-LTF Symbols And Midamble Periodicity subfield of the Common Info field of the Trigger frame.
- The STBC parameter is set to the value indicated by the UL STBC subfield of the Common Info field of the Trigger frame.
- The LDPC_EXTRA_SYMBOL parameter is set to the value indicated by the LDPC Extra Symbol Segment subfield of the Common Info field of the Trigger frame.
- The SPATIAL_REUSE parameter is set to the value of the UL Spatial Reuse subfield in the Common Info field of the eliciting Trigger frame.
- The DOPPLER parameter is set to the value of the Doppler subfield in the Common Info field of the Trigger frame.
- The MIDAMBLE_PERIODICITY parameter is present if the Doppler subfield in the Common Info field of the Trigger frame is 1. If present, it is set to the value indicated by the Number Of HE-LTF Symbols And Midamble Periodicity subfield in the Common Info field of the Trigger frame.
- The HE_SIG_A2_RESERVED parameter is set to the value of the UL HE-SIG-A2 Reserved subfield in the Common Info field of the Trigger frame.
- The MCS parameter is set to the value of the UL HE-MCS subfield in the User Info field of the Trigger frame.
- The DCM parameter is set to the value indicated by the UL DCM subfield of the User Info field of the Trigger frame.
- The STARTING_STS_NUM parameter is set to the value of the Starting Spatial Stream subfield in the SS Allocation field in the User Info field of the Trigger frame. The STARTING_STS_NUM parameter is set to 0 if the HE TB PPDU is sent on an RA-RU following the UORA procedure.
- The FEC_CODING parameter is set to the value indicated by the UL FEC Coding Type subfield of the User Info field of the Trigger frame.
- The RU_ALLOCATION parameter is set as follows:
  - If the RU is not an RA-RU or an RA-RU with the Number Of RA-RU subfield of the User Info subfield of the Trigger frame set to 0, it is set to the value indicated by the RU Allocation subfield of the User Info subfield of the Trigger frame.
  - If the RU is the $k^{th}$ RU of a set of contiguous RA-RUs starting with an RA-RU with Number Of RA-RU subfield of the User Info subfield of the Trigger frame set to a nonzero value, it is set to the value indicated by the RU Allocation subfield of the corresponding User Info subfield of the Trigger frame plus $k$ minus 1.
- The TXPWR_LEVEL_INDEX parameter is set to a value based on the computed transmission power (see 27.3.15.2 (Power precorrection(M118))) for an HE TB PPDU and the value of the AP Tx

Copyright © 2024 IEEE. All rights reserved.

Power subfield in the Common Info field and the UL Target Receive Power subfield in the User Info field of the Trigger frame.

— The HE_TB_PE_DISAMBIGUITY parameter is set to the value indicated by the PE Disambiguity subfield in the Common Info field in the Trigger frame.

— The PRE_FEC_PADDING_FACTOR parameter is set to the value indicated by the Pre-FEC Padding Factor subfield in the Common Info field in the Trigger frame.

#### 26.5.2.3.4 TXVECTOR parameters for HE TB PPDU response to TRS Control subfield

A non-AP STA transmitting an HE TB PPDU in response to a frame containing a TRS Control subfield shall set the TXVECTOR parameters as follows:

— The FORMAT parameter is set to HE_TB.

— The TRIGGER_METHOD parameter is set to TRS.

— The L_LENGTH parameter is computed as described in Equation (27-11) using the TXTIME value. The TXTIME is defined by Equation (27-149) where $N_{SYM}$ is set to $F_{VAL}$ + 1, where $F_{VAL}$ is the value of the UL Data Symbols subfield of the TRS Control subfield.

— The RU_ALLOCATION and MCS parameters are set to the values of the RU Allocation and UL HE-MCS subfields of the TRS Control subfield, respectively.

— The CH_BANDWITDTH parameter is set to the value of the RXVECTOR parameter CH_BANDWIDTH of the soliciting DL HE PPDU (see Table 27-1 (TXVECTOR and RXVECTOR parameters(#12)(11ax))).

— The BSS_COLOR and DCM parameters are set to the values of the RXVECTOR parameters BSS_COLOR and DCM of the soliciting DL HE PPDU, respectively.

— The DOPPLER parameter is set to 0, and the MIDAMBLE_PERIODICITY parameter is absent.

— The NUM_HE_LTF parameter is set to 1.

— The STARTING_STS_NUM parameter is set to 0.

— The STBC parameter is set to 0, and the NUM_STS parameter is set to 1 (the HE_LTF_MODE parameter is not present).

— The FEC_CODING parameter is set to BCC_CODING if the RU Allocation subfield indicates an RU that is smaller than a 484-tone RU; otherwise, it is set to LDPC_CODING.

— The LDPC_EXTRA_SYMBOL parameter is set to 0 if the RU Allocation subfield indicates less than a 484-tone RU; otherwise, it is set to 1.

— The SPATIAL_REUSE parameter is set to PSR_AND_NON_SRG_OBSS_PD_PROHIBITED.

— The DEFAULT_PE_DURATION parameter is set to the default PE duration value for UL MU response scheduling, which is indicated by the AP in the Default PE Duration subfield of the HE Operation element it transmits.

— The TXOP_DURATION parameter is set as defined in 26.11.5 (TXOP_DURATION).

— The HE_SIG_A2_RESERVED parameter is set to 511 (all 1s).

— If the RXVECTOR parameters HE_LTF_TYPE and GI_TYPE of HE MU PPDU carrying the frame with the TRS Control subfield are either 4xHE-LTF and 3u2s_GI, respectively, or 2xHE-LTF and 1u6s_GI, respectively, then the HE_LTF_TYPE and GI_TYPE parameters are set to 4xHE-LTF and 3u2s_GI, respectively. Otherwise, the HE_LTF_TYPE and GI_TYPE parameters are set to 2xHE-LTF and 1u6s_GI, respectively.

— The TXPWR_LEVEL_INDEX parameter is set to a value based on the computed transmission power (see 27.3.15.2 (Power precorrection(M118))) for an HE TB PPDU and the value of the AP Tx Power subfield of the TRS Control subfield and the UL Target Receive Power subfield of the TRS Control subfield.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

NOTE 1—A non-AP STA transmitting an HE TB PPDU in response to a frame carrying a TRS Control subfield considers both physical CS and virtual CS to be 0 (see 26.5.2.5 (UL MU CS mechanism)).

NOTE 2—The only permissible values for CH_BANDWIDTH are CBW20, CBW40, CBW80, CBW80+80, and CBW160 if the triggering PPDU is an HE SU PPDU or HE MU PPDU. The only permissible value for CH_BANDWIDTH is CBW20 if the triggering PPDU is an HE ER SU PPDU.

#### 26.5.2.3.5 RA field for frames carried in an HE TB PPDU

The RA field of the frames sent in response to a MU-RTS Trigger frame is set as defined in 9.3.1.3 (CTS frame format). The RA field of the frames sent in response of a GCR MU-BAR Trigger frame or MU-BAR Trigger frame is set as defined in 9.3.1.8 (BlockAck frame format). The RA field of the QoS Null frames, QoS Data frames, and Management frames sent in response to a Trigger frame shall be set to the MAC address of the destination AP (see 9.3.2.1 (Format of Data frames) and 9.3.3.1 (Format of (PV0) Management frames)). The RA field of a QoS Null frame or Action No Ack frame sent in response to a frame carrying TRS Control subfield shall be the MAC address of the destination AP (see 9.3.2.1 (Format of Data frames) and 9.3.3.1 (Format of (PV0) Management frames)).

NOTE 1—If dot11MultiBSSIDImplemented is true and the TA field of the soliciting Trigger frame contains the transmitted BSSID, the destination AP is the BSSID to which the non-AP STA intends to send the frame.

NOTE 2—All MPDUs within an A-MPDU carried in an HE TB PPDU have the same RA (see 9.7.3 (A-MPDU contents)). The settings of the address fields of MPDUs within the A-MPDU depend on the type and subtype of the MPDU as defined in 9.3 (Format of individual frame types).

### 26.5.2.4 A-MPDU contents in an HE TB PPDU

A non-AP STA that receives a triggering frame other than an MU-RTS Trigger frame or an NFRP Trigger frame and that transmits an HE TB PPDU response shall follow the A-MPDU padding procedure described in 26.6.2.3 (A-MPDU padding in an HE TB PPDU) and construct the A-MPDU carried in the HE TB PPDU as described below in this subclause, provided the AP allocates sufficient resources for the non-AP STA to include MPDU(s) in the A-MPDU. Otherwise, the non-AP STA is not required to include MPDUs in the A-MPDU and includes only padding in the A-MPDU.

NOTE 1—The responses to a MU-RTS Trigger frame and a NFRP Trigger frame are exempt from these construction rules since the MU-RTS Trigger frame does not solicit an HE TB PPDU and the NFRP Trigger frame solicits an HE TB PPDU that does not carry an A-MPDU.

A non-AP STA shall follow the rules in 26.5.4.5 (Additional considerations for unassociated STAs) to construct an HE TB PPDU in response to a Trigger frame that is not an MU-RTS Trigger frame from an AP with which it is not associated and that allocates RA-RUs for unassociated STAs.

A non-AP STA that responds to a DL MU PPDU containing one or more frames addressed to it that include a TRS Control subfield follows the rules defined in 10.3.2.11 (Acknowledgment procedure) for generating the Ack frame, the rules defined in 10.25.6.5 (Generation and transmission of BlockAck frames by an HT STA, DMG STA, or S1G STA) for generating the BlockAck frame, and the rules defined in 26.4 (HE acknowledgment procedure) for generating the Multi-STA BlockAck frame if at least one of the received MPDUs solicits an immediate acknowledgment. The contents of the A-MPDU carried in the HE TB PPDU shall be as defined in the following:

— Table 9-663 (A-MPDU contents in the control response context) if at least one of the received MPDUs solicits an immediate acknowledgment.
— Table 9-662 (A-MPDU contents in the data enabled no immediate response context) with the exception that the A-MPDU does not contain QoS Data frames, if none of the received MPDUs solicit an immediate acknowledgment.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

NOTE 2—The non-AP STA additionally follows the rules in 26.3.2 (Dynamic fragmentation) if fragments are present in the soliciting A-MPDU.

NOTE 3—An AP might transmit an HE MU PPDU with an RU allocated to STA-ID 2045 with an A-MPDU that includes a Management frame that is addressed to an unassociated non-AP STA, solicits an acknowledgment, and carries a TRS Control subfield. The TRS Control subfield allocates resources for the unassociated non-AP STA to respond with an HE TB PPDU that carries the acknowledgment.

An associated non-AP STA that responds to a Basic Trigger frame addressed to it shall construct the A-MPDU carried in the HE TB PPDU as defined in the following:

- Table 9-663 (A-MPDU contents in the control response context) if the Trigger frame is contained in an A-MPDU and the non-AP STA received in the same A-MPDU at least one MPDU that solicits an immediate acknowledgment. The TID Aggregation Limit field of the User Info field addressed to the non-AP STA may have any value.
- Table 9-662 (A-MPDU contents in the data enabled no immediate response context) with the exception that the A-MPDU does not contain QoS Data frames, if the Trigger frame either is not carried in an A-MPDU or is carried in an A-MPDU but the non-AP STA receives no other MPDUs that solicit an immediate acknowledgment. The TID Aggregation Limit field of the User Info field addressed to the non-AP STA may have any value.
- Table 9-664 (A-MPDU contents in the S-MPDU context(#1762))with the following restrictions:
  - The S-MPDU shall be a control response frame if the non-AP STA received in the same A-MPDU at least one MPDU that solicits an immediate acknowledgment. The TID Aggregation Limit field of the User Info field addressed to the non-AP STA may have any value.
  - The S-MPDU may be a Multi-TID BlockAckReq frame, provided that the number of TIDs present in the Multi-TID BlockAckReq frame does not exceed the TID aggregation limit indicated by the TID Aggregation Limit field of the User Info field addressed to the non-AP STA.
  - The S-MPDU may be a QoS Data, QoS Null, Management, BlockAckReq, or PS-Poll frame if the TID Aggregation Limit field of the User Info field addressed to the non-AP STA is greater than 0.
  - Otherwise, the S-MPDU shall be a QoS Data, QoS Null, or Management frame that does not solicit an immediate acknowledgment.
- Table 9-665 (A-MPDU contents in the HE non-ack-enabled single-TID immediate response context(11ax)) or Table 9-667 (A-MPDU contents in the HE non-ack-enabled multi-TID immediate response context(11ax)) if the TID Aggregation Limit field of the User Info field addressed to the non-AP STA in the Trigger frame is greater than 0 and the non-AP STA intends to carry one or more untagged MPDUs (see 10.12 (A-MPDU operation) and 26.6.3.3 (Non-ack-enabled multi-TID A-MPDU operation)). The A-MPDU is subject to the following restrictions:
  - It shall contain a control response frame if the non-AP STA received in the same A-MPDU at least one MPDU that solicits an immediate acknowledgment.
  - The number of TIDs present in the A-MPDU shall count towards reaching the TID aggregation limit indicated by the TID Aggregation Limit field of the User Info field addressed to the non-AP STA in the Trigger frame.
- Table 9-666 (A-MPDU contents in the HE ack-enabled single-TID immediate response context(11ax)) or Table 9-668 (A-MPDU contents in the HE ack-enabled multi-TID immediate response context(11ax)) if the TID Aggregation Limit field of the User Info field addressed to the non-AP STA in the Trigger frame is greater than 0 and the non-AP STA intends to carry an ack-enabled single-TID A-MPDU or ack-enabled multi-TID A-MPDU (see 26.6.3.1 (General) and 26.6.3.4 (Ack-enabled multi-TID A-MPDU operation)). The A-MPDU is subject to the following restrictions:
  - It shall contain a control response frame if the non-AP STA receives at least another MPDU that solicits an immediate acknowledgment.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

— The number of TIDs present in the A-MPDU, in either QoS Data or BlockAckReq frames, shall count towards reaching the TID aggregation limit that is obtained from the TID Aggregation Limit field of the User Info field addressed to the non-AP STA in the Trigger frame.

If the associated non-AP STA has no frames pending or is unable to include pending frames in response to a Basic Trigger frame because the allocated resource is insufficient, then the associated non-AP STA shall include in the A-MPDU at least one QoS Null frame if the allocated resource is sufficient for containing a QoS Null frame.

NOTE 4—The non-AP STA can transmit one QoS Null frame as defined in 9-664 (A-MPDU contents in the S-MPDU context(#1762)) or one or more QoS Null frames as defined in Table 9-662 (A-MPDU contents in the data enabled no immediate response context).

A non-AP STA that responds to a BFRP Trigger frame addressed to it shall construct an A-MPDU carried in the HE TB PPDU with one or more HE Compressed Beamforming/CQI frames (see 26.7 (HE sounding operation(#2388))); other frames shall not be allowed in the A-MPDU.

NOTE 5—It is not always possible to (#6006)segment the HE Compressed Beamforming/CQI Report field (see 26.7.4 (Rules for generating segmented feedback)). If the length (#6006)of the HE TB PPDU is insufficient to contain the HE compressed beamforming/CQI report requested by a BFRP Trigger frame, no feedback is sent.

A non-AP STA that responds to an MU-BAR Trigger frame addressed to it shall construct the A-MPDU carried in the HE TB PPDU as defined in Table 9-663 (A-MPDU contents in the control response context). The non-AP STA includes either a BlockAck frame or a Multi-STA BlockAck frame in the A-MPDU as defined in 26.4 (HE acknowledgment procedure).

A non-AP STA that responds to a GCR MU-BAR Trigger frame addressed to it shall construct the A-MPDU carried in the HE TB PPDU as defined in Table 9-663 (A-MPDU contents in the control response context). The non-AP STA includes a GCR BlockAck frame in the A-MPDU as defined in 10.25.8.

A non-AP STA that responds to a BSRP or BQRP Trigger frame addressed to it and that is not aggregated with any MPDUs that solicit an immediate acknowledgment shall construct the A-MPDU carried in the HE TB PPDU as defined in 9-662 (A-MPDU contents in the data enabled no immediate response context) with the exception that the A-MPDU does not contain QoS Data frames. The non-AP STA shall include in the A-MPDU at least one QoS Null frame. A non-AP STA that responds to a BSRP or BQRP Trigger frame addressed to it and that is aggregated with at least one MPDU that solicits an immediate acknowledgment, shall construct the A-MPDU carried in the HE TB PPDU as defined in (#2317)Table 9-663 (A-MPDU contents in the control response context).

NOTE 6—The frame type of MPDUs might(M118) be different across A-MPDUs within the same HE TB PPDU subject to A-MPDU context.

NOTE 7—A non-AP STA follows the rules in 26.6.3 (Multi-TID A-MPDU and ack-enabled single-TID A-MPDU) for aggregating the QoS Data frames with multiple TIDs in HE TB PPDUs.

A non-AP STA may set dot11HEUPHControlActivated to false if the most recent OM Control field sent (if any) to the AP had the UL MU Disable field equal to 1; otherwise, the non-AP STA shall set dot11HEUPHControlActivated to true.

A STA that transmits an HE TB PPDU transmits the decibel value of its UL power headroom, $HR_{STA}$, in the UPH Control subfield of frames (that can carry an HE-variant HT Control field) carried in the HE TB PPDU, to assist in the AP's HE-MCS selection. The UL power headroom for the assigned HE-MCS is defined in Equation (26-2).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$HR_{STA} = Tx_{pwr}^{Max} - Tx_{pwr}^{STA} \quad (26\text{-}2)$$

where

$Tx_{pwr}^{Max}$ represents the maximum UL transmit power of an HE TB PPDU with the assigned HE-MCS after considering hardware capability, regulatory requirements, and local maximum transmit power levels (see 11.7.5 (Specification of regulatory and local maximum transmit power levels)) as well as non-IEEE-802.11 in-device coexistence requirements

$Tx_{pwr}^{STA}$ represents the current UL transmit power of the HE TB PPDU for the assigned HE-MCS, which is determined by power control and subject to the non-AP STA's capabilities and other requirements as defined in 27.3.15.2 (Power precorrection(M118))

$HR_{STA}$ is the UL power headroom, in dB, of the HE TB PPDU, the encoding of which is specified in 9.2.4.7.5 (UPH Control)

NOTE 8—If the Minimum Transmit Power Flag subfield in the UPH Control subfield is 1, then the non-AP STA is transmitting the HE TB PPDU at its minimum $Tx_{pwr}^{STA}$ for the assigned HE-MCS. The UL power headroom is calculated for the assigned HE-MCS and is independent of TOM parameters provided in any OM Control field contained in the same A-Control field (see 26.9.3 (Transmit operating mode (TOM) indication)).

NOTE 9—The uplink power headroom is not normalized to 20 MHz bandwidth, unlike the value in the AP Tx Power subfield.

A non-AP STA shall include an HE variant HT Control field containing the UPH Control subfield in the frames carried in the A-MPDU of the HE TB PPDU with the following exceptions:

— A UPH Control subfield is not included in any frame if the remaining space in the A-MPDU, after inclusion of solicited frames that are required to be included in the A-MPDU but cannot contain an HE variant HT Control field, is not sufficient to contain a frame that can be included in the A-MPDU and can contain an HE variant HT Control field.

— A UPH Control subfield is not included in a frame if the frame contains Control subfields other than UPH Control and ONES Control subfields and the remaining space in the HE variant HT Control field of the frame is not sufficient to contain a UPH Control subfield as well.

— A UPH Control subfield is not included in a frame that is a Control frame.

A non-AP STA shall not include a ONES Control subfield in the HE variant HT Control field of the frames carried in an HE TB PPDU.

#### 26.5.2.5 UL MU CS mechanism

The ED-based CCA and virtual CS functions are used to determine the state of the medium if CS is required before responding to a received Trigger frame. ED-based CCA for the UL MU CS mechanism is defined in 27.3.22.6.4 (CCA sensitivity for signals not occupying the primary 20 MHz channel), and virtual CS is defined in 10.3.2.1 (CS mechanism).

If the CS Required subfield in a received Trigger frame is 0 or a frame that includes a TRS Control subfield and solicits a response is received, then the non-AP STA may respond without regard to the busy/idle state of the medium.

NOTE 1—Responding without regard to the busy/idle state of the medium means that a non-AP STA can respond without the need to check the medium indication from physical CS and virtual CS (i.e., basic NAV and intra-BSS NAV).

A non-AP STA does not consider the intra-BSS NAV in determining whether to respond to a Trigger frame sent by the AP with which the non-AP STA is associated.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

A non-AP STA considers the basic NAV in determining whether to respond to a Trigger frame sent by the AP with which the non-AP STA is associated.

A non-AP STA considers the NAV in determining whether to respond to a Trigger frame sent by an AP with which the non-AP STA is not associated, through the UORA procedure (see 26.5.4 (UL OFDMA-based random access (UORA))), unless the NAV was set by a frame originating from the AP sending the Trigger frame.

NOTE 2—A non-AP STA considers the intra-BSS NAV associated with an AP in determining whether to respond to a Trigger frame with RU allocations for unassociated STAs sent by another AP.

NOTE 3—The details of how a non-AP STA is solicited by the Trigger frame for transmission are described in 26.5.2.2.4 (Allowed settings of the Trigger frame fields and TRS Control subfield).

NOTE 4—If a non-AP STA responds to a Trigger frame from an AP with which it is not associated through the UORA procedure, the method to identify that a NAV was set by a frame originating from the AP sending the Trigger frame is implementation specific. For example, the non-AP STA can save the TXOP holder address and match the saved TXOP holder address with the TA field of the Trigger frame.

For a non-AP STA that is solicited by a Trigger frame for transmission, the indication of the virtual CS is described as follows. If the non-AP STA does not consider any NAV, then the virtual CS indicates idle. If all NAVs that the non-AP STA considers have their NAV counter equal to 0, then the virtual CS indicates idle. Otherwise, the virtual CS indicates busy.

If the CS Required subfield in a Trigger frame is 1, then the non-AP STA shall consider the status of the CCA [using energy detect defined in (#2365)27.3.22.6 (CCA sensitivity) and the virtual carrier sense (NAV)] during the SIFS between the Trigger frame and the PPDU sent in response to the Trigger frame. In this case, the non-AP STA shall sense the medium using energy detect after receiving the PPDU that contains the Trigger frame (i.e., during the SIFS), and it shall perform the energy detect at least in the subchannel that contains the non-AP STA's UL allocation, where the sensed subchannel consists of one or more 20 MHz channels. The non-AP STA may transmit the solicited PPDU if the 20 MHz channels containing the RUs allocated in the Trigger frame are considered idle. If the non-AP STA detects that the 20 MHz channels containing the allocated RUs are not all idle, then the non-AP STA shall not transmit.

NOTE 5—The solicited PPDU is a non-HT or non-HT duplicate PPDU if the Trigger frame is an MU-RTS Trigger frame (see 26.2.6 (MU-RTS Trigger/CTS frame exchange sequence procedure(#109))); otherwise, the solicited PPDU is an HE TB PPDU (see 26.5.2.3 (Non-AP STA behavior for UL MU operation)).

The CS Required subfield in the MU-RTS Trigger frame shall be set to 1.

An AP that transmits a BFRP Trigger frame with the UL Length subfield in the Common Info field set to a value greater than 76 shall set the CS Required subfield in the Common Info field to 1.

An AP that transmits a Basic, BSRP, MU-BAR, BQRP, or GCR MU-BAR Trigger frame shall set the CS Required subfield to 1, unless one of the following conditions is met:

— The RA of the Trigger frame is an individually addressed non-AP STA's MAC address, a QoS Data frame with HETP Ack ack policy and/or a Management frame that solicits an acknowledgment is aggregated with the Trigger frame in an A-MPDU, and the UL Length subfield in the Common Info field of the Trigger frame is less than or equal to 418.
— The Trigger frame is either an MU-BAR or a GCR MU-BAR Trigger frame, and the UL Length subfield in the Common Info field of the Trigger frame is less than or equal to 418.
— The UL Length subfield in the Common Info field of the Trigger frame is less than or equal to 76.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

NOTE 6—The threshold value 418 of the UL Length subfield in the Common Info field of the Trigger frame is obtained from the maximum HE TB PPDU duration, 584 μs, that can be solicited by the TRS Control subfield based on Equation (27-16). This duration is the sum of 20 μs for the L-STF, L-LTF, and L-SIG fields; 20 μs for the RL-SIG, HE-SIG-A, and HE-STF fields; 16 μs for the 4x HE-LTF field with 3.2 μs GI; 512 μs for 32 OFDM symbols in the Data field with 3.2 μs GI; and 16 μs for the PE field (see 9.2.4.7.1 (TRS Control), 26.5.2.3 (Non-AP STA behavior for UL MU operation), and 27.3.4 (HE PPDU formats)).

NOTE 7—The UL Length subfield value 76 is derived from the duration 128 μs, which is the duration of an HE TB PPDU with 4 HE-LTF symbols and a PE field.

An AP may transmit an NFRP Trigger frame with the CS Required subfield set to 0 or 1.

(11az)An RSTA that transmits a Ranging Trigger frame shall set the CS Required subfield to 1 unless one of the following conditions is met:

— The Ranging Trigger frame is of subvariant Poll, Sounding, Secure Sounding, or Passive Sounding.
— The Ranging Trigger frame is of subvariant Report and the UL Length subfield in the Common Info field of the Trigger frame is less than or equal to 418.

### 26.5.3 MU cascading sequence

An MU cascading sequence is a frame exchange sequence between an AP and one or more non-AP STAs in which the AP, within a single PPDU, acknowledges one or more frames from a STA and triggers the STA for a further UL transmission. An example of an MU cascading sequence is shown in Figure 26-5 (Example of MU cascading sequence(11ax)(#1866)). In this figure the second HE MU PPDU contains an Ack or BlockAck frame and a triggering frame.

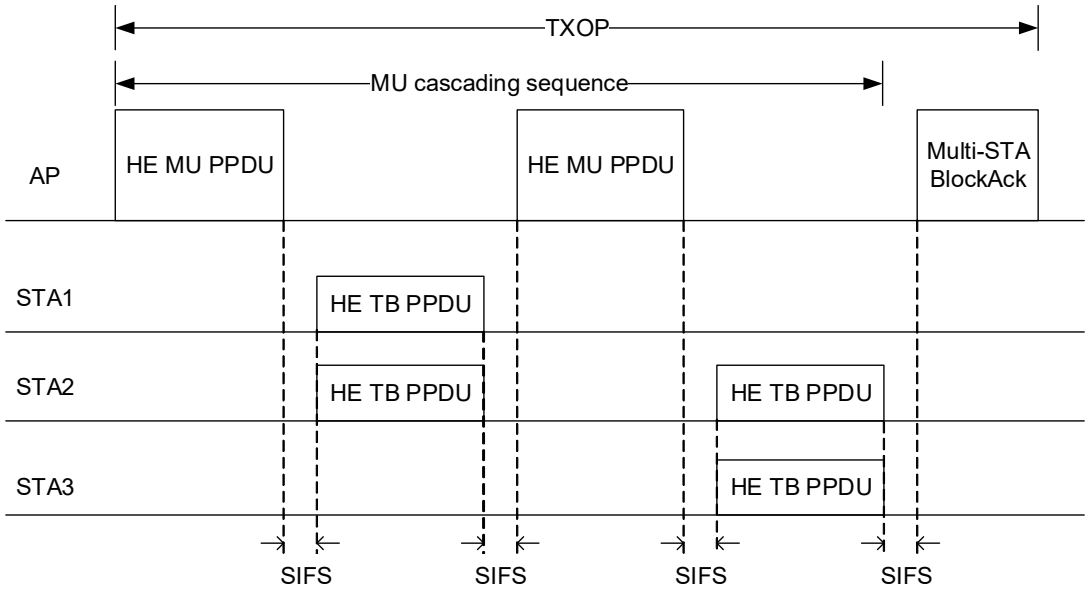

**Figure 26-5—Example of MU cascading sequence(11ax)(#1866)**

An AP shall not transmit an A-MPDU to a non-AP STA that includes an Ack or BlockAck frame together with a triggering frame, unless both the AP and the non-AP STA have indicated support by setting the MU Cascading Support subfield to 1 in the MAC Capabilities Information field in the HE Capabilities element they transmit.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

NOTE—An A-MPDU sent by an AP in an MU cascading sequence typically includes, in addition to the acknowledgement and triggering frames, one or more QoS Data frames with HETP Ack ack policy and/or a Management frame soliciting acknowledgement, subject to the rules in 26.6 (A-MPDU operation in an HE PPDU).

In an MU cascading sequence, the receivers of an HE MU PPDU may differ from the transmitters of preceding HE TB PPDUs. An MU cascading sequence is sent within a single TXOP.

An AP follows the procedure in 26.5.2.2.5 (AP access procedures for UL MU operation).

### 26.5.4 UL OFDMA-based random access (UORA)

#### 26.5.4.1 General

An HE STA with dot11OFDMARandomAccessOptionImplemented equal to true shall set the OFDMA RA Support subfield in the HE MAC Capabilities Information field in the HE Capabilities element to 1. Otherwise, it shall set the OFDMA RA Support subfield to 0.

NOTE 1—A non-AP STA that does not support UORA can contend for the WM using EDCA for sending UL frames to the AP with which it intends to communicate.

A non-AP STA with dot11OFDMARandomAccessOptionImplemented set to true shall follow the procedure defined in 26.5.4.3 (Transmission procedure for UORA) and 26.5.4.5 (Additional considerations for unassociated STAs) to contend for an eligible RA-RU.

An HE AP may transmit a Basic Trigger frame, BQRP Trigger frame, or BSRP Trigger frame that contains one or more RUs for random access. An AP that transmits a Trigger frame that is not a Basic Trigger frame shall not set the AID12 subfield of any User Info field of the frame to indicate allocation of one or more RA-RUs for unassociated STAs. An AP that transmits a Trigger frame that is not a Basic Trigger frame, BQRP Trigger frame, or BSRP Trigger frame shall not set the AID12 subfield of any User Info field of the frame to indicated allocation of one or more RA-RUs for associated STAs.

NOTE 2—A(#1426) non-AP HE STA that changes the maximum number of receiving spatial streams to 1 and sets the OFDMA RA Support subfield in the HE MAC Capabilities Information field in the HE Capabilities element to 1 cannot receive a Trigger frame sent with more than one spatial stream. As a result, if the Trigger frame indicates eligible RA-RUs for associated non-AP STAs, the non-AP HE STA cannot perform UORA defined in 26.5.4 (UL OFDMA-based random access (UORA))). An AP might take this behavior into consideration when sending a Trigger frame indicating eligible RA-RUs for associated non-AP STAs.

An HE AP that transmits a Basic Trigger frame should set the TID Aggregation Limit subfield in the User Info field indicating an RA-RU to 0 or 1.

An AP shall set the More RA-RU subfield in the User Info field to 1 if it intends to transmit additional Trigger frames in the current broadcast TWT SP that allocate RA-RUs matching the AID12 subfield value in the User Info field (see Table 9-52 (AID12 subfield encoding(11ax))).

A non-AP HE STA shall ignore the More RA-RU subfield if the More TF field in the Trigger frame is equal to 0.

The HE AP may include the UORA Parameter Set element (see 9.4.2.249 (UORA Parameter Set element(11ax))) in Management frames that it transmits. The AP shall indicate the range of OFDMA contention window (OCW) in the UORA Parameter Set element for non-AP STAs to initiate random access following the Trigger frame transmission. An AP corresponding to a nontransmitted BSSID in a multiple BSSID set shall follow the rules in 11.1.3.8.4 (Inheritance of element values(11ax)).

NOTE 3—An AP with dot11MultiBSSIDImplemented equal to true can allocate RA-RUs for non-AP STAs associated with different BSSIDs in a multiple BSSID set by transmitting a DL MU PPDU carrying broadcast RUs, one per BSS in

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

the set (see 26.5.1.2 (RU addressing in an HE MU PPDU)), with an A-MPDU in each broadcast RU carrying a Trigger frame with at least one User Info field with the AID12 subfield set to 0.

A non-AP HE STA shall maintain an internal OCW and an internal OBO counter. OCW is an integer in the range *OCWmin* to *OCWmax*. The *OCWmin* and *OCWmax* parameters are defined by dot11OCWmin and dot11OCWmax. A non-AP HE STA shall update dot11OCWmin and dot11OCWmax from an UORA Parameter Set element within an interval of time equal to one beacon interval after receiving an updated UORA Parameter Set element carried in a Beacon, Probe Response, or (Re)Association Response frame transmitted by its associated AP, unless the non-AP HE STA is associated with an AP corresponding to a nontransmitted BSSID of a multiple BSSID set. In this case, it shall update dot11OCWmin and dot11OCWmax by following the rules in 11.1.3.8.4 (Inheritance of element values(11ax)).

Each time a non-AP HE STA associates with a different AP and prior to the initial attempt of RA-RU transmission towards it, the non-AP STA shall set the value of OCW to the *OCWmin* value and shall initialize its OBO counter in the range 0 to OCW as defined in 26.5.4.3 (Transmission procedure for UORA).

NOTE 4—For a non-AP STA with dot11MultiBSSIDImplemented equal to true, associating with a different AP includes associating with an AP corresponding to a different BSSID in the same multiple BSSID set.

### 26.5.4.2 Eligible RA-RUs

A non-AP STA that is the intended receiver of a User Info field in a Trigger frame (i.e., the AID12 subfield equal to the 12 LSBs of the AID of the non-AP STA) shall not contend for an RA-RU that is indicated by a Trigger frame contained in the same PPDU and shall not decrement its OBO counter.

A non-AP STA shall consider an RU as an eligible RA-RU if it is capable of transmitting an HE TB PPDU in that RU according to the parameters indicated in the Common Info field and in the User Info field that allocates the RU (as described in 26.5.2.3 (Non-AP STA behavior for UL MU operation)), the non-AP STA is associated with the BSS whose BSSID is the value in the TA field of the Trigger frame, and the RA-RU is allocated for associated STAs.

NOTE 1—If the STA is a 20 MHz operating non-AP HE STA, RUs that are excluded as specified in 27.3.2.8 (RU restrictions for 20 MHz operation) are not present in the list of eligible RA-RUs.

A non-AP STA may consider an RU as an eligible RA-RU if it supports all the transmit parameters indicated in the Common Info field and in the User Info field that allocates that RU (as described in 26.5.2.3 (Non-AP STA behavior for UL MU operation)), the non-AP STA is not associated with the BSS, and the RA-RU is allocated for unassociated STAs.

An HE AP may allocate a contiguous set of RUs for random access by setting the Number Of RA-RU subfield in the User Info field of the Trigger frame to a value greater than 1. The RA-RU indicated by the RU Allocation subfield in the User Info field shall represent the starting RU of the set. The size of all RA-RUs in the set shall be the same and equal to the size of the RA-RU indicated by the RU Allocation subfield in the User Info field. The remaining subfields of the User Info field apply to each RA-RU in the set. An AP allocating a contiguous set of RA-RUs in a Trigger frame with (#2318)a UL BW subfield that indicates 80+80 MHz or 160 MHz shall set the Number Of RA-RU(#3522) subfield so that all the RA-RUs in the set lie in one 80 MHz frequency segment.

NOTE 2—An AP can transmit a Trigger frame carrying more than one User Info field, each allocating a single or a contiguous set of RA-RUs, to ensure that an RA-RU set does not overlap with other RUs allocated by the frame.

A non-AP HE STA shall determine the total number of eligible RA-RUs in a contiguous set from the Number Of RA-RU subfields (see Table 9-95 (RA-RU Information subfield format(11ax)(M118))) in the

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

User Info field corresponding to an eligible RA-RU, excluding RA-RUs that are not within its operating bandwidth.

A non-AP HE STA may consider as eligible RA-RUs all or a subset of the RA-RUs indicated by the User Info fields in a Trigger frame that carries more than one User Info field that allocates RA-RUs. The number of eligible RA-RUs that the non-AP STA considers for OBO countdown and transmission (see 26.5.4.3 (Transmission procedure for UORA)) shall be the total number of eligible RA-RUs indicated by the selected subset of User Info fields.

NOTE 3—A STA that considers only a subset of User Info fields can randomly select User Info fields from the available set of User Info fields that allocate RA-RUs so that the UORA contention is not concentrated at the RA-RU set indicated by the first User Info field.

### 26.5.4.3 Transmission procedure for UORA

In this subclause, the transmit procedure using RA-RUs is described with respect to UORA parameters. The procedure is also illustrated in Figure 26-6 (Illustration of UORA procedure(11ax)).

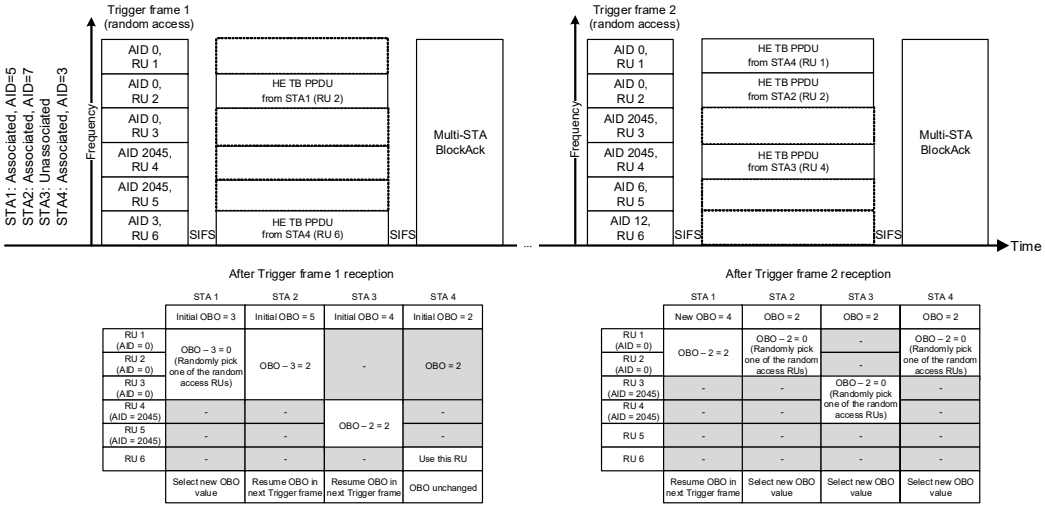

**Figure 26-6—Illustration of UORA procedure(11ax)**

A non-AP STA shall not contend for an eligible RA-RU or decrement its OBO counter if it does not have pending frames for the AP.

If an HE STA has a pending frame for the AP upon the reception of a Trigger frame containing at least one eligible RA-RU and if the OBO counter of an HE STA is not greater than the number of eligible RA-RUs in a Trigger frame from that AP, then the HE STA shall set its OBO counter to zero and randomly select one of the eligible RA-RUs to be considered for transmission. Otherwise, the HE STA decrements its OBO counter by the number of eligible RA-RUs in the Trigger frame.

In the example in Figure 26-6 (Illustration of UORA procedure(11ax)):

— Before Trigger frame 1 was sent by the AP, HE STA 1, STA 2, STA 3, and STA 4 had initial OBO values of 3, 5, 4, and 2, respectively.

— Upon receiving Trigger frame 1:

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

- STA 4, which is associated with the AP and has pending frames for the AP, is allocated a dedicated RU (RU6). The STA does not contend for RA-RUs and instead transmits its pending frames on RU6.
- STA 1 and STA 2, both associated with the AP and having pending frames for the AP, decrement their respective OBO counters by the number of eligible RA-RUs indicated in the Trigger frame (i.e., three RA-RUs for associated STAs). Since STA 1's OBO counter decrements to 0, it transmits its pending frames on RU2 that it randomly selects from the eligible set of RUs (i.e., RU1, RU2, and RU3). Since STA 2's OBO counter decrements to a nonzero value, it maintains the new OBO value (2) until it receives a later Trigger frame carrying RA-RUs for associated STAs.
- STA 3, which is not associated with the AP but has a pending frame for the AP, decrements its OBO counter by the number of eligible RA-RUs indicated in the Trigger frame (i.e., two RA-RUs for unassociated STAs). Since STA 3's OBO counter decrements to a nonzero value, it maintains the new OBO value (2) until it receives a later Trigger frame carrying RA-RUs for unassociated STAs.

— After transmission of HE TB PPDU in response to Trigger frame 1:
  - STA 4 has additional frames pending for the AP. Therefore, it maintains its initial OBO value (2) until it receives a later Trigger frame carrying RA-RUs for associated STAs.
  - STA 1 has additional frames pending for the AP and randomly selects a new OBO value (4).

— Upon receiving Trigger frame 2:
  - STA 1, STA 2, and STA 4 decrement their respective OBO counters by the number of eligible RA-RUs (two in this case). Since STA 2 and STA 4's OBO counters decrements to 0, they both transmit their pending frames on a randomly selected RU (RU2 in the case of STA 2 and RU1 in the case of STA 4). If either STAs have additional frames pending for the AP, each would randomly select a new OBO value. Since STA 1's OBO decrements to a nonzero value, it maintains the new OBO value (2) until it receives a later Trigger frame carrying RA-RUs for associated STAs.
  - STA 3 decrements its OBO counter by the number of eligible RA-RUs (two in this case). Since the STA's OBO counter decrements to 0, it transmits its pending frame on a randomly selected RU (RU4 in this case).

A non-AP STA shall follow the rules in 26.5.2.3 (Non-AP STA behavior for UL MU operation) to construct an HE TB PPDU and shall follow the rules as defined in 26.5.2.5 (UL MU CS mechanism) to determine the state of the medium before transmitting the HE TB PPDU. If CS is required and the selected RU is considered busy, then the non-AP STA shall not transmit the HE TB PPDU and the non-AP STA shall set its OBO counter to a random value drawn from a uniform distribution in the range 0 to OCW.

The MU acknowledgment procedure for UORA follows the procedure as defined in 10.3.2.13.3 (Acknowledgment procedure for UL MU transmission(11ax)).

If a non-AP STA transmits an HE TB PPDU that contains a frame that solicits an immediate response in an RA-RU and the expected response is not received, the transmission is considered unsuccessful. Otherwise, the transmission is considered successful. After each successful HE TB PPDU transmission in an RA-RU, a non-AP HE STA shall set the value of OCW to the *OCWmin* obtained from the most recent *OCWmin* indicated in the UORA Parameter Set element from the HE AP or the default (if UORA Parameter Set element was not received) and shall initialize its OBO counter to an integer value randomly selected from a uniform distribution in the range 0 to OCW. The non-AP STA shall follow the retransmission procedure defined in 26.5.4.4 (Retransmission procedure for UORA) if the transmission is not successful.

NOTE—A non-AP STA that transmits an HE TB PPDU in response to a Trigger frame that is not an MU-RTS Trigger frame that allocates RA-RU(s) by following the UORA procedure does not update its state variables to the values contained in the MU EDCA Parameter Set element (see 26.2.7 (EDCA operation using MU EDCA parameters)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

#### 26.5.4.4 Retransmission procedure for UORA

A non-AP STA whose HE TB PPDU transmission sent in an RA-RU of a Trigger frame is unsuccessful, may attempt to retransmit the failed PPDU using EDCA or as a response to a Trigger frame.

If the HE TB PPDU is not successfully transmitted in the selected RA-RU, then the non-AP STA shall update its OCW to 2 × OCW + 1 when the OCW is less than the value of *OCWmax*, and shall randomly select its OBO counter in the range(#3482) 0 and OCW. Once the OCW reaches *OCWmax* for successive retransmission attempts, the OCW shall remain at the value of *OCWmax* until the OCW is reset as described in 26.5.4.3 (Transmission procedure for UORA).

A non-AP STA shall update its OCW value under the condition that the updated OCW remains in the range *OCWmin* to *OCWmax* obtained from the most recently received UORA Parameter Set element (see 9.4.2.249 (UORA Parameter Set element(11ax))). If the updated OCW becomes greater than *OCWmax* as a consequence of receiving a modified UORA Parameter Set element, then the non-AP STA shall set the value of OCW to the new *OCWmax* value.

#### 26.5.4.5 Additional considerations for unassociated STAs

An AP transmitting a Trigger frame that allocates one or more RA-RUs for unassociated STAs shall transmit the Trigger frame in an HE PPDU.(#3318)

NOTE 1—This allows an unassociated non-AP STA to determine the BSS color. The non-AP STA needs this information to indicate it in the HE TB PPDU.(#3318)

An HE AP that supports the UORA procedure and broadcast TWT operation and that intends to transmit Trigger frames that allocate one or more RA-RUs for unassociated STAs shall schedule the transmission of at least one such Trigger frame within each TWT SP corresponding to a Broadcast TWT Parameter Set field in a TWT element with a Broadcast TWT ID subfield equal to 0, Flow Type subfield equal to 0, Trigger subfield equal to 1, and Broadcast TWT Recommendation subfield equal to 2.

An AP that receives an Authentication frame within an RA-RU should schedule for transmission, at a time no less than 3 TUs and no greater than 5 TUs subsequent to the transmission of the Authentication frame that is a response to that reception, a Trigger frame that allocates one or more RA-RUs for unassociated STAs.

NOTE 2—This Trigger frame provides a potential opportunity for an unassociated STA that transmitted the Authentication frame to transmit another Authentication frame or an Association Request frame.

An AP that supports the UORA procedure, broadcasts TWT operation, operates a BSS with a width of 80 MHz or greater, and transmits a Trigger frame that allocates one or more RA-RUs for unassociated STAs shall include at least 2 RA-RUs for unassociated STAs for at least one transmission of such a Trigger frame within a Broadcast TWT SP that meets the conditions described above.

An AP that intends to transmit Trigger frames that allocates one or more RA-RUs for unassociated STAs should transmit FILS Discovery frames as described in 11.45.2.1 (FILS Discovery frame transmission) at regular intervals within a beacon period to assist unassociated STA discovery of the BSS and its operating parameters.

The TWT scheduling AP (see 26.8.3.1 (General)) that supports the UORA procedure may include a broadcast TWT element in FILS Discovery frames and in broadcast Probe Response frames to indicate the TWT SPs during which the AP intends to schedule for transmission at least one Trigger frame allocating one or more RA-RUs for STAs not associated with the AP. The broadcast TWT element shall carry only a broadcast TWT parameter set with the Broadcast TWT Recommendation subfield set to 2, the Trigger

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

subfield set to 1, the Flow Type subfield set to 0, and the Broadcast TWT ID subfield set to 0. The AP transmits broadcast Probe Response frames if it has dot11FILSOmitReplicateProbeResponses equal to true.

A non-AP STA that receives a FILS Discovery frame from an AP with which it is not associated may use the values carried in the frame to determine the operating parameters for that AP and may use the information when responding to a Trigger frame from the AP containing RA-RUs for unassociated non-AP STAs.

An unassociated non-AP STA that has not received an UORA Parameter Set element from the AP with which it intends to communicate shall use the default OCW values as defined in 26.5.4.1 (General). Each time an unassociated non-AP STA communicates with a different AP using random access, it shall initialize its OCW using the default values or the parameters from the UORA Parameter Set element received from that AP and shall initialize its OBO counter as defined in 26.5.4.3 (Transmission procedure for UORA).

An unassociated non-AP STA that supports the UORA and TWT procedure may begin listening for Trigger frames at the start of a particular broadcast TWT SP after receiving a Beacon frame, a broadcast Probe Response frame, or a FILS Discovery frame containing a TWT element with a Broadcast TWT Parameter Set field that has the Broadcast TWT ID subfield equal to 0, the Flow Type subfield equal to 0, the Trigger subfield equal to 1, and the Broadcast TWT Recommendation subfield equal to 2.

A non-AP STA shall include at most one Management frame that is an S-MPDU when it transmits an HE TB PPDU in response to a Trigger frame that is not an MU-RTS Trigger frame sent by an AP with which the non-AP STA is not associated.

An AP that receives Management frames from one or more unassociated non-AP STAs carried in HE TB PPDUs transmitted on RA-RUs shall respond with a Multi-STA BlockAck frame carried either in an SU PPDU or in a DL HE MU PPDU on a broadcast RU corresponding to parameter STA-ID equal to 2045.

An AP with dot11FILSOmitReplicateProbeResponses equal to true shall follow the procedure defined in 11.1.4.3.4 (Criteria for sending a response) to respond with a broadcast Probe Response frame or the next Beacon frame if it receives one or more Probe Request frames via the UORA procedure.

### 26.5.5 Buffer status report operation

A non-AP STA delivers buffer status reports (BSRs) to assist its AP in allocating UL MU resources. The non-AP STA can either implicitly deliver BSRs in the QoS Control field or BSR Control subfield of any frame transmitted to the AP (unsolicited BSR) or explicitly deliver BSRs in any frame sent to the AP in response to a BSRP Trigger frame (solicited BSR). The buffer status reported in the QoS Control field consists of a queue size value for a given TID (see 9.2.4.5.6 (Queue Size subfield)). The buffer status reported in the BSR Control field consists of an ACI bitmap, delta TID, a high priority AC, and two queue sizes (see 9.2.4.7.4 (BSR Control)).

An HE STA shall set the BSR Support subfield in the HE Capabilities element it transmits to 1 if dot11HEBSRControlImplemented is true; otherwise, the HE STA shall set the BSR Support subfield to 0.

A non-AP STA reports its buffer status (unsolicited BSR) to the AP with which it is associated in the QoS Control field in QoS Null and QoS Data frames and in the BSR Control subfield (if present) in QoS Null, QoS Data, and Management frames as defined below:

— The HE STA shall report the queue size for a given TID in the Queue Size subfield of the QoS Control field in QoS Data or QoS Null frames it transmits; the STA may set the Queue Size subfield to 255 to indicate an unknown/unspecified queue size for that TID.

— The HE STA may aggregate multiple QoS Data frames or QoS Null frames in an A-MPDU to report the queue size for different TIDs. The HE STA shall follow the A-MPDU aggregation rules defined in 26.6.3 (Multi-TID A-MPDU and ack-enabled single-TID A-

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

MPDU) for aggregating QoS Data frames with multiple TIDs. The HE STA does not follow the rules defined in 26.6.3 (Multi-TID A-MPDU and ack-enabled single-TID A-MPDU) for QoS Null frames with No Ack ack policy.

— The HE STA may report the buffer status in the BSR Control subfield of frames it transmits if the AP has indicated its support in the BSR Support subfield of its HE Capabilities element; otherwise, the STA shall not report the buffer status in the BSR Control subfield.
  — The HE STA shall report the queue size for its preferred AC, indicated by the ACI High subfield, in the Queue Size High subfield of the BSR Control subfield; the STA may set the Queue Size High subfield to 255 to indicate an unknown/unspecified queue size for that AC.
  — The HE STA shall report the queue size for the ACs, indicated by the ACI Bitmap subfield, in the Queue Size All subfield of the BSR Control subfield; the STA may set the Queue Size All subfield to 255 to indicate an unknown/unspecified BSR for those ACs.
  — The HE STA shall set the Delta TID subfield according to Table 9-32 (Delta TID subfield encoding(11ax)) and the Scaling Factor subfield as defined in 9.2.4.7.4 (BSR Control).

NOTE 1—The STA can send an unsolicited BSR in response to certain Trigger frames except MU-RTS and BSRP (with or without RA-RUs, as defined in 26.5.2.3 (Non-AP STA behavior for UL MU operation) and 26.5.4 (UL OFDMA-based random access (UORA))), or it can send the unsolicited BSR after accessing the WM using EDCA.

NOTE 2—The STA might include a BSR Control subfield in a QoS Data or QoS Null frame. In this case the Queue Size subfield in the QoS Control field and the Queue Size High and Queue Size All subfields in the BSR Control subfield might differ, and any of the three subfields might be set to 255 to indicate unspecified/unknown queue size. The STA might include only the BSR Control subfield in a Management frame.

An AP can also solicit one or more associated non-AP STAs for their BSR(s) by sending a BSRP Trigger frame (see 9.3.1.22.6 (BSRP Trigger frame format)). The non-AP STA responds (solicited BSR) as defined below:

— The non-AP STA that receives a BSRP Trigger frame shall follow the rules defined in 26.5.2.3 (Non-AP STA behavior for UL MU operation) to generate the HE TB PPDU if the Trigger frame contains the 12 LSBs of the non-AP STA's AID in any of the User Info fields; otherwise, if the non-AP STA's buffers are not empty and the non-AP STA supports the UORA procedure, it may follow the rules defined in 26.5.4 (UL OFDMA-based random access (UORA)) to gain access to an RA-RU and generate the HE TB PPDU when the Trigger frame contains one or more RA-RUs.
— The non-AP STA shall include in the HE TB PPDU one or more QoS Null frames containing one or more of the following:
  — The QoS Control field(s) with Queue Size subfields for each of the TIDs for which the non-AP STA has queue size to report to the AP.
  — The BSR Control subfield with the Queue Size All subfield indicating the queue size for the ACs, indicated by the ACI Bitmap subfield, for which the non-AP STA has queue size to report to the AP if the AP has indicated its support in the BSR Support subfield of its HE Capabilities element. The non-AP STA shall set Delta TID, Scaling Factor, ACI High, and Queue Size High subfields of the BSR Control subfield as defined in 9.2.4.7.4 (BSR Control).
— The non-AP STA shall not solicit an immediate response for the frames carried in the HE TB PPDU (e.g., the Ack Policy Indicator subfield of a QoS Null frame shall not be set to Normal Ack or Implicit BAR).

NOTE 3—As with unsolicited BSR, the STA might include a BSR Control subfield in a QoS Null frame that is sent in response to the BSRP Trigger frame. In this case, the Queue Size subfield in the QoS Control field and the Queue Size High and Queue Size All subfields in the BSR Control subfield might differ, and any of the three subfields might be set to 255 to indicate an unspecified/unknown queue size.

NOTE 4—An AP does not send a BSRP Trigger frame containing the 12 LSBs of the AID of the non-AP STA that sets the UL MU Disable field to 1.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

An AP may include a BSRP Trigger frame together with other Control, Data, and Management frames in one A-MPDU to a non-AP STA if the HE Capabilities element received from the non-AP STA has the BSRP BQRP A-MPDU Aggregation field equal to 1. A non-AP STA constructs the A-MPDU contained in the HE TB PPDU sent in response to a BSRP Trigger frame as described in 26.5.2.4 (A-MPDU contents in an HE TB PPDU).

The NDP feedback report procedure described in 26.5.7 (NDP feedback report procedure) can be used for buffer status feedback operation. An AP that sent an NFRP Trigger frame to one or more non-AP STAs may send a BSRP Trigger frame to those non-AP STAs to get more precise buffer status information.

### 26.5.6 Bandwidth query report operation

A non-AP STA may send bandwidth query reports (BQRs) to assist its AP in allocating DL MU and UL MU resources. The non-AP STA may either implicitly deliver BQRs in the BQR Control subfield of a frame transmitted to the AP (unsolicited BQR) or explicitly deliver BQRs in a frame sent to the AP in response to a BQRP Trigger frame (solicited BQR).

An HE STA shall set the BQR Support subfield in the HE Capabilities element it transmits to 1 if dot11HEBQRControlImplemented is true; otherwise, the HE STA shall set the BQR Support subfield to 0.

The HE STA may report the channel availability information as specified in 27.3.22.6.5 (Per 20 MHz CCA sensitivity) in the BQR Control subfield of frames it transmits if the AP has indicated its support in the BQR Support subfield of its HE Capabilities element; otherwise, the STA shall not report the channel availability information in the BQR Control subfield.

The availability of each 20 MHz subchannel reported in the BQR Control field shall be reported for the 20 MHz subchannels located in the operating channel of the reporting STA (see 9.2.4.7.6 (BQR Control)).

NOTE 1—The STA can send an unsolicited BQR in response to certain Trigger frames except NFRP, MU-RTS, and BQRP (with or without RA-RUs, as defined in 26.5.2.3 (Non-AP STA behavior for UL MU operation) and 26.5.4 (UL OFDMA-based random access (UORA))), or it can send the unsolicited BQR after accessing the WM using EDCA.

An AP may solicit BQRs from a non-AP STA only if the non-AP STA has indicated support by setting the BQR Support field in the HE Capabilities element it transmits to 1; otherwise, the AP shall not solicit BQRs from the non-AP STA. An AP may solicit BQRs from one or more non-AP HE STAs that support generating BQRs, by sending a BQRP Trigger frame (see 9.3.1.22.8 (BQRP Trigger frame format)).

An AP shall not transmit a BQR Trigger frame with the User Info field addressed to a non-AP STA, unless it has received from the non-AP STA an HE Capabilities element with the BQR Support subfield equal to 1.

If a non-AP STA supports BQR operation and receives a BQRP Trigger frame with a User Info field addressed to the non-AP STA, then the non-AP STA shall respond by following the procedure in 26.5.2.3.1 (General).

If a non-AP STA supports both BQR operation and the UORA procedure and receives a BQRP Trigger frame from the AP with which it is associated and that allocates RA-RUs for associated STAs but that does contain a User Info field addressed to the non-AP STA, then the non-AP STA shall respond by following the procedure in 26.5.4 (UL OFDMA-based random access (UORA)).

If the non-AP STA responds with an HE TB PPDU using one of the above procedures, then the A-MPDU carried in the HE TB PPDU shall include one or more QoS Null frames containing a BQR Control subfield with the channel availability information of the STA. The non-AP STA shall not solicit an immediate response for the frames carried in the HE TB PPDU. The Ack Policy Indication subfield of the frame shall be set to No Ack.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

NOTE 2—An AP does not send a BQRP Trigger frame addressed to a STA that has set the UL MU Disable field to 1.

NOTE 3—The channel availability information of the STA is limited to the STA's operating channel width. See 9.2.4.7.6 (BQR Control).

An AP may include a BQRP Trigger frame together with other Control, Data, and Management frames in one A-MPDU to a STA if the HE Capabilities element received from the STA has the BSRP BQRP A-MPDU Aggregation field equal to 1. A non-AP STA constructs the A-MPDU contained in the HE TB PPDU sent in response to a BQRP Trigger frame as described in 26.5.2.4 (A-MPDU contents in an HE TB PPDU).

### 26.5.7 NDP feedback report procedure

#### 26.5.7.1 General

The NDP feedback report procedure allows an HE AP to collect feedback that is not channel sounding from multiple non-AP HE STAs.

An HE AP sends an NFRP Trigger frame to solicit NDP feedback report response from many non-AP STAs that are identified by a range of scheduled AIDs in the Trigger frame. The NDP feedback report response from a non-AP STA is an HE TB feedback NDP (see 27.3.18 (HE TB feedback NDP)). A non-AP STA uses the information carried in the NFRP Trigger frame to know if it is scheduled and, in this case, to derive the parameters for the transmission of the response.

The NDP feedback report procedure is described in 26.5.7.2 (STA behavior) through 26.5.7.5 (Power save operation with NDP feedback report procedure).

#### 26.5.7.2 STA behavior

A non-AP STA shall set the NDP Feedback Report Support subfield in the HE Capabilities element to 1 if it supports NDP feedback report and set it 0, otherwise.

A non-AP STA shall not transmit an NDP feedback report response, unless it is explicitly enabled by an AP in one of the operation modes described in this subclause. The interframe space between a PPDU that contains an NFRP Trigger frame and the (#1182)NDP feedback report response is SIFS. A non-AP STA shall commence the transmission of an NDP feedback report response at the SIFS time boundary after the end of a received PPDU if all the following conditions are met:

- The received PPDU contains an NFRP Trigger frame.
- The non-AP STA is scheduled by the NFRP Trigger frame.
- The NDP feedback report support subfield in HE MAC Capabilities Information field is set to 1.
- The non-AP STA intends to provide a response to the type of the NDP feedback contained in the NFRP Trigger frame, as described in 26.5.7.4 (NDP feedback report for a resource request).

A non-AP STA that does not satisfy all of the above conditions shall not respond to the NFRP Trigger frame.

A non-AP STA is scheduled to respond to the NFRP Trigger frame if all the following conditions are met:

- The non-AP STA is associated with an AP corresponding to the BSSID indicated in the TA field of the NFRP Trigger frame; or the non-AP STA is associated with an AP corresponding to a nontransmitted BSSID of a multiple BSSID set, and the TA field of the NFRP Trigger frame is set to the transmitted BSSID of that multiple BSSID set.
- The non-AP STA's AID is greater than or equal to the starting AID and less than the starting AID + $N_{STA}$, using the Starting AID subfield in the eliciting Trigger frame and $N_{STA}$ as the total

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

number of non-AP STAs that are scheduled to respond to the NFRP Trigger frame. $N_{STA}$ is calculated by the following equation, using UL BW subfield and Number Of Spatially Multiplexed Users subfield from the eliciting Trigger frame:

$$N_{STA} = 18 \times 2^{BW} \times (\text{value of the Number Of Spatially Multiplexed Users subfield} + 1)$$

A non-AP STA shall obtain NDP feedback report parameter values from the most recently received NDP Feedback Report Parameter Set element carried in a Beacon, Probe Response, or (Re)Association Response frame from its associated AP, unless the non-AP STA is associated with an AP corresponding to a nontransmitted BSSID of a multiple BSSID set. In this case, it shall follow the rules in 11.1.3.8.4 (Inheritance of element values(11ax)) to determine the NDP feedback parameter values. If the NDP Feedback Report Parameter Set element is not received in a Management frame with a TA equal to the BSSID of the associated AP or to the transmitted BSSID of the multiple BSSID set, the non-AP STA shall use default values for the NDP Feedback Report parameters.

An NDP feedback report response is an HE TB feedback NDP as defined in 27.3.4 (HE PPDU formats).

A non-AP STA transmitting an (#1182)NDP feedback report response shall set the TXVECTOR parameters as for transmitting an HE TB PPDU in response to a Trigger frame that is not an MU-RTS Trigger frame as described in 26.5.2.3 (Non-AP STA behavior for UL MU operation), except for the following parameters:

- The FORMAT parameter shall be set to HE_TB.
- The APEP_LENGTH parameter shall be set to 0.
- The RU_ALLOCATION parameter shall be set to be maximum RU size for the BW.
- The RU_TONE_SET_INDEX parameter shall be set using the following equation, with the value of the Starting AID subfield in the User Info field of the eliciting Trigger frame:

  $$\text{RU\_TONE\_SET\_INDEX} = 1 + ((\text{AID} - \text{Starting AID}) \bmod (18 \times 2^{BW}))$$

- The NUM_STS parameter shall be set to 1.
- The SPATIAL_REUSE parameter shall be set to PSR_DISALLOW.
- The STARTING_STS_NUM parameter shall be set with the following equation, using the values of the Starting AID subfield in the User Info field of the eliciting Trigger frame:

  $$\text{STARTING\_STS\_NUM} = \lfloor (\text{AID} - \text{Starting AID}) / 18 / 2^{BW} \rfloor$$

- The MCS parameter shall be set to 0.
- The DCM parameter shall be set to 0.
- The FEC_CODING parameter shall be set to BCC_CODING.
- The TXPWR_LEVEL_INDEX parameter shall be set to the value based on the Transmit Power Control for an HE TB PPDU and based on the value of the AP Tx Power subfield and the UL Target Receive Power subfield in the User Info field of the eliciting Trigger frame (see 27.3.15.2 (Power precorrection(M118))).

NOTE—The subcarriers for each RU_TONE_SET index are contained in a 20 MHz channel and can be transmitted by a 20 MHz operating STA.

### 26.5.7.3 AP behavior

An AP shall set the NDP Feedback Report Support subfield in the HE Capabilities element to 1 if it supports NDP feedback report and set it 0 otherwise.

An AP may include the NDP Feedback Report Parameter Set element in Beacon frames, Probe Response frames, and (Re)Association Response frames in order to modify parameters for NDP Feedback Report

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

operation. The procedure of NDP Feedback report described in this subclause allows operation even if the NDP Feedback Report Parameter Set element is not sent by the AP.

The NFRP Trigger frame shall be transmitted in a non-HT PPDU or HT PPDU, or as a tagged MPDU in a VHT, HE ER SU PPDU, or HE SU PPDU.

An AP that transmits an NFRP Trigger frame shall set the TA field of the frame to the MAC address of the AP, unless dot11MultiBSSIDImplemented is true and the Trigger frame is directed to STAs from at least two different BSSs of a multiple BSSID set. In this case, the AP shall set the TA field of the frame to the transmitted BSSID.

Following the transmission from an AP of an NFRP Trigger frame, multiple STAs may simultaneously send NDP feedback report responses to the AP. Based on the RXVECTOR parameter NDP_REPORT, which provides the detected status array for the resources of each spatial stream and tone set assigned by the Trigger frame, the AP can derive the list of AIDs from the resources to which an NDP feedback report response was sent and their responses.

The AP shall not send any acknowledgment in response to the reception of NDP feedback report responses.

#### 26.5.7.4 NDP feedback report for a resource request

If the Feedback Type subfield in the User Info field of the NFRP Trigger frame is 0, a STA that is scheduled may send an NDP feedback report response in order to signal to the AP that it is in the awake state and that it might have frames in its queues for UL MU. If the STA does not satisfy either of the conditions in Table 26-3 (FEEDBACK_STATUS description(11ax)), then the STA shall not respond to the NFRP Trigger frame.

Each STA that is scheduled is assigned a STARTING_STS_NUM and an RU_TONE_SET_INDEX to transmit a FEEDBACK_STATUS bit.

The meaning of the FEEDBACK_STATUS bit is defined in Table 26-3 (FEEDBACK_STATUS description(11ax)):

**Table 26-3—FEEDBACK_STATUS description(11ax)**

| FEEDBACK_STATUS | Condition |
|---|---|
| 0 | The STA is in the awake state and reports buffered octets for transmission not exceeding the resource request buffer threshold.<br><br>NOTE—The STA can use this value to indicate that it is in the awake state even if it does not have any buffered octets for transmission, e.g., to solicit delivery of BUs known to be buffered at the AP. |
| 1 | The STA is in the awake state and reports buffered octets for transmission exceeding the resource request buffer threshold. |

The resource request buffer threshold is equal to $2^{(\text{Resource request buffer threshold exponent})}$ octets, using the Resource Request Buffer Threshold Exponent subfield in the most recently received NDP Feedback Report Parameter Set element sent by the AP with which the STA is associated. The resource request buffer threshold is equal to 256 octets if the STA did not receive an NDP Feedback Report Parameter Set element from the AP with which the STA is associated.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

#### 26.5.7.5 Power save operation with NDP feedback report procedure

An HE AP that sends an NFRP Trigger frame to a non-AP STA in PS mode and receives an NDP feedback report response from the STA shall assume the STA to be in, or to have transitioned to, the awake state and shall follow the rules defined in

— 11.2.3.5 to deliver BUs to the STA as if the STA had sent a U-APSD trigger frame if the STA is using U-APSD.
— 11.2.3.1 to deliver BUs to the STA as if the STA had sent a PS-Poll frame, if the STA is not using U-APSD.
— 26.8 (TWT operation) for delivery of BUs during the TWT SP if the STA operates with TWT.

NOTE—As the AP does not send an acknowledgment in response to the NDP Feedback Report response, a STA that sends an NDP Feedback Report response and indicates that it is in the awake state might still schedule for transmission a PS-Poll or U-APSD trigger frame in order to indicate that it is in the awake state.

### 26.5.8 Use of TSPEC by HE STAs

In addition to the TS Setup operations as described in 11.4.4 (TS setup), a non-AP HE STA may use a TSPEC contained in a Basic ADDTS Request frame to provide its traffic characteristics and QoS requirements to an HE AP that supports the reception of Basic ADDTS Request frame in order to facilitate efficient scheduling for HE AP's UL and DL MU operations. A TSPEC provided by a non-AP HE STA is used by a receiving HE AP to facilitate the creation of a schedule for contention based channel access (EDCA) or MU operation. How the HE AP uses the information provided by the non-AP HE STA is beyond the scope of this standard.

An HE AP transmits an ADDTS Response frame as a response to ADDTS Request frame as described in 11.4.4 (TS setup).

A non-AP HE STA should send a DELTS frame with the corresponding TSID if the traffic associated with the TSID has been terminated. When receiving a DELTS from a non-AP HE STA, the HE AP shall consider the information provided in the TSPEC as no longer valid.

### 26.5.9 UL MU transmit power capabilities

A non-AP HE STA may use the UL MU Power Capabilities element in a (Re)Association Request frame in order to inform an HE AP of the relative maximum transmit power at which the non-AP HE STA is capable of transmitting an HE TB PPDU for each HE-MCS when using an RU size greater than or equal to 242 subcarriers.

An HE AP might use this information as an input into the algorithm used to schedule the non-AP HE STA for UL MU transmission. The specification of the algorithm is beyond the scope of this standard.

## 26.6 A-MPDU operation in an HE PPDU

### 26.6.1 General

A-MPDU operation for an HE PPDU follows the procedures defined in 10.12 (A-MPDU operation) and the additional rules in this subclause.

An HE STA that sends a Class 1 frame or a Class 2 frame in an HE PPDU shall send the frame as an S-MPDU (see Table 9-664 (A-MPDU contents in the S-MPDU context(#1762))).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

An HE STA that sends a VHT Capabilities element, an HT Capabilities element, or an HE 6 GHz Band Capabilities element and an HE Capabilities element with Maximum A-MPDU Length Exponent Extension field of 0 shall support in reception an A-MPDU pre-EOF padding with maximum length defined in Table 10.12.2 (A-MPDU length limit rules).

An HE STA that sends a VHT Capabilities element and an HE Capabilities element with Maximum A-MPDU Length Exponent Extension subfield greater than 0 shall support reception of an HE PPDU with an A-MPDU pre-EOF padding as defined in Table 10.12.2 (A-MPDU length limit rules), except that the maximum length for the A-MPDU pre-EOF padding shall be equal to $min(2^{(20 + \text{Maximum A-MPDU Length Exponent Extension})} - 1, 6\,500\,631)$. An HE STA that sets the Maximum A-MPDU Length Exponent Extension subfield in the HE Capabilities element to a value greater than 0 shall set the Maximum A-MPDU Length Exponent subfield of the VHT Capabilities element to 7.

NOTE 1—The value 6 500 631 is defined in Table 9-34 (Maximum data unit sizes and durations(#1327)(#4013)) as the upper bound of A-MPDU size.

An HE STA that does not send a VHT Capabilities element but sends an HT Capabilities element and an HE Capabilities element with Maximum A-MPDU Length Exponent Extension subfield greater than 0 shall support in reception an A-MPDU pre-EOF padding in an HE PPDU as defined in Table 10.12.2 (A-MPDU length limit rules), except that the maximum length for the A-MPDU pre-EOF padding shall be equal to $2^{(16 + \text{Maximum A-MPDU Length Exponent Extension})} - 1$. An HE STA that sets the Maximum A-MPDU Length Exponent Extension subfield in the HE Capabilities element to a value greater than 0 shall set the Maximum A-MPDU Length Exponent subfield of the HT Capabilities element to 3.

NOTE 2—An HE STA that is a VHT STA sends a VHT Capabilities element. An HE STA that is not a VHT STA does not send a VHT Capabilities element.

An HE STA that sends an HE 6 GHz Band Capabilities element and an HE Capabilities element with Maximum A-MPDU Length Exponent Extension subfield greater than 0 shall support in reception an A-MPDU pre-EOF padding in an HE PPDU as defined in Table 10.12.2 (A-MPDU length limit rules), except that the maximum length for the A-MPDU pre-EOF padding shall be equal to $min(2^{(20 + \text{Maximum A-MPDU Length Exponent Extension})} - 1, 6\,500\,631)$. An HE STA that sets the Maximum A-MPDU Length Exponent Extension subfield in the HE Capabilities element to a value greater than 0 shall set the Maximum A-MPDU Length Exponent subfield of the HE 6 GHz Band Capabilities element to 7.

An HE STA shall not transmit an A-MPDU in an HE PPDU to a STA that exceeds the maximum A-MPDU length capability indicated in the HE Capabilities, VHT Capabilities, and HT Capabilities elements received from the recipient STA. If a VHT Capabilities element is received from the recipient STA, then the maximum A-MPDU length capability is derived from the Maximum A-MPDU Length Exponent Extension subfield in the HE Capabilities and the Maximum A-MPDU Length Exponent subfield in the VHT Capabilities element. Otherwise, the maximum A-MPDU length capability is derived from the Maximum A-MPDU Length Exponent subfields in the HE Capabilities element and the Maximum A-MPDU Length Exponent subfield in the HT Capabilities element or in the HE 6 GHz Band Capabilities element.

An HE STA may transmit an HE SU PPDU or HE MU PPDU that carries an A-MPDU with contents defined in Table 9-662 (A-MPDU contents in the data enabled no immediate response context) or Table 9-665 (A-MPDU contents in the HE non-ack-enabled single-TID immediate response context(11ax)).

An A-MPDU with any number of QoS Null frames with any TID and with No Ack ack policy and aggregated with or without other frames may be transmitted to a recipient STA in an HE PPDU that is not an HE TB PPDU regardless of the value of the Multi-TID Aggregation Rx/Tx Support subfield in the HE MAC Capabilities Information field in the HE Capabilities element received from the recipient STA.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

An A-MPDU with any number of QoS Null frames with any TID and with No Ack ack policy and aggregated with or without other frames in an A-MPDU may be transmitted in the HE TB PPDU regardless of the value of the TID Aggregation Limit subfield and the value of the Preferred AC subfield in the Basic Trigger frame and the value of the Multi-TID Aggregation Rx Support of the AP that solicits the A-MPDU.

NOTE 3—A QoS Null frame with Normal Ack or Implicit BAR ack policy is not allowed to be sent in an A-MPDU, except for a QoS Null frame with Normal Ack ack policy in an S-MPDU (as defined in Table 9-662 (A-MPDU contents in the data enabled no immediate response context), Table 9-663 (A-MPDU contents in the control response context), Table 9-665 (A-MPDU contents in the HE non-ack-enabled single-TID immediate response context(11ax)), Table 9-666 (A-MPDU contents in the HE ack-enabled single-TID immediate response context(11ax)), Table 9-667 (A-MPDU contents in the HE non-ack-enabled multi-TID immediate response context(11ax)), and Table 9-668 (A-MPDU contents in the HE ack-enabled multi-TID immediate response context(11ax))).

### 26.6.2 A-MPDU padding in an HE PPDU

#### 26.6.2.1 General

In an HE PPDU, a STA shall not add an A-MPDU subframe with the EOF/Tag field set to 1 and with the MPDU Length field set to 0 before an A-MPDU subframe with a nonzero MPDU Length field. In an HE PPDU, a STA should add an A-MPDU subframe with the EOF/Tag field set to 1 and with the MPDU Length field set to 0 (i.e., EOF padding) immediately after the last A-MPDU subframe with a nonzero MPDU Length field.

#### 26.6.2.2 A-MPDU padding in an HE SU PPDU, HE ER SU PPDU, and HE MU PPDU

An HE STA that transmits a DL HE MU PPDU that contains one or more PSDUs, each of which carries an A-MPDU, shall construct the A-MPDUs as described in 10.12.6 (A-MPDU padding for VHT, HE(11ax) or S1G PPDU), except that one or more A-MPDU subframes with a nonzero MPDU Length field and with an EOF/Tag field equal to 1 may be added if the A-MPDU is an ack-enabled single-TID A-MPDU (see 26.6.3 (Multi-TID A-MPDU and ack-enabled single-TID A-MPDU)).

An HE STA that transmits an HE SU PPDU, HE ER SU PPDU, or UL HE MU PPDU that contains one A-MPDU shall construct the A-MPDU as described in 10.12.6 (A-MPDU padding for VHT, HE(11ax) or S1G PPDU), except that one or more A-MPDU subframes with a nonzero MPDU Length field and with an EOF/Tag field equal to 1 may be added if the A-MPDU is an ack-enabled single-TID A-MPDU (see 26.6.3 (Multi-TID A-MPDU and ack-enabled single-TID A-MPDU)).

#### 26.6.2.3 A-MPDU padding in an HE TB PPDU

A non-AP STA that transmits an HE TB PPDU shall construct the PSDU carried in the HE TB PPDU as described in this subclause.

The STA calculates the PSDU_LENGTH as defined in 6.7 (PLME SAP interface) and initializes A-MPDU_Length to 0.

The STA may add A-MPDU subframes to the A-MPDU contained in the PSDU, provided that the following constraints are fulfilled:

- The A-MPDU content constraints (see 10.12.1 (A-MPDU contents) and 26.6.3 (Multi-TID A-MPDU and ack-enabled single-TID A-MPDU)) for the intended recipient
- The Length limit constraints (see 9.7.1 (A-MPDU format) and 10.12.2 (A-MPDU length limit rules)) for the intended recipient
- The MPDU start spacing constraints (see 10.12.3 (Minimum MPDU start spacing rules)) for the intended recipient

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

and provided that the following conditions are met:

— The A-MPDU subframes have a value greater than 0 in the MPDU Length field, or have a value 0 in the MPDU Length field and a value 0 in the EOF/Tag field.

— After incrementing the A-MPDU_Length with the length of each such added A-MPDU subframe, the relationship A-MPDU_Length ≤ PSDU_LENGTH is true.

Padding is then added so that the resulting A-MPDU contains exactly PSDU_LENGTH octets as follows:

— First, while A-MPDU_Length < PSDU_LENGTH and A-MPDU_Length mod 4 ≠ 0, add an octet to the final A-MPDU subframe's Padding subfield, and increment A-MPDU_Length by 1.

— Then, while A-MPDU_Length + 4 ≤ PSDU_LENGTH, add an EOF padding subframe to the EOF Padding Subframes field, and increment A-MPDU_Length by 4.

— Finally, while A-MPDU_Length < PSDU_LENGTH, add an octet to the EOF Padding Octets subfield, and increment A-MPDU_Length by 1.

An A-MPDU pre-EOF padding is constructed from each user from any of the following:

— A-MPDU subframes constructed from the MPDUs available for transmission from any AC that is selected by the STA.

— A-MPDU subframes with 0 in the MPDU Length field and 0 in the EOF/Tag field.

### 26.6.3 Multi-TID A-MPDU and ack-enabled single-TID A-MPDU

#### 26.6.3.1 General

A non-ack-enabled multi-TID A-MPDU is an A-MPDU that does not contain a tagged MPDU but does contain untagged MPDUs from at least two TIDs (see Table 9-667 (A-MPDU contents in the HE non-ack-enabled multi-TID immediate response context(11ax))).

An ack-enabled multi-TID A-MPDU is an A-MPDU that contains at least one tagged MPDU that solicits acknowledgment and one or more MPDUs from at least one TID (see Table 9-668 (A-MPDU contents in the HE ack-enabled multi-TID immediate response context(11ax))).

An ack-enabled single-TID A-MPDU is an A-MPDU that contains one tagged MPDU that solicits acknowledgment and one or more untagged MPDUs that do not solicit an immediate response (see Table 9-666 (A-MPDU contents in the HE ack-enabled single-TID immediate response context(11ax))).

An HE STA with dot11HEAMPDUwithMultipleTIDOptionImplemented equal to true shall set the Multi-TID Aggregation Rx Support subfield to a nonzero value in the HE MAC Capabilities Information field in the HE Capabilities element it transmits. An HE STA with dot11HEAMPDUwithMultipleTIDOptionImplemented equal to false shall set the Multi-TID Aggregation Rx Support subfield to 0.

An HE STA with dot11AckEnabledAMPDUOptionImplemented equal to true shall set the Ack-Enabled Aggregation Support subfield to 1 in the HE MAC Capabilities Information field in the HE Capabilities element it transmits. An HE STA with dot11AckEnabledAMPDUOptionImplemented equal to false shall set the Ack-Enabled Aggregation Support subfield to 0.

A multi-TID A-MPDU is either a non-ack-enabled multi-TID A-MPDU or an ack-enabled multi-TID A-MPDU. A first HE STA may transmit a non-ack-enabled multi-TID A-MPDU to a second HE STA if the first HE STA has received from the second STA an HE Capabilities element where the Multi-TID Aggregation Rx Support subfield is nonzero. A first HE STA may transmit an ack-enabled multi-TID A-MPDU or a non-ack-enabled multi-TID A-MPDU to a second HE STA if the first HE STA has received from the second HE STA an HE Capabilities element where the Multi-TID Aggregation Rx Support subfield

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

is nonzero and the Ack-Enabled Aggregation Support subfield is 1. Otherwise, the first HE STA shall not transmit a multi-TID A-MPDU to the second HE STA.

An HE STA shall not transmit a multi-TID A-MPDU or ack-enabled single-TID A-MPDU in a VHT PPDU or a HT PPDU.

A non-AP STA shall not send a non-ack-enabled multi-TID A-MPDU in an HE TB PPDU, unless it is in response to a Basic Trigger frame where the TID Aggregation Limit field of the User Info field addressed to the STA is greater than 1. A non-AP STA shall not send an ack-enabled multi-TID A-MPDU in an HE TB PPDU, unless it is in response to a Basic Trigger frame where the TID Aggregation Limit field of the User Info field addressed to the STA is greater than 0.

NOTE 1—An ack-enabled multi-TID A-MPDU solicited by a Basic Trigger frame with TID Aggregation Limit field equal to 1 can contain one Management frame that solicits acknowledgment and one or more QoS Data frames from the same TID if the AP supports reception of ack-enabled multi-TID A-MPDUs.

A multi-TID A-MPDU shall not be transmitted in an HE SU PPDU, HE ER SU PPDU, or HE MU PPDU, unless the TXOP limit is greater than 0 for the AC that is used to gain access to the medium. The AC used to gain access to the medium is the primary AC (see 10.23.2.9 (TXOP limits)). If the TXOP limit of the primary AC is greater than 0, then the STA may aggregate QoS Data frames from one or more TIDs in the A-MPDU under the following conditions:

— The A-MPDU shall be carried in either an HE SU PPDU or an HE ER SU PPDU transmitted by the STA within the obtained TXOP or in an HE MU PPDU transmitted by a non-AP STA within the obtained TXOP.
— The A-MPDU shall contain one or more MPDUs with any of the TIDs that correspond to the primary AC.
— If no more MPDUs can be aggregated in the A-MPDU from any of the TIDs that correspond to the primary AC, then the A-MPDU may additionally contain one or more MPDUs with TIDs that do not correspond to the primary AC if the TIDs correspond to any AC that has a higher priority with respect to the primary AC and the addition of these MPDUs does not cause the STA to exceed the TXOP limit of the primary AC.

An HE AP may aggregate MPDUs from any TIDs in a multi-TID A-MPDU for DL HE MU PPDU transmission, and the number of TIDs in the multi-TID A-MPDU shall not be more than the Multi-TID Aggregation Rx Support announced by the recipient.

The Multi-STA BlockAck frame is used to acknowledge the MPDUs in a multi-TID A-MPDU as defined in 26.4 (HE acknowledgment procedure).

In a multi-TID A-MPDU, MPDUs with the same TID are not necessarily contiguous.

A non-AP HE STA that transmits a multi-TID A-MPDU in an HE TB PPDU should aggregate QoS Data frames in the following order:

— First, any and all MPDUs that correspond to the Preferred AC subfield of the Trigger Dependent User Info field addressed to the STA in the Trigger frame.
— Then, any and all MPDUs that correspond to any AC that has a higher priority.
— Then, any MPDUs that correspond to any AC that has a lower priority.

The aggregation of the QoS Data frames is subject to the following:

— The limit indicated in the TID Aggregation Limit subfield in the Trigger Dependent User Info field addressed to the STA in the Trigger frame.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

- The restrictions in Table 26-2 (Relation between TID Aggregation Limit field, Multi-TID Aggregation Tx Support field, and solicited immediate response(11ax)).
- The duration indicated in the UL Length subfield in the Common Info field of the Trigger frame.

NOTE 2—These rules permit a STA to not aggregate any MPDUs from the preferred AC or a higher priority AC, and permit a STA to aggregate MPDUs in any order.

NOTE 3—A multi-TID A-MPDU allows the aggregation of a Management frame regardless of the value indicated in the Multi-TID Aggregation Rx Support subfield in the HE MAC Capabilities Information field in the HE Capabilities element as long as the indicated value of the TID Aggregation Limit subfield in the Trigger Dependent User Info field of a the Basic Trigger frame is nonzero.

A(#1426) non-AP HE STA that transmits a single-TID A-MPDU in an HE TB PPDU should select the TID in the following order:

- A TID that corresponds to the Preferred AC subfield of the Trigger Dependent User Info field addressed to the STA in the Trigger frame if there is a corresponding MPDU for that TID.
- Otherwise, a TID that corresponds to any AC that has a higher priority, if there is a corresponding MPDU for that TID.
- Otherwise, a TID that corresponds to any AC that has a lower priority.

The TID selection is subject to the following:

- The limit indicated in the TID Aggregation Limit subfield in the Trigger Dependent User Info field addressed to the STA in the Trigger frame.
- The duration indicated in the UL Length subfield in the Common Info field of the Trigger frame.

NOTE 4—These rules permit a STA to not select MPDUs from the preferred AC or a higher priority AC.

#### 26.6.3.2 Ack-enabled single-TID A-MPDU operation

An ack-enabled single-TID A-MPDU is an A-MPDU with contents defined in Table 9-666 (A-MPDU contents in the HE ack-enabled single-TID immediate response context(11ax)).

NOTE—An ack-enabled single-TID A-MPDU does not contain more than one of the following frames: (a) a QoS Data frame or (b) a Management frame that solicits acknowledgment. In this case, the Management frame that solicits acknowledgment is treated as if it were a QoS Data frame with TID equal to 15.

An HE STA shall not transmit an ack-enabled single-TID A-MPDU to a recipient STA, unless it has received from the recipient STA an HE Capabilities element with the Ack-Enabled Aggregation Support subfield equal to 1.

#### 26.6.3.3 Non-ack-enabled multi-TID A-MPDU operation

A non-ack-enabled multi-TID A-MPDU is an A-MPDU with contents defined in Table 9-667 (A-MPDU contents in the HE non-ack-enabled multi-TID immediate response context(11ax)).

NOTE—A non-ack-enabled multi-TID A-MPDU might include other frames such as a Trigger frame, BlockAck frame, or QoS Null frame (see Table 9-661 (A-MPDU contents in the non-HE(11ax) data enabled immediate response context)).

An HE STA shall not transmit a non-ack-enabled multi-TID A-MPDU to a recipient STA, unless it has received from the recipient STA an HE Capabilities element where the Multi-TID Aggregation Rx Support subfield is nonzero.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

A STA that receives a non-ack-enabled multi-TID A-MPDU responds as defined in 26.4.4 (Per-PPDU acknowledgment selection rules).

#### 26.6.3.4 Ack-enabled multi-TID A-MPDU operation

An ack-enabled multi-TID A-MPDU is an A-MPDU with contents defined in Table 9-668 (A-MPDU contents in the HE ack-enabled multi-TID immediate response context(11ax)).

QoS Data frames with the same TID shall have the same ack policy.

QoS Data frames with the same TID shall be carried in A-MPDU subframes with the same value in the EOF/Tag field setting.

In an ack-enabled multi-TID A-MPDU, the EOF/Tag field in the MPDU delimiter of each A-MPDU subframe carrying a frame that solicits an Ack frame as defined in Table 9-668 (A-MPDU contents in the HE ack-enabled multi-TID immediate response context(11ax)) shall be set to 1. The EOF/Tag field in all other A-MPDU subframes in the A-MPDU that carry frames shall be set to 0.

An HE STA shall not transmit an ack-enabled multi-TID A-MPDU to a recipient STA, unless it has received from the recipient STA an HE Capabilities element where the Multi-TID Aggregation Rx Support subfield is nonzero and the Ack-Enabled Aggregation Support subfield is 1.

A STA that receives an ack-enabled multi-TID A-MPDU responds as defined in 26.4.4 (Per-PPDU acknowledgment selection rules).

A STA that transmits an ack-enabled multi-TID A-MPDU that contains at least two tagged MPDUs shall (#3683)discard the immediate response if it is an Ack frame.

## 26.7 HE sounding operation(#2388)

### 26.7.1 General

Transmit beamforming and DL MU-MIMO require knowledge of the channel state to compute a steering matrix that is applied to the transmit signal to optimize reception at one or more receivers. HE STAs use the HE sounding protocol to determine the channel state information. The HE sounding protocol provides explicit feedback mechanisms, defined as HE non-trigger-based (non-TB) sounding and HE trigger-based (TB) sounding, where the HE beamformee measures the channel using a training signal (i.e., an HE sounding NDP) transmitted by the HE beamformer and sends back a transformed estimate of the channel state. The HE beamformer uses this estimate to derive the steering matrix.

The HE beamformee returns an estimate of the channel state in an HE compressed beamforming/CQI report carried in (#6006)the HE Compressed Beamforming/CQI Report field. There are three types of HE compressed beamforming/CQI report:

— SU feedback: The HE Compressed Beamforming/CQI Report field(#6006) consists of an HE Compressed Beamforming Report field.

— MU feedback: The HE Compressed Beamforming/CQI Report field(#6006) consists of an HE Compressed Beamforming Report field and HE MU Exclusive Beamforming Report field.

— CQI feedback: The HE Compressed Beamforming/CQI Report field(#6006) consists of an HE CQI Report field.

NOTE—Use of HE TB sounding does not necessarily imply MU feedback. HE TB sounding is also used to obtain SU feedback and CQI feedback.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The HE Compressed Beamforming/CQI Report field(#6006) is carried in a single HE Sounding Feedback Segment field if the resulting HE Compressed Beamforming/CQI frame is less than or equal to 11 454 octets in length (see 26.7.3 (Rules for HE sounding protocol sequences)). Otherwise, the HE Compressed Beamforming/CQI Report field is segmented, with each segment carried in an HE Sounding Feedback Segment field, and each HE Sounding Feedback Segment field carried in separate HE Compressed Beamforming/CQI frames.(#6006)

An HE beamformer shall support a maximum MPDU length for an HE Compressed Beamforming/CQI frame(#7156) that is the minimum of 11 454 octets and the maximum length of the HE Compressed Beamforming/CQI frame(#7156) that the HE beamformer intends to solicit from its HE beamformees.(#6006)

### 26.7.2 HE sounding protocol

An SU beamformer is an HE STA that sets the SU Beamformer subfield in the HE PHY Capabilities Information field in the HE Capabilities element it transmits to 1.

An SU beamformee is an HE STA that sets the SU Beamformee subfield in the HE PHY Capabilities Information field in the HE Capabilities element it transmits to 1. A non-AP HE STA shall set the SU Beamformee subfield to 1. An HE AP may set the SU Beamformee subfield to 1.

An MU beamformer is an HE AP that sets the MU Beamformer subfield in the HE PHY Capabilities Information field in the HE Capabilities element it transmits to 1. An HE AP that indicates support for 4 or more space-time streams in the Tx HE-MCS Map ≤ 80 MHz subfield in the Supported HE-MCS And NSS field in the HE Capabilities element shall set the MU Beamformer subfield to 1. A non-AP HE STA shall set the MU Beamformer subfield to 0. An MU beamformer is also an SU beamformer and shall set the SU Beamformer subfield to 1.

NOTE—A non-AP STA might use the setting of the MU Beamformer subfield to determine the AP with which it will associate.

A non-AP HE STA shall support operation as an MU beamformee. An HE AP does not support operation as an MU beamformee.

The term *HE beamformer* refers to both the SU beamformer and MU beamformer. The term *HE beamformee* refers to both the SU beamformee and MU beamformee.

The type of feedback (SU, MU, or CQI) solicited by an HE beamformer from an HE beamformee is indicated in the Feedback Type And Ng and Codebook subfields in the STA Info field identifying the HE beamformee in the HE NDP Announcement frame as defined in Table 9-45 (Feedback Type And Ng subfield and Codebook Size subfield encoding for HE TB sounding(11ax)) and Table 9-46 (Feedback Type And Ng subfield and Codebook Size subfield encoding for HE non-TB sounding(11ax)).

The bandwidth (partial or full) of the feedback solicited by an HE beamformer from an HE beamformee depends on the Partial BW Info subfield in the STA Info field identifying the HE beamformee in the HE NDP Announcement frame, (#2337)the bandwidth of the PPDU carrying the HE NDP Announcement frame, and the value of the Disallowed Subchannel Bitmap subfield, if present. Full bandwidth feedback is solicited if the RU Start Index subfield in the Partial BW Info subfield is 0, the Disallowed Subchannel Bitmap subfield is absent or contains all zeroes, and the RU End Index subfield in the Partial BW subfield is the value shown in Table 26-4 (Settings for BW, RU Start Index, and RU End Index fields in HE NDP Announcement frame(11ax)) where partial bandwidth is not supported by the HE beamformer, for (#2337)the bandwidth of the PPDU carrying the HE NDP Announcement frame.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Other settings of the Partial BW Info subfield solicit partial-bandwidth feedback. Punctured sounding is indicated by the inclusion of a nonzero Disallowed Subchannel Bitmap subfield in the HE NDP Announcement frame. In such a case, the disallowed subchannels are applied to the tone information to be included in the feedback after selecting tones for feedback based on the RU Start Index and RU End Index subfield values and HE NDP Announcement frame bandwidth as described above. See Table 26-4 (Settings for BW, RU Start Index, and RU End Index fields in HE NDP Announcement frame(11ax)).

The RU Start Index and RU End Index subfields shall cover at least one allowed subchannel.

An SU beamformer may solicit full-bandwidth SU feedback from an SU beamformee in an HE non-TB sounding sequence. An SU beamformer shall not solicit partial-bandwidth SU feedback in an HE non-TB sounding sequence. An SU beamformer may solicit partial-bandwidth or full-bandwidth SU feedback from an SU beamformee in an HE TB sounding sequence if the SU beamformee indicates support by setting the Triggered SU Beamforming Feedback subfield in the HE PHY Capabilities Information field in the HE Capabilities element it transmits to 1.

An MU beamformer may solicit full-bandwidth MU feedback from an MU beamformee in an HE TB sounding sequence. An MU beamformer may solicit partial-bandwidth MU feedback from an MU beamformee in an HE TB sounding sequence if the MU beamformee indicates support by setting the Triggered MU Beamforming Partial BW Feedback subfield to 1. An MU beamformer shall not solicit MU feedback in an HE non-TB sounding sequence.

An MU beamformer may solicit full-bandwidth or partial-bandwidth CQI feedback from an MU beamformee in an HE TB sounding sequence if the MU beamformee indicates support by setting the Triggered CQI Beamforming Feedback subfield to 1.

An MU beamformer may solicit full-bandwidth CQI feedback from an MU beamformee in an HE non-TB sounding sequence if the MU beamformee indicates support by setting the Non-Triggered CQI Beamforming Feedback subfield to 1.

An HE beamformer may solicit punctured SU feedback from an HE beamformee in an HE TB sounding sequence if the HE beamformee indicates support for punctured sounding by setting the Punctured Sounding Support subfield in the HE Capabilities elements it transmits to 1. An HE beamformer shall indicate punctured subchannels in the HE sounding NDP of an HE TB sounding sequence by setting the appropriate bits of the Disallowed Subchannel Bitmap subfield of the STA Info field with the AID11 subfield set to 2047 in the preceding HE NDP Announcement frame. An SU beamformer that indicates punctured subchannels in an HE NDP Announcement frame in an HE TB sounding sequence shall set the TXVECTOR parameter INACTIVE_SUBCHANNELS of the non-HT duplicate PPDU carrying the HE NDP Announcement frame and the HE sounding NDP as described in 26.11.7 (INACTIVE_SUBCHANNELS and RU_ALLOCATION).

An SU beamformee that supports punctured sounding shall generate feedback corresponding to the subchannels indicated in the STA Info field addressed to it in an HE NDP Announcement frame, but excluding subcarriers that are disallowed according to the value of the Disallowed Subchannel Bitmap subfield in that frame.

An HE beamformer shall not send an HE NDP Announcement frame that initiates an HE TB sounding sequence with a STA Info field identifying an HE beamformee if the STA Info field and the PHY Capabilities Information field in the HE Capabilities element most recently received from the HE beamformee meet any of the following conditions (see Table 9-45 (Feedback Type And Ng subfield and Codebook Size subfield encoding for HE TB sounding(11ax))):

— The Feedback Type And Ng subfield in the STA Info field indicates SU and $Ng = 16$, and the $Ng = 16$ SU Feedback subfield in the HE PHY Capabilities Information field is 0.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

- The Feedback Type And Ng subfield in the STA Info field indicates MU and *Ng* = 16, and the *Ng* = 16 MU Feedback subfield in the HE PHY Capabilities Information field is 0.
- The Feedback Type And Ng subfield in the STA Info field indicates SU, the Codebook Size subfield indicates codebook resolution ($\phi$, $\psi$) = {4, 2}, and the Codebook Size ($\phi$, $\psi$) ={4, 2} SU Feedback subfield in the HE PHY Capabilities Information field is 0.
- The Feedback Type And Ng subfield in the STA Info field indicates MU, the Codebook Size subfield in the STA Info field indicates codebook resolution ($\phi$, $\psi$) = {7, 5}, and the Codebook Size ($\phi$, $\psi$) ={7, 5} MU Feedback subfield in the HE PHY Capabilities Information field is 0.
- The Feedback Type And Ng and Codebook Size subfields in the STA Info field indicate CQI, and the Triggered CQI Beamforming Feedback subfield in the HE PHY Capabilities Information field is 0.
- The Feedback Type And Ng subfield in the STA Info field indicates MU, the Partial BW Info subfield in the STA Info field indicates partial bandwidth, and the Triggered MU Beamforming Partial BW Feedback subfield in the HE PHY Capabilities Information field is 0.
- The Feedback Type And Ng subfield indicates SU, and the Triggered SU Beamforming Feedback subfield in the HE PHY Capabilities Information field is 0.

An HE beamformee indicates the maximum number of HE-LTF symbols it can receive in a 20 MHz, 40 MHz, or 80 MHz HE sounding NDP in the Beamformee STS ≤ 80 MHz subfield in the PHY Capabilities Information field in the HE Capabilities element it transmits.

An HE beamformee shall set the Beamformee STS ≤ 80 MHz subfield to indicate a maximum number of HE-LTF symbols of 4 or greater.

An HE beamformee that supports 160 MHz or 80+80 MHz channel widths indicates the maximum number of HE-LTF symbols it can receive in a 160 MHz or 80+80 MHz HE sounding NDP in the Beamformee STS > 80 MHz subfield in the PHY Capabilities Information field in the HE Capabilities element it transmits.

An HE beamformer shall not transmit a 20 MHz, 40 MHz, or 80 MHz HE sounding NDP with a TXVECTOR parameter NUM_STS that is greater than the maximum number of HE-LTF symbols indicated in the Beamformee STS ≤ 80 MHz subfield of any STA identified by a STA Info field in the preceding HE NDP Announcement frame.

An HE beamformer shall not transmit a 160 MHz or 80+80 MHz HE sounding NDP with a TXVECTOR parameter NUM_STS that is greater than the maximum number of HE-LTF symbols indicated in the Beamformee STS > 80 MHz subfield of any STA identified by a STA Info field in the preceding HE NDP Announcement frame.

An HE beamformer indicates the maximum number of HE-LTF symbols it might transmit in a 20 MHz, 40 MHz, or 80 MHz HE sounding NDP in the Number Of Sounding Dimensions ≤ 80 MHz subfield.

An HE beamformer indicates the maximum number of HE-LTF symbols it might transmit in an 80+80 MHz or 160 MHz HE sounding NDP in the Number Of Sounding Dimensions > 80 MHz subfield.

An HE beamformer shall not transmit a 20 MHz, 40 MHz, or 80 MHz HE sounding NDP where the number of HE-LTF symbols exceeds the value indicated in the Number Of Sounding Dimensions ≤ 80 MHz subfield.

An HE beamformer shall not transmit an 80+80 MHz or 160 MHz HE sounding NDP where the number of HE-LTF symbols exceeds the value indicated in the Number Of Sounding Dimensions > 80 MHz subfield.

### 26.7.3 Rules for HE sounding protocol sequences

An HE non-TB sounding sequence is initiated by an HE beamformer with an individually addressed HE NDP Announcement frame comprising exactly one STA Info field, followed after a SIFS(#6587) by an HE sounding NDP. The triggered(#2345) HE beamformee responds after a SIFS(#6587) with an HE Compressed Beamforming/CQI frame.

The AID11 subfield of the STA Info field shall be set to the AID of the STA identified by the RA field of the HE NDP Announcement frame, or to 0 if the STA identified by the RA field is a mesh STA, AP, or IBSS STA.

An example of an HE non-TB sounding sequence with a single HE beamformee is shown in Figure 26-7 (Example of HE non-TB sounding(11ax)).

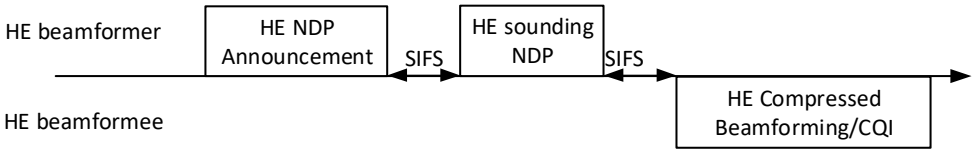

**Figure 26-7—Example of HE non-TB sounding(11ax)**

An HE beamformer that initiates the HE non-TB sounding sequence shall transmit the HE NDP Announcement frame with a single STA Info field, and the value in the AID11 field of that STA Info field shall be other than 2047 and set to the AID of the STA identified by the RA field or to 0 if the STA identified by the RA field is a mesh STA, AP, or IBSS member STA.

An HE beamformer may initiate an HE non-TB sounding sequence with an HE beamformee to solicit SU feedback over full bandwidth.

An HE beamformer shall not initiate an HE non-TB sounding sequence with an HE NDP Announcement frame that has a Partial BW Info subfield that indicates less than full bandwidth (see Table 26-4 (Settings for BW, RU Start Index, and RU End Index fields in HE NDP Announcement frame(11ax))).

An HE TB sounding sequence is initiated by an HE beamformer with a broadcast HE NDP Announcement frame with two or more STA Info fields, followed after a SIFS by an HE sounding NDP, followed after a SIFS by a BFRP Trigger frame. (#2343)Each triggered HE beamformee responds after a SIFS with an HE TB PPDU containing one or more HE Compressed Beamforming/CQI frame.

An example of an HE TB sounding sequence with more than one HE beamformee is shown in Figure 26-8 (Example of HE TB sounding(11ax)).

An HE beamformer that initiates an HE TB sounding sequence shall transmit the HE NDP Announcement frame with two or more STA Info fields and the RA field set to the broadcast address.

An HE beamformer may initiate an HE TB sounding sequence to solicit MU feedback over full bandwidth.

An HE beamformer may initiate an HE TB sounding sequence to solicit a feedback variant only if the feedback variant is computed based on parameters supported by the HE beamformee; otherwise, the HE beamformer shall not solicit a feedback variant computed based on parameters not supported by the HE beamformee (see 26.7.2 (HE sounding protocol)).

This is an unapproved IEEE Standards Draft, subject to change.

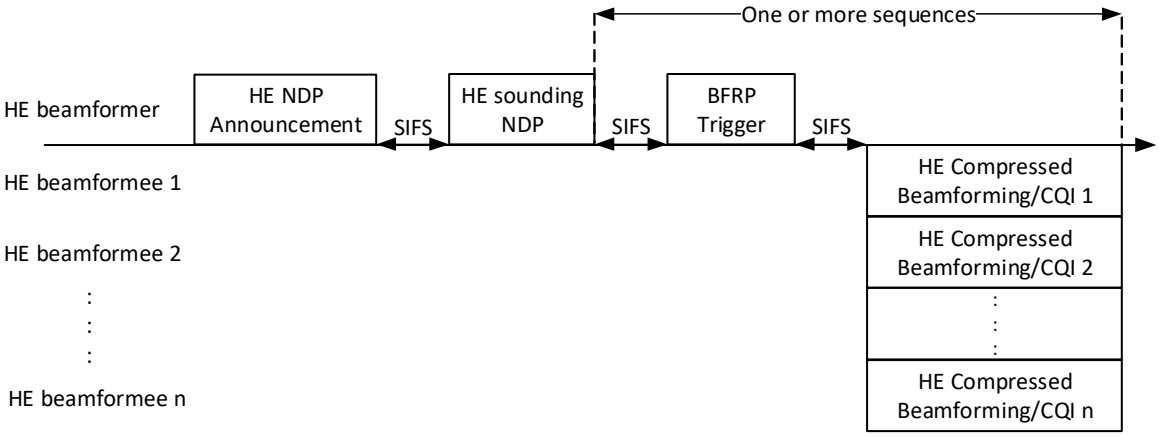

**Figure 26-8—Example of HE TB sounding(11ax)**

An HE AP with dot11MultiBSSIDImplemented equal to true shall not send an HE NDP Announcement frame with the TA field set to the transmitted BSSID to a non-AP STA that is associated with an AP corresponding to a nontransmitted BSSID in the multiple BSSID set, unless the AP has received from the non-AP STA an HE Capabilities element with the Rx Control Frame To MultiBSS subfield in the HE MAC Capabilities Information field equal to 1. An AP with dot11MultiBSSIDImplemented equal to true shall not send an individually addressed HE NDP Announcement frame with the TA field set to the transmitted BSSID to a non-AP STA associated with an AP corresponding to a nontransmitted BSSID.

An AP that transmits an HE NDP Announcement frame identifying HE STAs shall set the TA field of the frame to the MAC address of the AP, unless dot11MultiBSSIDImplemented is true and the HE NDP Announcement frame identifies STAs from at least two different BSSs of the multiple BSSID set. In this case, the AP shall set the TA field of the frame to the transmitted BSSID. If the HE NDP Announcement frame is transmitted in a non-HT duplicate PPDU, then the TA field of the HE NDP Announcement frame is a bandwidth signaling TA (see 10.6.6.6 (Channel Width selection for Control frames)).

An HE beamformer that transmits an HE NDP Announcement frame to an HE beamformee that is an AP, TDLS peer STA, mesh STA, or IBSS STA shall include one STA Info field in the HE NDP Announcement frame and shall set the AID11 field in the STA Info field of the frame to 0.

An HE beamformer that is an AP and that transmits an HE NDP Announcement frame to one or more HE beamformees shall set the AID11 field in the STA Info field identifying a non-AP STA to the 11 LSBs of the AID of the non-AP STA.

An HE NDP Announcement frame shall not include multiple STA Info fields that have the same value in the AID11 subfield.

An HE beamformer that transmits an HE NDP Announcement frame initiating an HE TB sounding sequence may include a STA Info field with an AID11 subfield value of 2047 to indicate disallowed subchannels during punctured channel operation. When present, the STA Info field with AID11 value of 2047 shall be the first STA Info field in the frame. An HE beamformer that transmits an HE NDP Announcement frame shall not include more than one STA Info field with an AID11 subfield value of 2047. An HE beamformer that transmits an HE NDP Announcement frame initiating a HE non-TB sounding sequence shall not include a STA Info field with an AID11 subfield value of 2047.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

In an HE TB sounding sequence, a STA Info field in the HE NDP Announcement frame that solicits SU or MU feedback indicates the subcarrier grouping (*Ng*), codebook size, and number of columns (*Nc*) to be used by the HE beamformee identified by the STA Info field for the generation of the SU or MU feedback.

In an HE non-TB sounding sequence where the STA Info field in the HE NDP Announcement frame solicits SU feedback, the *Ng*, codebook size, and the *Nc* used for the generation of the SU feedback are determined by the HE beamformee.

In an HE TB sounding sequence, a STA Info field in the HE NDP Announcement frame that solicits CQI feedback indicates the *Nc* to be used by the HE beamformee identified by the STA Info field for the generation of the CQI feedback.

In an HE non-TB sounding sequence where the STA Info field in the HE NDP Announcement frame solicits CQI feedback, the *Nc* used for the generation of the CQI feedback is determined by the HE beamformee.

An HE beamformer that has initiated an HE TB sounding sequence (#2345)shall transmit a BFRP Trigger frame to solicit feedback and may send one or more additional BFRP Trigger frames in the same TXOP as shown in Figure 26-8 (Example of HE TB sounding(11ax)). The HE beamformer uses the additional BFRP Trigger frames to solicit HE compressed beamforming/CQI reports from HE beamformees not addressed in a previous BFRP Trigger frame or to solicit retransmission of an HE compressed beamforming/CQI report. An HE beamformer shall not transmit a BFRP Trigger frame that identifies a STA identified in the HE NDP Announcement frame of an HE TB sounding sequence, unless it is in the same TXOP as the HE TB sounding sequence.

An HE beamformer that transmits an HE NDP Announcement frame as part of an HE TB sounding sequence shall set the Nc subfield of the STA Info field to indicate a value less than or equal to the minimum of the following:

— The maximum number of supported spatial streams according to the corresponding HE beamformee's Rx HE-MCS Map ≤ 80 MHz, Rx HE-MCS Map 160 MHz, and Rx HE-MCS Map 80+80 MHz subfields in the Supported HE-MCS And NSS Set field in the HE Capabilities element sent by the HE beamformee.

— The maximum number of supported spatial streams according to the Rx NSS subfield value in the most recently received Operating Mode Notification frame, Operating Mode Notification element with the Rx NSS Type subfield equal to 0, or OM Control subfield sent by the corresponding HE beamformee (see 26.9 (Operating mode indication)).

— The maximum *Nc* indicated by the Max Nc subfield in the HE PHY Capabilities Information field in the HE Capabilities element sent by the HE beamformee.

An HE beamformer that transmits an HE NDP Announcement frame shall set the RU Start Index and RU End Index subfields in a STA Info field to indicate the starting 26-tone RU and the ending 26-tone RU, respectively, of the solicited HE compressed beamforming/CQI report (see 9.3.1.19 (VHT/HE/Ranging NDP Announcement frame format(11ax)(11az))). For preamble punctured sounding, the RU Start Index and RU End Index correspond to the bandwidth before puncturing, and the Disallowed Subchannel Bitmap subfield is used to indicate the subcarriers that are punctured in the HE sounding NDP and in the solicited feedback.

NOTE 1—In order to maximize the channel estimate quality after interpolation/extrapolation resulting from grouping, the subcarriers for which feedback is requested using the RU Start Index and RU End Index subfields do not necessarily lie within the actual RU as defined in Table 27-8 (Data and pilot subcarrier indices for RUs in a 20 MHz HE PPDU and in a non-OFDMA 20 MHz HE PPDU(11ax)), Table 27-9 (Data and pilot subcarrier indices for RUs in a 40 MHz HE PPDU and in a non-OFDMA 40 MHz HE PPDU(11ax)), and Table 27-10 (Data and pilot subcarrier indices for RUs in an 80 MHz HE PPDU and in a non-OFDMA 80 MHz HE PPDU(11ax)). Rather, they are defined in Table 9-124 (Subcarrier indices scidx(0) and scidx(Ns – 1) for Ng = 4(11ax)) and Table 9-125 (Subcarrier indices scidx(0) and scidx(Ns – 1) for Ng = 16(11ax)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

(#2337)The bandwidth of the PPDU carrying the HE NDP Announcement frame is obtained from the RXVECTOR parameter CH_BANDWIDTH of the HE NDP Announcement frame if received in an HE, VHT, or HT PPDU; is obtained from the RXVECTOR parameter CH_BANDWIDTH_IN_NON_HT if the HE NDP Announcement frame is received in a non-HT duplicate PPDU; and is 20 MHz if the HE NDP Announcement frame is received in a non-HT PPDU.

In an HE non-TB sounding sequence, an HE beamformer shall solicit full-bandwidth feedback. In an HE TB sounding sequence, an HE beamformer shall solicit full-bandwidth feedback in a STA Info field identifying an HE beamformee that has not indicated support for partial-bandwidth feedback. In an HE TB sounding sequence, an HE beamformer may solicit full-bandwidth or partial-bandwidth feedback in a STA Info field identifying an HE beamformee that has indicated support for partial-bandwidth feedback (see 26.7.2 (HE sounding protocol)).

For 80+80 MHz, feedback is not requested for the gap between the 80 MHz segments.

The HE beamformer shall set the TXVECTOR parameter CH_BANDWIDTH or CH_BANDWIDTH_IN_NON_HT, the RU Start Index field, and the RU End Index field of the HE NDP Announcement frame, depending on the operating channel width and partial BW support of the HE beamformee, as defined in Table 26-4 (Settings for BW, RU Start Index, and RU End Index fields in HE NDP Announcement frame(11ax)). (#2337)The bandwidth of the PPDU carrying the HE NDP Announcement frame is determined before applying puncturing based on disallowed subchannels.

**Table 26-4—Settings for BW, RU Start Index, and RU End Index fields in HE NDP Announcement frame(11ax)**

| Partial bandwidth supported by HE beamformer | Operating channel width of the HE beamformee (MHz) | Bandwidth of HE NDP Announcement frame | RU Start Index field | RU End Index field |
|---|---|---|---|---|
| No | 20, 40, 80, 160/80+80 | 20 MHz | 0 | 8 |
| Yes | 20, 40, 80, 160/80+80 | | 0–8 | 0–8 |
| No | 40, 80, 160/80+80 | 40 MHz | 0 | 17 |
| Yes | 40, 80, 160/80+80 | | 0–17 | 0–17 |
| No | 80, 160/80+80 | 80 MHz | 0 | 36 |
| Yes | 80, 160/80+80 | | 0–36 | 0–36 |
| No | 160/80+80 | 160 MHz or 80+80 MHz | 0 | 73 |
| Yes | 160/80+80 | | 0–73 | 0–73 |

NOTE 1—The value of the RU Start Index field is always less than or equal to the value of the RU End Index field.

NOTE 2—Partial BW feedback can be solicited only with an HE TB sounding sequence and cannot be solicited with an HE non-TB sounding sequence.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The HE beamformer shall use the lowest 26-tone RU, which is the lower bound of the starting 26-tone in the RU Start Index subfield of a STA Info field that is equal to the maximum of the following:

— The minimum 26-tone RU located within the channel width indicated in the VHT Operation Information field of either the HE Operation element or the VHT Operation element, whichever is present, and within the channel width indicated in the HT Operation element.

— The minimum 26-tone RU located within the channel width indicated in the most recently received Operating Mode Notification frame, Operating Mode Notification element with the Rx NSS Type subfield equal to 0, or OM Control subfield sent by the corresponding HE beamformee (see 26.9 (Operating mode indication)).

The HE beamformer shall use the highest 26-tone RU, which is the upper bound of the ending 26-tone RU in the RU End Index subfield of a STA Info field that is equal to the minimum of the following:

— The maximum 26-tone RU located within the channel width indicated in the VHT Operation Information field of either the HE Operation element or the VHT Operation element, whichever is present, and within the channel width indicated in the HT Operation element.

— The maximum 26-tone RU located within the channel width indicated in the most recently received Operating Mode Notification frame, Operating Mode Notification element with the Rx NSS Type subfield equal to 0, or OM Control field sent by the corresponding HE beamformee (see 26.9 (Operating mode indication)).

In an HE non-TB sounding sequence soliciting SU feedback, B26 (in the Feedback Type And Ng subfield), the Codebook Size subfield, and the Nc subfield in the STA Info field of the HE NDP Announcement frame are reserved.

In an HE non-TB sounding sequence soliciting CQI feedback, the Nc subfield in an HE NDP Announcement frame is reserved.

An HE beamformee that receives an HE NDP Announcement frame soliciting SU feedback as part of an HE non-TB sounding sequence shall generate an HE compressed beamforming/CQI report for SU feedback with *Nc* in the range 1 to 8, *Ng* = 4 or *Ng* = 16, and codebook size ($\phi$, $\psi$) = {4, 2} or ($\phi$, $\psi$) = {6, 4}. The HE beamformee shall transmit the HE compressed beamforming/CQI report a SIFS after the HE sounding NDP.

An HE beamformee that receives an HE NDP Announcement frame soliciting CQI feedback as part of an HE non-TB sounding sequence shall generate an HE compressed beamforming/CQI report for CQI feedback with *Nc* determined by the HE beamformee.

An HE beamformee that receives an HE NDP Announcement frame soliciting CQI feedback as part of an HE TB sounding sequence shall generate an HE compressed beamforming/CQI report for CQI feedback with *Nc* determined by the HE beamformer.

An HE beamformee that receives an HE NDP Announcement frame from an HE beamformer with which it is associated and that contains the HE beamformee's MAC address in the RA field (indicating a non-TB sounding sequence) and also receives an HE sounding NDP a SIFS after the HE NDP Announcement frame shall transmit its HE compressed beamforming/CQI report a SIFS after the HE sounding NDP. The TXVECTOR parameter CH_BANDWIDTH for the PPDU containing the HE compressed beamforming/ CQI report shall be set to indicate a bandwidth not wider than that indicated by the RXVECTOR parameter CH_BANDWIDTH of the HE sounding NDP.

An HE beamformee that receives an HE NDP Announcement frame as part of an HE TB sounding sequence with a STA Info field identifying it soliciting SU or MU feedback shall generate an HE compressed beamforming/CQI report using the feedback type, *Ng*, codebook size, and *Nc* indicated in the STA Info field. If the HE beamformee then receives a BFRP Trigger frame with a matching STA Info field, the HE beamformee transmits an HE TB PPDU containing the HE compressed beamforming/CQI report following

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

the rules defined in 26.5.2.3 (Non-AP STA behavior for UL MU operation). If the HE NDP Announcement frame has the TA field set to the transmitted BSSID and the HE beamformee is a non-AP STA associated with an AP corresponding to a nontransmitted BSSID that supports receiving Control frames with TA field set to the transmitted BSSID, then the (#6006)HE Compressed Beamforming/CQI frame(s) sent in response shall have the RA field set to as defined in 26.5.2.3.5 (RA field for frames carried in an HE TB PPDU).

NOTE 2—A non-AP HE beamformee that transmits an OM Control subfield with the UL MU Disable field set to 1 does not respond to BFRP Trigger frames (see 26.9 (Operating mode indication)).

An HE beamformee that is a non-AP STA that transmits an HE Compressed Beamforming/CQI frame(#6006) shall set the RU Start Index and RU End Index subfields of the HE MIMO Control field to indicate the range of tones for which compressed beamforming/CQI information is provided. If the HE NDP Announcement frame that solicited the feedback includes a Disallowed Subchannel Bitmap field with a nonzero value, then a beamformee that indicates support for punctured sounding by setting the Punctured Sounding Support subfield in the HE Capabilities elements that it transmits to 1 shall include a Disallowed Subchannel Bitmap subfield in the solicited feedback with the same value as the Disallowed Subchannel Bitmap subfield of the HE NDP Announcement frame that solicited the feedback to indicate subcarriers for which feedback information is not provided from within the range of subcarriers indicated by the RU Start Index and RU End Index subfields.

An HE beamformee that transmits HE compressed beamforming/CQI report shall include neither the HE Compressed Beamforming Report field nor the HE MU Exclusive Beamforming Report field in the HE Compressed Beamforming/CQI Report field if the transmission duration of the PPDU carrying the HE Compressed Beamforming/CQI Report field would exceed the maximum PPDU duration. In this case, the HE Compressed Beamforming/CQI frame does not include the HE Sounding Feedback Segment field.(#6006)

The Sounding Dialog Token Number field in the HE MIMO Control field shall be set to the same value as the Sounding Dialog Token Number field in the corresponding HE NDP Announcement frame.

An HE beamformer that sends a BFRP Trigger frame shall set the Feedback Segment Retransmission Bitmap fields of the BFRP Trigger frame to all 1s, except when the HE beamformer intends to solicit the retransmission of segmented feedback as defined in 26.7.4 (Rules for generating segmented feedback).

NOTE 3—The BFRP Trigger frame contains one or more User Info fields, each of which identifies an HE beamformee.

The SNR per subcarrier computation (#161)should be done on at least 4 subcarriers in a 26-tone RU.

### 26.7.4 Rules for generating segmented feedback

(#6006)The HE Sounding Feedback Segment field consists of bits in octet number $N1$ to octet number $N2$ of the HE Compressed Beamforming/CQI Report field (see 9.4.1.66 (HE Compressed Beamforming/CQI Report field(#6006))). Let $L_{HCBCR}$ denote the length of the HE Compressed Beamforming/CQI Report field in octets.

(#6006)If the HE Compressed Beamforming/CQI Report field would result in an HE Compressed Beamforming/CQI frame that does not exceed 11 454 octets in length, then the HE Compressed Beamforming/CQI Report field shall be included in a single HE Sounding Feedback Segment field. In this case, $N1 = 1$ and $N2 = L_{HCBCR}$ for the HE Sounding Feedback Segment field.

(#6006)If the HE Compressed Beamforming/CQI Report field would result in an HE Compressed Beamforming/CQI frame that exceeds 11 454 octets in length, then the HE Compressed Beamforming/CQI Report field shall be split into $K$ HE Sounding Feedback Segment fields. Let $L$ be the length of the HE Sounding Feedback Segment field in octets that results in the length of the HE Compressed Beamforming/

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

CQI frame being 11 454 octets (see NOTE 1). Then, the number of HE Sounding Feedback Segment fields is $K$ = Ceil ($L_{HCBCR}$ / $L$). For the $k$-th HE Sounding Feedback Segment field that is not the last HE Sounding Segment field ($k$ = 1, …, $K$-1), $N1 = (k\text{-}1) \times L + 1$ and $N2 = k \times L$. For the last HE Sounding Segment field, $N1 = (K\text{-}1) \times L + 1$ and $N2 = L_{HCBCR}$ (see NOTE 3). Each HE Sounding Feedback Segment field shall be included in a separate HE Compressed Beamforming/CQI frame. Each HE Sounding Feedback Segment field is identified by the value of the Remaining Feedback Segments subfield and the First Feedback Segment subfield in the HE MIMO Control field in the HE Compressed Beamforming/CQI frame containing the HE Sounding Feedback Segment field as defined in 9.4.1.62 (HE MIMO Control field(11ax)); the other nonreserved subfields of the HE MIMO Control field shall be the same for all HE Compressed Beamforming/CQI frames carrying different HE Sounding Feedback Segment fields of the same HE Compressed Beamforming/CQI Report field. All HE Compressed Beamforming/CQI frames carrying different portions of the same HE Compressed Beamforming/CQI Report field shall be sent in a single A-MPDU contained in a PPDU and shall be included in the A-MPDU in the descending order of the Remaining Feedback Segments subfield values.

NOTE 1—An HE Sounding Feedback Segment field together with the other fields in the Frame Body field of the HE Compressed Beamforming/CQI frame (see Figure 9-128 (Management frame format) and Table 9-643 (HE Action field values(#3764)(11ax)), constitutes a single unfragmented MMPDU.(#6006)

NOTE 2—The maximum length of the HE Compressed Beamforming/CQI Report field is 30 008 octets (160 MHz MU type feedback with 8 columns, 8 rows, $Ng$ = 4 and ($\phi$, $\psi$) = {9, 7} bits, see Table 9-122 (HE MIMO Control field encoding(11ax))). Therefore, the maximum number of the HE Compressed Beamforming/CQI frames needed to carry an HE Compressed Beamforming/CQI Report field is 3.(#6006)

NOTE 3—This results in all HE Sounding Feedback Segment fields that are not the last HE Sounding Segment field to have equal length. All HE Compressed Beamforming/CQI frames that do not contain the last HE Sounding Feedback Segment field have equal length of 11 454 octets. The last HE Sounding Feedback Segment field might have length smaller than the other HE Sounding Feedback Segment fields. The HE Compressed Beamforming/CQI frame containing the last HE Sounding Feedback Segment field has a length less than or equal to 11 454 octets.(#6006)

An HE beamformer that sends a BFRP Trigger frame, in its first attempt to retrieve an HE compressed beamforming/CQI report from an HE beamformee, shall solicit all possible feedback segments by setting all of the bits in the Feedback Segment Retransmission Bitmap subfield to 1 in the User Info field identifying the HE beamformee.

An HE beamformer that fails to receive some or all of the feedback segments of the HE compressed beamforming/CQI report from the HE beamformee may solicit the selective retransmission of missing feedback segments by sending a BFRP Trigger frame that indicates in the Feedback Segment Retransmission Bitmap subfield of the User Info field identifying the HE beamformee the list of feedback segments solicited for retransmission (see 9.3.1.22.3 (BFRP Trigger frame format)).

NOTE 4—In an HE non-TB sounding sequence, if the HE beamformer does not receive all feedback segments from the HE beamformee, the HE beamformer cannot use a BFRP Trigger frame to request retransmission of the feedback segments. In this case the HE beamformee can only repeat the entire non-TB sounding sequence.

An HE beamformer that fails to receive the first feedback segment (identified by the First Feedback Segment field set to 1), may solicit the selective retransmission of the missing feedback segments assuming the HE Compressed Beamforming/CQI Report field(#6006) is split into 8 feedback segments. The HE beamformer may also solicit the retransmission of all feedback segments by setting all of the bits in the Feedback Segment Retransmission Bitmap subfield to 1 in the User Info field identifying the HE beamformee.

An HE beamformee that transmits an HE compressed beamforming/CQI report including the HE Compressed Beamforming Report information and any HE MU Exclusive Beamforming Report information in response to a BFRP Trigger frame shall either transmit only the feedback segments indicated in the Feedback Segment Retransmission Bitmap field in the User Info field of the BFRP Trigger frame

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

identifying the HE beamformee or transmit all the feedback segments available at the HE beamformee, excluding the feedback segments that do not exist at the HE beamformee.

NOTE 5—If an HE beamformer solicits the missing feedback segments from a beamformee and does not receive a response from the beamformee, the HE beamformer might either initiate an HE TB sounding sequence or transmit an additional BFRP Trigger frame to the HE beamformee.

### 26.7.5 HE sounding NDP transmission

The TXVECTOR parameters for an HE sounding NDP shall be set as follows:

- FORMAT is set to HE_SU.
- APEP_LENGTH is set to 0.
- HE_LTF_TYPE is set to either 2xHE-LTF or 4xHE-LTF.
- If HE_LTF_TYPE is 2xHE-LTF, then GI_TYPE is set to either 0u8s_GI or 1u6s_GI.
- If HE_LTF_TYPE is 4xHE-LTF, then GI_TYPE is set to 3u2s_GI.
- NUM_STS indicates two or more space-time streams if the Feedback Type field in the HE MIMO Control field of the preceding HE NDP Announcement frame indicates either SU or MU, or one or more space-time streams if the Feedback Type field in the HE MIMO Control field of the preceding HE NDP Announcement frame indicates CQI.
- CH_BANDWIDTH is set to the same value as the TXVECTOR parameter CH_BANDWIDTH in the preceding HE NDP Announcement frame.
- INACTIVE_SUBCHANNELS is set to the value of the Disallowed Subchannel Bitmap subfield of the STA Info field with the AID11 subfield set to 2047 in the preceding HE NDP Announcement frame.
- SPATIAL_REUSE is set to PSR_AND_NON_SRG_OBSS_PD_PROHIBITED (see 26.11.6 (SPATIAL_REUSE)).
- BSS_COLOR is set to the value indicated in the BSS Color subfield of the HE Operation element received or transmitted by the HE AP.
- TXOP_DURATION set to either 127 or a value defined in Equation (26-3).

$$\max\left(\min\left(8\left\lfloor\frac{\lceil D_{\text{HE\_NDPA}} - \text{SIFS} - \text{TXTIME}\rceil}{8}\right\rfloor, 504\right), \min\left(128\left\lfloor\frac{\lceil D_{\text{HE\_NDPA}} - \text{SIFS} - \text{TXTIME}\rceil}{128}\right\rfloor, 8448\right)\right) \quad (26\text{-}3)$$

where

$D_{\text{HE\_NDPA}}$ is the value of the Duration/ID field in the MAC header of the preceding HE NDP Announcement frame

TXTIME is the transmission time of an HE sounding NDP defined in Equation (27-149)

The Supported HE-MCS and NSS Set field in the HE Capabilities element transmitted by the transmitter and the receiver of the HE sounding NDP do not affect the values used for the NUM_STS parameter for the TXVECTOR of an HE sounding NDP.

The destination of an HE sounding NDP is equal to the RA of the immediately preceding HE NDP Announcement frame.

The source of an HE sounding NDP is equal to the TA of the immediately preceding HE NDP Announcement frame.

## 26.8 TWT operation

### 26.8.1 General

Target wake time (TWT) allows an AP to manage activity in the BSS in order to minimize contention between STAs and to reduce the required amount of time that a STA utilizing a power management mode needs to be awake. This is achieved by allocating STAs to operate at nonoverlapping times and/or frequencies, and concentrate the frame exchange sequences(#109) in predefined service periods.

An HE STA negotiates individual TWT agreements, as defined in 10.46 (Target wake time (TWT)), subject to the additional rules and restrictions that are defined in 26.8.2 (Individual TWT agreements) and 26.8.7 (HE subchannel selective transmission). A non-AP HE STA establishes membership in broadcast TWT schedules, as defined in 26.8.3 (Broadcast TWT operation), which are used as defined in 26.8.3.3 (Rules for TWT scheduled STA), 26.14.2 (Power save with UORA and TWT), and 26.14.3 (Opportunistic power save). An HE AP delivers broadcast TWT parameter sets to non-AP HE STAs as described in 26.8.3.2 (Rules for TWT scheduling AP), 26.14.2 (Power save with UORA and TWT), and 26.14.3 (Opportunistic power save).

A STA does not need to be aware of the values of TWT parameters of the TWT agreements of other STAs in the BSS of the STA or of TWT agreements of STAs in other BSSs. A STA does not need to be aware that a TWT service period (SP) is used to exchange frames with other STAs. Frames transmitted during a TWT SP are carried in any PPDU format supported by the pair of STAs that have established the TWT agreement corresponding to that TWT SP, including HE MU PPDU, HE TB PPDU, etc.

An HE STA with dot11TWTOptionImplemented equal to true shall set the following:

— The TWT Requester Support subfield to 1 in the HE Capabilities element that it transmits if it supports operating in the role of a TWT requesting STA; otherwise, to 0.

— The TWT Responder Support subfield to 1 in the HE Capabilities elements that it transmits if it supports operating in the role of a TWT responding STA; otherwise, to 0.

— The Broadcast TWT Support subfield to 1 in the HE Capabilities element that it transmits if it supports operating in the role of a TWT scheduled STA or in the role of a TWT scheduling AP; otherwise, to 0.

An HE AP shall set the TWT Responder Support subfield of the Extended Capabilities element and HE Capabilities element to 1.

An HE AP may request TWT participation by all associated STAs that have declared support for TWT. A non-AP STA declares support for the role of TWT requesting STA by setting the TWT Requester Support subfield in the Extended Capabilities element or in the HE Capabilities element to 1 and declares support for the role of TWT scheduled STA by setting the Broadcast TWT Support subfield in the HE Capabilities element to 1. The HE AP makes the request for TWT participation by setting the TWT Required subfield to 1 in HE Operation elements it transmits. A STA that supports TWT and that has received an HE Operation element with the TWT Required subfield equal to 1 from the HE AP with which it is associated shall either negotiate individual TWT agreements, as defined in 26.8.2 (Individual TWT agreements), or participate in broadcast TWT operation, as defined in 26.8.3 (Broadcast TWT operation).

NOTE—The AP sets the TWT Required subfield to 1 if it is not available outside TWT SPs (see 26.8.2 (Individual TWT agreements) and 26.8.3 (Broadcast TWT operation)). The AP might not be available outside TWT SPs if it sets the Responder PM Mode subfield to 1 (see 10.46.7 (TWT Sleep setup).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 26.8.2 Individual TWT agreements

An HE STA may negotiate individual TWT agreements with another HE STA as defined in 10.46.1 (TWT overview), except that the STA

- May set the Responder PM Mode subfield to 1 if it is a TWT responding STA that intends to go to doze state outside of TWT SPs.
  - If the TWT responding STA is an AP then it may set the Responder PM Mode subfield to 1 only if all non-AP STAs that are associated to it indicate support of TWT and the AP has set the TWT Required subfield to 1 in the HE Operation element it transmits; otherwise, it shall set the Responder PM Mode subfield to 0.
  - An AP that sets the Responder PM Mode subfield to 1 follows the rules defined in 10.46.7 (TWT Sleep setup).
- Shall set the Implicit subfield to 1 and the NDP Paging Indicator/Unavailability Mode(#4010) subfield to 0 in all TWT elements that it transmits during the TWT setup.
- May set the Trigger subfield to 1 in the TWT element it transmits during the TWT setup to negotiate a trigger-enabled TWT.
  - A successful TWT agreement whose Trigger subfield in the TWT response sent by the AP is 1 is a trigger-enabled TWT; otherwise, it is not a trigger-enabled TWT.
- Shall set the TWT Channel subfield in the TWT element it transmits to 0, unless the HE STA sets up a subchannel selective transmission operation as defined in 26.8.7 (HE subchannel selective transmission).
- May set the TWT Protection field to 1 to indicate that TXOPs within the TWT SPs shall be initiated with a NAV protection mechanism, such as (MU) RTS/CTS or CTS-to-self frame; otherwise, it shall set it to 0.
- Shall not use the RAW mechanism for protection of TWT SPs.

NOTE 1—Whether the Responder PM Mode subfield is set to 0 or 1, the AP unavailability both inside and outside of the TWT SP is affected by any advertised broadcast TWT element with Broadcast TWT ID subfield equal to 0 and with Responder PM Mode subfield equal to 1 (see 26.8.3.2 (Rules for TWT scheduling AP)).(#4010)

An HE STA that successfully sets up a TWT agreement with another HE STA shall follow the rules defined in 10.46.1 (TWT overview) and 10.46.4 (Implicit TWT operation) except that all the additional rules defined in 26.8 (TWT operation) supersede all the respective rules defined in 10.46.1 (TWT overview) and 10.46.4 (Implicit TWT operation). A TWT or TWT SP that is set up under an implicit TWT agreement is an implicit TWT or implicit TWT SP, respectively (see 10.46.1 (TWT overview)). A TWT or TWT SP that is set up under a trigger-enabled TWT agreement is a trigger-enabled TWT or trigger-enabled TWT SP, respectively. The TWT responding STA of a trigger-enabled TWT agreement is an HE AP.

An example of individual TWT operation is shown in Figure 26-9 (Example of individual TWT operation(11ax)), where the AP is the TWT responding STA and STA 1 and STA 2 are the TWT requesting STAs.

In this example, STA 1 sends a TWT request to the TWT responding STA to setup a trigger-enabled TWT agreement. The TWT responding STA accepts the TWT agreement with STA 1 and confirms the acceptance in the TWT response sent to STA 1. Subsequently, the TWT responding STA sends an unsolicited TWT response to STA 2 to set up a trigger-enabled TWT agreement with STA 2. Both these TWT agreements are set up as announced TWTs. During the trigger-enabled TWT SP, the TWT responding STA sends a Basic Trigger frame to which the TWT requesting STAs indicate that they are awake during the TWT SP. STA 1 indicates that it is awake by sending a PS-Poll frame, and STA 2 indicates that it is awake by sending a QoS Null frame in response to the Basic Trigger frame. STA 1 and STA 2 receive their DL BUs in a subsequent exchange with the TWT responding STA and go to doze state outside of this TWT SP.

This is an unapproved IEEE Standards Draft, subject to change.

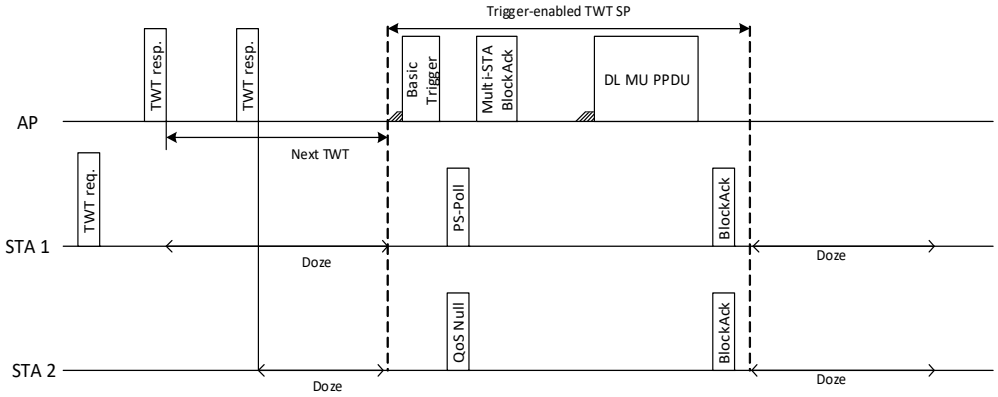

**Figure 26-9—Example of individual TWT operation(11ax)**

An HE STA may execute the individual TWT setup exchanges defined in Table 26-5 (TWT setup exchange for unsolicited TWT and recommended broadcast TWT switch (11ax)) in addition to the exchanges defined in 10.46 (Target wake time (TWT)). An HE STA that intends to set up an individual TWT shall set the Negotiation Type subfield to 0 as defined in 10.46 (Target wake time (TWT)) or as defined in Table 26-5 (TWT setup exchange for unsolicited TWT and recommended broadcast TWT switch (11ax)). The HE STA may respond to the TWT request with a TWT response that has the Negotiation Type subfield equal to 3 as indicated in Table 26-5 (TWT setup exchange for unsolicited TWT and recommended broadcast TWT switch (11ax)) to provide recommended broadcast TWT schedules for the requesting STA.

**Table 26-5—TWT setup exchange for unsolicited TWT and recommended broadcast TWT switch (11ax)**

| TWT Setup Command field in an initiating frame | TWT Setup Command field in a response frame | TWT condition after the completion of the exchange |
|---|---|---|
| Request TWT, Suggest TWT, or Demand TWT with Broadcast subfield = 0 | Accept TWT with Broadcast subfield = 1 | This response is not allowed. |
| Request TWT, Suggest TWT, or Demand TWT with Broadcast subfield = 0 | Dictate TWT with Broadcast subfield = 1 | No individual TWT agreement exists with the associated TWT Flow identifier. One or more broadcast TWT schedules exist that use the TWT parameters identified in the response frame including a Broadcast TWT ID. The broadcast TWT schedules are not necessarily newly created. The responding STA does(M118) not create any new individual TWT agreement with the requester at this time. The STA transmitting the initiating frame is not a member of the broadcast TWT; however, the STA (#161)may join any of the broadcast TWT schedules. |
| Accept TWT with Broadcast subfield set to 0 | No frame transmitted | The STA receiving this frame now has an individual TWT agreement with the transmitter of the frame where the parameters of the individual TWT agreement are identified by the initiating frame. |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 26-5—TWT setup exchange for unsolicited TWT and recommended broadcast TWT switch *(continued)*(11ax)**

| TWT Setup Command field in an initiating frame | TWT Setup Command field in a response frame | TWT condition after the completion of the exchange |
|---|---|---|
| Alternate TWT or Dictate TWT with Broadcast subfield = 0 | No frame transmitted | The STA receiving this frame is not, through the receipt of this frame, a member of the TWT identified by the initiating frame but can use the information provided to create a request to set up a TWT in a subsequent initiating frame that it transmits. |
| NOTE 1—The Negotiation Type subfield in the TWT element contained in these frames is 0 if the Broadcast subfield is 0 and is 3 if the Broadcast subfield is 1.<br>NOTE 2—The initiating frame and response frame settings not listed in the tables in 10.46 (Target wake time (TWT)) or 26.8 (TWT operation) are not allowed. The initiating frame is a TWT request if the TWT element carried in the frame has the TWT Request field set to 1; otherwise, it is a TWT response (see Table 9-347 (TWT Setup Command field values(11ax))). The response frame is a TWT response if the TWT element contained in the frame has the TWT Request field equal to 0. | | |

An HE STA that successfully sets up an individual TWT agreement and operates in PS mode may listen to Beacon frames, but is exempt from the requirements for receiving Beacon frames as defined in 11.2.3.1 (General). The HE STA follows the rules in 11.2.3 (Power management in a non-DMG infrastructure network) to receive group addressed frames.

NOTE 2—An HE AP sets the bit in the TIM element of the Beacon frame that corresponds to the AID of the TWT requesting STA to 1 to indicate the presence of available buffered BUs for the STA (see 11.2.3.7 (Receive operation for STAs in PS mode)).

NOTE 3—The TWT responding STA might inform the TWT requesting STA, if it supports TIM Broadcast, of any critical update (as defined in 11.2.3.14 (TIM Broadcast)) by sending a Management frame to the TWT requesting STA when the STA is in the awake state.

An HE STA may tear down an individual TWT agreement by sending a TWT Teardown frame with the Negotiation Type subfield set to 0. An HE STA may tear down all individual TWT agreements by sending a TWT Teardown frame with the Teardown All TWT field set to 1.

An HE AP may send an unsolicited TWT response with the Trigger subfield equal to 1 to a non-AP HE STA that has set the TWT Requester Support subfield to 1 in the HE Capabilities elements that it transmits to the AP. The TWT response shall have one of these values in the TWT Setup Command field: Accept TWT, Alternate TWT, or Dictate TWT. An unsolicited TWT response with TWT Setup Command field of Alternate TWT or Dictate TWT contains an advisory notification to the recipient of TWT parameters that are likely to be accepted by the AP if the recipient transmits a subsequent TWT request to the AP that includes those TWT parameters. An unsolicited TWT response with the TWT Setup Command field of Accept TWT creates a TWT agreement between the two STAs. A STA that receives an unsolicited TWT response with the TWT Setup Command field of Accept TWT may transmit a TWT Teardown frame to delete the unsolicited individual TWT agreement.

NOTE 4—The HE AP might send an unsolicited TWT response to a non-AP HE STA with a TWT Flow Identifier that corresponds to an existing TWT agreement. The unsolicited TWT response with TWT Setup Command field of Accept TWT (M118)indicates new TWT parameters that are different from the previously negotiated TWT parameters for that TWT agreement.

An HE STA shall not transmit BAT, TACK, or STACK frames, which are allowed in 10.46.2 (TWT acknowledgment procedure).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

A TWT requesting STA should not transmit frames to the TWT responding STA outside of negotiated TWT SPs and should not transmit frames that are not contained within HE TB PPDUs to the TWT responding STA within trigger-enabled TWT SPs.

NOTE 5—The TWT requesting STA decides which frames to transmit within or outside a TWT SP; and while it is recommended that the TWT requesting STA not transmit using EDCA within or outside TWT SPs, the TWT requesting STA might still do so. If the STA decides to transmit, then the STA might contend for access to the medium as defined in 10.23.2 (HCF contention based channel access (EDCA)) and in 26.2.7 (EDCA operation using MU EDCA parameters).

The TWT responding STA of a trigger-enabled TWT agreement shall schedule for transmission a Trigger frame for the TWT requesting STA, as described in 26.5.2 (UL MU operation), within each TWT SP for that TWT agreement, except that the Trigger frame may be replaced by a frame carrying a TRS Control subfield, provided that the frame is carried in a DL MU PPDU and the AP allocates enough resources in the HE TB PPDU for the STA to at least deliver its BSRs in response to the soliciting DL MU PPDU. The TWT responding STA should solicit buffer status reports from the TWT requesting STA at the start of the TWT SP following the procedure described in 26.5.5 (Buffer status report operation) or as described in 26.5.7 (NDP feedback report procedure). The TWT responding STA that intends to schedule for transmission additional Trigger frames during a trigger-enabled TWT SP shall set the More TF subfield in the Common Info field of the Trigger frame to 1 to indicate that it will schedule for transmission another Trigger frame within the same TWT SP. The TWT responding STA shall set the More TF subfield to 0 when the Trigger frame is the last scheduled Trigger frame of the TWT SP or when the Trigger frame is scheduled for transmission outside of a TWT SP.

NOTE 6—The TWT responding STA can cancel the transmission of a scheduled Trigger frame if the STA gains access to the wireless medium outside of the TWT SP. The TWT responding STA does not schedule for transmission a Trigger frame for the TWT requesting STA when the TWT agreement is not a trigger-enabled TWT agreement or when the TWT requesting STA has sent an OM Control subfield that has the UL MU Disable subfield equal to 1 (see 26.9 (Operating mode indication)).

NOTE 7—If the AP replaces the Trigger frame with a frame carrying a TRS Control field, then it is recommended that the AP allocate enough resources in subsequent Trigger frames sent during the TWT SP so that the STA can send as much as possible of the data reported in the BSR.

A TWT requesting STA transmits an HE TB PPDU as a response to a Trigger frame that identifies it and is sent during a trigger-enabled TWT SP (see 26.5.2 (UL MU operation)). A TWT requesting STA that is in PS mode and is awake shall include a PS-Poll frame or a U-APSD trigger frame in the HE TB PPDU if the TWT is an announced TWT, unless the STA has already transmitted a PS-Poll or U-APSD trigger frame or transmitted any other indication that the STA is in the awake state within that TWT SP or has, previous to the start of the TWT SP but after the end of the most recent TWT SP, indicated to the AP that it is currently in the awake state. The STA may include other frames in the HE TB PPDU when other rules do not prohibit their inclusion (see 26.5.2 (UL MU operation) and 9.7.3 (A-MPDU contents)).

NOTE 8–A Trigger frame identifies a TWT requesting STA if it is sent by the AP with which the STA is associated and the frame contains the 12 LSBs of the STA's AID in any of its User Info fields. The Trigger frame can have multiple recipients, each of which is identified by the presence of the 12 LSBs of the recipient's AID in any of its User Info fields (see 26.5.2 (UL MU operation)), and can have in the TA field the MAC address of the AP or the transmitted BSSID under the conditions defined in 26.5.2.2.4 (Allowed settings of the Trigger frame fields and TRS Control subfield).

NOTE 9—Other indications that the STA is in the awake state are the transmission of an HE TB feedback NDP in response to an NFRP Trigger frame (see 26.5.7 (NDP feedback report procedure)) or the transmission of a frame that indicates that the STA is in active mode (see 11.2.3.2 (Non-AP STA power management modes)).

A TWT responding STA that receives a PS-Poll frame or a U-APSD trigger frame or any other indication from a TWT requesting STA in PS mode, during or before an announced TWT SP but after the end of the most recent TWT SP, that the TWT requesting STA is in the awake state during the TWT SP shall follow the rules defined in 11.2.3.6 (AP operation), except that the TWT responding STA should deliver to the

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

TWT requesting STA as many buffered BUs as are available at the TWT responding STA, provided that the BU delivery does not exceed the duration of the TWT SP, the TWT requesting STA has indicated that it is in the awake state for that TWT SP, and the TWT requesting STA has not entered the doze state (see 26.8.4.2 (TWT Information frame exchange for individual TWT) and 26.8.5 (Power save operation during TWT SPs)).

NOTE 10—The indication that the TWT requesting STA is in the awake state for that TWT SP might be a PS-Poll, U-APSD trigger frame, or any frame for which an immediate response is solicited and that follows the rules in 11.2.3.2 (Non-AP STA power management modes) but the corresponding immediate response frame is not received by the TWT requesting STA. Other indications that the STA is in the awake state are the transmission of an HE TB feedback NDP in response to an NFRP Trigger frame (see 26.5.7 (NDP feedback report procedure)) or the transmission of a frame that indicates that the STA is in active mode (see 11.2.3.2 (Non-AP STA power management modes)).

A TWT responding STA that sends frames to a TWT requesting STA that is in PS mode during an unannounced TWT SP shall follow the rules defined in 11.2.3.6 (AP operation), except that the TWT responding STA should deliver to the TWT requesting STA as many buffered BUs as are available at the TWT responding STA, provided that the BU delivery does not exceed the duration of the TWT SP and the TWT requesting STA has not entered the doze state (see 26.8.4.2 (TWT Information frame exchange for individual TWT) and 26.8.5 (Power save operation during TWT SPs)).

NOTE 11—The TWT responding STA can deliver the buffered BUs in A-MPDUs sent under a block ack agreement if the TWT is an announced TWT and the TWT requesting STA is awake for that TWT SP, or if the TWT is an unannounced TWT (at the start of which the TWT requesting STA is assumed to already be awake). The buffered BUs can be delivered in multiple PPDUs transmitted within the TWT SP. The TWT responding STA can transmit frames to TWT requesting STA after the end of the TWT SP if the STA is in active mode.

A TWT responding STA may transmit to a TWT requesting STA that is in active mode at any time (see 11.2.3.2 (Non-AP STA power management modes)). A TWT responding STA may transmit to a TWT requesting STA that is in PS mode and awake outside of a TWT SP following the rules in 11.2.3.6 (AP operation).

### 26.8.3 Broadcast TWT operation

#### 26.8.3.1 General

A TWT scheduling AP is an HE AP with dot11TWTOptionActivated equal to true that sets the Broadcast TWT Support field in the HE Capabilities element it transmits to 1 and that follows the rules for TWT scheduling APs in 26.8.3.2 (Rules for TWT scheduling AP), for power save with UORA and TWT in 26.14.2 (Power save with UORA and TWT), and for periodic opportunistic power save (OPS) defined in 26.14.3 (Opportunistic power save).

A TWT scheduling AP includes a broadcast TWT element in the Beacon frame as described in 26.8.3.2 (Rules for TWT scheduling AP). An AP corresponding to a nontransmitted BSSID in a multiple BSSID set shall follow the rules in 11.1.3.8.4 (Inheritance of element values(11ax)).

A TWT scheduling AP may include a TWT element with the Negotiation Type subfield equal to 3 in a (Re)Association Response frame or in a TWT setup frame to assign the recipient STA to a broadcast TWT schedule without having received a request from the STA to become a member of the broadcast TWT schedule if that STA has set the Broadcast TWT Support field of HE Capabilities element it transmits to 1.

A non-AP HE STA shall obtain TWT parameter values from the most recently received TWT element carried in a Beacon, Probe Response, or (Re)Association Response frame from its associated AP, unless the non-AP HE STA is associated with an AP corresponding to a nontransmitted BSSID of a multiple BSSID set. In this case, it shall follow the rules in 11.1.3.8.4 (Inheritance of element values(11ax)) to determine the TWT parameter values.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

(#7083)The non-AP HE STA determines the start time of subsequent TWTs of a TWT parameter set from the Target Wake Time field of the TWT parameter set contained in the received TWT element, (#8162)TSF timer, and the TWT wake interval (see 26.8.3.2 (Rules for TWT scheduling AP)).

NOTE—The Target Wake Time field carries only B10:B25 of the relevant target TSF time, and changes in B26:B63 of the corresponding TSF timer are not explicitly communicated to the receiving STA. Hence, the STA must consider when setting up a broadcast TWT schedule the rollover of B26:B63 of the target TSF time that might happen at the receiving STA during the lifetime of the broadcast TWT schedule (i.e., resulting from the Target Wake Time field and the Broadcast TWT Persistence field).(#7083)

A TWT scheduled STA is a non-AP HE STA that sets the Broadcast TWT Support field in the HE Capabilities element it transmits to 1 and receives a broadcast TWT element transmitted by an HE AP that is a TWT scheduling AP.

A TWT scheduled STA follows the schedule provided by the TWT scheduling AP as described in 26.8.3.3 (Rules for TWT scheduled STA) and, in addition, the rules in 26.14.2 (Power save with UORA and TWT) if the STA supports the UORA procedure and the rules in 26.14.3 (Opportunistic power save) if the STA supports OPS operation. A TWT scheduled STA can negotiate the wake TBTT and wake interval for Beacon frames it intends to receive as described in 26.8.6 (Negotiation of wake TBTT and wake interval) or can join a particular broadcast TWT as described below in this subclause.

An example of broadcast TWT operation is shown in Figure 26-10 (Example of broadcast TWT operation with optional TBTT negotiation(11ax)), where the AP is the TWT scheduling AP and STA 1 and STA 2 are the TWT scheduled STAs.

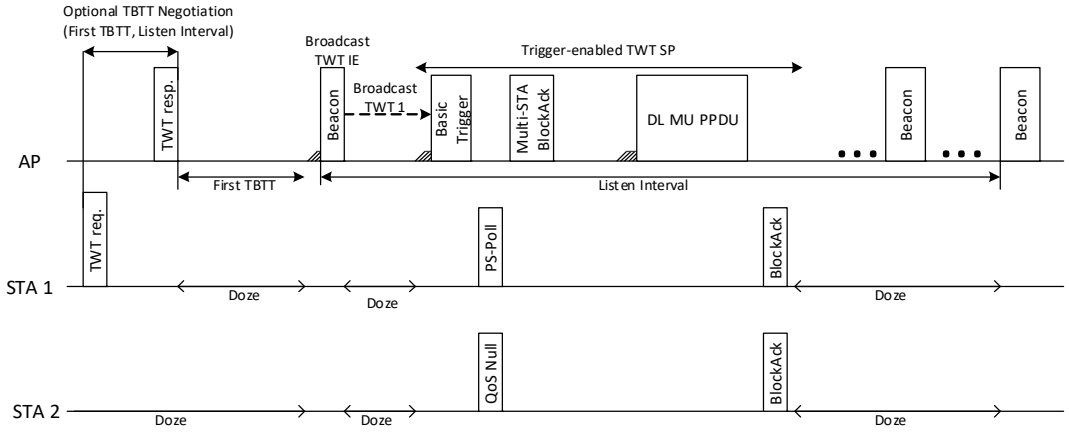

**Figure 26-10—Example of broadcast TWT operation with optional TBTT negotiation(11ax)**

The TWT scheduling AP includes a broadcast TWT element in the Beacon frame that indicates a broadcast TWT SP during which the AP intends to send Trigger frames, or DL BUs to the TWT scheduled STAs. STA 1 and STA 2 wake to receive the Beacon frame to determine the broadcast TWT. During the trigger-enabled TWT SP, the AP sends a Basic Trigger frame to which STA 1 and STA 2 indicate that they are awake during the TWT SP. STA 1 indicates that it is awake by sending a PS-Poll, and STA 2 indicates that it is awake by sending a QoS Null frame in response to the Basic Trigger frame. STA 1 and STA 2 receive their DL BUs in a subsequent exchange with the AP and go to doze state outside of this TWT SP.

Each broadcast TWT is uniquely identified by the <broadcast TWT ID, MAC address> tuple, where the broadcast TWT ID is the value of the Broadcast TWT ID subfield and is greater than 0 and the MAC address is the address of the TWT scheduling AP.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Broadcast TWT schedules are advertised by the TWT scheduling AP in frames that carry TWT elements with the Negotiation Type subfield set to 2 as described in 26.8.3.2 (Rules for TWT scheduling AP). Broadcast TWT schedules that are intended for member TWT scheduled STAs are identified by a Broadcast TWT ID subfield that is greater than 0, and broadcast TWT schedules that are intended for all TWT scheduled STAs are identified by a Broadcast TWT ID subfield equal to 0.

Negotiations to become a member of or terminate membership in a broadcast TWT, identified by a Broadcast TWT ID subfield greater than 0, are performed with an exchange of frames that carry TWT elements with the Negotiation Type subfield set to 3 as described in 26.8.3.3 (Rules for TWT scheduled STA).

The TWT scheduling AP may send an unsolicited TWT response with the Trigger subfield set to 1 to a non-AP HE STA that has set the Broadcast TWT Support subfield to 1 in the HE Capabilities elements that it transmits to the AP. The TWT response shall indicate one of the following values in the TWT Setup Command field: Accept TWT, Alternate TWT, or Dictate TWT. An unsolicited TWT response with TWT Setup Command field indicating Alternate TWT or Dictate TWT contains an advisory notification to the recipient of TWT parameters that are likely to be accepted by the AP if the recipient transmits a subsequent TWT request to the AP that includes those TWT parameters. An unsolicited TWT response with a TWT Setup Command field that indicates Accept TWT allocates a broadcast TWT schedule to the receiving STA. A STA that receives an unsolicited TWT response with a TWT Setup Command field that indicates Accept TWT may transmit a TWT Teardown frame or a TWT response with TWT Setup Command field indicating Reject TWT to withdraw from the unsolicited broadcast TWT schedule.

### 26.8.3.2 Rules for TWT scheduling AP

A TWT scheduling AP may include a broadcast TWT element in a Beacon frame that is scheduled at a TBTT (see 11.1.3.2 (Beacon generation in non-DMG infrastructure networks)). The TWT scheduling AP shall include one or more TWT parameter sets in the TWT element, and each TWT parameter set may indicate a periodic occurrence of TWTs. The TWT scheduling AP shall set the Last Broadcast Parameter Set subfield to 0 in each TWT parameter set, except for the last (or only) TWT parameter set of the TWT element that shall have the Last Broadcast Parameter Set subfield set to 1. The TWT scheduling AP shall set (#4010)the Negotiation Type subfield to 2 and may set the Responder PM Mode subfield to 0 in the TWT element (see 10.46.7 (TWT Sleep setup)). (#4010)The TWT scheduling AP may set the NDP Paging Indicator/Unavailability Mode subfield to 0 or 1 subject to the additional rules defined in this subclause if the Broadcast TWT ID subfield is equal to 0 and the Responder PM Mode subfield is equal to 1, otherwise, the NDP Paging Indicator/Unavailability Mode subfield is reserved for a TWT scheduling AP. Each TWT parameter set specifies the TWT parameters of a specific broadcast TWT that are valid within a broadcast TWT SP. Each specific broadcast TWT is identified as indicated in 26.8.3.1 (General). Individual STAs may have membership in broadcast TWTs as a result of negotiation with a TWT scheduling AP as described in 26.8.3.1 (General).

The TWT scheduling AP sets the TWT parameters of each TWT parameter set as described below in this subclause.

The TWT scheduling AP shall set the TWT Request subfield to 0 and the TWT Setup Command subfield as defined in Table 26-6 (Broadcast TWT announcements(11ax)) and shall include the broadcast TWT element in the Beacon frames for as long as there is at least one active broadcast TWT schedule. Broadcast TWT announcements are broadcast TWT schedules advertised in broadcast TWT elements contained in broadcast Management frames.

This is an unapproved IEEE Standards Draft, subject to change.

**Table 26-6—Broadcast TWT announcements(11ax)**

| TWT Setup Command field in an initiating frame | TWT Setup Command field in a response frame | Condition after the completion of the exchange |
|---|---|---|
| Accept TWT | No frame transmitted | Only an HE AP is permitted to transmit this sequence.<br><br>TWT scheduled STAs that receive this frame use the provided TWT parameters to determine the broadcast TWT schedule.<br><br>The broadcast TWT schedule is identified by the broadcast TWT ID and the TA of the initiating frame. |
| Alternate TWT | No frame transmitted | When transmitted by a TWT scheduling AP, some of the parameters of the broadcast TWT schedule identified by the broadcast TWT ID and the TA of the initiating frame will change at the TBTT that occurs after the Broadcast TWT Persistence field of that broadcast TWT parameter set reaches 0. The new parameters will be present in the first Beacon frame transmitted by the TWT scheduling AP at the TBTT that has a broadcast TWT parameter set with the same broadcast TWT ID and same TA, but with the TWT command value set to Accept TWT. |
| Reject TWT | No frame transmitted | When transmitted by a TWT scheduling AP, the broadcast TWT schedule identified by the broadcast TWT ID and the TA of the initiating frame will be terminated at the TBTT that occurs after the Broadcast TWT Persistence field of that broadcast TWT parameter reaches 0. The termination occurs at the TBTT at which a Beacon frame is transmitted by the TWT scheduling AP that does not include a broadcast TWT parameter set with the same broadcast TWT ID and same TA as the initiating frame. |

NOTE 1—The Negotiation Type subfield of the TWT element contained in these frames is 2.

NOTE 2—The initiating frame and response frame settings not listed in the tables in 10.46 (Target wake time (TWT)) or 26.8 (TWT operation) are not allowed. The initiating frame is a TWT response.

NOTE 3—MMPDUs that contain a broadcast TWT element generated by a TWT scheduling AP can be broadcast Probe Response, FILS Discovery, and Beacon frames. The TWT element has the TWT Request field equal to 0 and the Negotiation Type subfield equal to 2. The TWT scheduling AP can include a TWT parameter set with Broadcast TWT ID value 0 to indicate a TWT allocated for all STAs, and Broadcast TWT ID greater than 0 to indicate a TWT intended to TWT scheduled STAs that are members of that broadcast TWT.

The TWT scheduling AP shall set the Broadcast TWT Persistence subfield for each broadcast TWT to the number of TBTTs for which the Broadcast TWT schedule will be in existence, counting forward from the current TBTT. The AP may change the value of the Broadcast TWT Persistence subfield for any Broadcast TWT within any transmitted TWT element. If the AP reduces the value of the subfield, it shall not reduce the value by more than one as compared to the value transmitted during the immediately preceding beacon interval. If the AP increases the value of the Broadcast TWT Persistence subfield, it may increase the value by any amount as compared to the value transmitted during the immediately preceding TBTT.

A TWT scheduling AP that sets the TWT Setup Command subfield to Reject TWT shall indicate the TBTT at which the periodic broadcast TWT will be terminated by setting the value of the Broadcast TWT Persistence subfield to indicate the number of TBTTs that remain until the broadcast TWT schedule is terminated. The broadcast TWT schedule terminates at the next TBTT that follows the TBTT at which the TWT scheduling AP transmits the broadcast TWT element with Broadcast TWT Persistence subfield for that broadcast TWT schedule equal to 0.A TWT scheduling AP may terminate the membership of a TWT

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

scheduled STA in all broadcast TWTs by transmitting a TWT Teardown frame with the Teardown All TWT field set to 1.

A TWT scheduling AP that sets the TWT Setup Command subfield to Alternate TWT shall indicate the TBTT at which the periodic broadcast TWT parameter set will be modified by setting the Broadcast TWT Persistence subfield to indicate the number of TBTTs that remain until the broadcast TWT schedule is modified. The broadcast TWT schedule will be modified at the next TBTT that follows the TBTT at which the TWT scheduling AP transmits the broadcast TWT element with Broadcast TWT Persistence subfield for that broadcast TWT schedule equal to 0. The AP shall include in the broadcast TWT element the future broadcast TWT parameter set that will take effect at that TBTT. The future broadcast TWT parameter set shall have the same values in the TWT Setup Command and Broadcast TWT ID subfields as the current broadcast TWT parameter set that is being modified and switch the TWT Setup Command subfield from Alternate TWT to Accept TWT at that TBTT. The future broadcast TWT parameter set shall be in a Broadcast TWT Parameter Set field that is located after the Broadcast TWT Parameter Set field that contains the current broadcast TWT parameter set.

NOTE 1—TWT scheduled STAs follow the broadcast TWT parameters that are included in the current broadcast TWT parameter set and switch to following the broadcast TWT parameters in the future broadcast TWT parameter set only if the TWT Setup Command field is equal to Accept TWT in the Broadcast TWT Parameter Set field that contains the future broadcast TWT parameter set.

A TWT scheduling AP should indicate Alternate TWT or Reject TWT in the TWT Setup Command field of the broadcast TWT element for as many TBTTs as needed to exceed the longest interval any STA is expected to not receive Beacon frames either when the TWT parameters of a periodic TWT will change, or when the periodic TWT specified by that TWT parameter set will be terminated.

The TWT scheduling AP shall set the Trigger field to 1 to indicate a trigger-enabled TWT. Otherwise, it shall set the Trigger field to 0 (i.e., the TWT is not a trigger-enabled TWT). The AP is not expected to schedule for transmission Trigger frames during a non-trigger-enabled TWT SP and is expected to schedule Trigger frames during a trigger-enabled TWT SP as described below in this subclause.

The TWT scheduling AP shall schedule for transmission of a Trigger frame addressed to one or more TWT scheduled STAs during a trigger-enabled TWT SP, except that the Trigger frame may be replaced by a frame carrying a TRS Control subfield, provided that the frame is carried in a DL MU PPDU and the AP allocates enough resources in the HE TB PPDU for the STA to at least deliver its BSRs in response to the soliciting DL MU PPDU. A TWT scheduling AP should not include the 12 LSBs of the STA's AID in a User Info field of a Trigger frame transmitted within a broadcast TWT SP, unless the STA is in the awake state, has established membership in the broadcast TWT with that Broadcast TWT ID, or has indicated to receive the Beacon frame preceding the beacon interval that contains this TWT SP (see 26.8.6 (Negotiation of wake TBTT and wake interval)). A TWT scheduling AP may cancel the transmission of a Trigger frame during a trigger-enabled TWT SP if the AP does not expect any member TWT scheduled STAs to be in the awake state at the time of transmitting the Trigger frame.(#2202)

The TWT scheduling AP that schedules for transmission additional Trigger frames during a trigger-enabled TWT SP shall set the More TF subfield in the Common Info field of the Trigger frame to 1 to indicate that it will schedule for transmission another Trigger frame within the same TWT SP. The TWT scheduling AP shall set the More TF subfield to 0 if the Trigger frame is the last scheduled Trigger frame of the TWT SP or if the Trigger frame is scheduled for transmission outside of a trigger-enabled TWT SP. The TWT scheduling AP should poll as many STAs as possible among TWT scheduled STAs that are members of that nonzero Broadcast TWT ID so that the STAs can perform a frame exchange with the TWT scheduling AP during that TWT SP.

NOTE 2—The TWT scheduling AP does not intend to schedule for transmission of a Trigger frame for the TWT scheduled STA when the broadcast TWT is not a trigger-enabled TWT or when the TWT scheduled STA has sent an OM Control subfield that has the UL MU disable bit equal to 1 (see 26.9 (Operating mode indication)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

NOTE 3—The TWT scheduling AP can cancel the transmission of a scheduled Trigger frame if the AP gains access to the wireless medium outside of the TWT SP.

NOTE 4—If the AP replaces the Trigger frame with a frame carrying a TRS Control field, then it is recommended that the AP allocate enough resources in subsequent Trigger frames sent during the TWT SP so that the STA can send as much as possible of the data reported in the BSR.

The TWT scheduling AP shall set the Flow Type field to 1 to indicate an unannounced TWT. Otherwise, it shall set the Flow Type field to 0 to indicate an announced TWT.

The TWT scheduling AP should schedule delivery of individually addressed DL BUs during unannounced TWT SPs with nonzero Broadcast TWT ID subfield.

The TWT scheduling AP shall set the Broadcast TWT Recommendation subfield according to Table 9-348 (Broadcast TWT Recommendation field for a broadcast TWT element(11ax)). The TWT scheduling AP shall set the Trigger field to 1 if the Broadcast TWT Recommendation subfield is 1 or 2 and may set the Trigger field to any value if the Broadcast TWT Recommendation subfield is 0 or 3.

A TWT scheduling AP that has advertised a broadcast TWT with a Broadcast TWT ID equal to 0 shall schedule the following:

— The delivery of group addressed DL BUs during the broadcast TWT SPs located within the beacon interval that follows the DTIM beacon(#3309) if the TWT parameter set indicated non-trigger enabled unannounced TWT SP and had the Broadcast TWT Recommendation subfield equal to 0.

— The transmission of a Trigger frame that does not contain an RA-RU during the broadcast TWT SPs if the TWT parameter set indicated trigger-enabled announced TWT SP and had the Broadcast TWT Recommendation subfield equal to 1. The Trigger frame shall contain at least one User Info field addressed to a TWT scheduled STA whose TIM bit in the Beacon frame is 1 and that is not a member of any nonzero broadcast TWT during this beacon interval.

— The transmission of a Trigger frame that contains at least one RA-RU (see 26.5.4 (UL OFDMA-based random access (UORA))) during the broadcast TWT SPs if the TWT parameter set indicated a trigger enabled announced TWT SP and had the Broadcast TWT Recommendation subfield set to 2 (see 26.14.2 (Power save with UORA and TWT)).

— The transmission of a TIM frame or FILS Discovery frame at the start of a broadcast TWT SP if the TWT parameter set indicated a non-trigger enabled unannounced TWT SP and had the Broadcast TWT Recommendation subfield set to 3 (see 26.14.3.2 (AP operation for opportunistic power save)).

(#4010)If a TWT scheduling AP has advertised a TWT element that carries one or more Broadcast TWT Parameter Set fields with a Broadcast TWT ID subfield equal to 0 and a Responder PM Mode subfield equal to 1, then:

— If the NDP Paging Indicator/Unavailability Mode subfield is set to 0, the AP may be unavailable outside of these broadcast TWT SPs, except within any other TWT SP that is setup with the AP or advertised by the AP.

— If the NDP Paging Indicator/Unavailability Mode subfield is set to 1, the AP may be unavailable outside of these broadcast TWT SPs, even if that time falls within any other TWT SP that is setup with the AP or advertised by the AP.

NOTE 5—An AP that is unavailable is not capable of receiving PPDUs, following the definition in 11.2.1 (General).(#4010)

A Trigger frame transmitted during a broadcast TWT SP whose TWT parameter set has the Broadcast TWT Recommendation subfield equal to 0 or 3 may contain zero or more RA-RUs (see 26.5.4 (UL OFDMA-

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

based random access (UORA))). A Trigger frame transmitted during a broadcast TWT SP whose TWT parameter set has the Broadcast TWT Recommendation subfield equal to 1 shall contain no RA-RU.

(#7083)The TWT scheduling AP shall set the Target Wake Time field to (#2360)$TSF_{Ref}$ [10:25], where $TSF_{Ref}$ corresponds a TWT scheduled for this TWT parameter set that will occur after the AP has queued for transmission the frame that contains the TWT element. The TSF timer at which that TWT is scheduled has bits 0 to 9 equal to 0 and bits 26 to 63 equal to the same value as the respective bits in the (#8162)current value of the TSF timer.

The TWT scheduling AP shall include a nonzero value for the TWT wake interval in the TWT Wake Interval Exponent and TWT Wake Interval Mantissa fields for a periodic TWT and a zero value for an aperiodic TWT. The TWT wake interval shall be a multiple of 1 TU.(#4413)

The TWT parameters are valid for each successive TWT of a periodic TWT and for the only TWT of an aperiodic TWT.

The TWT scheduling AP shall include a unique value in the Broadcast TWT ID subfield for each Broadcast TWT to allow identification of each Broadcast TWT, unless the TWT Setup Command field is Alternate TWT or the Broadcast TWT ID subfield is zero.

NOTE 6—The broadcast TWT element contains two Broadcast TWT Parameter Set fields with the same Broadcast TWT ID subfield value if the TWT Setup Command field indicates Alternate TWT in one of the Broadcast TWT Parameter Set fields. The broadcast TWT element might contain multiple Broadcast TWT Parameter Set fields with the Broadcast TWT ID subfield equal to 0.

A TWT scheduling AP that receives a PS-Poll or a U-APSD trigger frame or any other indication from a TWT scheduled STA in PS mode, during or before a specific announced TWT SP but after the end of the most recent TWT SP preceding the specific TWT SP (if any), that the TWT scheduled STA is in the awake state during the TWT SP shall follow the rules defined in 11.2.3.6 (AP operation), except that the AP should deliver to the TWT scheduled STA as many buffered BUs as are available at the AP, provided that the BU delivery does not exceed the duration of the TWT SP, the TWT scheduled STA has indicated that it is in the awake state for that TWT SP, and the TWT scheduled STA has not entered the doze state (see 26.8.4.3 (TWT Information frame exchange for broadcast TWT) and 26.8.5 (Power save operation during TWT SPs)).

NOTE 7—The indication that the TWT scheduled STA is in the awake state for that TWT SP might be a PS-Poll, U-APSD trigger frame, or any frame for which an immediate response is solicited and that follows the rules in 11.2.3.2 (Non-AP STA power management modes) but the corresponding immediate response frame is not received by the TWT scheduled STA. Other indications that the STA is in the awake state are the transmission of an HE TB feedback NDP in response to an NFRP Trigger frame (see 26.5.7 (NDP feedback report procedure)) or the transmission of a frame that indicates that the STA is in active mode (see 11.2.3.2 (Non-AP STA power management modes)).

A TWT scheduling AP that sends frames to a TWT scheduled STA that is in PS mode during an unannounced TWT SP shall follow the rules defined in 11.2.3.6 (AP operation), except that the AP should deliver to the TWT scheduled STA as many buffered BUs as available at the AP, provided that the BU delivery does not exceed the duration of the TWT SP and the TWT scheduled STA has not entered the doze state (see 26.8.4.3 (TWT Information frame exchange for broadcast TWT) and 26.8.5 (Power save operation during TWT SPs)).

NOTE 8—The TWT scheduling AP can deliver the buffered BUs in A-MPDUs sent under a block ack agreement(#3741) if the TWT is an announced TWT and the TWT scheduled STA is awake for that TWT SP or if the TWT is an unannounced TWT (at the start of which the TWT scheduled STA is assumed to already be awake). The buffered BUs can be delivered in multiple PPDUs transmitted within the TWT SP. The TWT scheduling AP can exceed the duration of the TWT SP if the TWT scheduled STA is in active mode.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

A TWT scheduling AP may transmit to a TWT scheduled STA that is in active mode at any time (see 11.2.3.2 (Non-AP STA power management modes)). A TWT scheduling AP may transmit to a TWT scheduled STA that is in PS mode and awake outside of a TWT SP following the rules in 11.2.3.6 (AP operation).

A TWT scheduling AP that receives a TWT element with the TWT Request field equal to 1, the Negotiation Type subfield equal to 3, and the TWT Setup Command field set to Suggest or Demand may respond with a frame containing a TWT element as shown in Table 26-7 (Broadcast TWT membership exchanges(11ax)) (in 26.8.3.3 (Rules for TWT scheduled STA)).

A TWT scheduling AP that receives a TWT element with the TWT Request field equal to 1, the Negotiation Type subfield equal to 3, and the TWT Setup Command field set to Reject shall delete the membership of the STA corresponding to the TA of the MMPDU that contained the TWT element from the broadcast TWT schedule that has the Broadcast TWT ID value that is equal to the value of the Broadcast TWT ID field of the TWT element.

A TWT scheduling AP may transmit a broadcast TWT announcement at any time. Valid broadcast TWT announcements are described in Table 26-6 (Broadcast TWT announcements(11ax)).

### 26.8.3.3 Rules for TWT scheduled STA

A TWT scheduled STA that receives a broadcast TWT element in a Beacon frame shall follow the rules defined in this subclause to interact with the TWT scheduling AP.

A TWT scheduled STA should not transmit frames to the TWT scheduling AP outside of broadcast TWT SPs and should not transmit frames that are not contained within HE TB PPDUs to the TWT scheduling AP within trigger-enabled broadcast TWT SPs, except that the STA can transmit frames within negotiated individual TWT SPs as defined in 26.8.2 (Individual TWT agreements).

NOTE 1—The TWT scheduled STA decides which frames to transmit within or outside a TWT SP; and while it is recommended that the TWT scheduled STA not transmit using EDCA within or outside TWT SPs, the TWT scheduled STA might still do so. If the STA decides to transmit, then the STA might contend for accessing the medium as defined in 10.23.2 (HCF contention based channel access (EDCA)) and in 26.2.7 (EDCA operation using MU EDCA parameters).

A TWT scheduled STA may request to become a member of a broadcast TWT by transmitting a frame to its associated AP that contains a TWT element with the Negotiation Type subfield set to 3 and the TWT Setup Command field set to Request TWT, Suggest TWT, or Demand TWT. The TWT Parameter set indicates the Broadcast TWT ID of the broadcast TWT that the STA is requesting to join. See Table 26-7 (Broadcast TWT membership exchanges(11ax)).

A TWT scheduled STA may terminate membership in a broadcast TWT by transmitting a frame to its associated AP that contains a TWT element with the Negotiation Type subfield set to 3 and the TWT Setup Command field set to Reject TWT or by transmitting a TWT Teardown frame that has the Negotiation Type subfield set to 3. A TWT scheduled STA may terminate membership in all broadcast TWTs by transmitting a TWT Teardown frame with the Teardown All TWT field set to 1.

A TWT scheduled STA that receives a TWT element with the TWT Request field equal to 0, the Negotiation Type subfield equal to 3, and the TWT Setup Command field indicating Accept TWT is a member of the broadcast TWT identified by the <broadcast TWT ID, MAC address> tuple, where the broadcast TWT ID is the value of the Broadcast TWT ID subfield in the TWT element and the MAC address that is the TA of the MMPDU that contained the TWT element is equal to the MAC address of the AP with which the STA is associated, regardless of whether the TWT scheduled STA had previously transmitted a corresponding TWT element to the AP with the TWT Setup Command field indicating Request TWT, Suggest TWT, or Demand TWT.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Valid broadcast TWT membership exchanges are described in Table 26-7 (Broadcast TWT membership exchanges(11ax)).

**Table 26-7—Broadcast TWT membership exchanges(11ax)**

| TWT Setup Command field in an initiating frame | TWT Setup Command field in a response frame | Condition after the completion of the exchange |
|---|---|---|
| Demand TWT | Accept TWT | A broadcast TWT schedule exists or has been created with the TWT parameters indicated in the initiating frame and repeated in the response frame.<br><br>The TWT scheduled STA transmitting the initiating frame is a member of the Broadcast TWT schedule identified by the Broadcast TWT ID and the TA of the response frame. |
| Request TWT or Suggest TWT | Accept TWT | A broadcast TWT schedule exists or has been created with the TWT parameters indicated in the response frame.<br><br>The TWT scheduled STA transmitting the initiating frame is a member of the broadcast TWT schedule identified by the broadcast TWT ID and the TA of the response frame. |
| Suggest TWT or Demand TWT | Alternate TWT | No new broadcast TWT schedule has been created with the TWT parameters indicated in the initiating frame.<br><br>The TWT scheduling AP is offering an alternative set of parameters to those indicated in the initiating frame as a means of negotiating TWT parameters with the TWT scheduled STA.<br><br>The TWT scheduled STA can send a new request with any set of TWT parameters, and the TWT scheduling AP might create a new broadcast TWT schedule using the parameters indicated in the response frame. |
| Suggest TWT or Demand TWT | Dictate TWT | A broadcast TWT schedule either is created or already exists and is using the TWT parameters identified in the response frame, including a broadcast TWT ID.<br><br>The TWT scheduling AP will not create any new broadcast TWT schedule with the TWT scheduled STA at this time.<br><br>The TWT scheduled STA transmitting the initiating frame is not a member of the broadcast TWT schedule identified by the broadcast TWT ID and the TA of the response frame.<br><br>The TWT scheduled STA can send a new request, but will receive an Accept TWT only if it uses the dictated TWT parameters. |
| Request TWT, Suggest TWT, or Demand TWT | Reject TWT | The TWT scheduled STA transmitting the initiating frame is a not a member of a broadcast TWT identified by the broadcast TWT ID and the TA of the response frame, if such a broadcast TWT exists.<br><br>The TWT scheduling AP will not accept any new request from the TWT scheduled STA to join or create a broadcast TWT at this time. |

**Table 26-7—Broadcast TWT membership exchanges(11ax) *(continued)***

| TWT Setup Command field in an initiating frame | TWT Setup Command field in a response frame | Condition after the completion of the exchange |
|---|---|---|
| Accept TWT | No frame transmitted | Not permitted to be transmitted by a TWT scheduled STA.<br><br>When transmitted by a TWT scheduling AP, the recipient STA's membership in the broadcast TWT schedule identified by the broadcast TWT ID and the TA of the initiating frame is established. |
| Alternate TWT or Dictate TWT | No frame transmitted | Not permitted to be transmitted by a TWT scheduled STA.<br><br>When transmitted by a TWT scheduling AP, the TWT scheduled STA receiving this frame is not, through the receipt of this frame, a member of the broadcast TWT identified by the initiating frame.<br><br>The TWT scheduled STA can use the information provided to create a request to join a TWT in a subsequent initiating frame that it transmits. |
| Reject TWT | No frame transmitted | When transmitted by a TWT scheduled STA, the transmitting STA's membership in the broadcast TWT schedule identified by the broadcast TWT ID and the RA of the initiating frame is terminated.<br><br>When transmitted by a TWT scheduling AP, the receiving STA's membership in the broadcast TWT schedule identified by the broadcast TWT ID and the TA of the initiating frame is terminated. |

NOTE 1—The Negotiation Type subfield of the TWT element contained in these frames is 3.

NOTE 2—The initiating frame and response frame settings not listed in the tables in 10.46 (Target wake time (TWT)) or 26.8 (TWT operation) are not allowed. The initiating frame is a TWT request if the TWT element contained in the frame has the TWT Request field equal to 1 (see Table 9-347 (TWT Setup Command field values(11ax))); otherwise, it is a TWT response. The response frame is a TWT response.

NOTE 3—In addition to these exchanges, the TWT scheduling AP might respond to an initiating frame that solicits membership in a broadcast TWT schedule with an indication or solicitation of the establishment of an individual TWT agreement.

NOTE 4—MMPDUs that contain a broadcast TWT element generated by a TWT scheduled STA can be (Re)Association Request frames and can be TWT Setup frames with TWT Request field equal to 1. The TWT element has the Negotiation Type subfield equal to 3 and the Broadcast TWT ID(s) that the STA intends to join or withdraw. MMPDUs that contain a broadcast TWT element generated by a TWT scheduled AP can be (Re)Association Response frames and can be TWT Setup frames with TWT Request field equal to 0. The TWT element has the Negotiation Type subfield equal to 3 and the Broadcast TWT ID(s) to which the STA is assigned or from which the STA is withdrawn.

A TWT scheduled STA that is in PS mode may enter the doze state after receiving a Beacon frame with a TWT element indicating the existence of a broadcast TWT and shall be in the awake state at (#1034)specific broadcast TWT start times for which the STA has indicated it will be awake by any of the following means:

— Establishing a membership for the unannounced broadcast TWT with the applicable broadcast TWT IDs, in which case the specific broadcast TWTs are the unannounced broadcast TWTs.(#1034)

— Negotiating a wake TBTT and wake interval between Beacon frames that the STA receives, as defined in 26.8.6 (Negotiation of wake TBTT and wake interval), in which case the specific

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

broadcast TWTs are those that occur during the beacon interval, and the Beacon frame that is sent at the start of that beacon interval and that had the TIM bit corresponding to that STA equal to 1.(#1034)

— Having sent a PS-Poll or U-APSD trigger frame during the beacon interval, in which case the specific broadcast TWT is the first broadcast TWT that occurs during that beacon interval and either during or after sending that frame.(#1034)

— Having sent another indication that it is in the awake state during that beacon interval, in which case the specific broadcast TWT is the first broadcast TWT that occurs during that beacon interval and either during or after sending that indication.(#1034)

NOTE 2—Other indications that the STA is in the awake state are the transmission of an HE TB feedback NDP in response to an NFRP Trigger frame (see 26.5.7 (NDP feedback report procedure)) or the transmission of a frame that indicates that the STA is in active mode (see 11.2.3.2 (Non-AP STA power management modes)).

NOTE 3—The STA might indicate that it will not be awake at certain broadcast TWT start times by sending a TWT Information frame. The AP might indicate to a STA that it need not be awake at certain broadcast TWT start times by sending a TWT information frame (see 26.8.4 (Use of TWT Information frames)).

A TWT scheduled STA is not required to be in the awake state at broadcast TWT SP start times corresponding to the broadcast TWT that has the broadcast TWT ID value of 0.

A TWT scheduled STA that did not receive a Beacon frame at a TBTT shall act as if it had received the expected Beacon frame containing a TWT element for a broadcast TWT if the missed beacon corresponds to a TBTT that is within the next *n* TBTTs beyond the most recently received Beacon frame that included a TWT element for that broadcast TWT, where *n* is equal to 1 plus the value obtained from the Broadcast TWT Persistence subfield of the corresponding Broadcast TWT, except that *n* is infinite if the Broadcast TWT Persistence subfield is 255.

A TWT scheduled STA transmits an HE TB PPDU as a response to a Trigger frame that is addressed to it and is sent during a trigger-enabled TWT SP (see 26.5.2 (UL MU operation)). A TWT scheduled STA that is in PS mode and is awake during an announced TWT SP shall include a PS-Poll frame or a U-APSD trigger frame in the HE TB PPDU if it intends to solicit buffered BUs from the TWT scheduling AP (see 11.2.3.7 (Receive operation for STAs in PS mode)), unless the STA has already transmitted within that TWT SP a PS-Poll or U-APSD trigger frame, or has transmitted any other indication that the STA is in the awake state within that TWT SP, or has, previous to the start of the TWT SP but after the end of the most recent TWT SP, indicated to the AP that it is currently in the awake state. A TWT scheduled STA that is in PS mode shall transition to the awake state at the start of an unannounced TWT SP of which it is a member. The STA may include other frames in the HE TB PPDU when other rules do not prohibit their inclusion (see 26.5.2 (UL MU operation) and 9.7.3 (A-MPDU contents)).

NOTE 4—A TWT scheduling AP sets the bit in the TIM element of the Beacon frame that corresponds to the AID of the TWT scheduled STA to 1 to indicate that it expects the TWT scheduled STA to solicit available buffered BUs (see 11.2.3.7 (Receive operation for STAs in PS mode)).

NOTE 5—Other indications that the STA is in the awake state are the transmission of an HE TB feedback NDP in response to an NFRP Trigger frame (see 26.5.7 (NDP feedback report procedure)) or the transmission of a frame that indicates that the STA is in active mode (see 11.2.3.2 (Non-AP STA power management modes)).

A TWT scheduled STA should not send frames that do not satisfy the Broadcast TWT Recommendation subfield recommendations in Table 9-348 (Broadcast TWT Recommendation field for a broadcast TWT element(11ax)) during the corresponding TWT SP(s). Frames sent as a response to a Trigger frame are subject to further restrictions as defined in 26.5.2 (UL MU operation) and 9.7.3 (A-MPDU contents).

## 26.8.4 Use of TWT Information frames

### 26.8.4.1 General

An HE STA may transmit a TWT Information frame to its peer STA during an individual TWT agreement, during broadcast TWT schedule, or at any time as defined in 26.8.4.2 (TWT Information frame exchange for individual TWT), 26.8.4.3 (TWT Information frame exchange for broadcast TWT), and 26.8.4.4 (TWT Information frame exchange for flexible wake time), respectively.

NOTE 1—An HE AP might include multiple TWT Information frames, each addressed to a different peer STA, in an HE MU PPDU (see 26.5.1 (HE DL MU operation)).

The TWT Information frame shall have the Response Requested subfield equal to 0, the Next TWT Request subfield equal to 0, and one of the following:

- The Next TWT subfield that is equal to a nonzero value if the frame is transmitted by a TWT responding STA, by a TWT scheduling AP, or by any HE STA to a peer STA that has set the Flexible TWT Schedule Support field to 1 in the HE Capabilities element it transmits.
  - The value of the Next TWT subfield shall be selected from (#6196)the future target wake times of an individual TWT agreement if the Flexible TWT Schedule Support field in the HE Capabilities element received from the peer STA is 0 and shall be selected from (#6196)the future target wake times of a broadcast TWT schedule regardless of the value of the Flexible TWT Schedule Support field received from the peer STA.
  - The Next TWT subfield may contain any nonzero value if the Flexible TWT Schedule Support field in the HE Capabilities element received from the peer STA is 1.
  - The All TWT subfield is 1 if the resumption applies to all broadcast TWT schedules followed by the TWT scheduled STA and/or to all individual TWT agreements followed by the TWT responding STA.
- A Next TWT subfield that is present if the frame is transmitted by a TWT requesting STA, by a TWT scheduled STA, or by any HE STA to a peer STA that has set the Flexible TWT Schedule Support field to 1 in the HE Capabilities element it transmits.
  - The Next TWT subfield indicates the earliest TWT at which the individual TWT agreement or broadcast TWT schedule is resumed and shall be selected from (#6196)the future target wake times of that TWT agreement or broadcast TWT schedule if the Flexible TWT Schedule Support field in the HE Capabilities element received from the peer STA is 0.
  - The All TWT subfield is 1 if the resumption applies to all broadcast TWT schedules followed by the TWT scheduled STA and/or to all individual TWT agreements followed by the TWT requesting STA.
  - The Next TWT subfield may contain any nonzero value if Flexible TWT Schedule Support field in the HE Capabilities element received from the peer STA is 1.
- A Next TWT subfield that is not present if the frame is transmitted by a TWT requesting STA or a TWT scheduled STA to indicate suspension of the individual TWT agreement or broadcast TWT schedule.
  - The All TWT subfield is 1 if the suspension applies to all broadcast TWT schedules followed by the TWT scheduled STA and/or to all individual TWT agreements followed by the TWT requesting STA.

NOTE 2—Information exchanged with TWT Information frames does not modify the TWT parameters of any existing TWT session, except if the TWT Information frame is sent under flexible TWT (see 26.8.4.4 (TWT Information frame exchange for flexible wake time)).

The use of TWT Information frames for suspending and/or resuming existing individual TWT agreements is described in 26.8.4.2 (TWT Information frame exchange for individual TWT). The use of TWT Information frames for suspending and/or resuming existing broadcast TWT schedules is described in 26.8.4.3 (TWT

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Information frame exchange for broadcast TWT). The use of TWT Information frames for providing a flexible TWT that is independent of any existing TWT agreements or TWT schedules is described in 26.8.4.4 (TWT Information frame exchange for flexible wake time).

### 26.8.4.2 TWT Information frame exchange for individual TWT

An HE STA that has an individual TWT agreement may transmit a TWT Information frame to a peer STA with which it has the agreement if the peer STA has set the TWT Information Frame Disabled field to 0 in the TWT element sent during TWT setup; otherwise, the HE STA shall not transmit a TWT Information frame to the peer STA. The HE STA sets the fields of the TWT Information frame as defined in 26.8.4.1 (General).

A TWT requesting STA that receives a TWT Information frame containing a Next TWT subfield follows the rules in 10.46.4 (Implicit TWT operation) and the rules below in this subclause.

A TWT requesting STA that receives an acknowledgment in response to a TWT Information frame transmitted by the STA that does not contain a Next TWT subfield shall consider the corresponding TWT agreement suspended until the TWT session is resumed. A TWT requesting STA that receives an acknowledgment in response to a TWT Information frame transmitted by the STA that does contain a Next TWT subfield shall consider the corresponding TWT agreement suspended and shall resume the TWT agreement starting from the value indicated in the Next TWT subfield of the transmitted TWT Information frame. A TWT requesting STA that receives an acknowledgment in response to a TWT Information frame transmitted by the STA assumes that any other individual TWT agreements and broadcast TWT schedules (see 26.8.3 (Broadcast TWT operation)) are not affected by the transmission of this TWT Information frame, except when the All TWT subfield of the TWT Information frame is equal to 1. Other default PS procedures are not affected by the transmission of this TWT Information frame (see 11.2 (Power management)).

NOTE—The TWT Flow Identifier, together with the MAC addresses of the TWT requesting STA and TWT responding STA, identifies the TWT agreement for which the TWT Information frame is sent (see 10.46.1 (TWT overview)).

If the TWT Information frame contains an All TWT subfield equal to 1, then the above rules apply to all individual TWT agreements, except that the resumptions of the respective TWTs shall occur at the first TWT of the respective TWT agreement that occurs not earlier than the Next TWT value contained in the TWT Information frame, regardless of the value of the Flexible TWT Schedule Support field in the HE Capabilities element exchanged between the two STAs.

A TWT requesting STA that is in PS mode and that transmits a TWT Information frame to a TWT responding STA shall suspend the corresponding TWT agreement and may transition to doze state after receiving the acknowledgment even if it has previously transmitted a PS-Poll or U-APSD trigger frame and has not yet received the expected frames from the AP in response. The STA shall resume TWT operation for the corresponding TWT agreement at the specified TWT indicated (if any) in the TWT Information frame. A TWT requesting STA that is in PS mode and that receives a TWT Information frame from a TWT responding STA shall suspend the TWT agreement and may go to doze state after transmitting the acknowledgment even if it has previously transmitted a PS-Poll or U-APSD trigger frame and has not yet received the expected frames from the TWT responding STA in response. The STA shall resume TWT operation for the corresponding TWT agreement at the specified TWT indicated (if any) in the TWT Information frame.

### 26.8.4.3 TWT Information frame exchange for broadcast TWT

An HE STA that is a TWT scheduling AP may transmit a TWT Information frame to any of the members of a broadcast TWT schedule if the member has set the TWT Information Frame Disabled field to 0 in the TWT element sent when joining the broadcast TWT schedule. An HE STA that is a TWT scheduled STA

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

may transmit a TWT Information frame to the TWT scheduling AP corresponding to a broadcast TWT schedule established by that STA if the AP has set the TWT Information Frame Disabled field to 0 in the broadcast TWT element it transmits. The HE STA sets the fields of the TWT Information frame as defined in 26.8.4.1 (General).

A TWT scheduled STA that receives a TWT Information frame that contains an All TWT subfield equal to 1 follows the rules defined in 26.8.3.3 (Rules for TWT scheduled STA), except that the TWT scheduled STA shall consider all the broadcast TWT schedules as suspended and shall resume each broadcast TWT schedule at the first TWT that occurs not earlier than the Next TWT subfield value contained in the received TWT Information frame.

A TWT scheduled STA that receives an acknowledgment in response to a TWT Information frame transmitted by the STA that contains an All TWT subfield equal to 1 and that does not contain a Next TWT subfield shall consider all broadcast TWT schedules suspended and can follow the default PS procedure defined in 11.2 until the broadcast TWT schedules are resumed.

A TWT scheduled STA that receives an acknowledgment in response to a TWT Information frame transmitted by the STA that contains an All TWT subfield equal to 1 and contains a Next TWT subfield shall suspend all broadcast TWT schedules and shall resume the broadcast TWT schedules at the first scheduled TWT for each respective broadcast TWT schedule that occurs not earlier than the value indicated in the Next TWT subfield contained in the transmitted TWT Information frame, regardless of the values of the Flexible TWT Schedule Support field in the HE Capabilities element exchanged between the two STAs.

NOTE—TWT suspension and resumption as indicated by a TWT Information frame with the All TWT subfield equal to 1 applies to all broadcast TWT schedules of the TWT scheduling AP.

A TWT scheduled STA that is in PS mode and that transmits a TWT Information frame to a TWT scheduling AP shall suspend the corresponding broadcast TWT schedule and may transition to doze state after receiving the acknowledgment, even if it has previously transmitted a PS-Poll or U-APSD trigger frame and has not yet received the expected frames from the TWT scheduling AP in response. The STA shall resume TWT operation for the corresponding broadcast TWT schedule at the specified TWT indicated (if any) in the TWT Information frame. A TWT scheduled STA that is in PS mode and that receives a TWT Information frame from a TWT scheduling AP shall suspend the corresponding broadcast TWT schedule and may transition to doze state after transmitting the acknowledgment, even if it has previously transmitted a PS-Poll or U-APSD trigger frame and has not yet received the expected frames from the TWT scheduling AP in response. The STA shall resume TWT operation for the corresponding broadcast TWT schedule at the specified TWT indicated (if any) in the TWT Information frame.

#### 26.8.4.4 TWT Information frame exchange for flexible wake time

An HE STA may transmit a TWT Information frame that contains a flexible TWT to a peer STA if the peer STA has set the Flexible TWT Schedule Support field in the HE Capabilities it transmits to 1; otherwise, the HE STA shall not transmit a TWT Information frame that contains a flexible TWT to the peer STA.

A flexible TWT is a nonzero value indicated in the Next TWT subfield of a TWT Information frame with All TWT subfield equal to 0, and the value is independent from any existing TWT values of TWT agreements that the HE STA might be following (if any). The HE STA sets the fields of the transmitted TWT Information frame as defined in 26.8.4.1 (General).

NOTE 1—Flexible TWT support does not depend on the STA's TWT capabilities, i.e., the STA can use flexible TWT without being required to set up an individual TWT agreement or broadcast TWT schedule.

An HE STA that receives an acknowledgment for a TWT Information frame with flexible TWT that contains a TWT Flow Identifier (#3308)field that identifies an existing individual TWT agreement shall

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

replace the next TWT SP start time for that TWT agreement with the value contained in the Next TWT subfield of the TWT Information frame.

(#1203)An HE STA that receives a TWT Information frame with flexible TWT that contains a TWT Flow Identifier (#3308)field that identifies an existing individual TWT agreement shall replace the next TWT SP start time for that TWT agreement with the value contained in the Next TWT subfield of the TWT Information frame.

A non-AP HE STA that receives an acknowledgment for a TWT Information frame with flexible TWT that contains a TWT Flow Identifier (#3308)field that does not identify any existing individual TWT agreement (#1199)will use the same PM mode that the STA has at time *t1*, which is the time the acknowledgment for the TWT Information frame was received(#1205), (#1199)at time *t2*, which is the time indicated in the Next TWT subfield of the TWT Information frame as described below in this subclause.

(#1204)A non-AP HE STA that receives a TWT Information frame with flexible TWT that contains a TWT Flow Identifier (#3308)field that does not identify any existing individual TWT agreement preserves the PM mode from the time the acknowledgment of the TWT Information frame was transmitted to the time indicated in the Next TWT subfield of the TWT Information frame as described below in this subclause.

NOTE 2—If the TWT Information frame has the All TWT field equal to 1, then the TWTs are suspended and resumed as described in 26.8.4.2 (TWT Information frame exchange for individual TWT) and 26.8.4.3 (TWT Information frame exchange for broadcast TWT).

A non-AP HE STA that transmits a TWT Information frame with flexible TWT to a peer STA

- May go to doze state after receiving the acknowledgment sent in response to the TWT Information frame if it is in PS mode (i.e., the PM subfield of the Frame Control field of the TWT Information frame is 1).
- May be unavailable if it is in active mode (i.e., the PM subfield of the Frame Control field of the TWT Information frame is 0).
- Shall be in the awake state at the time indicated in the Next TWT subfield of the TWT Information frame.(#1201)
- Shall be in the PS mode if the PM subfield of the TWT Information frame was 1 and in active mode if the PM subfield of the TWT Information frame was 0.

The STA, once in the awake state, shall follow the rules that correspond to the power management mode of the STA, which are defined in 11.2.3 (Power management in a non-DMG infrastructure network) for the active and PS modes and in 26.8 (TWT operation) when the STA operates within TWT SPs.

NOTE 3—An HE AP delivers DL BUs to the STA at or after the flexible TWT indicated in the flexible TWT by following the rules in 11.2.3.6 (AP operation) if the STA does not follow TWT and by following the rules in 26.8 (TWT operation) if the STA follows TWT and the delivery falls within a TWT SP. The STA is not required to send a frame at or after the flexible TWT to indicate its awake state to the AP. If the STA is following U-APSD, then the operation is resumed at a time that occurs at the flexible TWT; and if the STA is following an APSD schedule, then the operation is resumed at a time that occurs at or after the flexible TWT.

A non-AP HE STA that receives a TWT Information frame with flexible TWT from a peer STA

- May go to doze state after transmitting the acknowledgment if it is in PS mode.
- May be unavailable if it is in active mode.
- Shall be in the awake state at the time it indicated in the Next TWT subfield of the TWT Information frame.
- Shall be in the PS mode if the STA was in PS mode when it received the TWT Information frame and in active mode if the STA was in active mode when it received the TWT Information frame.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The STA, once in the awake state, shall follow the rules that correspond to the power management mode of the STA, which are defined in 11.2.3 (Power management in a non-DMG infrastructure network) for the active and PS modes and in 26.8 (TWT operation) when the STA operates within TWT SPs.

### 26.8.5 Power save operation during TWT SPs

The following rules apply to TWT SPs for both broadcast TWT schedules and individual TWT agreements where the TWT SP of a broadcast TWT is uniquely identified by the <broadcast TWT ID, MAC address of TWT scheduling AP> tuple and the TWT SP of an individual TWT is uniquely identified by the <TWT flow identifier, MAC address of TWT requesting STA, MAC address of TWT responding STA> triple.

A TWT requesting STA or a TWT scheduled STA that is not in PS mode and that transmits a frame with the Power Management subfield set to 1 during a TWT SP shall remain in the awake state until the AdjustedMinimumTWTWakeDuration time has elapsed from the TWT SP start time or until a TWT SP termination event is detected, whichever occurs first for that particular TWT SP.

A TWT requesting STA or a TWT scheduled STA in PS mode that is in the awake state for a TWT SP may transition to the doze state after AdjustedMinimumTWTWakeDuration time has elapsed from the TWT SP start time even if it has previously transmitted a PS-Poll frame or U-APSD trigger frame and has not yet received the expected frames from the AP in response. For a trigger-enabled TWT SP, if the AdjustedMinimumTWTWakeDuration time has elapsed from the scheduled TWT SP start time and no Trigger frames are received by the STA, the HE STA may enter doze state if no other condition requires the STA to remain awake.

When a TWT SP termination event is detected within a TWT SP by a STA in PS mode that is participating in the TWT SP, the STA may transition to the doze state without waiting for the expiration of the AdjustedMinimumTWTWakeDuration time as described in 10.46.1 (TWT overview), even if it has previously transmitted a PS-Poll frame or U-APSD trigger frame and has not yet received the expected frames from the AP in response.

A TWT requesting STA or a TWT scheduled STA shall classify any of the following events as a TWT SP termination event:

a) The transmission by the TWT requesting STA of an acknowledgment in response to an individually addressed QoS Data or QoS Null frame sent by the TWT responding STA that had the EOSP subfield equal to 1.

b) The transmission by the TWT scheduled STA of an acknowledgment in response to an individually addressed QoS Data or QoS Null frame sent by the TWT scheduling AP that had the EOSP subfield equal to 1.

c) The transmission by the TWT requesting STA of an acknowledgment in response to an individually addressed frame that is neither a QoS Data frame nor a QoS Null frame, but that was sent by the TWT responding STA with the More Data field equal to 0.

d) The transmission by the TWT scheduled STA of an acknowledgment in response to an individually addressed frame that is neither a QoS Data frame nor a QoS Null frame, but that was sent by the TWT scheduling AP with the More Data field equal to 0.

e) The reception of an individually addressed or broadcast QoS Data or QoS Null frame sent by the TWT responding STA or TWT scheduling AP that does not solicit an immediate response and had the EOSP subfield equal to 1.

f) The reception of an individually addressed frame that is neither a QoS Data frame nor a QoS Null frame, but that was sent by the TWT responding STA or TWT scheduling AP, does not solicit an immediate response, and had the More Data field equal to 0.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

g) The reception of a Trigger frame sent by the TWT responding STA or TWT scheduling AP that has the More TF field equal to 0 and is not addressed to the TWT requesting STA or TWT scheduled STA, provided that the TWT requesting STA or TWT scheduled STA either is awake for an announced trigger-enabled TWT SP but did not transmit an indication that it is in the awake state to the TWT responding STA or TWT scheduling AP or is awake for an unannounced trigger-enabled TWT SP.

h) The transmission or reception by the TWT requesting STA of the acknowledgment for a TWT Information frame that satisfies specific conditions in 26.8.4.2 (TWT Information frame exchange for individual TWT) and 26.8.4.4 (TWT Information frame exchange for flexible wake time).

i) The transmission or reception by the TWT scheduled STA of the acknowledgment for a TWT Information frame that satisfies specific conditions in 26.8.4.3 (TWT Information frame exchange for broadcast TWT) and 26.8.4.4 (TWT Information frame exchange for flexible wake time).

The classification of a More Data field equal to 0 in an Ack, BlockAck, or individually addressed Multi-STA BlockAck frame as an event that terminates a TWT SP is possible only when both STAs have indicated support of transmitting or receiving the frame with a nonzero More Data subfield, which is indicated in the More Data Ack subfield of the QoS Info field of frames they transmit (see 11.2.3 (Power management in a non-DMG infrastructure network)).

NOTE 1—A STA participating in multiple TWT SPs that overlap in time stays in the awake state until the latest AdjustedMinimumTWTWakeDuration time of all of the TWT SPs expires, except that a TWT SP termination event causes all of the overlapping TWT SPs to terminate.

NOTE 2—A Trigger frame is addressed to the STA if the Trigger frame contains the AID of the STA in one of its User Info fields (see 26.5.2 (UL MU operation)) and has in its TA field either the MAC address of its associated AP or the transmitted BSSID (see 26.5.2.2.4 (Allowed settings of the Trigger frame fields and TRS Control subfield)). Otherwise, the Trigger frame is not addressed to the STA. If the Trigger frame contains one or more RA-RUs for which the STA can gain access according to 26.5.4 (UL OFDMA-based random access (UORA)), then the STA can follow the rules defined in 26.14.2 (Power save with UORA and TWT) to determine an early TWT SP termination event.

### 26.8.6 Negotiation of wake TBTT and wake interval

A TBTT scheduled STA that intends to operate in power save mode (see 11.2.3.2 (Non-AP STA power management modes)) may transmit a TWT request to the TBTT scheduling AP that identifies the wake TBTT of the first Beacon frame and the wake interval between subsequent Beacon frames it intends to receive. The TWT request shall contain the following:

— The Negotiation Type subfield equal to 1 and the TWT Setup Command field equal to Suggest TWT or Demand TWT.
— The requested first wake TBTT in the Target Wake Time field.
— The requested wake interval between consecutive TBTTs in the TWT Wake Interval Mantissa and TWT Wake Interval Exponent fields.
— The requested TBTT wake duration in the Nominal Minimum TWT Wake Duration field.
— All other fields in the TWT element reserved.

A TBTT scheduling AP that receives a TWT request from a STA whose value of the Negotiation Type subfield is 1 shall respond with a TWT response that contains Accept TWT, Alternate TWT, or Reject TWT in the TWT Setup Command field. For an Accept TWT, it shall also contain the following:

— The Negotiation Type subfield equal to 1.
— The allocated first wake TBTT in the Target Wake Time field.
— The allocated wake interval between consecutive TBTTs in the TWT Wake Interval Mantissa and TWT Wake Interval Exponent fields.
— The allocated TBTT wake duration in the Nominal Minimum TWT Wake Duration field.
— All other fields in the TWT element reserved.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

After successfully completing the negotiation, the TBTT scheduled STA may go to doze state until its TSF matches the next negotiated wake TBTT, provided that the STA is in power save mode and no other condition requires the STA to remain awake. The TBTT scheduled STA shall be in the awake state to listen to Beacon frames transmitted at negotiated wake TBTTs and shall operate as described in 26.8.3.3 (Rules for TWT scheduled STA).

If the TBTT scheduled STA receives a Beacon frame from the TBTT scheduling AP at or after TBTT, the TBTT scheduled STA may go to doze state until the next wake TBTT if no other condition requires the STA to remain awake. The TBTT scheduled STA may go to doze state after a nominal minimum TBTT wake duration time has elapsed from the TBTT start time if no other condition requires the STA to remain awake.

Either STA that is a party to an established wake TBTT agreement can tear down the wake TBTT agreement by following the teardown procedure described in 10.47.8 and by setting the Negotiation Type subfield to 1 in the TWT Teardown frame.

Table 26-8 (Wake TBTT negotiation exchanges(11ax)) summarizes the interactions between devices that negotiate a Wake TBTT agreement.

**Table 26-8—Wake TBTT negotiation exchanges(11ax)**

| TWT Setup Command field in an initiating frame | TWT Setup Command field in a response frame | Condition after the completion of the exchange |
|---|---|---|
| Request TWT | Accept TWT, Alternate TWT, Dictate TWT, Reject TWT, or no response | This exchange is not allowed. |
| Demand TWT or Suggest TWT | Accept TWT | A Wake TBTT agreement has been created with the Wake TBTT parameters indicated in the initiating frame. |
| Demand TWT or Suggest TWT | Reject TWT | No Wake TBTT agreement has been created. |
| Demand TWT or Suggest TWT | Alternate TWT | No Wake TBTT agreement has been created. The TBTT scheduling AP is offering an alternative set of parameters to those indicated in the initiating frame. The TBTT scheduled STA can send a new request with any set of Wake TBTT parameters, and the responder might create a Wake TBTT agreement using those parameters.<br><br>The TBTT scheduled STA is unlikely to send a new request if the TWT Setup Command is Demand TWT and is very likely to send a new request if the TWT Setup Command is Suggest TWT. |
| NOTE 1—The Negotiation Type subfield of the TWT element contained in these frames is equal to 1.<br><br>NOTE 2—The initiating frame and response frame settings not listed in the tables in 10.46 (Target wake time (TWT)) or 26.8 (TWT operation) are not allowed. The initiating frame is a TWT request, and the response frame is a TWT response. | | |

## 26.8.7 HE subchannel selective transmission

### 26.8.7.1 General

An HE STA that supports HE subchannel selective transmission (SST) operation shall set dot11HESubchannelSelectiveTransmissionImplemented to true and shall set the HE Subchannel Selective

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Transmission Support field in the HE Capabilities element it transmits to 1. An HE STA that does not support HE SST operation shall set the HE Subchannel Selective Transmission Support field in the HE Capabilities element it transmits to 0.

A non-AP HE STA with dot11HESubchannelSelectiveTransmissionImplemented equal to true is a HE SST non-AP STA.

An HE AP with dot11HESubchannelSelectiveTransmissionImplemented equal to true is an HE SST AP.

An HE SST non-AP STA and an HE SST AP may set up SST operation by negotiating a trigger-enabled TWT as defined in 26.8.2 (Individual TWT agreements) with the following exceptions:

- The TWT request may have a TWT Channel field with up to one bit set to 1 to indicate the secondary channel requested to contain the RU allocations addressed to the HE SST non-AP STA that is a 20 MHz operating STA.
- The TWT request may have a TWT Channel field with all 4 LSBs or all 4 MSBs set to 1 to indicate whether the primary 80 MHz channel or the secondary 80 MHz channel is requested to contain the RU allocations addressed to the HE SST non-AP STA that is an 80 MHz operating STA.
- The TWT response shall have a TWT Channel field with up to one bit set to 1 to indicate the secondary channel that will contain the RU allocations addressed to the HE SST non-AP STA that is a 20 MHz operating STA.
- The TWT response shall have a TWT Channel field with all 4 LSBs or all 4 MSBs set to 1 to indicate whether the primary 80 MHz channel or the secondary 80 MHz channel will contain the RU allocations addressed to the HE SST non-AP STA that is a 80 MHz operating STA.

#### 26.8.7.2 SST operation

An HE SST non-AP STA and HE SST AP that successfully set up SST operation shall follow the rules defined in this subclause.

If an HE SST AP causes its operating channel or channel width to change and if any secondary channel of a trigger-enabled TWT is not within the new operating channel or channel width, then the HE SST AP and the HE SST non-AP STA implicitly terminate the trigger-enabled TWT.

The HE SST AP follows the rules in 26.8.2 (Individual TWT agreements) to exchange frames with the HE SST non-AP STA during trigger-enabled TWT SPs, except that the AP shall ensure the following:

- The individually addressed RUs allocated in DL MU PPDUs and in Trigger frames addressed to the HE SST non-AP STA are within the subchannel indicated in the TWT Channel field of the TWT response and follow the RU restriction rules defined in 27.3.2.8 (RU restrictions for 20 MHz operation) if the HE SST non-AP STA is a 20 MHz operating STA and in 27.3.2.9 (80 MHz operating non-AP HE STAs) if the HE SST non-AP STA is an 80 MHz operating STA.
- The TXVECTOR parameter CH_BANDWIDTH of a DL MU PPDU is not set to HE-CBW-PUNC160-PRI20, HE-CBW-PUNC80+80-PRI20, HE-CBW-PUNC160-SEC40, or HE-CBW-PUNC80+80-SEC40 if the DL MU PPDU is addressed to at least one HE SST non-AP STA that is an 80 MHz operating STA operating in a secondary channel.
- The trigger-enabled TWT SPs do not overlap with TBTTs at which DTIM beacons(#3309) are sent.
- The same subchannel is used for all trigger-enabled TWT SPs with the same HE SST non-AP STA that overlap in time.

An HE SST non-AP STA operating on the secondary channel shall not conduct OMI operation as defined in 26.9 (Operating mode indication) or (#7113)operating mode notification operation as defined in (#1314)11.40 (Notification of operating mode changes) to change the operating bandwidth.

This is an unapproved IEEE Standards Draft, subject to change.

The HE SST non-AP STA follows the rules in 26.8.2 (Individual TWT agreements) to exchange frames with the HE SST AP during trigger-enabled TWT SPs, except that the STA

- Shall be available in the subchannel indicated in the TWT Channel field of the TWT response at TWT start times.
- Shall not access the medium in the subchannel using DCF or EDCAF.
- Shall not respond to Trigger frames addressed to it (see 26.5 (MU operation) and 26.8.2 (Individual TWT agreements)), unless it has performed CCA until a frame is detected by which it can set its NAV, or until a period equal to NAVSyncDelay has transpired, whichever is earlier.
- Shall update its NAV according to 26.2.4 (Updating two NAVs) if it receives a PPDU in the subchannel.

An HE SST non-AP STA may include a Channel Switch Timing element in (M118)(#4154)(Re)Association Request frames it transmits to an HE SST AP to indicate the time required by the STA to switch between different subchannels. The received channel switch time informs the HE SST AP of the duration of time that the HE SST non-AP STA might not be available to receive frames before the TWT start time and after the end of the trigger-enabled TWT SP.

NOTE—An HE SST STA in PS mode is not required to move to the primary channel after the end of the trigger-enabled TWT SP.

## 26.9 Operating mode indication

### 26.9.1 General

OMI is a procedure used between an OMI initiator and an OMI responder. An HE STA that transmits a frame including an OM Control subfield is defined as an OMI initiator. An HE STA with dot11OMIOptionImplemented equal to true that receives a frame including an OM Control subfield is defined as an OMI responder.

An HE STA with dot11OMIOptionImplemented equal to true shall set the OM Control Support subfield in the HE MAC Capabilities Information field in the HE Capabilities element it transmits to 1; otherwise, the HE STA shall set the OM Control Support subfield to 0. An HE AP shall set dot11OMIOptionImplemented to true, and the HE AP shall implement the reception of the OM Control subfield.

An OMI initiator may send to an OMI responder an individually addressed QoS Data, QoS Null, or Class 3 Management frame after association that contains the OM Control subfield and that solicits an immediate acknowledgment to indicate a change in its receive operating mode (ROM) as defined in 26.9.2 (Receive operating mode (ROM) indication) and/or transmit operating parameters (TOM) as defined in 26.9.3 (Transmit operating mode (TOM) indication). An OMI responder implements the reception of an individually addressed QoS Data, QoS Null, or Class 3 Management frame that contains the OM Control subfield that indicates a change in ROM and/or TOM parameters.

The OMI initiator shall indicate a change in its ROM parameters by including the OM Control subfield in a QoS Data, QoS Null, or Class 3 Management frame that solicits acknowledgment and is addressed to the OMI responder as defined in 26.9.2 (Receive operating mode (ROM) indication).

NOTE 1—Frames that solicit an immediate acknowledgment are, for example, QoS Null frames and QoS Data frames with Normal Ack or Implicit BAR ack policy and Action frames.

An HE STA can change its operating mode setting using either the operating mode notification as described in (#7036)11.40 (Notification of operating mode changes) or the operating mode indication (OMI) procedure described in this subclause. An HE STA should not transmit an OM Control subfield and an Operating Mode field in the same PPDU. If a STA transmits both an OM Control subfield and Operating

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Mode field in the same PPDU, then the OMI responder shall use the channel width and the maximum number of spatial streams indicated by the most recently received OM Control subfield or Operating Mode field from the OMI initiator.

NOTE 2—An OM Control field is transmitted before an Operating Mode field in the same frame.

The OMI initiator supports receiving PPDUs with a bandwidth up to the value indicated by the Channel Width subfield and with a number of spatial streams, *Nss*, as indicated in the Rx NSS subfield of the OM Control subfield and calculated in (#6291)Equation (26-4).

If the operating channel width of the STA is greater than 80 MHz, then the maximum number of spatial streams that the STA supports in reception for a given HE-MCS as a function of the received HE PPDU bandwidth *BW* at an HE STA transmitting an OM Control subfield is defined in Equation (26-4).

$$\text{Floor}\left(Rx\text{-}NSS\text{-}from\text{-}OMI \times \left(Max\text{-}HE\text{-}NSS\text{-}at\text{-}BW \,/\, Max\text{-}HE\text{-}NSS\text{-}at\text{-}80\right)\right) \quad (26\text{-}4)$$

where

*Rx-NSS-from-OMI* is Rx NSS from the OM Control subfield transmitted by the STA

*Max-HE-NSS-at-BW* is the maximum NSS among all HE-MCS at *BW* MHz from the Supported HE-MCS And NSS Set field transmitted by the STA as described in 26.15.4 (Rate selection constraints for HE STAs)

*Max-HE-NSS-at-80* is the maximum NSS among all HE-MCS at 80 MHz from the Supported HE-MCS And NSS Set field transmitted by the STA

NOTE 3—If the operating channel width of the STA is greater than 80 MHz, then the Rx NSS subfield indicates the maximum number of spatial streams for PPDU bandwidths that are equal to or less than 80 MHz. If the operating channel width of the STA is less than or equal to 80 MHz, then the Rx NSS subfield indicates the maximum number of spatial streams, $N_{SS}$, that the STA supports in reception.

The VHT channel width and the VHT NSS allowed at an HE STA transmitting an OM Control subfield are defined in Table 26-9 (Setting of VHT Channel Width and VHT NSS at an HE STA transmitting the OM Control subfield) to determine the allowed NSS when operating as HE STA using channel bandwidth of 160 MHz or 80+80 MHz.

**Table 26-9—Setting of VHT Channel Width and VHT NSS at an HE STA transmitting the OM Control subfield**

| OM Control subfield | VHT capabilities of STA transmitting OM Control subfield | | VHT NSS support of STA transmitting the OM Control subfield as a function of the PPDU bandwidth (× Max VHT NSS) (see requirements R1 and R2 at end of this table) | | | | | Location of 160 MHz center frequency if BSS bandwidth is 160 MHz | Location of secondary 80 MHz center frequency if BSS bandwidth is 80+80 MHz |
|---|---|---|---|---|---|---|---|---|---|
| Channel Width | Supported Channel Width | Extended NSS BW Support | 20 MHz | 40 MHz | 80 MHz | 160 MHz | 80+80 MHz | | |
| 0 | 0–2 | 0–3 | 1 | | | | | | |
| 1 | 0–2 | 0–3 | 1 | 1 | | | | | |
| 2 | 0–2 | 0–3 | 1 | 1 | 1 | | | | |
| 3 | 0 | 1 | 1 | 1 | 1 | 1/2 | | CCFS2 | |
| 3 | 0 | 2 | 1 | 1 | 1 | 1/2 | 1/2 | CCFS2 | CCFS2 |

This is an unapproved IEEE Standards Draft, subject to change.

**Table 26-9—Setting of VHT Channel Width and VHT NSS at an HE STA transmitting the OM Control subfield *(continued)***

| OM Control subfield | VHT capabilities of STA transmitting OM Control subfield | | VHT NSS support of STA transmitting the OM Control subfield as a function of the PPDU bandwidth (× Max VHT NSS) (see requirements R1 and R2 at end of this table) | | | | | Location of 160 MHz center frequency if BSS bandwidth is 160 MHz | Location of secondary 80 MHz center frequency if BSS bandwidth is 80+80 MHz |
|---|---|---|---|---|---|---|---|---|---|
| Channel Width | Supported Channel Width | Extended NSS BW Support | 20 MHz | 40 MHz | 80 MHz | 160 MHz | 80+80 MHz | | |
| 3 | 0 | 3 | 1 | 1 | 1 | 3/4 | 3/4 | CCFS2 | CCFS2 |
| 3 | 1 | 0 | 1 | 1 | 1 | 1 | | CCFS1 | |
| 3 | 1 | 1 | 1 | 1 | 1 | 1 | 1/2 | CCFS1 | CCFS2 |
| 3 | 1 | 2 | 1 | 1 | 1 | 1 | 3/4 | CCFS1 | CCFS2 |
| 3 | 1 | 3 | 2 | 2 | 2 | 2 | 1 | CCFS1 | CCFS1 |
| 3 | 2 | 0 | 1 | 1 | 1 | 1 | 1 | CCFS1 | CCFS1 |
| 3 | 2 | 3 | 2 | 2 | 2 | 1 | 1 | CCFS1 | CCFS1 |

R1: NSS support shall be rounded down to the nearest integer.
R2: The maximum NSS support shall be 8.

NOTE 1—Max VHT NSS as indicated by the value of the Rx NSS field. The Rx NSS field indicates the same Max HE NSS and Max VHT NSS. Max VHT NSS is at the bandwidth indicated in the VHT Capabilities element. For all allowed MCS values, the Max VHT NSS values are same, but the supported NSS can be different.

NOTE 2—1/2 × or 3/4 × Max VHT NSS support might end up being 0, indicating no support.

NOTE 3—Any other combination than the ones listed in this table is reserved.

NOTE 4—CCFS1 refers to the value of the Channel Center Frequency Segment 1 field of the most recently transmitted VHT Operation element (if any) or HE Operation element.

NOTE 5—CCFS2 refers to the value of the Channel Center Frequency Segment 2 field of the most recently transmitted HT Operation element.

NOTE 6—CCFS1 is nonzero when the current BSS bandwidth is 160 MHz or 80+80 MHz and the NSS support is at least Max VHT NSS. CCFS2 is zero in this case.

NOTE 7—CCFS2 is nonzero when the current BSS bandwidth is 160 MHz or 80+80 MHz and the NSS support is less than Max VHT NSS. CCFS1 is zero in this case.

NOTE 8—At most one of CCFS1 and CCFS2 is nonzero.

NOTE 9—A supported multiple of Max VHT NSS applies to both transmit and receive. A supported multiple of Max HE NSS applies to receive.

NOTE 10—Some combinations of Supported Channel Width Set and Extended NSS BW support might not occur in practice.

The OMI initiator shall indicate a change in its TOM parameters by including the OM Control subfield in a QoS Data, QoS Null, or Class 3 Management frame that solicits an immediate acknowledgment frame and is addressed to the OMI responder as defined in 26.9.3 (Transmit operating mode (TOM) indication).

A non-AP STA OMI initiator that sends an OM Control subfield with UL MU Disable subfield equal to 0, supports transmitting an HE TB PPDU with an RU allocation that is within the operating channel width indicated in the Channel Width subfield and with a number of space-time streams, $N_{STS}$, that is up to the

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

value indicated by the Tx NSTS subfield of the OM Control subfield as defined in 26.9.3 (Transmit operating mode (TOM) indication).

NOTE 4—To avoid possible frame loss, an OMI initiator can continue with its current operating channel width, active receive chains, and active transmit chains in HE TB PPDUs and not suspend HE TB PPDUs or Data frames in HE TB PPDUs until it infers that the OMI responder has processed an OM Control subfield from the OMI initiator indicating any of the following changes:

— Reduced operating channel width
— Reduction in the number of active receive chains
— Reduction in the number of active transmit chains in HE TB PPDUs
— Suspension of UL MU operation

The OMI initiator might make this inference from any combination of the following:

— By receiving a frame addressed to itself from the second HE STA in a PPDU with a bandwidth and NSS that are less than or equal to the channel width and NSS, respectively, indicated in the OM Control subfield.
— Based on the passage of time in some implementation-dependent way, which is beyond the scope of this standard.

NOTE 5—It might take a long time for a STA to change its operating mode following the transmission of the OM Control subfield. During that time the STA might not be able to receive frames, and this situation may result in frame loss. If a non-AP STA cannot tolerate frame loss during that period, it can set the Power Management subfield of the Frame Control field of the frame that carries the OM Control subfield to 1 to indicate that the STA has entered power save. When the non-AP STA has completed its operating mode change, it can send another frame (such as a QoS Null) with the Frame Control field Power Management subfield set to 0 to indicate that the STA has exited power save.

### 26.9.2 Receive operating mode (ROM) indication

ROM indication allows the OMI initiator to adapt the maximum operating channel width and/or the maximum number of spatial streams, *Nss*, it can receive from the OMI responder.

An OMI initiator that sends a frame that includes an OM Control subfield should change its OMI parameters, Rx NSS and Channel Width as follows:

— When the OMI initiator changes a ROM parameter from higher to lower, it should make the change for that parameter only after the TXOP in which it received the immediate acknowledgment from the OMI responder.
— When the OMI initiator changes a ROM parameter from lower to higher, it should make the change for that parameter only after the TXOP in which it expects to receive acknowledgment from the OMI responder.

An OMI initiator that is an HE AP should be capable of receiving within an operating channel width and with $N_{SS}$ that are up to the values of the most recently transmitted Channel Width subfield and Rx NSS subfield that the OMI initiator has successfully indicated in the OM Control subfield or in the Operating Mode field sent to any associated STA.

NOTE 1—In the event of transmission failure of the frame containing the OM Control subfield, the OMI initiator attempts the recovery procedure defined in 10.23.2.8 (Multiple frame exchange sequences in an EDCA TXOP(#109)).

The OMI responder shall update the operating channel width and the maximum $N_{SS}$ values as obtained from the Channel Width and Rx NSS subfields, respectively, of the most recently received OM Control subfield sent by the OMI initiator to send SU PPDUs and to assign an RU allocation in sent MU PPDUs, subject to restrictions defined in 27.3.1.2 (OFDMA), addressed to the OMI initiator in subsequent TXOPs. The OMI responder shall update the maximum $N_{SS}$ value to a value determined from the Rx NSS subfield and Table 26-9 (Setting of VHT Channel Width and VHT NSS at an HE STA transmitting the OM Control subfield) if the Channel Width subfield of the OM Control field indicates 160 MHz or 80+80 MHz.

After transmitting the acknowledgment for the frame containing the OM Control subfield, the OMI responder may transmit subsequent SU PPDUs or MU PPDUs that are addressed to the OMI initiator.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

NOTE 2—The acknowledgment is transmitted a SIFS after the frame. A subsequent PPDU is a PPDU that is intended for the OMI initiator and need not be the PPDU immediately following the acknowledgment.

An OMI initiator that is a non-AP STA may set the DL MU-MIMO Resound Recommendation subfield to 1 in the OM Control field in frames addressed to an OMI responder that is an AP to indicate that the non-AP STA suggests that the AP resound the channel with the non-AP STA. An OMI initiator that is a non-AP STA and that has no recommendation on the AP's DL MU-MIMO operation shall set DL MU-MIMO Resound Recommendation subfield to 0.

An OMI responder that receives a frame that carries an OM Control field with the DL MU-MIMO Resound Recommendation field equal to 1 from an OMI initiator may resound the channel or increase the frequency of the channel sounding with the OMI initiator if the OMI responder sends a DL MU-MIMO PPDU addressed to the OMI initiator.

### 26.9.3 Transmit operating mode (TOM) indication

TOM indication allows the OMI initiator to suspend and resume responding to variants of the Trigger frame and TRS Control subfields per the UL MU Disable and UL MU Data Disable subfields settings as indicated in Table 9-29 (UL MU Disable and UL MU Data Disable subfields encoding(11ax)) or to adapt the maximum operating channel width and/or the maximum number of space-time streams, $N_{STS}$, that it can transmit in response to a triggering frame sent by the OMI responder

NOTE 1—TOM indication does not relate to transmissions in PPDUs other than HE TB PPDUs. An AP does not perform TOM indication as an OMI initiator.

An OMI initiator that is a non-AP STA may indicate changes in its transmit parameters by sending a frame that contains the OM Control subfield to the OMI responder. The OMI initiator shall set

- The UL MU Disable subfield to 1 to indicate that responding to a triggering frame is suspended (see 26.5.2 (UL MU operation)).
  - An AP that is an OMI initiator shall set the UL MU Disable subfield to 0.
- The Tx NSTS subfield to the maximum $N_{STS}$ that the STA will use for an HE TB PPDU sent in response to a triggering frame.
- The Channel Width subfield to the maximum operating channel width that the STA will use for an HE TB PPDU sent in response to a triggering frame.

NOTE 2—Responding to all Trigger frame variants, including MU-RTS Trigger frames and NFRP Trigger frames, is suspended.

If a non-AP HE STA has received the OM Control UL MU Data Disable RX Support field in the HE Capabilities element set to 1, then the non-AP HE STA, acting as an OMI initiator, may set the UL MU Disable subfield to 0 and the UL MU Data Disable subfield to 1 to indicate that only UL MU Data frame transmission is suspended. In other words, UL MU control response frame transmissions in response to a Basic Trigger frame are not suspended (see 26.5.2 (UL MU operation)), responses to other Trigger frame variants are not suspended, and management frame transmissions are not suspended.

An OMI initiator shall set the UL MU Disable subfield to 0 and the UL MU Data Disable subfield to 0 to indicate resumption or continuation of participation in all triggered UL MU operations.

If an HE AP has set the OM Control UL MU Data Disable RX Support field in the HE Capabilities element it transmits to 0, an associated STA shall not set the UL MU Data Disable subfield in the OM Control field to 1.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

An OMI initiator that sent a frame including the OM Control subfield should change its TOM parameters, Tx NSTS, UL MU Disable, UL MU Data Disable, and Channel Width as follows:

— If the OMI initiator changes a TOM parameter from higher to lower, it should make the change for that parameter only after the TXOP in which it received the immediate acknowledgment from the OMI responder.

— If the OMI initiator changes a TOM parameter from lower to higher, it should make the change for that parameter only after the TXOP in which it expects to receive acknowledgment from the OMI responder.

The TOM parameters UL MU Disable and UL MU Data Disable change from higher to lower if their values change from 0 to 1. The change of UL MU Disable from 1 to 0 and UL MU Data Disable from 0 to 1 is a change from lower to higher.

An OMI responder that receives a frame containing an OM Control subfield from an OMI initiator performs the operations described below in this subclause.

An AP OMI responder shall not send any triggering frames to a non-AP STA OMI initiator for subsequent TXOPs (see 26.5.2 (UL MU operation)) if the UL MU Disable subfield is 1 in the most recently received OM Control subfield sent by the STA.

NOTE 3—A device might have multiple radios that can create difficult in-device coexistence challenges. The device might set UL MU Disable subfield to 1 and the UL MU Data Disable subfield to 0 if it has trouble responding to a triggering frame because the timing or high transmit power would cause interference with another radio in the device.

An OMI responder shall consider the OMI initiator as participating in UL MU operation for subsequent TXOPs if the UL MU Disable subfield is 0 in the most recently received OM Control subfield with the following restrictions:

— The maximum $N_{STS}$ that the OMI initiator can transmit in an HE TB PPDU is indicated in the Tx NSTS subfield of the OM Control subfield.

— The maximum operating channel width over which the OMI initiator can transmit in an HE TB PPDU is indicated in the Channel Width subfield of the OM Control subfield.

An OMI responder that has transmitted the OM Control UL MU Data Disable RX Support subfield set to 1 shall regard an OMI initiator as capable of participating in UL MU operation only for transmitting acknowledgments if the UL MU Disable subfield is equal to 0 and the UL MU Data Disable subfield is equal to 1 in the most recently received OM Control subfield from that OMI initiator.

The OMI responder shall indicate a number of spatial streams, $N_{SS}$, in the User Info field of a Trigger frame, which contains the AID of the OMI initiator, that is less than or equal to the $N_{STS}$ that is calculated from the Tx NSTS subfield of the OM Control subfield received from the OMI initiator.

The OMI responder shall indicate, in the RU Allocation subfield of the User Info field of a triggering frame addressed to the OMI initiator, an RU allocation that is within the operating channel width specified in the Channel Width subfield of the OM Control subfield received from the OMI initiator and subject to the restrictions defined in 27.3.1.2 (OFDMA).

## 26.10 HE spatial reuse operation(#2389)

### 26.10.1 General

The objective of HE spatial reuse operation is to allow the medium to be reused more often between OBSSs in dense deployment scenarios by the early identification of signals from overlapping basic service sets (OBSSs) and interference management.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

There are two independent spatial reuse modes: OBSS PD-based spatial reuse and PSR-based spatial reuse.

An HE AP participating in spatial reuse may request an associated non-AP HE STA to gather information regarding the neighborhood by sending a Beacon request (see 9.4.2.20.7 (Beacon report)) following the procedure described in 11.11 (DSE procedures). An HE AP shall not set a measurement mode in a Beacon request to an associated STA to a mode for which the STA has not explicitly indicated support via the RM Enabled Capabilities element (see 9.4.2.43 (RM Enabled Capabilities element)). An HE AP that sends a Beacon request for this purpose

- May request that the non-AP HE STA gather information of BSSs matching a particular BSSID and/or SSID.
- May request that the non-AP HE STA generate a report that is only for the channel on which the requesting AP is operating or to which the requesting AP is considering switching.
- Shall request that the non-AP HE STA include the HE Operation element of neighboring HE APs in order to help determine the BSS color information of the neighboring APs.

A non-AP HE STA that performs spatial reuse operation shall have dot11RadioMeasurementActivated set to true and shall respond to a Beacon request from its associated AP with a Beacon report as described in 11.11 (DSE procedures).

A Class B device as defined in 27.3.15.3 (Precorrection accuracy requirements(M118)) shall not operate with the procedures defined in this subclause.

### 26.10.2 OBSS PD-based spatial reuse operation

#### 26.10.2.1 General

OBSS PD-based spatial reuse operation comprises two types of operation. The first type is defined in 26.10.2.2 (General operation with non-SRG OBSS PD level) and allows a STA, under specific conditions, to ignore an inter-BSS PPDU using a non-SRG OBSS PD level. The second type is defined in 26.10.2.3 (General operation with SRG OBSS PD level) and allows a STA, under specific conditions, to ignore inter-BSS PPDUs that are identified as being SRG PPDUs, using an SRG OBSS PD level. In addition to these differences between the two types, Non-SRG OBSS PD Min offset is fixed and defined in the specification while the SRG OBSS PD Min offset can be defined by the AP. A STA may operate using one of the two types, neither type, or both types simultaneously.

#### 26.10.2.2 General operation with non-SRG OBSS PD level

If the PHY of a STA issues a PHY-CCA.indication(BUSY) followed by a (#3038)PHY-RXEARLYSIG.indication or PHY-RXSTART.indication due to a PPDU reception, then the STA's MAC sublayer may(#1120)(#1119):

a) (#1120)issue a PHY-CCARESET.request primitive before the end of the PPDU and not update its basic NAV timer based on the PPDU, or

b) (#1120)treat the PPDU as not having been received for purposes of its basic NAV timer (i.e., not update its basic NAV timer),

(#1120)if (for either (a) or (b)) all the following conditions are met:

1) The STA has not set the TXVECTOR parameter SPATIAL_REUSE to the value PSR_AND_NON_SRG_OBSS_PD_PROHIBITED in any HE PPDU it has transmitted in the current beacon period and in the previous beacon period.

2) The most recently received Spatial Reuse Parameter Set element from its associated AP had the Non-SRG OBSS PD SR Disallowed subfield equal to 0, or the non-AP STA has not received a Spatial Reuse Parameter Set element from its associated AP, or the STA is an AP and its most

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

recently transmitted Spatial Reuse Parameter Set element had the Non-SRG OBSS PD SR Disallowed subfield equal to 0, or the STA is an AP and has not transmitted a Spatial Reuse Parameter Set element.

3) The received PPDU is an inter-BSS PPDU (see 26.2.2 (Intra-BSS and inter-BSS PPDU classification)), and the received PPDU is not a non-HT PPDU carrying a response frame (Ack, BlockAck, or CTS frame); or the received PPDU contains a CTS, a PHY-CCA.indication transition from BUSY to IDLE occurred within the PIFS time immediately preceding the received CTS, and that transition corresponded to the end of an inter-BSS PPDU that contained an RTS that was (#3683)discarded following this procedure.

4) The STA is operating with an SRG OBSS PD level as described in 26.10.2.3 (General operation with SRG OBSS PD level), and the received PPDU is not an SRG PPDU; or the STA is not operating with an SRG OBSS PD level.

5) The SPATIAL_REUSE subfield in the HE-SIG-A field (if present) of the received PPDU is not set to PSR_AND_NON_SRG_OBSS_PD_PROHIBITED.

6) The received signal strength level, which is measured from the L-STF or L-LTF fields of the PPDU or the PHY SYNC field, shortSYNC field, or Long PHY SYNC field, whichever exists and is used to determine PHY-CCA.indication, is below the non-SRG OBSS PD level. The non-SRG OBSS PD level is defined in 26.10.2.4 (Adjustment of OBSS PD and transmit power). If the STA has dot11HEPSROptionImplemented set to true, it also follows the rules defined in 26.10.4 (Interaction of OBSS PD and PSR-based spatial reuse) to determine non-SRG OBSS PD level.

7) The PPDU is not one of the following:

   i) A non-HE PPDU that carries a frame where the RA field is equal to the STA MAC address

   ii) A non-HE PPDU that carries a Public Action frame

   iii) A non-HE PPDU that carries a VHT/HE NDP Announcement frame or FTM frame(#7223)

   iv) A non-HE NDP

NOTE 1—A STA cannot perform SR over an HE sounding NDP or HE TB feedback NDP (see 26.11.6 (SPATIAL_REUSE)).

If the frame is carried in an HE ER SU PPDU that is identified as an inter-BSS PPDU (where power of the L-STF/L-LTF symbols is boosted 3 dB), 3 dB shall be subtracted from the received signal strength measured from the L-STF or L-LTF fields of the PPDU, prior to using it to determine PHY-CCA.indication and to comparing it to the non-SRG OBSS PD level as described in this subclause, to compensate for the power difference.

NOTE 2—If a received CF-End frame satisfies the conditions above, neither the issuance of a PHY-CCARESET.request nor the choice to not update the basic NAV timer results in the cancellation of the NAV, which would normally occur following the reception of a CF-End frame.

The PHY-CCARESET.request primitive shall be issued at the end of the PPDU if the PPDU is an HE SU PPDU or an HE ER SU PPDU and the RXVECTOR parameter SPATIAL_REUSE indicates SR_DELAYED.

NOTE 3—A STA sets the TXVECTOR parameter SPATIAL_REUSE to SR_DELAYED in a PPDU if it allows OBSS PD-based spatial reuse operation, but only after the end of the PPDU.

NOTE 4—An AP can get protection equivalent to SR_DELAYED by transmitting the Trigger frame in a non-HT PPDU or HT PPDU with the TXVECTOR parameter AGGREGATION set to 0 instead of in a VHT PPDU.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

If the PHY-CCARESET.request primitive is issued before the end of the received PPDU, and a TXOP is initiated within the duration of the received PPDU, then the TXOP and the duration of the transmitted PPDU within that TXOP shall be limited to the duration of the received PPDU if the received PPDU is an HE MU PPDU and the RXVECTOR parameter SPATIAL_REUSE indicates SR_RESTRICTED.

NOTE 5—A STA sets the TXVECTOR parameter SPATIAL_REUSE to SR_RESTRICTED in a PPDU if it allows OBSS PD-based spatial reuse operation, but only before the end of the PPDU.

A STA that ignores a PPDU following the procedure described in this subclause is deemed to perform non-SRG OBSS PD-based spatial reuse.

### 26.10.2.3 General operation with SRG OBSS PD level

If the PHY of a STA issues a PHY-CCA.indication(BUSY) followed by a (#3038)PHY-RXEARLYSIG.indication or PHY-RXSTART.indication due to a PPDU reception, then the STA's MAC sublayer may(#1121):

a) (#1121)issue a PHY-CCARESET.request primitive before the end of the PPDU and not update its basic NAV timer based on the PPDU, or

b) (#1121)treat the PPDU as not having been received for purposes of its basic NAV timer (i.e., not update its basic NAV timer),

(#1121)if (for either (a) or (b)) all the following conditions are met:

1) The received PPDU is an SRG PPDU (see 26.2.3 (SRG PPDU identification))

2) The received signal strength level, which is measured from the L-STF or L-LTF fields of the PPDU or the PHY SYNC field, shortSYNC field, or Long PHY SYNC field, whichever exists and is used to determine PHY-CCA.indication, is below the SRG OBSS PD level. The SRG OBSS PD level is defined in 26.10.2.4 (Adjustment of OBSS PD and transmit power). If the STA has dot11HEPSROptionImplemented set to true, it also follows the rules defined in 26.10.4 (Interaction of OBSS PD and PSR-based spatial reuse) to determine SRG OBSS PD level.

3) The PPDU is not one of the following:

   i) A non-HE PPDU that carries a frame where the RA field is equal to the STA MAC address

   ii) A non-HE PPDU that carries a Public Action frame

   iii) A non-HE PPDU that carries a VHT/HE NDP Announcement frame or FTM frame(#7223)

   iv) A non-HE NDP

NOTE 1—A STA cannot perform SR over an HE sounding NDP or HE TB feedback NDP (see 26.11.6 (SPATIAL_REUSE)).

If the frame is carried in an HE ER SU PPDU that is identified as an inter-BSS PPDU (where power of the L-STF/L-LTF symbols is boosted 3 dB), 3 dB shall be subtracted from the received signal strength measured from the L-STF or L-LTF fields of the PPDU, prior to using it to determine PHY-CCA.indication and to comparing it to the SRG OBSS PD level as described in this subclause, to compensate for the power difference.

NOTE 2—If a received CF-End frame satisfies the conditions above, neither the issuance of a PHY-CCARESET.request nor the choice to not update the basic NAV timer results in the cancellation of the NAV, which would normally occur following the reception of a CF-End frame.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The PHY-CCARESET.request primitive shall be issued at the end of the PPDU if the PPDU is an HE SU PPDU or an HE ER SU PPDU and the RXVECTOR parameter SPATIAL_REUSE indicates SR_DELAYED.

NOTE 3—An AP can get protection equivalent to SR_DELAYED by transmitting the Trigger frame in a non-HT PPDU or HT PPDU with the TXVECTOR parameter AGGREGATION set to 0 instead of in a VHT PPDU.

If the PHY-CCARESET.request primitive is issued before the end of the received PPDU, and a TXOP is initiated within the duration of the received PPDU, then the TXOP and the duration of the transmitted PPDU within that TXOP shall be limited to the duration of the received PPDU if the received PPDU is an HE MU PPDU and the RXVECTOR parameter SPATIAL_REUSE indicates SR_RESTRICTED.

NOTE 4—The restriction, in addition to the TXOP limit, of the PPDU duration within the TXOP is included in the above paragraph related to SR_RESTRICTED as there are conditions where the TXOP limit can be exceeded (see 10.23.2.9 (TXOP limits)).

An AP that sends a Spatial Reuse Parameter Set element with the SRG Information Present subfield in the SR Control field set to 1 shall set the SRG BSS Color Bitmap and SRG Partial BSSID Bitmap fields as follows:

— If the transmitting AP is in the same ESS as another AP (i.e., with the same SSID and connected by a DS) or is controlled by the same external management entity as another AP (irrespective of SSID), then the transmitting AP may set the SRG BSS Color Bitmap and/or SRG Partial BSSID Bitmap fields that correspond to that other AP to 1.

— Otherwise, the AP shall set the bits in the SRG BSS Color Bitmap and/or SRG Partial BSSID Bitmap to 0.

If an HE AP determines values for dot11SRGAPBSSColorBitmap and dot11SRGAPBSSIDBitmap (i.e., the SRG for the AP's own transmissions), then the values shall be determined according to the rules above in this subclause.

### 26.10.2.4 Adjustment of OBSS PD and transmit power

If using OBSS PD-based spatial reuse, an HE STA shall maintain an OBSS PD level and may adjust this OBSS PD level in conjunction with its transmit power and a value, *PPDU_BW*, derived from the received PPDU. The adjustment shall be made in accordance with Equation (26-5).(#2379)

$$OBSS\_PD_{level} \le max(OBSS\_PD_{min}, min(OBSS\_PD_{max}, OBSS\_PD_{min} + (TX\_PWR_{ref} - TX\_PWR))) + 10\log 10(PPDU\_BW/20\ \text{MHz}) \quad (26\text{-}5)$$

where *PPDU_BW* is determined by Table 26-10 (PPDU_BW determination) using the following RXVECTOR parameter of the received PPDU:

— CH_BANDWIDTH if present

— CH_BANDWIDTH_IN_NON_HT if present and if CH_BANDWIDTH is not present

— DATARATE if neither CH_BANDWIDTH nor CH_BANDWIDTH_IN_NON_HT is present

**Table 26-10—*PPDU_BW* determination**

| DATARATE | CH_BANDWIDTH or CH_BANDIWDTH_IN_NON_HT | *PPDU_BW* |
|---|---|---|
| N/A | CBW20, HT_CBW20, NON_HT_CBW20 | 20 MHz |
| N/A | CBW40, HT_CBW40, NON_HT_CBW40 | 40 MHz |
| N/A | CBW80, HE-CBW-PUNC80-PRI, HE-CBW-PUNC80-SEC | 80 MHz |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 26-10—*PPDU_BW* determination *(continued)***

| | | |
|---|---|---|
| N/A | CBW160, CBW80+80, HE-CBW-PUNC160-PRI20, HE-CBW-PUNC80+80-PRI20, HE-CBW-PUNC160-SEC40, HE-CBW-PUNC80+80-SEC40 | 160 MHz |
| 1, 2, 5.5, or 11 | N/A | 20 MHz |

The value of the $OBSS\_PD_{level}$ is applicable to the start of a 20 MHz PPDU received on the primary 20 MHz channel. If the bandwidth of the received PPDU differs from 20 MHz, then the value of the $OBSS\_PD_{level}$ is increased by(#2379) 10 log10 (bandwidth/20 MHz), using the bandwidth in MHz indicated by the value of RXVECTOR parameter CH_BANDWIDTH or CH_BANDWIDTH_IN_NON_HT if present.

$TX\_PWR_{ref}$ = 21 dBm for non-AP STAs.

$TX\_PWR_{ref}$ = 21 dBm for an AP with the Max HE-MCS For 3 SS subfield in the Tx HE-MCS Map ≤ 80 MHz subfield in the Supported HE-MCS and NSS Set field of its HE Capabilities element field set to 3.

$TX\_PWR_{ref}$ = 25 dBm for an AP with the Max HE-MCS For 3 SS subfield in the Tx HE-MCS Map ≤ 80 MHz subfield in the Supported HE-MCS and NSS Set field of its HE Capabilities element field set to a value other than 3.

*TX_PWR* is the combined transmit power at the transmit antenna connector of all antennas in dBm and is set following the rules in (#1085)11.7.6 (Transmit power selection) and, for transmission of HE TB PPDU, also following the rules in 27.3.15.2 (Power precorrection(M118)).

NOTE 1—The $TX\_PWR_{ref}$ is 4 dB higher for APs with more than 2 spatial streams because those APs typically have higher transmit power than other devices and the OBSS PD procedure is based on a relative reduction of power.

NOTE 2—A STA might adjust its OBSS PD level, provided that Equation (26-5) is satisfied. As an example, a non-AP HE STA might monitor the beacons transmitted by the AP to which it is associated, measure their RSSI, subtract a value of 25 dB (as an approximation to the required RSNI) to provide a candidate OBSS PD level, and if Equation (26-5) is satisfied, adjust its OBSS PD level to the candidate level.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The adjustment rule is illustrated in Figure 26-11 (Illustration of the adjustment rule for OBSS PD and TX_PWR(11ax)).

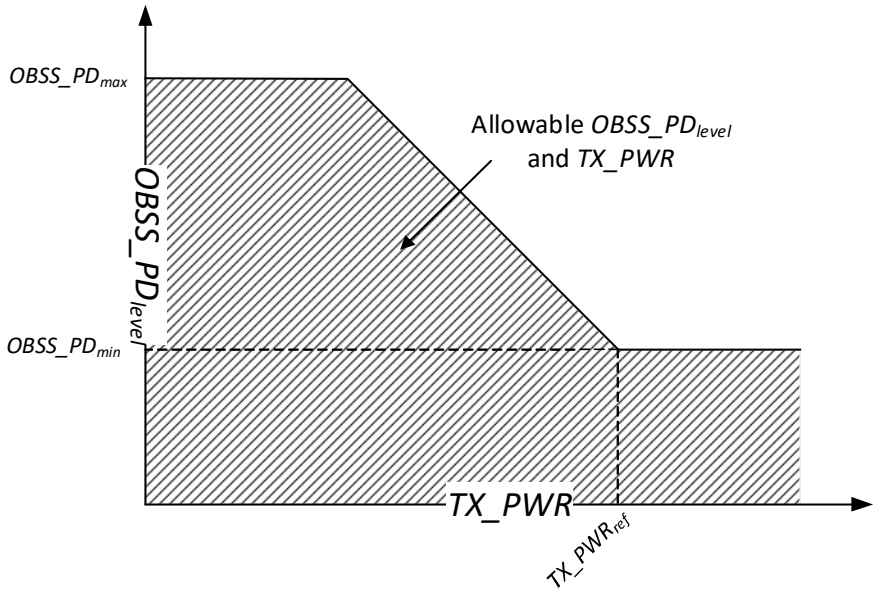

**Figure 26-11—Illustration of the adjustment rule for OBSS PD and TX_PWR(11ax)**

An AP may define SRG OBSS PD Min Offset and SRG OBSS PD Max Offset values that are used by its associated STAs to derive an SRG OBSS PD level for determining reception behavior for inter-BSS PPDUs that are determined to be SRG PPDUs. An AP may define a non-SRG OBSS PD Max Offset value that is used by its associated STAs to derive a non-SRG OBSS PD level for determining reception behavior for inter-BSS PPDUs that are not determined to be SRG PPDUs. The values of SRG OBSS PD Min Offset, SRG OBSS PD Max Offset, and Non-SRG OBSS PD Max Offset are transmitted to associated STAs within the Spatial Reuse Parameter Set element.

An AP transmitting a Spatial Reuse Parameter Set element shall respect the following constraints:

— $-82 \leq -82 + \text{SRG OBSS PD Min Offset} \leq -62$
— $\text{SRG OBSS PD Min Offset} \leq \text{SRG OBSS PD Max Offset}$
— $-82 + \text{SRG OBSS PD Max Offset} \leq -62$
— $-82 + \text{Non-SRG OBSS PD Max Offset} \leq -62$

An HE STA shall maintain a non-SRG OBSS PD level, with its value selected by respecting the OBSS PD level condition in Equation (26-5) but with Non-SRG OBSS PD Min and Non-SRG OBSS PD Max in place of $OBSS\_PD_{min}$ and $OBSS\_PD_{max}$, respectively. A non-AP STA shall determine Non-SRG OBSS PD Min and Non-SRG OBSS PD Max according to Table 26-11 (Non-SRG OBSS PD Min and Non-SRG OBSS PD Max values for non-AP STAs(11ax)). An HE AP shall set Non-SRG OBSS PD Min to –82 dBm and Non-SRG OBSS PD Max to –82 dBm + dot11NonSRGAPOBSSPDMaxOffset.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 26-11—Non-SRG OBSS PD Min and Non-SRG OBSS PD Max values for non-AP STAs(11ax)**

| Non-SRG OBSS PD SR Disallowed field in Spatial Reuse Parameter Set element | Non-SRG Offset Present field in Spatial Reuse Parameter Set element | Value of Non-SRG OBSS PD Min (dBm) | Value of Non-SRG OBSS PD Max (dBm) |
|---|---|---|---|
| Not applicable if the Spatial Reuse Parameter Set element is not received | Not applicable if the Spatial Reuse Parameter Set element is not received | –82 | –62 |
| 0 | 0 | –82 | –62 |
| 0 | 1 | –82 | –82 + Non-SRG OBSS PD Max Offset |
| 1 | N/A | –82 | –82 |

An HE STA shall maintain an SRG OBSS PD level, with its value selected by respecting the OBSS PD level condition in Equation (26-5) but with SRG OBSS PD Min and SRG OBSS PD Max in place of $OBSS\_PD_{min}$ and $OBSS\_PD_{max}$, respectively. A non-AP STA shall determine SRG OBSS PD Min and SRG OBSS PD Max using Table 26-12 (SRG OBSS PD Min and SRG OBSS PD Max values for non-AP STAs(11ax)). An HE AP shall set SRG OBSS PD Min to –82 + dot11SRGAPOBSSPDMinOffset dBm and SRG OBSS PD Max to –82 + dot11SRGAPOBSSPDMaxOffset dBm. An HE AP may transmit SRG OBSS PD Min and SRG OBSS PD Max offset values that are different from the ones that it uses.

**Table 26-12—SRG OBSS PD Min and SRG OBSS PD Max values for non-AP STAs(11ax)**

| SRG Information Present field in Spatial Reuse Parameter Set element | Value of SRG OBSS PD Min (dBm) | Value of SRG OBSS PD Max (dBm) |
|---|---|---|
| Not applicable if the Spatial Reuse Parameter Set element is not received | N/A see NOTE | N/A see NOTE |
| 0 | N/A see NOTE | N/A see NOTE |
| 1 | –82 + SRG OBSS PD Min Offset | –82 + SRG OBSS PD Max Offset |
| NOTE—If SRG Information is not present, a STA cannot determine a PPDU to be SRG and therefore will not use SRG OBSS PD Min or SRG OBSS PD Max values. | | |

The Spatial Reuse Parameter Set element is optionally present in Beacon frames, Probe Response frames, and (Re)Association Response frames.

### 26.10.2.5 OBSS PD SR transmit power restriction period

If a STA ignores an inter-BSS PPDU following the procedure in 26.10.2.3 (General operation with SRG OBSS PD level) using a chosen SRG OBSS PD level, or following the procedure in 26.10.2.2 (General operation with non-SRG OBSS PD level) using a chosen non-SRG OBSS PD level, then the STA shall start

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

an OBSS PD SR transmit power restriction period. This OBSS PD SR transmit power restriction period shall be terminated at the end of the TXOP that the STA gains once its backoff reaches zero.

If a STA starts an OBSS PD SR transmit power restriction period with a chosen non-SRG OBSS PD level, the STA's transmit power as measured at the transmit antenna connector shall be equal to or lower than the $TX\_PWR_{max}$, calculated with the chosen non-SRG OBSS PD level using Equation (26-6) and the appropriate non-SRG parameters according to Table 26-11 (Non-SRG OBSS PD Min and Non-SRG OBSS PD Max values for non-AP STAs(11ax)), for the transmissions of any PPDU that is not carrying a frame that is allowed to be sent without regard to the busy/idle state of the medium until the end of the OBSS PD SR transmit power restriction period.

If a STA starts an OBSS PD SR transmit power restriction period with a chosen SRG OBSS PD level, the STA's transmit power as measured at the transmit antenna connector shall be equal to or lower than the $TX\_PWR_{max}$, calculated with the chosen SRG OBSS PD level using Equation (26-6) and the appropriate SRG parameters according to Table 26-12 (SRG OBSS PD Min and SRG OBSS PD Max values for non-AP STAs(11ax)), for the transmissions of any PPDU that is not carrying a response frame that is allowed to be sent without regard to the busy/idle state of the medium until the end of the OBSS PD SR transmit power restriction period.

NOTE 1—Examples of frames that are transmitted without regard to the busy/idle state of the medium include but are not limited to a frame contained in an HE TB PPDU that is a response to a Trigger frame with the CS Required subfield set to 0 and an Ack or BlockAck frame sent as an immediate response.

A STA may have multiple ongoing OBSS PD SR transmit power restriction periods that overlap in time.

NOTE 2—The STA's transmit power is always equal to or lower than the minimum $TX\_PWR_{max}$ among all $TX\_PWR_{max}$ from ongoing OBSS PD SR transmit power restriction periods.

NOTE 3—Equation (26-6) is equivalent to the condition defined in Equation (26-5). The STA can derive $OBSS\_PD_{level}$ from its transmit power or can derive $TX\_PWR_{max}$ from $OBSS\_PD_{level}$(#1317).

$$TX\_PWR_{max} = \begin{cases} \text{unconstrained, if } OBSS\_PD_{level} \le OBSS\_PD_{min} \\ TX\_PWR_{ref} - (OBSS\_PD_{level} - OBSS\_PD_{min}), \text{ if } OBSS\_PD_{max} \ge OBSS\_PD_{level} > OBSS\_PD_{min} \end{cases} \quad (26\text{-}6)$$

NOTE 4—Anytime, even if $TX\_PWR_{max}$ is unconstrained, the STA has to respect the transmit power restrictions defined in 11.7.6.

An example of OBSS PD SR operation is shown in Figure 26-12 (Example of OBSS PD SR operation(11ax)). In this example, STA SR S2

- Receives the PPDU from S1 and, if it classifies the PPDU as inter-BSS PPDU, ignores the PPDU using OBSS PD-based spatial reuse with non-SRG OBSS PD, starts the OBSS PD SR transmit power restriction period 1 with TX_PWRmax 1, and decrements its backoff counter until the reception of the PPDU from D1.
- Receives the PPDU from D1 and, if it classifies the PPDU as inter-BSS PPDU, ignores the PPDU (if it chooses to do so) using OBSS PD-based spatial reuse with non-SRG OBSS PD, starts the OBSS PD SR transmit power restriction period 2 with TX_PWRmax 2, and decrements its backoff counter until the reception of the PPDU from S1".
- Defers during the TXOP S1" set by the intra-BSS PPDU from S1" that belongs to its own BSS and, at the end of the TXOP S1", resumes the decrement of its backoff until the reception of the PPDU from S1'.
- Receives the PPDU from S1' and, if it classifies the PPDU as SRG PPDU, ignores the PPDU (if it chooses to do so) using OBSS PD-based spatial reuse with SRG OBSS PD, starts the OBSS PD SR

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

transmit power restriction period 3 with TX_PWRmax 3, and decrements its backoff counter until the counter reaches zero because it does not receive the PPDU from D1'.

— Starts transmitting a PPDU with a TX_PWRmax equal to min(TX_PWRmax 1, TX_PWRmax 2, TX_PWRmax 3) and respects this transmit power restriction until the end of the SR TXOP.

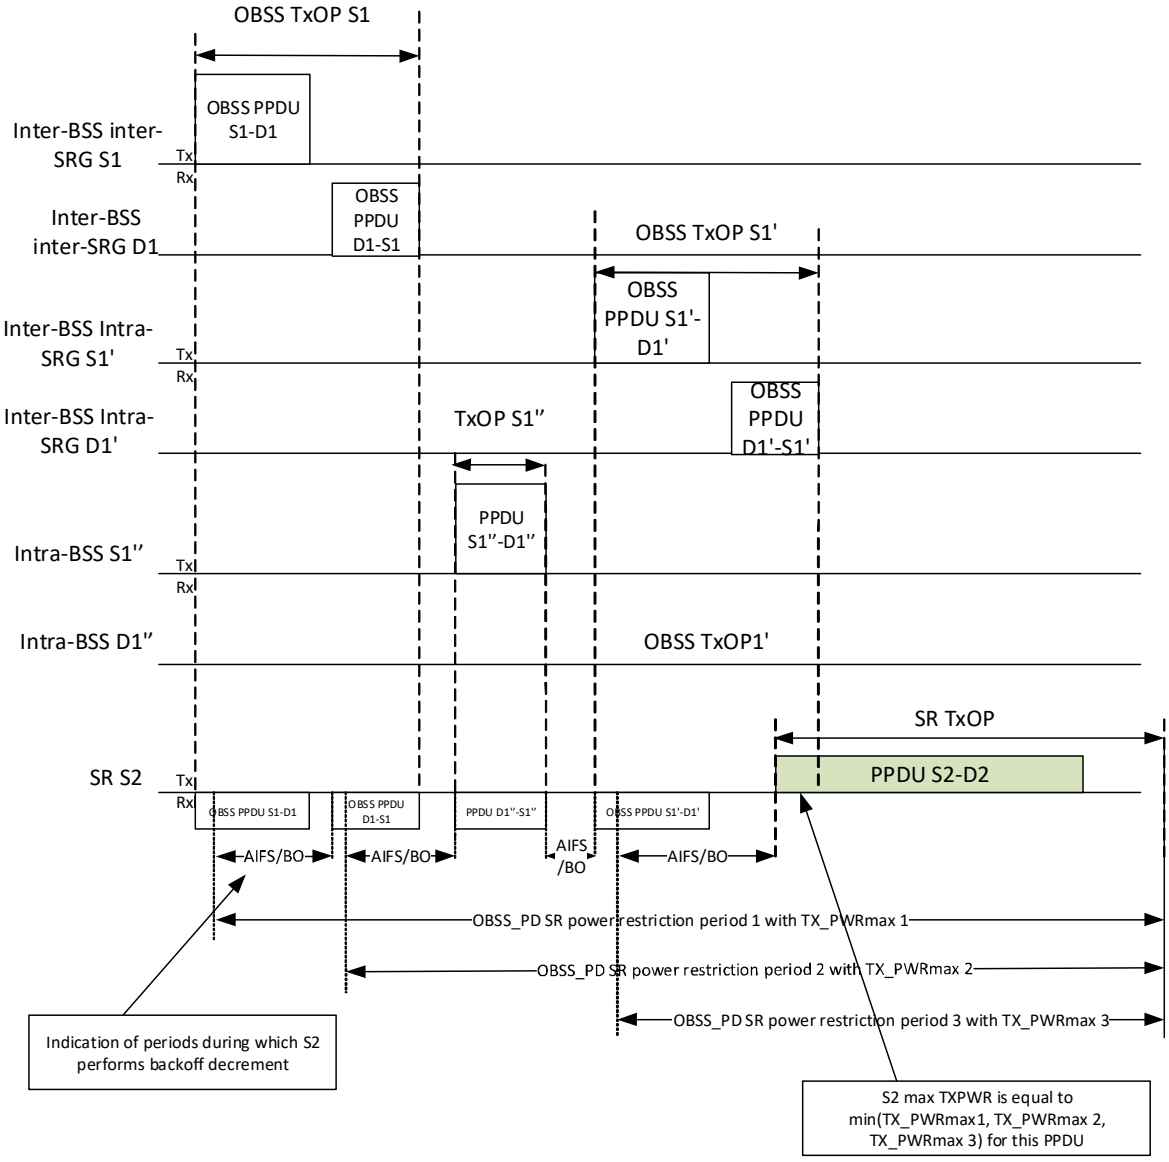

**Figure 26-12—Example of OBSS PD SR operation(11ax)**

### 26.10.2.6 OBSS PD-based spatial reuse backoff procedure

If an HE STA ignores an inter-BSS PPDU following the procedure in 26.10.2.2 (General operation with non-SRG OBSS PD level), the HE STA may resume EDCAF procedures after the PHY-CCARESET.request primitive is sent, provided that the medium condition is not otherwise indicated as BUSY.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 26.10.3 PSR-based spatial reuse operation

#### 26.10.3.1 General

An HE STA supporting PSR-based PSRT PPDU transmission indicates this support by setting the PSR-based SR Support subfield to 1 in the HE PHY Capabilities Information field in the HE Capabilities element (see Table 9-376 (Subfields of the HE PHY Capabilities Information field(11ax))). An HE-STA supporting PSR-based PSRT PPDU reception indicates this support by setting the PSR Responder subfield to 1 in the HE MAC Capabilities Information field in the HE Capabilities element (see Table 9-375 (Subfields of the HE MAC Capabilities Information field(11ax))).

An HE STA shall set the PSR-based SR Support field to 1 in the HE Capabilities element it transmits if it supports transmitting an PSRT PPDU under the conditions specified in this subclause; otherwise, the STA shall set the PSR-based SR Support field to 0.

STAs that receive a Spatial Reuse Parameter Set element from their associated AP that has a value of 1 in the PSR Disallowed subfield shall not perform PSR-based SR transmissions.

An PSR opportunity is identified from the value of the RXVECTOR parameter SPATIAL_REUSE of an HE TB PPDU and/or the contents of a Trigger frame. An HE STA may initiate an SR transmission during an PSR opportunity for the duration of an ongoing PPDU when certain conditions, designed to avoid interfering with the reception of the ongoing PPDU at the recipient, are met. If the RXVECTOR parameter SPATIAL_REUSE of the ongoing PPDU has the value PSR_DISALLOW or PSR_AND_NON_SRG_OBSS_PD_PROHIBITED, no PSR-based SR transmission is allowed for the duration of that PPDU.

An AP sending a Trigger frame may set the Spatial Reuse *n* field(s) in the UL Spatial Reuse subfield in the Common Info field of the Trigger frame to PSR_DISALLOW or, if permitted by the rules in 26.11.6 (SPATIAL_REUSE), to PSR_AND_NON_SRG_OBSS_PD_PROHIBITED to disallow OBSS STAs from performing PSR-based SR transmission during the ensuing uplink PPDU duration. An AP sending a Trigger frame shall not set the SR field in the Common Info field of the Trigger frame to SR_DELAYED or SR_RESTRICTED.

An HE STA shall set the PSR Responder subfield in the HE Capabilities element it transmits to 1 if dot11SRResponderOptionImplemented is true; otherwise, the HE STA shall set the PSR Responder subfield to 0.(#3035)(#3036)

#### 26.10.3.2 PSR-based spatial reuse initiation

An HE STA identifies an PSR opportunity if the following two conditions are met:

a) The STA receives a (#3038)PHY-RXEARLYSIG.indication or PHY-RXSTART.indication corresponding to the reception of a PSRR PPDU that is identified as an inter-BSS PPDU (see 26.2.2 (Intra-BSS and inter-BSS PPDU classification)).

b) An PSRT PPDU is queued for transmission, and the intended transmit power of the PSRT PPDU in dBm meets the following condition:(#2243)(#3360)(#4316)

$$TxPower_{PSRT} - 10 \times log10(N_{PSRT,nonpunc}) \leq PSR_{min} - RPL_{PSRR,20MHz}$$

where,

$TxPower_{PSRT}$ is the intended transmit power over the entire bandwidth of the PSRT PPDU in dBm
$N_{PSRT,nonpunc}$ is the number of nonpunctured 20 MHz subchannels of the PSRT PPDU
$RPL_{PSRR,20MHz}$ is the normalized received signal power in units of dBm/20 MHz, measured at the antenna connector in at least one 20 MHz subchannel. The measured 20 MHz subchannel(s)

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

shall be the subchannel(s) in which the preamble of both the PSRR PPDU and the PSRT PPDU are present. The measurement method is implementation dependent.

$PSR_{min}$ is equal to the PSR value if there exists one PSR value within the bandwidth of the PSRT PPDU or the smallest of the PSR values if there exist multiple PSR values within the bandwidth of the PSRT PPDU. Each PSR value is specified per 20 MHz. They are obtained from the Meaning column of Table 27-24 (Spatial Reuse field encoding for an HE TB PPDU(11ax)) based on at least one of the following:

i) The value of the UL Spatial Reuse subfield in the Common Info field of the Trigger frame of the PSRR PPDU.

ii) The value of the RXVECTOR parameter Spatial Reuse of the HE TB PPDU that follows the PSRR PPDU.

(#2243)The PSR value is determined for each 20 MHz subchannel for a 20 MHz, 40 MHz, or 80 MHz PPDU. In the case of a 160 MHz or 80+80 MHz PSRR PPDU or HE TB PPDU that follows the PSRR PPDU, the UL Spatial Reuse subfield or the RXVECTOR parameter SPATIAL_REUSE represent the PSR value per 20 MHz and the two 20 MHz subchannels within each 40 MHz subband have the same PSR value, see Table 27-22 (HE-SIG-A field of an HE TB PPDU(11ax)).

An HE STA that identifies an PSR opportunity may choose to not perform NAV update operations normally executed based on the receipt of the RXVECTOR parameter TXOP_DURATION and the Trigger frame Duration field. (#2245)An OBSS STA, shown as $STA_{OBSS-A}$ in Figure 26-13 (PSRR PPDU spatial reuse(#2245)(11ax)(#3277)), that identifies an PSR opportunity to transmit a PSRT PPDU to another OBSS STA, shown as $STA_{OBSS-B}$ in the same figure, may issue a PHY-CCARESET.request to (#3683)discard the associated HE TB PPDU(s) that are triggered by the Trigger frame of the PSRR PPDU and that occur within aSIFSTime + aRxPHYStartDelay + 2 × aSlotTime of the end of the last symbol on the air of the triggering PPDU (which is also the PSRR PPDU), provided that the value of the RXVECTOR parameter BSS_COLOR of the HE TB PPDU matches the BSS color of the PSRR PPDU. An OBSS STA that identifies an PSR opportunity shall not transmit an PSRT PPDU that terminates beyond the PPDU duration of the HE TB PPDU that is triggered by the Trigger frame of the PSRR PPDU.

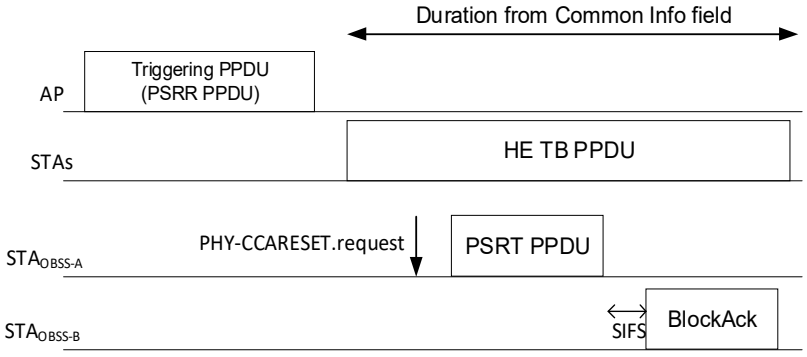

**Figure 26-13—PSRR PPDU spatial reuse(#2245)(11ax)(#3277)**

### 26.10.3.3 PSR-based spatial reuse backoff procedure

If an HE STA identifies an PSR opportunity as allowed in 26.10.3.2 (PSR-based spatial reuse initiation), the HE STA may continue the countdown of an existing backoff procedure, provided that the medium condition is not otherwise indicated as BUSY. If the HE STA receives another PPDU during the backoff procedure, it shall suspend its backoff; subsequently, if an PSR opportunity is identified based on the identification of the new PPDU as an PSRR PPDU, then the STA may resume its backoff procedure. The TXOP that the HE

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

STA gains once its backoff reaches zero shall not extend beyond the PSR opportunity endpoint that is the earliest ending of all durations of all PSRR PPDUs that were used to confirm the PSR opportunity and all durations indicated in the Common Info fields of Trigger frames within all PSRR PPDUs that were used to confirm the PSR opportunity.

If the HE STA is employing $OBSS\_PD_{level}$ as a threshold for determination of an IDLE medium condition prior to the reception of an PSRR PPDU per the rules specified in 26.10.2 (OBSS PD-based spatial reuse operation), the intended transmit power of the next PSRT PPDU in the transmission queue as measured at the transmit antenna connector shall be equal to or lower than the $TX\_PWR_{max}$, calculated with this specific $OBSS\_PD_{level}$ using Equation (26-6).

After a STA has identified the start of an PSR opportunity, and until the PSR opportunity endpoint is reached, the transmission of any PPDU by the STA shall be limited by the transmit power restrictions identified in 26.10.3 (PSR-based spatial reuse operation).

### 26.10.3.4 UL Spatial Reuse subfield of Trigger frame

An AP with dot11HEPSROptionImplemented set to true that transmits a Trigger frame may determine the value of the UL Spatial Reuse subfield of the Common Info field of the Trigger frame for each 20 MHz subchannel for a 20 MHz, 40 MHz, or 80 MHz PPDU or for each 40 MHz subchannel for an 80+80 MHz or 160 MHz PPDU by selecting the row in Table 27-24 (Spatial Reuse field encoding for an HE TB PPDU(11ax)) that has a(#3435) value in the (#4177)Meaning column that is the highest value that is less than or equal to the numeric(#3435) value of the computed MAC parameter PSR_INPUT as follows:

$$\text{PSR\_INPUT} = TX\_PWR_{AP} + \text{Acceptable Receiver Interference Level}_{\text{AP}} \quad (26\text{-}7)$$

where

$TX\_PWR_{AP}$ is the total power at the antenna connector, in dBm, for that 20 MHz subchannel for a 20 MHz, 40 MHz, or 80 MHz PPDU or for that 40 MHz subchannel for an 80+80 MHz or 160 MHz PPDU, over all antennas used to transmit the PSRR PPDU containing the Trigger frame

Acceptable Receiver Interference $\text{Level}_{\text{AP}}$ is a value in dBm for that 20 MHz subchannel for a 20 MHz, 40 MHz, or 80 MHz PPDU or for that 40 MHz subchannel for an 80+80 MHz or 160 MHz PPDU and should be set to the expected receive signal power indicated by the UL Target Receive Power subfield in the Trigger frame for the highest HE-MCS of the ensuing HE TB PPDUs minus the minimum SNR value that yields ≤ 10% PER for that MCS minus a safety margin value not to exceed 5 dB as determined by the AP

An AP with dot11HEPSROptionImplemented set to true that transmits a Trigger frame may set the value of the UL Spatial Reuse subfield of the Common Info field of the Trigger frame in each 20 MHz bandwidth for a 20 MHz, 40 MHz, or 80 MHz PPDU or in each 40 MHz bandwidth for an 80+80 or 160 MHz PPDU to PSR_DISALLOW.

An AP with dot11HEPSROptionImplemented set to false that transmits a Trigger frame shall set the value of the UL Spatial Reuse subfield of the Common Info field of the Trigger frame in each 20 MHz bandwidth for a 20 MHz, 40 MHz, or 80 MHz PPDU or in each 40 MHz bandwidth for an 80+80 or 160 MHz PPDU to PSR_DISALLOW.

### 26.10.3.5 PSRT PPDU transmission requirements

An HE STA that identifies an PSR opportunity shall not transmit a frame during the PSR opportunity that elicits a response transmission from a STA from which it has not received an HE Capabilities element with the PSR Responder subfield equal to 1. An HE STA that identifies an PSR opportunity shall not transmit a

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

frame that does not include a CAS Control subfield with the PSRT PPDU subfield set to 1 and that solicits a response transmission during that PSR opportunity.

#### 26.10.3.6 PSRT PPDU reception and response transmission requirements

An HE STA that receives a PPDU that contains at least one frame with a CAS Control subfield with an PSRT PPDU subfield equal to 1 shall not transmit a response PPDU elicited by the received PPDU if all outstanding PSR and OBSS PD transmit power requirements are not met by the response transmission.

### 26.10.4 Interaction of OBSS PD and PSR-based spatial reuse

An HE STA with dot11HEPSROptionImplemented set to true that receives a PPDU that is identified as an inter-BSS PPDU with a value other than PSR_DISALLOW or PSR_AND_NON_SRG_OBSS_PD_PROHIBITED for the RXVECTOR parameter SPATIAL_REUSE and fails to identify an PSR opportunity based on the receipt of the PPDU shall disable OBSS PD SR operation on this PPDU.

An HE STA with dot11HEPSROptionImplemented set to true that receives a PPDU that is identified as an inter-BSS PPDU with a value other than PSR_DISALLOW, SR_DELAYED, or PSR_AND_NON_SRG_OBSS_PD_PROHIBITED for the RXVECTOR parameter SPATIAL_REUSE and identifies an PSR opportunity based on the receipt of the PPDU may disable OBSS PD SR operation on this PPDU.

An HE STA with dot11HEPSROptionImplemented set to true that receives a PPDU that is identified as an inter-BSS PPDU with a value other than PSR_DISALLOW or PSR_AND_NON_SRG_OBSS_PD_PROHIBITED in the UL Spatial Reuse subfield of the Common Info field of a Trigger frame and fails to identify an PSR opportunity based on the receipt of the PPDU shall disable OBSS PD SR operation on the HE TB PPDU that is elicited by the Trigger frame.

An HE STA with dot11HEPSROptionImplemented set to true that receives a PPDU that is identified as an inter-BSS PPDU with a value other than PSR_DISALLOW in the UL Spatial Reuse subfield of the Common Info field of a Trigger frame and identifies an PSR opportunity based on the receipt of the PPDU may disable OBSS PD SR operation on the Data field of the HE TB PPDU that is elicited by the Trigger frame.

## 26.11 Rules for setting some TXVECTOR parameters for PPDUs transmitted by an HE STA

### 26.11.1 STA_ID

Each parameter STA_ID in the TXVECTOR identifies the STA or group of STAs that is the recipient of an RU in the HE MU PPDU transmitted with the TXVECTOR parameter UPLINK_FLAG set to 0. For an individually addressed RU the parameter STA_ID is set to the 11 LSBs of the AID of the STA receiving the PSDU contained in that RU. If an RU is intended for one or more unassociated non-AP STAs, then the parameter STA_ID for that RU is set to 2045. If an RU is intended for no user, then the parameter STA_ID for that RU is set to 2046.

If an RU is intended for an AP (i.e., the TXVECTOR parameter UPLINK_FLAG is 1), then the parameter STA_ID contains one element that is set to the 11 LSBs of the AID of the non-AP STA transmitting the PPDU. If the parameter STA_ID has more than one element, then all other elements are set to 2046.(#4409)

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

NOTE 1—When the UL HE MU PPDU is a 20 MHz HE MU PPDU with just a 106-tone RU, the parameter STA_ID contains two or more elements, one for the RU allocated to the AP and the others for unallocated RUs (see Table 27-27 (RU Allocation subfield(11ax))).(#4409)

NOTE 2—A non-AP STA can transmit (#2318)a UL HE MU PPDU to help the AP identify the transmitter of a failed PPDU so that the AP can allocate resources for that non-AP STA in a later TXOP. All unassociated STAs share the same parameter STA_ID value (i.e., 2045), which does not uniquely identify the transmitter. Therefore an unassociated STA is not allowed to transmit (#2318)a UL HE MU PPDU.

If an RU is intended for multiple STAs for MU-MIMO, then multiple STAs identified by STA-IDs in the parameter STA_ID (M118)use the same resource unit (see 26.5.2 (UL MU operation)). If an RU is intended for multiple associated STAs and carries a single A-MPDU, then the parameter STA_ID is set as follows:

— For an AP with dot11MultiBSSIDImplemented equal to false, if the RU is intended for more than one associated STA in the BSS that is not a recipient of an individually addressed RU, the parameter STA_ID is set to 0.

— For an AP with dot11MultiBSSIDImplemented equal to true, if the RU is intended for more than one associated STA in any of its BSSs that is not a recipient of an individually addressed RU, the parameter STA_ID is set to 0 for a transmitted BSSID or to the value of the BSSID Index field corresponding to that BSS (see 9.4.2.72 (Multiple BSSID-Index element)) for a nontransmitted BSSID. The number of such elements shall not exceed the maximum number of BSSs of the multiple BSSID set.

— For an AP with dot11MultiBSSIDImplemented equal to true, if the RU is intended for more than one associated STA on any of its BSSs that is not a recipient of an individually addressed RU or another broadcast RU corresponding to parameter STA_ID equal 0 or equal to the BSSID Index of a BSSID in a multiple BSSID set, the parameter STA_ID is set to 2047.

The parameter STA_ID values between 2008 and 2044 are reserved.

A non-AP STA shall not transmit an HE MU PPDU where the TXVECTOR parameter STA_ID includes more than one entry in the range 1 to 2007.

### 26.11.2 UPLINK_FLAG

An HE STA transmitting an HE SU PPDU, HE ER SU PPDU, or HE MU PPDU sets the TXVECTOR parameter UPLINK_FLAG as follows:

— A STA transmitting an HE PPDU containing frames that are addressed to an AP shall set the TXVECTOR parameter UPLINK_FLAG to 1, unless the HE PPDU is an HE ER SU PPDU with the TXVECTOR parameter TXOP_DURATION set to UNSPECIFIED and contains an RTS or CTS frame. In this case, the STA may set the TXVECTOR parameter UPLINK_FLAG to 0.

— Otherwise, the HE STA shall set the TXVECTOR parameter UPLINK_FLAG to 0.

### 26.11.3 BEAM_CHANGE

An HE STA uses the TXVECTOR parameter BEAM_CHANGE to indicate a change in the spatial mapping of the pre-HE-STF portion of the PPDU and the first symbol of HE-LTF (see Table 27-1 (TXVECTOR and RXVECTOR parameters(#12)(11ax))).

An HE STA that transmits an HE SU PPDU or an HE ER SU PPDU shall set the TXVECTOR parameter BEAM_CHANGE to 1 if one or more of the following conditions are met:

— The number of spatial streams is greater than 2.

— The PPDU is the first PPDU in a TXOP.

— The PPDU carries a Trigger frame.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 26.11.4 BSS_COLOR

An HE STA that transmits an HE Operation element shall select and advertise a BSS color as described in 26.17.3 (BSS color).

An HE STA that transmitted an HE Operation element shall set the TXVECTOR parameter BSS_COLOR as follows:

— For an HE SU PPDU, HE ER SU PPDU, or DL HE MU PPDU, the parameter BSS_COLOR is set to the value indicated in the BSS Color subfield of the HE Operation element if all the recipient STAs are members of the HE STA's BSS or the PPDU carries at least one triggering frame.

— For an HE SU PPDU, HE ER SU PPDU, or DL HE MU PPDU, the parameter BSS_COLOR is set to 0 if the HE STA expects that at least one intended recipient STA is not a member of the HE STA's BSS and the PPDU does not carry a triggering frame.

A non-AP HE STA that transmits an HE SU PPDU or HE ER SU PPDU to a STA that is not a member of the transmitting STA's HE BSS shall set the TXVECTOR parameter BSS_COLOR to 0.

NOTE 1—An HE AP that is starting an infrastructure BSS or an HE STA that is starting an IBSS or MBSS selects a nonzero BSS color as described in 26.17.3.2 (Initial BSS color).(#1022)

The active BSS color is one of the following:

— The value of the BSS Color field in the most recently received HE Operation element if an HE STA receives an HE Operation element from a peer HE STA.

— The value of the New BSS Color field in the most recently received BSS Color Change Announcement element if an HE STA receives a BSS Color Change Announcement element from a peer HE STA and the BSS color change TBTT has passed (see 26.17.3.4 (Selecting and advertising a new BSS color)).

An HE STA shall set the TXVECTOR parameter BSS_COLOR for an HE SU PPDU, HE ER SU PPDU, or UL HE MU PPDU that is addressed to a peer STA to the active BSS color value, if the HE STA has established any of the following:

— An association with the peer STA

— A (#2152)TDLS direct link with the peer STA

— An IBSS membership with the peer STA

NOTE 2—A non-AP HE STA sets the TXVECTOR parameter BSS_COLOR for an HE TB PPDU to the active color (see 26.5.2.3 (Non-AP STA behavior for UL MU operation)).

NOTE 3—An HE mesh STA sets the TXVECTOR parameter BSS_COLOR for an HE PPDU that it transmits to a peer HE mesh STA to the value in the BSS Color subfield of its transmitted HE Operation element.

An HE STA that receives an HE PPDU with RXVECTOR parameter BSS_COLOR with a value between 1 and 63 follows the spatial reuse rule described in 26.10 (HE spatial reuse operation(#2389)).

NOTE 4—An HE STA that receives an HE PPDU with the RXVECTOR parameter BSS_COLOR equal to 0 might not follow the spatial reuse rules described in 26.10 (HE spatial reuse operation(#2389)).

An HE STA that receives an HE SU PPDU, HE ER SU PPDU, or HE MU PPDU with the RXVECTOR parameter BSS_COLOR equal to 0 shall not discard the HE PPDU on that basis.

While the BSS Color Disabled subfield is 1, an HE STA shall continue to advertise a nonzero value (same as before the color was disabled) in the BSS Color subfield of HE Operation element and in the TXVECTOR parameter BSS_COLOR of an HE PPDU that it transmits.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

NOTE 5—A non-AP HE STA sets the TXVECTOR parameter BSS_COLOR of an HE PPDU that it transmits to the value advertised by the AP with which it intends to communicate even if the AP has disabled BSS color.

If the value of TXVECTOR parameter PARTIAL_AID[5:8] for VHT PPDUs with the TXVECTOR parameter GROUP_ID equal to 63 transmitted by an HE AP to any associated STA would not be consistent with the partial BSS color (i.e., *BCB*(0:3) described in 26.17.4 (AID assignment)) announced by the HE AP, then the HE AP shall set the Partial BSS Color field in the HE Operation element to 0. Otherwise, the HE AP may set the Partial BSS Color subfield in the HE Operation element to 1 (see 26.17.4 (AID assignment)).

### 26.11.5 TXOP_DURATION

The TXVECTOR parameter TXOP_DURATION of an HE PPDU indicates duration information for NAV setting and protection of the TXOP, except that the TXVECTOR parameter TXOP_DURATION is set to UNSPECIFIED to indicate no duration information.

NOTE 1—The value of TXVECTOR parameter TXOP_DURATION is converted to an indication in the TXOP field of the HE-SIG-A field as described in Table 27-19 (HE-SIG-A field of an HE SU PPDU and HE ER SU PPDU(11ax)), Table 27-21 (HE-SIG-A field of an HE MU PPDU(11ax)), and Table 27-22 (HE-SIG-A field of an HE TB PPDU(11ax)). The indication in the TXOP field of the HE-SIG-A field is converted to the RXVECTOR parameter TXOP_DURATION as described in Table 27-1 (TXVECTOR and RXVECTOR parameters(#12)(11ax)).

A STA that is not a TXOP responder and that transmits an HE SU PPDU, HE ER SU PPDU, or HE MU PPDU may set the TXVECTOR parameter TXOP_DURATION to UNSPECIFIED.

A STA that transmits an HE SU PPDU, HE ER SU PPDU, or HE MU PPDU that carries a PS-Poll frame shall set the TXVECTOR parameter TXOP_DURATION to UNSPECIFIED.

A STA that is a TXOP responder that transmits an HE SU PPDU, HE ER SU PPDU, or HE TB PPDU shall set the TXVECTOR parameter TXOP_DURATION to UNSPECIFIED if the RXVECTOR parameter TXOP_DURATION of the HE PPDU that solicits a response from the STA is UNSPECIFIED.

An HE AP that has set the BSS Color Disabled field in the HE Operation element to 1 shall set the TXVECTOR parameter TXOP_DURATION to UNSPECIFIED for an HE PPDU that it transmits to non-AP STAs associated to it.

If the BSS Color Disabled field is 1 in the HE Operation element most recently received from an AP by a non-AP STA, then the non-AP STA should set the TXVECTOR parameter TXOP_DURATION to UNSPECIFIED for an HE PPDU that is not an HE TB PPDU sent to that AP.

A STA that transmits an HE TB PPDU shall not set the TXVECTOR parameter TXOP_DURATION to UNSPECIFIED if any one of the following conditions is met:

- The RXVECTOR parameter TXOP_DURATION is present for the PPDU that solicits a response from the STA and is not UNSPECIFIED.
- The PPDU that solicits a response from the STA is not an HE PPDU.

A STA that transmits a frame with a Duration field in an HE PPDU with the TXVECTOR parameter TXOP_DURATION not set to UNSPECIFIED shall set the TXVECTOR parameter TXOP_DURATION to the smaller of the duration information indicated by the Duration field and 8448.

NOTE 2—For a TXOP responder, the Duration field in a frame carried in a response PPDU is set based on the Duration field in a frame carried in the PPDU that solicits a response from the TXOP responder as described in 9.2.5.6 (Setting for control response frames) or 9.2.5.7 (Setting for other response frames)

If a STA transmits either an HE TB feedback NDP or an HE TB PPDU carrying a PS-Poll frame with the TXVECTOR parameter TXOP_DURATION not set to UNSPECIFIED, it shall calculate the duration

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

information and set the TXVECTOR parameter TXOP_DURATION for the HE TB feedback NDP or HE TB PPDU to the value of the computed duration information. The TXOP responder shall calculate duration information equal to the duration information indicated by the Duration field of the frame that solicits the response minus the time, in microseconds, between the end of the PPDU carrying the frame that is soliciting the HE TB PPDU and the end of the HE TB PPDU. If the calculated duration information includes a fractional microsecond, the duration information is rounded up to the next higher integer. If the calculated duration information is smaller than 8448 μs, the TXVECTOR parameter TXOP_DURATION shall be set to the calculated duration information. Otherwise, the TXVECTOR parameter TXOP_DURATION shall be set to 8448.

NOTE 3—The time is equal to SIFS plus the duration of the HE TB PPDU, where the duration of the HE TB PPDU is defined in Equation (27-147).

In the 6 GHz band, a TXOP holder shall not set the TXVECTOR parameter TXOP_DURATION for a transmitted HE PPDU to UNSPECIFIED, unless at least one of the following conditions is true:

— The BSS Color Disabled field is 1 in the HE Operation element transmitted within the BSS of which the TXOP holder is a member.

— The HE PPDU carries a PS-Poll frame.

### 26.11.6 SPATIAL_REUSE

The contents of the Spatial Reuse fields are carried in the TXVECTOR parameter SPATIAL_REUSE for an HE PPDU indicating spatial reuse information. The behavior of STAs upon reception of an HE PPDU with different SPATIAL_REUSE values is described in 26.10.2 (OBSS PD-based spatial reuse operation) and 26.10.3 (PSR-based spatial reuse operation). The different values that may be indicated in the SPATIAL_REUSE parameter of the TXVECTOR are listed in Table 27-23 (Spatial Reuse field encoding for an HE SU PPDU, HE ER SU PPDU, and HE MU PPDU(11ax)) and Table 27-24 (Spatial Reuse field encoding for an HE TB PPDU(11ax)). The value PSR_DISALLOW is used to prohibit PSR-based spatial reuse during the transmission of the corresponding PPDU. The value PSR_AND_NON_SRG_OBSS_PD_PROHIBITED is used to prohibit both PSR-based spatial reuse and non-SRG OBSS PD-based spatial reuse during the transmission of the corresponding PPDU. The interpretations of other values are described in this subclause and in 26.10. The conditions for a STA to set the SPATIAL_REUSE parameter to its different values are described in this subclause.

For a PPDU with a value of HE_TB for the TXVECTOR parameter FORMAT, the SPATIAL_REUSE parameter contains an array of one to four values, depending on the TXVECTOR parameter CH_BANDWIDTH. If the TXVECTOR parameter CH_BANDWIDTH is CBW20, CBW40, or CBW80, the first value in the array is the SPATIAL_REUSE parameter that applies to the lowest frequency 20 MHz subband, the second value, if present, applies to the second lowest frequency 20 MHz subband, the third value, if present, applies to the third lowest frequency 20 MHz subband, and the fourth value, if present, applies to the highest frequency 20 MHz subband. If the TXVECTOR parameter CH_BANDWIDTH is CBW160 or CBW80+80, the first value in the array is the SPATIAL_REUSE parameter that applies to the lowest frequency 40 MHz subband, the second value applies to the second lowest frequency 40 MHz subband, the third value applies to the third lowest frequency 40 MHz subband, and the fourth value applies to the highest frequency 40 MHz subband. Each value in the SPATIAL_REUSE parameter array shall individually conform to the rules in this subclause.

An HE STA that transmits an HE TB PPDU sets the TXVECTOR parameter SPATIAL_REUSE as defined in 26.5.2.3 (Non-AP STA behavior for UL MU operation).

An AP with dot11HEPSROptionImplemented set to true that transmits an HE ER SU PPDU that does not contain a Trigger frame should set the TXVECTOR parameter SPATIAL_REUSE to PSR_DISALLOW.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

A non-AP STA with dot11HEPSROptionImplemented set to true that transmits an HE SU PPDU, HE ER SU PPDU, or HE MU PPDU may set the TXVECTOR parameter SPATIAL_REUSE, when permitted by other conditions, to PSR_AND_NON_SRG_OBSS_PD_PROHIBITED if the (#3060)HESIGA Spatial Reuse Value15 Allowed subfield of the SR Control field of the most recently received Spatial Reuse Parameter Set element from its associated AP is equal to 1. Otherwise, the non-AP STA shall set it to PSR_DISALLOW.

An HE STA that transmits an HE TB PPDU determines the value of the TXVECTOR parameter SPATIAL_REUSE according to 26.5.2.3 (Non-AP STA behavior for UL MU operation).

An HE AP with dot11HEPSROptionImplemented set to true that transmits an HE SU PPDU, HE ER SU PPDU, or HE MU PPDU may set the TXVECTOR parameter SPATIAL_REUSE to PSR_DISALLOW to disallow OBSS STAs from performing PSR-based SR transmission during the duration of the corresponding PPDU.

An HE STA with dot11HEPSROptionImplemented set to false may set the TXVECTOR parameter SPATIAL_REUSE to PSR_DISALLOW for any PPDU that is not an HE TB PPDU, an HE NDP PPDU, a PPDU containing an HE NDP Announcement frame, or a PPDU containing a response to an HE NDP Announcement frame.

A STA shall set the TXVECTOR parameter SPATIAL_REUSE of an HE PPDU to PSR_DISALLOW or, if permitted by the other rules in this subclause, to PSR_AND_NON_SRG_OBSS_PD_PROHIBITED, if the STA is a non-AP HE STA and the PSR Disallowed subfield of the SR Control field of the most recently received Spatial Reuse Parameter Set element from its associated AP is equal to 1.

An HE STA shall set the TXVECTOR parameter SPATIAL_REUSE to PSR_AND_NON_SRG_OBSS_PD_PROHIBITED for an HE NDP PPDU.

An HE STA shall set the TXVECTOR parameter SPATIAL_REUSE to PSR_AND_NON_SRG_OBSS_PD_PROHIBITED for a PPDU containing an NDP Announcement frame and in any frame that is transmitted as a response to an NDP Announcement frame.

A non-AP HE STA may set the TXVECTOR parameter SPATIAL_REUSE of an HE PPDU to PSR_AND_NON_SRG_OBSS_PD_PROHIBITED if the (#3060)HESIGA Spatial Reuse Value15 Allowed subfield of the SR Control field of the most recently received Spatial Reuse Parameter Set element from its associated AP is equal to 1. If the (#3060)HESIGA Spatial Reuse Value15 Allowed subfield of the SR Control field of the most recently received Spatial Reuse Parameter Set element from its associated AP is equal to 0 or if STA has not received a Spatial Reuse Parameter Set element from its associated AP, the STA shall not set the TXVECTOR parameter SPATIAL_REUSE of any HE PPDU to PSR_AND_NON_SRG_OBSS_PD_PROHIBITED, unless the HE PPDU contains an NDP, contains an NDP Announcement frame, or is a frame that is transmitted as a response to an NDP Announcement frame.

An AP HE STA may set the TXVECTOR parameter SPATIAL_REUSE of an HE PPDU to PSR_AND_NON_SRG_OBSS_PD_PROHIBITED if the (#3060)HESIGA Spatial Reuse Value15 Allowed subfield of the SR Control field of the most recently transmitted Spatial Reuse Parameter Set element is equal to 1. If the (#3060)HESIGA Spatial Reuse Value15 Allowed subfield of the SR Control field of the most recently transmitted Spatial Reuse Parameter Set element is equal to 0, or if the AP has not transmitted a Spatial Reuse Parameter Set element, the AP shall not set the TXVECTOR parameter SPATIAL_REUSE of any HE PPDU to PSR_AND_NON_SRG_OBSS_PD_PROHIBITED.

An HE AP that transmits an HE SU PPDU or an HE ER SU PPDU that contains a Trigger frame should set the TXVECTOR parameter SPATIAL_REUSE to SR_DELAYED. An HE STA that transmits an HE MU PPDU shall not set the TXVECTOR parameter SPATIAL_REUSE to SR_DELAYED.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

An HE STA that transmits an HE SU PPDU or HE ER SU PPDU shall not set the TXVECTOR parameter SPATIAL_REUSE to SR_RESTRICTED.

An HE AP that transmits an HE MU PPDU that contains a Trigger frame should set the TXVECTOR parameter SPATIAL_REUSE to SR_RESTRICTED.

An HE STA that transmits a PPDU that does not contain a Trigger frame shall not set the TXVECTOR parameter SPATIAL_REUSE to SR_DELAYED or SR_RESTRICTED.

### 26.11.7 INACTIVE_SUBCHANNELS and RU_ALLOCATION

The indication of which subchannels are punctured in an HE sounding NDP or in an HE NDP Announcement frame that is carried in a non-HT duplicate PPDU is conveyed from the MAC to the PHY through the TXVECTOR parameters INACTIVE_SUBCHANNELS and RU_ALLOCATION. The parameter INACTIVE_SUBCHANNELS may be present in the TXVECTOR of a non-HT duplicate PPDU that carries an HE NDP Announcement frame or of an HE sounding PPDU. The parameter INACTIVE_SUBCHANNELS shall not be present otherwise. The setting of the RU_ALLOCATION parameter for other PPDUs is specified in 26.5.2.3.3 (TXVECTOR parameters for HE TB PPDU response to Trigger frame), 26.5.2.3.4 (TXVECTOR parameters for HE TB PPDU response to TRS Control subfield), and 26.5.7.2 (STA behavior).

INACTIVE_SUBCHANNELS is an 8-bit bitmap with an encoding that is the same as the encoding for the Disallowed Subchannel Bitmap subfield defined in 9.3.1.19 (VHT/HE/Ranging NDP Announcement frame format(11ax)(11az)). A bit in the INACTIVE_SUBCHANNELS bitmap is set to 1 to indicate that no energy is transmitted on the corresponding subchannel for the corresponding PPDU. The RU_ALLOCATION parameter is set to a value that corresponds to the puncturing signaled by the INACTIVE_SUBCHANNELS bitmap. If a bit in the INACTIVE_SUBCHANNELS bitmap corresponds to a 20 MHz subchannel outside the PPDU bandwidth, then the bit is set to 1.

A STA transmitting an HE sounding NDP may set the TXVECTOR parameter INACTIVE_SUBCHANNELS to any value, provided that the bit representing the primary 20 MHz channel is set to 0.

If an HE AP transmits an HE NDP Announcement frame in a PPDU with punctured channels, then the TXVECTOR parameters FORMAT, NON_HT_MODULATION, INACTIVE_SUBCHANNELS, and CH_BANDWIDTH shall be set as follows:

- The TXVECTOR parameter FORMAT shall be set to NON_HT.
- The TXVECTOR parameter NON_HT_MODULATION shall be set to NON_HT_DUP_OFDM.
- The INACTIVE_SUBCHANNELS parameter may have any value, except that the bit in the bitmap representing the primary 20 MHz subchannel shall be set to 0.
- The CH_BANDWIDTH parameter value shall be set to CBW80 if there are no bits set to 0 in the INACTIVE_SUBCHANNELS bitmap that correspond to any 20 MHz subchannel of the secondary 80 MHz and at least one bit set to 0 that corresponds to any 20 MHz subchannel of the secondary 40 MHz.
- The CH_BANDWIDTH parameter value shall be set to CBW160 if there is at least one bit set to 0 in the INACTIVE_SUBCHANNELS bitmap that corresponds to any 20 MHz subchannel of the secondary 80 MHz.

Each 8 bits of the RU_ALLOCATION are set to 113 (01110001 in binary representation) for the 242-tone RU that is most closely aligned in frequency with the 20 MHz subchannel that is indicated as disallowed by the value 1 in the INACTIVE_SUBCHANNELS parameter. Each 8 bits of the RU_ALLOCATION are set to 192 (11000000 in binary representation) for the 242-tone RU that is most closely aligned in frequency

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

with the 20 MHz subchannel that is indicated as not disallowed by the value 0 in the INACTIVE_SUBCHANNELS parameter.

### 26.11.8 TRIGGER_RESPONDING

A(#1426) non-AP HE STA that transmits a non-HT or non-HT duplicate PPDU shall set the TXVECTOR parameter TRIGGER_RESPONDING to true if the PPDU is sent in response to an MU-RTS Trigger frame. Otherwise, the non-AP HE STA shall set the TXVECTOR parameter TRIGGER_RESPONDING to false.

### 26.11.9 STBC and DCM

An HE STA shall not transmit an HE SU PPDU or HE ER SU PPDU with the TXVECTOR parameter STBC set to 1 if any of the following conditions is met:

— TXVECTOR parameter DCM is set to 1.
— TXVECTOR parameter NUM_STS is not equal to 2.
— TXVECTOR parameters HE_LTF_TYPE and GI_TYPE are set to 4x HE-LTF and 0u8s_GI, respectively.

An HE STA shall not transmit an HE TB PPDU with the TXVECTOR parameter STBC set to 1 if any of the following conditions is met:

— TXVECTOR parameter DCM is set to 1.
— TXVECTOR parameter NUM_STS is not equal to 2.

An HE STA shall not transmit an HE MU PPDU with the TXVECTOR parameter STBC set to 1 if any of the following conditions is met:

— At least one element in the TXVECTOR parameter DCM is set to 1.
— At least one element in the TXVECTOR parameter NUM_STS is not equal to 2.
— Two or more STA_ID parameters in the TXVECTOR use the same RU.

NOTE—Two or more STA_ID parameters in the TXVECTOR using the same RU means that DL MU-MIMO is used.

An HE STA shall not transmit an HE SU PPDU or HE ER SU PPDU with the TXVECTOR parameter STBC or DCM set to 1 if the TXVECTOR parameters HE_LTF_TYPE and GI_TYPE are set to 4x HE-LTF and 0u8s_GI, respectively.

### 26.11.10 POWER_BOOST_FACTOR(#1067)

For an OFDMA HE MU PPDU, (#3483)the POWER_BOOST_FACTOR parameter for an occupied RU in the TXVECTOR shall be in the range $[1/\sqrt{2}, \sqrt{2}]$ if the Power Boost Factor Support subfield of the HE PHY Capabilities Information field in the HE Capabilities element from any recipient STA of the PPDU equals 0; otherwise (#3483)the POWER_BOOST_FACTOR parameter shall be in the range (#4161)[1/2, 2].

For an HE SU PPDU, non-OFDMA HE MU PPDU and HE ER SU PPDU, (#3483)the POWER_BOOST_FACTOR parameter in the TXVECTOR shall be set to 1.

NOTE—For an HE TB PPDU, (#3483)the POWER_BOOST_FACTOR parameter is not present in the TXVECTOR.

## 26.12 HE PPDU post-FEC padding and packet extension

An HE STA with dot11PPEThresholdsRequired set to false may set the PPE Thresholds Present subfield in HE Capabilities elements that it transmits to 0.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

An HE STA with dot11PPEThresholdsRequired set to true shall set the PPE Thresholds Present subfield in HE Capabilities elements that it transmits to 1.

A STA that sets the PPE Thresholds Present subfield to 0 and the Nominal Packet Padding subfield to 0 in HE Capabilities elements that it transmits has as a nominal packet padding of 0 μs for all constellations, NSS, and RU allocations that it supports.

A STA that sets the PPE Thresholds Present subfield to 0 and the Nominal Packet Padding subfield to 1 in the HE Capabilities elements that it transmits has a nominal packet padding of 8 μs for all constellations, NSS, and RU allocations that it supports.

A STA that sets the PPE Thresholds Present subfield to 0 and the Nominal Packet Padding subfield to 2 in the HE Capabilities elements that it transmits has nominal packet padding of 16 μs for all constellations, NSS, and RU allocations that it supports.

A STA that sets the PPE Thresholds Present subfield to 1 in the HE Capabilities elements that it transmits shall indicate its nominal packet padding per constellation, NSS and RU allocation by setting the subfields of the PPE Thresholds field according to 9.4.2.247 (HE Capabilities element(11ax)) and using the corresponding values from dot11PPEThresholdsMappingTable.

After receiving the PPE Thresholds field from a second STA, the first STA uses the combination of the PPET8 NSTS*n* RU*b* subfield and PPET16 NSTS*n* RU*b* subfield values to determine the nominal packet padding for HE PPDUs that are transmitted to the second STA, using NSTS = *n* and an RU allocation corresponding to RU Allocation Index b, for each value of NSTS and RU specified by the field. The nominal packet padding is used in computing the PE field duration (see 27.3.13 (Packet extension)).

NOTE 1—If the pre-FEC padding factor is 4, then the value of nominal $T_{PE}$ is equal to the nominal packet padding (see Table 27-47 (Nominal TPE values(11ax))).

For all values of *n* and *b* for which PPET8 and PPET16 are not present, the nominal packet padding is 0 for HE PPDUs that are transmitted to the STA using NSTS = *n* and an RU allocation corresponding to RU allocation index *b*. The nominal packet padding as a function of the PPE thresholds, the number of spatial streams, and the RU allocation index is described in Table 26-13 (PPE thresholds per PPET8 and PPET16(11ax)).

**Table 26-13—PPE thresholds per PPET8 and PPET16(11ax)**

| **Result of comparison of constellation index *x* of an HE PPDU with NSTS value *n* and RU allocation size that corresponds to RU Allocation index = (*b* + DCM) to the value in . . .** | | **Nominal packet padding for an HE PPDU transmitted to this STA using constellation index = *x*, NSTS = *n*, and RU allocation size that corresponds to RU Allocation index = (*b* + DCM)** |
|---|---|---|
| **PPET8 NSTS*n* RU (*b* + DCM) subfield** | **PPET16 NSTS*n* RU (*b* + DCM) subfield** | |
| *x* greater than or equal to PPET8 | *x* less than PPET16 or PPET16 equal to None | 8 μs |
| *x* greater than PPET8 or PPET8 equal to None | *x* greater than or equal to PPET16 | 16 μs |
| All other combinations not otherwise listed in this table | | 0 |
| NOTE—DCM = 1 if the HE PPDU uses DCM; DCM = 0 otherwise. | | |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

In Table 26-13 (PPE thresholds per PPET8 and PPET16(11ax)), "RU Allocation index = ($b$ + DCM)" means the following. With the exception of a 2×996-tone RU, if DCM is applied in a given RU, the nominal packet padding value is based on the next larger RU size (RU index + 1). For example, if DCM is applied to a 242-tone RU, then the nominal packet padding value for a 484-tone RU is used. If DCM is applied to 106-tone RU, then the nominal packet padding value for a 242-tone RU is used. If DCM is applied to a 2×996-tone RU, then the nominal packet padding value for a 2×996-tone RU is used.

The nominal packet padding value shall be 0 for all RU less than 242, unless the RU size is 106 and DCM is enabled.

A STA transmitting an HE PPDU provides the nominal packet padding in the TXVECTOR parameter NOMINAL_PACKET_PADDING for the minimal PE calculation (see 27.3.13 (Packet extension)).

A STA transmitting an HE PPDU that carries a broadcast frame shall set the value of the TXVECTOR parameter NOMINAL_PACKET_PADDING to 16 µs. A STA transmitting an HE PPDU that carries a group addressed, but not broadcast, frame shall not set the value of the TXVECTOR parameter NOMINAL_PACKET_PADDING to a value that is less than that required for any of the recipients in the group.

A STA transmitting an HE PPDU to a receiving STA shall include post-FEC padding determined by the pre-FEC padding factor (see 27.3.12 (Data field)); and after including the post-FEC padding, the transmitting STA shall include a packet extension with a duration indicated by the TXVECTOR parameter NOMINAL_PACKET_PADDING (see 27.3.13 (Packet extension)).

(11az)A STA A shall set the value of the TXVECTOR parameter NOMINAL_PACKET_PADDING to 16 µs when transmitting to a STA B if the STA A has not received a frame including the HE Capabilities element from the STA B.

NOTE 2—One such situation is an AP transmitting to an unassociated STA. Another such situation is an unassociated STA transmitting to an AP without having received a management frame including an HE Capabilities element from the AP, such as a Beacon or Probe Response frame.(11az)

## 26.13 Link adaptation using the HLA Control subfield

This subclause applies to frame exchange sequences that include PPDUs containing an HE variant HT Control field.

An HE STA shall set the HE Link Adaptation Support subfield in the HE Capabilities Information field in the HE Capabilities element it transmits to the value of dot11HEMCSFeedbackOptionImplemented.

A STA that supports HE link adaptation using the HLA Control subfield shall set the HE Link Adaptation Support subfield in the HE Capabilities Information field in the HE Capabilities element to 2 or 3, depending on its own link adaptation feedback capability. A STA shall not send an MRQ to a STA that has not set the HE Link Adaptation Support subfield to 3 in the HE Capabilities Information field in the HE Capabilities element. A STA shall not send an unsolicited MFB in any frame that contains an HLA Control subfield to a STA that has not set the HE Link Adaptation Support subfield to either 2 or 3 in the HE Capabilities Information field in the HE Capabilities element.

The MFB requester may set the MRQ subfield to 1 and Unsolicited MFB subfield to 0 in the HLA Control subfield of a frame to request a STA to provide link adaptation feedback. In each request, the MFB requester shall set the MSI field to a value ranging from 0 to 6. For the MFB requester, how to choose the MSI value is implementation dependent.

This is an unapproved IEEE Standards Draft, subject to change.

The appearance of more than one instance of an HLA Control subfield with the MRQ field equal to 1 within a single PPDU shall be interpreted by the receiver as a single request for link adaptation feedback.

The MFB requester shall specify the RU index and BW requesting the link adaptation feedback.

On receipt of an HLA Control subfield with the MRQ subfield equal to 1, an MFB responder computes the HE-MCS, NSS, and DCM of the RU and BW specified in the MRQ, and these estimates are based on the same RU of the PPDU carrying the MRQ. The PPDU carrying MRQ shall include the RU requested for MFB. The MFB responder labels the result of this computation with the MSI value from the HLA Control subfield in the received frame carrying the MRQ. The MFB responder may include the received MSI value in the MSI field of the corresponding response frame. In the case of a delayed response, this allows the MFB requester to associate the MFB with the soliciting MRQ.

An MFB responder that sends a solicited MFB shall set the Unsolicited MFB subfield to 0 and MRQ subfield to 0 in the HLA Control subfield.

The STA receiving MFB may use the received MFB to compute the appropriate HE-MCS, DCM, and NSS.

The MFB responder may send a solicited response frame with any of the following combinations of HE-MCS, NSS, and MSI:

- HE-MCS = 15, NSS = 7, MSI = 0–6: the responder does(M118) not provide feedback for the request that had the MSI value.
- HE-MCS = valid value, NSS = valid value, MSI = 0–6: the responder is providing feedback for the request that had the MSI value. The MSI value in the response frame matches the MSI value of the MRQ request.

A STA sending unsolicited MFB using the HLA Control subfield shall set the Unsolicited MFB subfield to 1.

Unsolicited HE-MCS, NSS, DCM, BW, and RU estimates reported in an HLA Control subfield sent by a STA are computed based on the most recent PPDU received by the STA that matches the description indicated by the PPDU format, Tx Beamforming, and Coding Type subfields in the same HLA Control subfield.

In an unsolicited MFB response the PPDU Formats, Coding Type, and Tx Beamforming subfields are set according to the RXVECTOR parameters of the received PPDU from which the HE-MCS, RU, BW, and NSS are estimated, as follows:

- The PPDU format subfield is set and encoded as follows:
  - 0 if the parameter FORMAT is equal to HE_SU
  - 1 if the parameter FORMAT is equal to HE_MU
  - 2 if the parameter FORMAT is equal to HE_ER_SU
  - 3 if the parameter FORMAT is equal to HE_TB
- The Coding Type subfield is set to 0 if the parameter FEC_CODING is equal to BCC_CODING and set to 1 if that parameter is equal to LDPC_CODING.
- The Tx Beamforming subfield is set to 1 if the parameter BEAMFORMED is equal to 1 and set to 0 if that parameter is equal to 0.
- The BW subfield shall indicate a bandwidth less than or equal to the bandwidth indicated by the parameter CH_BANDWIDTH.
- The RU subfield indicates the RU at which the recommended HE-MCS is applied. The recommended RU shall be within an RU or a bandwidth in which the received HE PPDU is located.

This is an unapproved IEEE Standards Draft, subject to change.

For either a solicited or an unsolicited response, the recommended HE-MCS and NSS subfields of HLA Control subfield shall be selected from the HE-MCS and NSS set supported by the recipient STA.

The HE-MCS subfield of HLA Control subfield is the recommended data rate, for given transmission properties carried in the RXVECTOR of the PPDU used for MFB estimation, which results in an estimated frame error rate of 10% or lower for an MPDU length of 3895 octets.

NOTE—Some HE PPDU might not be able to carry 3895 octets due to PPDU duration limitations.

If the MFB requester sets the MRQ subfield to 1 and sets the MSI subfield to a value that matches the MSI subfield value of a previous request for which the responder has not yet provided feedback, the responder shall discard or abandon the computation for the MRQ that corresponds to the previous use of that MSI subfield value and start a new computation based on the new request.

A STA may respond immediately to a current request for MFB with a frame containing an MSI field value and NSS, HE-MCS, and DCM subfields that correspond to a request that precedes the current request.

A non-AP HE STA may set the UL HE TB PPDU MFB to 1 in the HLA Control field it transmits to the AP to indicate that the NSS, HE-MCS, DCM, BW, and RU Allocation in the HLA Control field represent the recommended MFB for the HE TB PPDU sent from the non-AP HE STA. The AP should not exceed the recommended RU size indicated in the most recently received RU Allocation field of the HLA Control field when it sends a triggering frame addressed to the STA.

## 26.14 Power management

### 26.14.1 Intra-PPDU power save for non-AP HE STAs

Intra-PPDU power save is the power save mechanism for an HE STA to enter the doze state or become unavailable until the end of a received PPDU that is identified as an intra-BSS PPDU. The STA can enter the doze state if it is in PS mode and can become unavailable if it is in active mode (see 11.2.3.2 (Non-AP STA power management modes)).

A non-AP HE STA that has dot11IntraPPDUPowerSaveOptionActivated equal to true operates in intra-PPDU power save mode.

A non-AP HE STA that is in intra-PPDU power save mode may enter the doze state or become unavailable until the end of a PPDU currently being received if one of the following conditions is met:

- The PPDU is an HE MU PPDU where the RXVECTOR parameter BSS_COLOR is the BSS color of the BSS in which the STA is associated, the RXVECTOR parameter UPLINK_FLAG is 0, the RXVECTOR parameters STA_ID do not include the identifier of the STA or the broadcast identifier(s) intended for the STA, and the BSS Color Disabled subfield is 0 in the most recently received HE Operation element from the AP with which it is associated.
- The PPDU is an HE MU PPDU, HE SU PPDU, or HE ER SU PPDU and one of the following conditions is true:
  - The RXVECTOR parameter BSS_COLOR is the BSS color of the BSS in which the STA is associated, the RXVECTOR parameter UPLINK_FLAG is 1, and the BSS Color Disabled subfield is 0 in the most recently received HE Operation element from the AP with which it is associated.
  - The RXVECTOR parameter BSS_COLOR is the BSS color of the BSS in which the STA is associated, the RXVECTOR parameter UPLINK_FLAG is 0, a PHY-RXEND.indication(UnsupportedRate) primitive was received, and the BSS Color Disabled subfield is 0 in the most recently received HE Operation element from the AP with which it is associated.
