When the EDMG Channel Measurement Feedback element is included in a MIMO BF Feedback frame or when the EDMG Channel Measurement Feedback element is included in a BRP frame with the Sector Sweep Frame Type field of the DMG Beam Refinement element contained in the frame equal to 2, the EDMG Sector ID Order field indicates AWV feedback IDs, TX antenna IDs and RX antenna IDs. The RX Antenna ID subfields of the EDMG Sector ID Order field are reserved when the EDMG Channel Measurement Feedback element is included in the MIMO BF Feedback frame. The BRP CDOWN field indicates BRP CDOWN values. The EDMG Sector ID Order field and the BRP CDOWN field can be divided into $N_{meas}$ SISO ID subsets. Specifically, the $i$ SISO ID subset ($i$ = 1, 2, …, $N_{meas}$) comprises the values of the AWV Feedback IDi, TX Antenna IDi, RX Antenna IDi and BRP CDOWNi subfields, where the AWV Feedback IDi subfield indicates the AWV for a TX DMG antenna having its TX antenna ID equal to the TX Antenna IDi subfield value, which is used to transmit an EDMG BRP-RX/TX PPDU or EDMG BRP-TX PPDU with the BRP CDOWN field set to the BRP CDOWNi subfield value.

Table 9-389 (Sector and DMG antenna interpretation based on the Sector Sweep Frame Type field value(11ay)) summarizes how the sector and DMG antenna are interpreted on the basis of the value of the Sector Sweep Frame Type field value.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-389—Sector and DMG antenna interpretation based on the Sector Sweep Frame Type field value(11ay)**

| Sector Sweep Frame Type field value | Basis for sector sweep result | TX sector ID interpretation | TX antenna ID interpretation |
|---|---|---|---|
| 0 | DMG Beacon or SSW frame | Sector ID field value in frame | DMG/CMMGAntenna ID subfield value in frame |
| 1 | Short SSW PPDU | CDOWN field value in PPDU | RF Chain ID field in PPDU |
| 2 | BRP frame | AWV Feedback ID field value in frame | TX Antenna Mask field in EDMG BRP Request element |
| 3 | TRN field as part of beam tracking | AWV Feedback ID field value in frame | N/A |

When the EDMG Channel Measurement Feedback element is carried within a MIMO BF Feedback frame, the number of measurements, $N_{meas}$, is equal to $N_{tsc} \times N_{TX} \times N_{RX}$, where $N_{tsc}$ is given by the Number of TX Sector Combinations Present field in the MIMO Feedback Control element within the MIMO BF Feedback frame, $N_{TX}$ refers to the value indicated by the Number of TX Antennas subfield in the MIMO Feedback Control element within the MIMO BF Feedback frame, and $N_{RX}$ refers to the value indicated by the Number of RX Antennas subfield in the MIMO Feedback Control element within the MIMO BF Feedback frame.

When the EDMG Channel Measurement Feedback element is carried within a MIMO BF Feedback frame, every $N_{TX} \times N_{RX}$ consecutive SISO ID subsets constitute a set that corresponds to a specific TX sector combination (or equivalently a specific TX-RX AWV configuration). Each TX sector combination comprises a single TX sector for each of $N_{TX}$ TX DMG antennas. $N_{tsc}$ TX sector combinations are ranked in the decreasing order of an implementation dependent metric. Specifically, the $j$ set ($j = 1, 2, \ldots, N_{tsc}$), which corresponds to the $j$ TX-RX AWV configuration, comprises the $((j-1) \times N_{TX} \times N_{RX} + 1)$ SISO ID subset to the $(j \times N_{TX} \times N_{RX})$ SISO ID subset. Assume that the MIMO channel corresponding to the $j$ TX-RX AWV configuration is defined by the following equation:

$$H_j = \begin{bmatrix} h_{1,1}^{(j)} & \cdots & h_{1,N_{RX}}^{(j)} \\ \vdots & \ddots & \vdots \\ h_{N_{TX},1}^{(j)} & \cdots & h_{N_{TX},N_{RX}}^{(j)} \end{bmatrix}$$

Here, $h_{m,n}^{(j)}$ ($m = 1, 2, \ldots, N_{TX}$ and $n = 1, 2, \ldots, N_{RX}$) represents the channel between the $m$ TX DMG antenna and the $n$ RX DMG antenna and is indicated by the $((j-1) \times N_{TX} \times N_{RX} + (m-1) \times N_{RX} + n)$ SISO ID subset. In particular, for the $j$ TX sector combination ($j = 1, 2, \ldots, N_{tsc}$), the AWV used by the $m$ TX antenna ($m = 1, 2, \ldots, N_{TX}$) is indicated by the values of the AWV feedback $ID_l$ and BRP $CDOWN_l$ subfields, where $l = (j-1) \times N_{TX} \times N_{RX} + (m-1) \times N_{RX} + n$ and $n$ is any integer between 1 and $N_{RX}$.

NOTE—Since a DMG Beacon frame, SSW frame or Short SSW PPDU transmitted through a TX sector, or a TRN subfield of an EDMG BRP-TX PPDU or an EDMG BRP-RX/TX PPDU transmitted using a TX AWV, can be received by several RX DMG antennas, reception of each DMG Beacon frame, SSW frame, Short SSW PPDU or TRN subfield of an EDMG BRP-TX PPDU or an EDMG BRP-RX/TX PPDU through an RX DMG antenna has an entry in the SNR field, the EDMG Sector ID Order field, the Additional SNR field (if present) and the Additional EDMG Sector ID Order field (if present).

If both the Channel Aggregation Present field and the EDMG Extension Flag field in the accompanying DMG Beam Refinement element are 1 or if the Channel Aggregation Present subfield of the MIMO FBCK-TYPE field in the accompanying MIMO Feedback Control element is 1, the following apply:

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

— The EDMG Sector ID Order, BRP CDOWN and Tap Delay fields are for the channel that includes the primary channel in case of channel aggregation. Otherwise, the EDMG Sector ID Order, BRP CDOWN and Tap Delay fields are for the channel in which the measurement is taken.

— The Additional EDMG Sector ID Order, Additional BRP CDOWN and Additional Tap Delay fields are for the channel that does not include the primary channel in case of channel aggregation. Otherwise, the Additional EDMG Sector ID Order, Additional BRP CDOWN and Additional Tap Delay fields are not present.

### 9.4.2.268 EDMG Group ID Set element(11ay)

The EDMG Group ID Set element allows an AP or PCP to define groups of MU capable EDMG STAs to perform DL MU-MIMO beamforming training and transmissions.(M118)

The format of the EDMG Group ID Set element is shown in Figure 9-959 (EDMG Group ID Set element format(11ay)).

| | Element ID | Length | Element ID Extension | Number of EDMG Groups | EDMG Group Tuples |
|---|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | 1 | variable(M118) |

**Figure 9-959—EDMG Group ID Set element format(11ay)**

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1 (General).

The Number of EDMG Groups field indicates the number of EDMG Group fields.

The EDMG Group Tuples field contains one or more EDMG Group Tuple subfields. Each EDMG Group Tuple subfield has the structure shown in Figure 9-960 (EDMG Group Tuple subfield format(11ay)).

| | B0 B7 | B8 B12 | B13 B15 | B16 B23 | B24 B31 | | B(8×(*N*+1)) B(8×(*N*+2) – 1) |
|---|---|---|---|---|---|---|---|
| | EDMG Group ID | Group Size (*N*) | Reserved | AID0 | AID1 | … | AIDN-1 |
| Bits: | 8 | 5 | 3 | 8 | 8 | … | 8 |

**Figure 9-960—EDMG Group Tuple subfield format(11ay)**

The EDMG Group ID subfield is a unique, nonzero value that identifies the group.

The Group Size subfield indicates the number of EDMG STAs that belong to the group, i.e., the number of AID subfields following this subfield minus one.

Each AID subfield contains the AID of an EDMG STA that belongs to the group.

### 9.4.2.269 EDMG BRP Request element(11ay)

The EDMG BRP Request element provides BRP configuration in addition to the BRP configuration provided in the BRP Request field. The EDMG BRP Request element is defined in Figure 9-961 (EDMG BRP Request element format(11ay)).

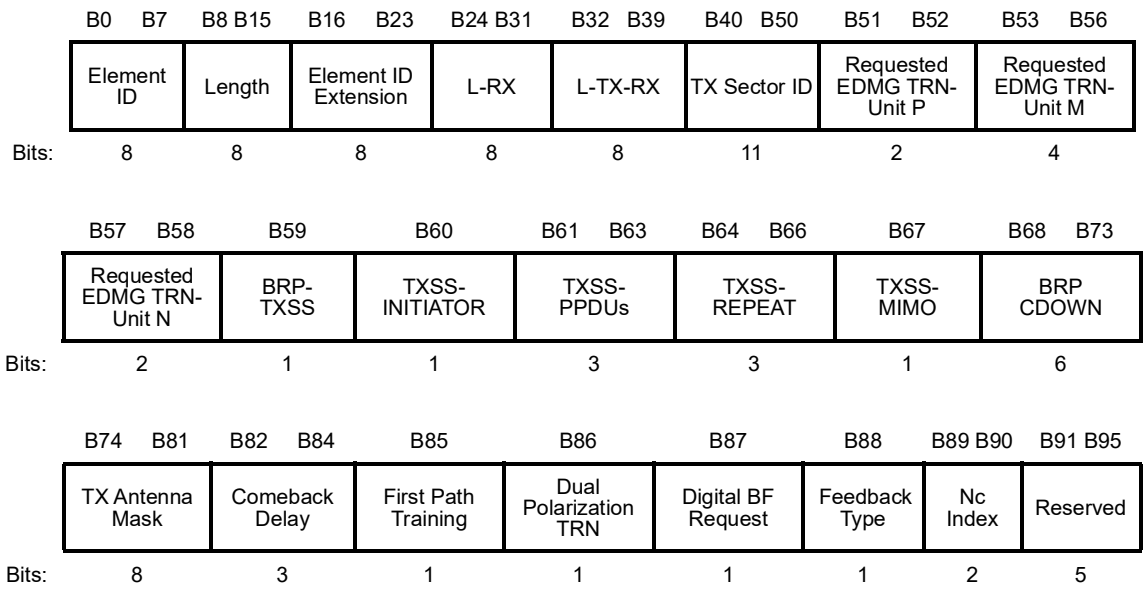

**Figure 9-961—EDMG BRP Request element format(11ay)**

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1 (General).

The L-RX field indicates the number of TRN-Units requested by the transmitting STA as part of receive beam refinement. When the EDMG BRP Request element is present in a frame, the value of this field overrides the value of the subfield with the same name carried in the BRP Request field.

The L-TX-RX field indicates the requested number of consecutive TRN-Units for which the transmit AWV remains with the same AWV configuration as part of simultaneous receive and transmit beam refinement.

The TX Sector ID field indicates the sector ID that is used when transmitting the frame. If the frame is transmitted using a pattern that is not a sector that has been used in the sector sweep, the value of this field is set to 2047. When the EDMG BRP Request element is present in a frame, the value of this field overrides the value of the subfield with the same name carried in the BRP Request field.

The Requested EDMG TRN-Unit P field indicates the requested number of TRN subfields at the start of a TRN-Unit that use the same AWV, which is the same AWV used in the transmission of the preamble and Data fields of the PPDU, except for the case when the DMG antenna used in the transmission of the PPDU changes at the beginning of the TRN field (see 28.9.2.2.5 (TRN field definition)). A svalue of zero indicates zero requested TRN subfields, a value of one indicates one requested TRN subfield, a value of two indicates two requested TRN subfields and a value of three indicates four requested TRN subfields.

The value of the Requested EDMG TRN-Unit M field plus one indicates the requested number of TRN subfields within a TRN-Unit that can be used for transmit training, as defined in 28.9.2.2 (EDMG BRP PPDU). The value of this field plus one is an integer multiple of the value indicated in the Requested EDMG TRN-Unit N field.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Requested EDMG TRN-Unit N field indicates the requested number of consecutive TRN subfields within EDMG TRN-Unit M that are transmitted using the same AWV. A value of zero indicates one requested TRN subfield, a value of one indicates two requested TRN subfields, a value of two indicates three requested TRN subfields if the Requested EDMG TRN-Unit M field is equal to 2, 5, 8, 11, or 14, a value of two indicates eight requested TRN subfields if the Requested EDMG TRN-Unit M field is equal to 7 or 15, and a value of three indicates four requested TRN subfields.

The BRP-TXSS field is set to 1 to indicate either a request to perform BRP TXSS or to acknowledge a request to perform BRP TXSS, as defined in 10.41.10.5 (BRP transmit sector sweep (BRP TXSS)). Otherwise, this field is set to 0.

If the BRP-TXSS field is equal to 1, the TXSS-INITIATOR field set to 1 indicates that the transmitter of the BRP frame is the initiator of a BRP TXSS and the TXSS-INITIATOR field set to 0 indicates that the transmitter of the BRP frame is the responder of a BRP TXSS. If the BRP-TXSS field is equal to 0, the TXSS-INITIATOR field is reserved.

If the BRP-TXSS field and the TXSS-INITIATOR are both equal to 1, the value in the TXSS-PPDUs field plus one indicates the number of EDMG BRP-TX PPDUs necessary for the initiator to perform transmit training. If the BRP-TXSS field is equal to 1 and the TXSS-INITIATOR field is equal to 0, the value in the TXSS-PPDUs field plus one indicates the number of EDMG BRP-TX PPDUs necessary for the responder to perform transmit training if the procedure includes a Responder BRP TXSS (see 10.41.10.5 (BRP transmit sector sweep (BRP TXSS))). If the BRP-TXSS field is equal to 0, the TXSS-PPDUs field is reserved.

If the BRP-TXSS field and the TXSS-INITIATOR field are both equal to 1, the TXSS-REPEAT field plus one indicates the number of times that the EDMG BRP-TX PPDUs transmitted in the Responder BRP TXSS is repeated if the BRP TXSS includes a Responder BRP TXSS. If the BRP-TXSS field is equal to 1 and the TXSS-INITIATOR field is equal to 0, the TXSS-REPEAT field plus one indicates the number of times that the EDMG BRP-TX PPDUs transmitted in the Initiator BRP TXSS is repeated. If the BRP-TXSS field is equal to 0, the TXSS-REPEAT field is reserved.

If the BRP-TXSS field and the TXSS-INITIATOR field are both equal to 1, the TXSS-MIMO field set to 1 indicates that the requested BRP TXSS is a MIMO BRP TXSS (see 10.41.10.5 (BRP transmit sector sweep (BRP TXSS))), and the TXSS-MIMO field set to 0 indicates that the requested BRP TXSS is a SISO BRP TXSS (see 10.41.10.5 (BRP transmit sector sweep (BRP TXSS))). If the BRP-TXSS field and the TXSS-INITIATOR field are not both equal to 1, the TXSS-MIMO field is reserved.

The BRP CDOWN field is a down counter indicating the number of remaining EDMG BRP PPDU transmissions to the end of the BF training.

The TX Antenna Mask field is a bitmap that indicates whether each of eight TX DMG antennas is used in the transmission of the EDMG BRP PPDU. The first bit (i.e., the least significant bit) corresponds to the first TX DMG antenna, the second bit corresponds to the second TX DMG antenna, and so on. A bit is set to 1 to indicate the associated TX DMG antenna is used in the transmission of the EDMG BRP PPDU; otherwise, the bit is set to 0.

The Comeback Delay field indicates that the STA might not be ready with the feedback within BRPIFS. The value in the Comeback Delay field indicates when the device is ready with feedback. The interpretation of this field is defined according to Table 9-390 (Interpretation of the Comeback Delay field(11ay)).

The First Path training field set to 1 indicates that the BRP procedure is designated as a first path training procedure as specified in 10.41.10.6 (First path beamforming training). This field is set to 0 otherwise.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-390—Interpretation of the Comeback Delay field(11ay)**

| Value | Meaning |
|---|---|
| 0 | Feedback is ready within this frame. |
| 1 | 64 μs |
| 2 | 128 μs |
| 3 | 256 μs |
| 4 | 512 μs |
| 5 | 768 μs |
| 6 | 1024 μs |
| 7 | 2048 μs |

The Dual Polarization TRN field is set to 1 to request a BRP initiator to send TRN subfields with different polarizations for the same AWV as specified in 10.41.10.7 (Dual polarization TRN beamforming training). It is set to 0 otherwise.

The Digital BF Request field set to 1 indicates a request for performing digital beamforming. Otherwise, this field is set to 0.

The Feedback Type field indicates the type of feedback requested. Set to 0 for SU and set to 1 for MU.

If the Feedback Type field indicates MU, then the *Nc* Index field indicates the number of columns, *Nc*, in the compressed beamforming feedback matrix minus 1 for hybrid beamforming feedback in the EDMG OFDM mode. The interpretation of this field is defined according to Table 9-391 (Encoding of Nc Index field(11ay)).

**Table 9-391—Encoding of Nc Index field(11ay)**

| Value | Meaning |
|---|---|
| 0 | $Nc = 1$. |
| 1 | $Nc = 2$. |
| 2 | Reserved. |
| 3 | Reserved. |

### 9.4.2.270 EDMG Training Field Schedule element(11ay)

The EDMG Training Field Schedule element allows an EDMG STA to announce BTIs in which TRN-R subfields are present in PPDUs containing DMG Beacon frames transmitted during the BTI.

The format of the EDMG Training Field Schedule element is shown in Figure 9-962 (EDMG Training Field Schedule element format(11ay)).

| | Element ID | Length | Element ID Extension | Next BTI With TRN | TRN Schedule Interval |
|---|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | 1 | 1 |

**Figure 9-962—EDMG Training Field Schedule element format(11ay)**

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1 (General).

The Next BTI With TRN field indicates the number of beacon intervals in which TRN-R subfields are not present in any PPDU transmitted in a BTI. The value of this field is this field is decreased by one at the start of every beacon interval until it reaches zero and is subsequently reset. If the Next BTI With TRN field is 0, TRN-R fields are present in the BTI.

The TRN Schedule Interval field indicates the periodic interval, in number of beacon intervals, at which TRN-R subfields are present in the BTI of one or more consecutive beacon intervals. If the value of this field is 0, there is no periodicity and the presence of TRN-R fields in a BTI is determined solely by the value of the Next BTI With TRN field.

### 9.4.2.271 EDMG Partial Sector Level Sweep element(11ay)

The EDMG Partial Sector Level Sweep element is used to exchange the length of a sector level sweep to be performed when the link is lost before the STA's resort to a complete sector level sweep. The format of the element is shown in Figure 9-963 (EDMG Partial Sector Level Sweep element format(11ay)).

| | Element ID | Length | Element ID Extension | Partial SLS Configuration |
|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | 4 |

**Figure 9-963—EDMG Partial Sector Level Sweep element format(11ay)**

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1 (General).

The Partial SLS Configuration field is defined in Figure 9-964 (Partial SLS Configuration field format(11ay)).

| | B0 B5 | B6 B16 | B17 B19 | B20 B22 | B23 B26 | B27 | B28 | B29 B31 |
|---|---|---|---|---|---|---|---|---|
| | Partial Number of Sectors | Total Number of Sectors | Partial Number of Rx Antennas | Total Number of Rx Antennas | Time to Switch to Full Sector Sweep | Agree to Change Initiator/ Responder Roles | Agree to Partial Sector Sweep | Reserved |
| Bits: | 6 | 11 | 3 | 3 | 4 | 1 | 1 | 3 |

**Figure 9-964—Partial SLS Configuration field format(11ay)**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Partial Number of Sector field indicates the number of sectors the sender intends to transmit per each of the peer STA's receive antennas as part of the partial sector level sweep.

The Total Number of Sector field indicates the number of sectors the sender intends to use as a transmitter per each of the peer STA's receive antennas as part of the complete sector level sweep.

The Partial Number of Rx antennas field indicates the number of RX antennas the sender intends to use when receiving the partial sector sweep.

The Total Number of Rx antennas field indicates the number of RX antennas the sender intends to use when receiving the complete sector level sweep.

When sent by the initiator of the partial sector level sweep exchange, the Time to Switch to (#4303)Full Sector Sweep field is the time, in units of one millisecond, after the expiration of the beamformed link maintenance timer (see 11.27.1.1 (General(11ay))) that the initiator of the exchange proposes to switch to a complete sector level sweep. This field is reserved when sent by the responder of this exchange.

When sent by the initiator of the partial sector level sweep exchange and set to 1, the Agree to Change Initiator/Responder Roles field indicates that the initiator requests to change the roles of initiator/responder in the sector level sweep starting with the expiration of the beamformed link maintenance timer. This field is reserved otherwise.

When sent by the initiator of the partial sector level sweep exchange, the Agree to Partial Sector Sweep field is set to 1. When sent by the responder of the partial sector level sweep exchange, the Agree to Partial Sector Sweep field is set to 1 to indicate agreement to the partial sector level sweep and is set to 0 to indicate disagreement to the partial sector level sweep.

### 9.4.2.272 MIMO Setup Control element(11ay)

The MIMO Setup Control element, defined in Table 9-392 (MIMO Setup Control element format(11ay)), is used to carry configuration information required for the SU-MIMO BF training and feedback subphases or the MU-MIMO BF training and feedback subphases.

**Table 9-392—MIMO Setup Control element format(11ay)**

| Field | Size (bits) | Meaning |
|---|---|---|
| Element ID | 8 | |
| Length | 8 | |
| Element ID Extension | 8 | |
| SU/MU | 1 | This field is set to 0 to indicate SU-MIMO beamforming and is set to 1 to indicate MU-MIMO beamforming. |
| Nonreciprocal/Reciprocal MIMO Phase | 1 | This field is set to 0 to indicate the nonreciprocal MIMO phase and is set to 1 to indicate the reciprocal MIMO phase. |
| EDMG Group ID | 8 | Indicates the EDMG Group ID of target MU group. This field is reserved when the SU/MU field is set to 0. |
| Group User Mask | 32 | |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-392—MIMO Setup Control element format(11ay) *(continued)***

| Field | Size (bits) | Meaning |
|---|---|---|
| L-TX-RX | 8 | Indicates the requested number of consecutive TRN-Units in which the same AWV is used in the transmission of the last *M* TRN subfields of each TRN-Unit. This field is reserved when the SU/MU field is set to 1 or when the SU/MU field is set to 0, the Nonreciprocal/Reciprocal MIMO phase field is set to 1 and the Initiator field is set to 1.<br><br>NOTE—*M* is equal to the value of the Requested EDMG TRN-Unit M field plus 1. |
| Requested EDMG TRN-Unit M | 4 | The value of this field plus one indicates the requested number of TRN subfields in a TRN-Unit that can be used for transmit training, as defined in 28.9.2.2. This field is reserved when the SU/MU field is set to 1 or when the SU/MU field is set to 0, the Nonreciprocal/Reciprocal MIMO phase field is set to 1 and the Initiator field is set to 1. |
| Initiator | 1 | This field is set to 1 to indicate the sender is the initiator and is set to 0 otherwise. This field is set to 1 when the SU/MU field is set to 1. |
| MIMO FBCK-REQ | 10 | Indicates requested channel measurement feedback. |
| Reserved | 7 | |

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1 (General).

The Group User Mask field is a bitmap that indicates whether an EDMG STA in the target MU group is requested to engage in the subsequent MU-MIMO BF training. The order of EDMG STAs in the Group User Mask field follows the order in which they appear in the corresponding EDMG Group field of the EDMG Group ID Set element defining the target MU group. The first bit (i.e., the least significant bit) of the Group User Mask field corresponds to the first EDMG STA in the MU group, the second bit corresponds to the second EDMG STA, and so on. A bit is set to 1 to indicate that the corresponding EDMG STA is requested to engage in the subsequent MU-MIMO BF training; otherwise, the bit is set to 0. This Group User Mask field is reserved when the SU/MU field is set to 0. If the number of EDMG STAs in the target MU group is smaller than 32, the corresponding bits in the Group User Mask field are set to 0.

The MIMO FBCK-REQ field is defined in Figure 9-965 (MIMO FBCK-REQ field format(11ay)(M118)).

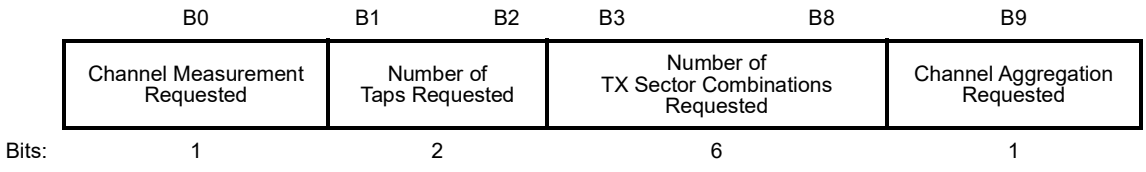

**Figure 9-965—MIMO FBCK-REQ field format(11ay)(M118)**

If the Channel Measurement Requested subfield is set to 1, the Channel Measurement subfield is requested as part of MIMO BF feedback. Otherwise, set to 0.

The Number of Taps Requested subfield indicates the number of taps requested in each channel measurement. The encoding for this subfield is specified in Table 9-296 (FBCK-TYPE field description).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The value of the Number of TX Sector Combinations Requested subfield plus one indicates the number of TX sector combinations requested as part of MIMO BF feedback.

The Channel Aggregation Requested subfield is set to 1 to indicate that the TRN field is transmitted over a 2.16+2.16 GHz or 4.32+4.32 GHz channel and to request the channel measurement feedback per channel, in case channel aggregation is used as part of MIMO BF feedback. Otherwise, this subfield is set to 0.

#### 9.4.2.273 MIMO Poll Control element(11ay)

The MIMO Poll Control element is defined in Table 9-393 (MIMO Poll Control element format(11ay)).

**Table 9-393—MIMO Poll Control element format(11ay)**

| Field | Size (bits) | Meaning |
|---|---|---|
| Element ID | 8 | |
| Length | 8 | |
| Element ID Extension | 8 | |
| SU/MU | 1 | This field is set to 0 to indicate SU-MIMO beamforming and is set to 1 to indicate MU-MIMO beamforming. |
| Poll Type | 1 | This field is set to 1 to indicate training PPDU poll used in the reciprocal MU-MIMO beamforming or the MU-MIMO hybrid beamforming feedback phase. It is set to 0 to indicate MIMO BF feedback poll used in the SU-MIMO beamforming or the nonreciprocal MU-MIMO beamforming. |
| L-TX-RX | 8 | Indicates the requested number of consecutive TRN-Units in which the same AWV is used in the transmission of the last *M* TRN subfields of each TRN-Unit. This field is reserved when the Poll Type field is set to 0. |
| Requested EDMG TRN-Unit M | 4 | The value of this field plus one indicates the requested number of TRN subfields in a TRN-Unit can be used for transmit training, as defined in 28.9.2.2 (EDMG BRP PPDU). This field is reserved when the Poll Type field is set to 0. |
| Requested EDMG TRN-Unit P | 2 | Indicates the requested number of TRN subfields at the start of a TRN-Unit that use the same AWV. A value of zero indicates zero requested TRN subfields, a value of one indicates one requested TRN subfield, a value of two indicates two requested TRN subfields and a value of three indicates four requested TRN subfields. This field is reserved when the Poll Type field is set to 0. |
| Training Duration | 14 | Indicates the maximum duration, in microseconds, that can be used by the polled responder to transmit EDMG BRP-RX/TX PPDUs and starts following the reception of the MIMO BF Poll frame containing this element. Possible values range from 1 to 16383. This field is reserved when the Poll Type field is set to 0. |
| Reserved | 2 | |

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1 (General).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 9.4.2.274 MIMO Feedback Control element(11ay)

The MIMO Feedback Control element, as shown in Table 9-394 (MIMO Feedback Control element format(11ay)), is used to carry configuration information for accompanying Channel Measurement Feedback element, EDMG Channel Measurement Feedback element and/or Digital BF Feedback element.

**Table 9-394—MIMO Feedback Control element format(11ay)**

| Field | Size (bits) | Meaning |
|---|---|---|
| Element ID | 8 | |
| Length | 8 | |
| Element ID Extension | 8 | |
| SU/MU | 1 | This field is set to 0 to indicate SU-MIMO beamforming and is set to 1 to indicate MU-MIMO beamforming. |
| Link Type | 1 | This field is set to 0 to indicate initiator link and is set to 1 otherwise. This field is set to 0 when the SU/MU field is set to 1. |
| Comeback Delay | 3 | This field indicates whether MIMO BF feedback is included in the MIMO BF Feedback frame containing the MIMO Feedback Control element or when the EDMG STA transmitting the MIMO Feedback Control element is ready with MIMO BF feedback. The encoding of this field is defined in Table 9-390 (Interpretation of the Comeback Delay field(11ay)). |
| MIMO FBCK-TYPE | 18 | |
| Digital Fbck Control | 30 | Defines the requirements for the digital feedback type. |
| Reserved | 3 | |

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1 (General).

The MIMO FBCK-TYPE field is defined in Figure 9-966 (MIMO FBCK-TYPE field format(11ay)). This field is reserved when the Comeback Delay field is set to a nonzero value.

| | B0 | B1 | B2 B3 | B4 B9 | B10 | B11 | B12 B14 | B15 B17 |
|---|---|---|---|---|---|---|---|---|
| | Channel Measurement Present | Tap Delay Present | Number of Taps Present | Number of TX Sector Combinations Present | Precoder Information Present | Channel Aggregation Present | Number of TX Antennas | Number of RX Antennas |
| Bits: | 1 | 1 | 2 | 6 | 1 | 1 | 3 | 3 |

**Figure 9-966—MIMO FBCK-TYPE field format(11ay)**

If the Channel Measurement Present subfield is set to 1, the Channel Measurement subfield is present as part of the MIMO BF feedback. Otherwise, set to 0.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

If the Tap Delay Present subfield is set to 1, the Tap Delay subfield is present as part of the MIMO BF feedback. Otherwise, set to 0.

The Number of Taps Present subfield indicates the number of taps present in each channel measurement. This subfield has the same encoding as the Number of Taps Requested subfield specified in Table 9-296 (FBCK-TYPE field description).

The value of the Number of TX Sector Combinations Present subfield plus one indicates the number of TX sector combinations, $N_{tsc}$, for the MIMO BF feedback. The number of measurements, $N_{meas}$, is $N_{TX} \times N_{RX}$ multiples of the number of TX sector combinations, $N_{tsc}$ (see 9.4.2.267 (EDMG Channel Measurement Feedback element(11ay))).

The Precoder Information Present subfield is set to 1 to indicate that precoding information is present as part of the MIMO BF feedback. Otherwise, it is set to 0.

The Channel Aggregation Present subfield is set to 1 to indicate that, in case of channel aggregation, channel measurement feedback per channel is present. Otherwise, it is set to 0.

The Number of TX Antennas and the Number of RX Antennas subfields describe the $N_{TX}$ and $N_{RX}$ used in each of the $N_{tsc}$ sector combinations.

The Digital Fbck Control field defines the parameters of the accompanying digital BF feedback. The field is defined in Figure 9-967 (Digital Fbck Control field format(11ay)), and its subfields are described in Table 9-395 (Definition of subfields within Digital Fbck Control field(11ay)).

| | B0 B2 | B3 B5 | B6 B13 | B14 B15 | B16 B17 | B18 | B19 | B20 B29 |
|---|---|---|---|---|---|---|---|---|
| | Nc Index | Nr Index | Tx Antenna Mask | Ncb | Grouping | Codebook Information | Feedback Type | Number of Feedback Matrices or Feedback Taps |
| Bits: | 3 | 3 | 8 | 2 | 2 | 1 | 1 | 10 |

**Figure 9-967—Digital Fbck Control field format(11ay)**

**Table 9-395—Definition of subfields within Digital Fbck Control field(11ay)**

| Subfield | Meaning |
|---|---|
| Nc Index | Indicates the number of columns, *Nc*, in the beamforming feedback matrix minus one:<br>Set to 0 for *Nc* = 1.<br>Set to 1 for *Nc* = 2.<br>Set to 2 for *Nc* = 3.<br>Set to 3 for *Nc* = 4.<br>Set to 4 for *Nc* = 5.<br>Set to 5 for *Nc* = 6.<br>Set to 6 for *Nc* = 7.<br>Set to 7 for *Nc* = 8. |

This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-395—Definition of subfields within Digital Fbck Control field(11ay) *(continued)***

| Subfield | Meaning |
|---|---|
| Nr Index | Indicates the number of rows, Nr, in a beamforming feedback matrix minus one:<br>Set to 0 for Nr = 1.<br>Set to 1 for Nr = 2.<br>Set to 2 for Nr = 3.<br>Set to 3 for Nr = 4.<br>Set to 4 for Nr = 5.<br>Set to 5 for Nr = 6.<br>Set to 6 for Nr = 7.<br>Set to 7 for Nr = 8. |
| Tx Antenna Mask | Indicates the Tx Antennas reported in the accompanying Digital BF Feedback element. If the CSI for the $i^{th}$ Tx Antenna is included in the accompanying Digital BF Feedback element, the $i^{th}$ bit in Tx Antenna Mask is set to 1. Otherwise, the $i^{th}$ bit in Tx Antenna Mask is set to 0. |
| Ncb | Indicates the number of contiguous 2.16 GHz channels the measurement was made for minus one:<br>Set to 0 for 2.16 GHz.<br>Set to 1 for 4.32 GHz.<br>Set to 2 for 6.48 GHz.<br>Set to 3 for 8.64 GHz. |
| Grouping | Indicates the subcarrier grouping, Ng, used for beamforming feedback matrix<br>Set to 0 for $N_g = 2$.<br>Set to 1 for $N_g = 4$.<br>Set to 2 for $N_g = 8$.<br>Set to 3 for dynamic grouping; reserved if dynamic grouping is not supported.<br><br>If the Feedback Type subfield is 0, the Grouping subfield is reserved. |
| Codebook Information | Indicates the size of codebook entries.<br><br>If the SU/MU field in the MIMO Feedback Control element is 1:<br>Set to 0 for 6 bits for Ψ, 4 bits for ϕ.<br>Value 1 is reserved.<br><br>If the SU/MU field in the MIMO Feedback Control element is 0:<br>Set to 0 for 9 bits for Ψ , 7 bits for ϕ.<br>Value 1 is reserved. |
| Feedback Type | Indicates which type of feedback is provided. Set to 0 for uncompressed beamforming feedback in time domain (EDMG SC mode) and set to 1 for compressed using Givens-Rotation in frequency domain (EDMG OFDM mode). |
| Number of Feedback Matrices or Feedback Taps | This field is set to the value of the variable *Nsc*. The value 0 is reserved.<br><br>If the Feedback Type subfield is 0, *Nsc* is the number of feedback taps per element of the SC feedback matrix.<br><br>If the Feedback Type subfield is 1 and the Grouping subfield is less than 3, *Nsc* is determined by Table 9-403 (Subcarriers for which a compressed beamforming feedback matrix is sent back(11ay)).<br><br>If the Feedback Type subfield is 1 and the Grouping subfield is 3, *Nsc* specifies the number of subcarriers present in the Digital Beamforming Feedback Information field of the Digital BF Feedback element. |

### 9.4.2.275 MIMO Selection Control element(11ay)

The MIMO Selection Control element is defined in Table 9-396 (MIMO Selection Control element format(11ay)).

**Table 9-396—MIMO Selection Control element format(11ay)**

| Field | Size (bits) | Meaning |
|---|---|---|
| Element ID | 8 | |
| Length | 8 | |
| Element ID Extension | 8 | |
| EDMG Group ID | 8 | Indicates the EDMG group ID of target MU group. |
| Number of MU-MIMO Transmission Configurations | 3 | Indicates the number of MU-MIMO transmission configurations, $N_{\text{conf}}$. |
| MU-MIMO Transmission Configuration Type | 1 | This field is set to 0 to indicate the MU-MIMO transmission configurations obtained from the nonreciprocal MU-MIMO BF training. This field is set to 1 to indicate the MU-MIMO transmission configurations obtained from the reciprocal MU-MIMO BF training. |
| Number of TX Antennas | 3 | Indicates the $N_{TX}$ used in each MU-MIMO transmission configuration. |
| Nonreciprocal MU-MIMO BF Training Based Transmission Configuration | | |
| Configuration 1 Group User Mask for Antenna 1 | 32 | Indicates the STA(s) in the target MU group associated with the first TX DMG antenna in the first MU-MIMO transmission configuration. |
| Configuration 1 User 1 SISO ID Subset Index/RX Antenna ID for Antenna 1 | 12 | Indicates the RX AWV, from a receiver's perspective, or RX DMG antenna of the first STA associated with the first TX DMG antenna in the first MU-MIMO transmission configuration. |
| ... | | |
| Configuration 1 User $N_{1,1}^{(u)}$ SISO ID Subset Index/RX Antenna ID for Antenna 1 | 12 | Indicates the RX AWV, from a receiver's perspective, or RX DMG antenna of the $N_{1,1}^{(u)}$ STA associated with the first TX DMG antenna in the first MU-MIMO transmission configuration. |
| ... | | |
| Configuration 1 Group User Mask for Antenna $N_{\text{TX}}$ | 32 | Indicates the STA(s) in the target MU group associated with the $N_{\text{TX}}$ TX DMG antenna in the first MU-MIMO transmission configuration. |
| Configuration 1 User 1 SISO ID Subset Index/RX Antenna ID for Antenna $N_{\text{TX}}$ | 12 | Indicates the RX AWV, from a receiver's perspective, or RX DMG antenna of the first STA associated with the $N_{\text{TX}}$ TX DMG antenna in the first MU-MIMO transmission configuration. |
| ... | | |
| Configuration 1 User $N_{1,N_{TX}}^{(u)}$ SISO ID Subset Index/RX Antenna ID for Antenna $N_{\text{TX}}$ | 12 | Indicates the RX AWV, from a receiver's perspective, or RX DMG antenna of the $N_{1,N_{TX}}^{(u)}$ STA associated with the $N_{\text{TX}}$ TX DMG antenna in the first MU-MIMO transmission configuration. |
| ... | | |

**Table 9-396—MIMO Selection Control element format(11ay) *(continued)***

| Field | Size (bits) | Meaning |
|---|---|---|
| Configuration $N_{conf}$ Group User Mask for Antenna 1 | 32 | Indicates the STA(s) in the target MU group associated with the first TX DMG antenna in the $N_{conf}$ MU-MIMO transmission configuration. |
| Configuration $N_{conf}$ User 1 SISO ID Subset Index/RX Antenna ID for Antenna 1 | 12 | Indicates the RX AWV, from a receiver's perspective, or RX DMG antenna of the first STA associated with the first TX DMG antenna in the $N_{conf}$ MU-MIMO transmission configuration. |
| ... | | |
| Configuration $N_{conf}$ User $N^{(u)}_{N_{conf},1}$ SISO ID Subset Index/RX Antenna ID for Antenna $N_{TX}$ | 12 | Indicates the RX AWV, from a receiver's perspective, or RX DMG antenna of the $N^{(u)}_{N_{conf},1}$ STA associated with the first TX DMG antenna in the $N_{conf}$ MU-MIMO transmission configuration. |
| ... | | |
| Configuration $N_{conf}$ Group User Mask for Antenna $N_{TX}$ | 32 | Indicates the STA(s) in the target MU group associated with the $N_{TX}$ TX DMG antenna in the $N_{conf}$ MU-MIMO transmission configuration. |
| Configuration $N_{conf}$ User 1 SISO ID Subset Index/RX Antenna ID for Antenna $N_{TX}$ | 12 | Indicates the RX AWV, from a receiver's perspective, or RX DMG antenna of the first STA associated with the $N_{TX}$ TX DMG antenna in the $N_{conf}$ MU-MIMO transmission configuration. |
| ... | | |
| Configuration $N_{conf}$ User $N^{(u)}_{N_{conf},N_{TX}}$ SISO ID Subset Index/RX Antenna ID for Antenna $N_{TX}$ | 12 | Indicates the RX AWV, from a receiver's perspective, or RX DMG antenna of the $N^{(u)}_{N_{conf},N_{TX}}$ STA associated with the $N_{TX}$ TX DMG antenna in the $N_{conf}$ MU-MIMO transmission configuration. |
| Reciprocal MU-MIMO BF Training Based Transmission Configuration | | |
| Configuration 1 Group User Mask for Antenna 1 | 32 | Indicates the STA(s) in the target MU group associated with the first TX DMG antenna in the first MU-MIMO transmission configuration. |
| Configuration 1 User 1 AWV feedback ID for Antenna 1 | 11 | Indicates the RX AWV, from a receiver's perspective, or RX DMG antenna of the first STA associated with the first TX DMG antenna in the first MU-MIMO transmission configuration. |
| Configuration 1 User 1 BRP CDOWN for Antenna 1 | 6 | |
| Configuration 1 User 1 RX Antenna ID for Antenna 1 | 3 | |
| ... | | |
| Configuration 1 User $N^{(u)}_{1,1}$ AWV feedback ID for Antenna 1 | 11 | Indicates the RX AWV, from a receiver's perspective, or RX DMG antenna of the $N^{(u)}_{1,1}$ STA associated with the first TX DMG antenna in the first MU-MIMO transmission configuration. |
| Configuration 1 User $N^{(u)}_{1,1}$ BRP CDOWN for Antenna 1 | 6 | |
| Configuration 1 User $N^{(u)}_{1,1}$ RX Antenna ID for Antenna 1 | 3 | |
| ... | | |

**Table 9-396—MIMO Selection Control element format(11ay) *(continued)***

| Field | Size (bits) | Meaning |
|---|---|---|
| Configuration $N_{conf}$ Group User Mask for Antenna $N_{TX}$ | 32 | Indicates the STA(s) in the target MU group associated with the $N_{TX}$ TX DMG antenna in the $N_{conf}$ MU-MIMO transmission configuration. |
| Configuration $N_{conf}$ User 1 AWV feedback ID for Antenna $N_{TX}$ | 11 | Indicates the RX AWV, from a receiver's perspective, or RX DMG antenna of the first STA associated with the $N_{TX}$ TX DMG antenna in the $N_{conf}$ MU-MIMO transmission configuration. |
| Configuration $N_{conf}$ User 1 BRP CDOWN for Antenna $N_{TX}$ | 6 | |
| Configuration $N_{conf}$ User 1 RX Antenna ID for Antenna $N_{TX}$ | 3 | |
| ... | | |
| Configuration $N_{conf}$ User $N^{(u)}_{N_{conf},N_{TX}}$ AWV feedback ID for Antenna $N_{TX}$ | 11 | Indicates the RX AWV, from a receiver's perspective, or RX DMG antenna of the $N^{(u)}_{N_{conf},N_{TX}}$ STA associated with the $N_{TX}$ TX DMG antenna in the $N_{conf}$ MU-MIMO transmission configuration. |
| Configuration $N_{conf}$ User $N^{(u)}_{N_{conf},N_{TX}}$ BRP CDOWN for Antenna $N_{TX}$ | 6 | |
| Configuration $N_{conf}$ User $N^{(u)}_{N_{conf},N_{TX}}$ RX Antenna ID for Antenna $N_{TX}$ | 3 | |
| Padding | 0–7 | Zero padding to make the MIMO Selection Control element length a multiple of 8 bits |

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1 (General).

The Configuration *i* Group User Mask for Antenna *j* field ($i$ = 1, 2, …, $N_{conf}$ and $j$ = 1, 2, …, $N_{TX}$) is a bitmap that indicates whether each of EDMG STAs in the target MU group is associated with the $j^{th}$ TX DMG antenna in the $i^{th}$ MU-MIMO transmission configuration. An MU-MIMO transmission configuration defines a specific subset of STAs in the target MU group and their respective RX AWVs to be used for receiving DL MU-MIMO data transmission. The order of EDMG STAs in the Configuration *i* Group User Mask for Antenna *j* field follows the order in which they appear in the corresponding EDMG Group field of the EDMG Group ID Set element containing the target MU group. The first bit (i.e., the least significant bit) corresponds to the first EDMG STA, and the second bit corresponds to the second EDMG STA, and so on. A bit is set to 1 to indicate the corresponding STA is associated with the $j^{th}$ TX DMG antenna in the $i^{th}$ MU-MIMO transmission configuration; otherwise, the bit is set to 0. If the number of EDMG STAs in the target MU group is smaller than 32, the corresponding bits in the Configuration *i* Group User Mask for Antenna *j* field ($i$ = 1, 2, …, $N_{conf}$ and $j$ = 1, 2, …, $N_{TX}$) is set to 0.

The Nonreciprocal MU-MIMO BF Training Based Transmission Configuration field is not present in the MIMO BF Selection frame when the MU-MIMO Transmission Configuration Type field is set to 1. The Reciprocal MU-MIMO BF Training Based Transmission Configuration field is not present in the MIMO BF Selection frame when the MU-MIMO Transmission Configuration Type field is set to 0.

### 9.4.2.276 EDMG Flow Control Extension Configuration element(11ay)

The EDMG Flow Control Extension Configuration element is defined in Figure 9-968 (EDMG Flow Control Extension Configuration element format).

| | Element ID | Length | Element ID Extension | RBUFCAP | Flow Control Status | Advanced Recipient Memory Length Exponent | Recipient Memory Capabilities | Optional Subelements |
|---|---|---|---|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | variable(M118) |

**Figure 9-968—EDMG Flow Control Extension Configuration element format**

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1 (General).

When sent in an ADDBA Response frame, the RBUFCAP field is as defined in 9.3.1.8.7 (EDMG Compressed BlockAck variant(11ay)). This field is reserved when sent in an ADDBA Request frame.

When sent in an ADDBA Response frame, the Flow Control Status field is defined in Figure 9-969 (Flow Control Status field format(11ay)). This field is reserved when sent in an ADDBA Request frame.

| | B0 | B1 | B2 B7 |
|---|---|---|---|
| | No Memory Kept | Memory Configuration Tag | Reserved |
| Bits: | 1 | 1 | 6 |

**Figure 9-969—Flow Control Status field format(11ay)**

The No Memory Kept and Memory Configuration Tag subfields are defined in 9.3.1.8.1 (Overview).

When sent in an ADDBA Response frame, the Advanced Recipient Memory Length Exponent field indicates the amount of free space at the recipient's memory at the start of a TXOP or SP. This field is an integer in the range 0 to 9. The length defined by this subfield is equal to $2^{(13 + \text{Advanced Recipient Memory Length Exponent})} - 1$ octets. The value $2^{(13 + \text{Advanced Recipient Memory Length Exponent})}$ is smaller than or equal to the value $2^{(13 + \text{Maximum A-MPDU Length Exponent})}$ as advertised by the STA's EDMG Capabilities element. Only one value for the Advanced Recipient Memory Length Exponent field can be present in all Block Ack agreements. This field applies to all successfully established Block Ack agreements identified by the same pair of Address 1 and Address 2 fields. This field is reserved when sent in an ADDBA Request frame.

The Recipient Memory Capabilities field is defined in Figure 9-970 (Recipient Memory Capabilities field format(11ay)).

| | B0 | B1 | B2 | B3 | B4 | B5 B7 |
|---|---|---|---|---|---|---|
| | RBUFCAP Quantity Capable | Advanced Recipient Memory Length Capable | Recipient Memory Multiple Buffer Units Capable | TID Grouping Capable | Two Memory Config Tag Capable | Reserved |
| Bits: | 1 | 1 | 1 | 1 | 1 | 3 |

**Figure 9-970—Recipient Memory Capabilities field format(11ay)**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The RBUFCAP Quantity Capable subfield is set to 1 to indicate support of RBUFCAP values in the range 1 through 254 and is set to 0 otherwise (Table 9-41 (RBUFCAP subfield encoding for the EDMG Compressed BlockAck variant(11ay))).

The Advanced Recipient Memory Length Capable subfield is set to 1 by the recipient to indicate its request to be supported with the Advanced Recipient Memory Length Exponent (Figure 9-968 (EDMG Flow Control Extension Configuration element format)) and is set to 0 otherwise.

The Recipient Memory Multiple Buffer Units Capable subfield is set to 1 to indicate support of Memory Unit Size, Maximum MPDU per Memory Unit, and MPDU Split in Buffer values (Figure 9-971 (Recipient Memory Configuration subelement format(11ay))) and is set to 0 otherwise.

The TID Grouping Capable subfield is set to 1 to indicate support of TID Grouping values (Figure 9-971 (Recipient Memory Configuration subelement format(11ay))) and set to 0 otherwise.

The Two Memory Config Tag Capable subfield is set to 1 to indicate the capability to support two Memory Configuration Tag values per TID or TID group (Figure 9-971 (Recipient Memory Configuration subelement format(11ay))) and is set to 0 otherwise.

The Optional Subelements field is defined in Table 9-397 (Optional subelement IDs for the EDMG Flow Control Extension Configuration element(11ay)). An EDMG Flow Control Extension Configuration element contains no more than two Recipient Memory Configuration subelements.

**Table 9-397—Optional subelement IDs for the EDMG Flow Control Extension Configuration element(11ay)**

| Subelement ID | Name | Extensible |
|---|---|---|
| 0 | Recipient Memory Configuration | Yes |
| 1–220 | Reserved | |
| 221 | Vendor specific | Vendor defined |
| 222–225 | Reserved | |

The Recipient Memory Configuration subelement is defined in Figure 9-971 (Recipient Memory Configuration subelement format(11ay)).

| | Subelement ID | Length | Memory Configuration Tag | Buffer Unit Size | Recipient Memory Multiple Buffer Units Parameters | | | TID Grouping |
|---|---|---|---|---|---|---|---|---|
| | | | | | Memory Unit Size | Maximum MPDU per Memory Unit | MPDU Split in Buffer | |
| Octets: | 1 | 1 | 1 | 2 | 2 | 1 | 1 | 2 |

**Figure 9-971—Recipient Memory Configuration subelement format(11ay)**

The Subelement ID field is defined in Table 9-397 (Optional subelement IDs for the EDMG Flow Control Extension Configuration element(11ay)).

The Length field is defined in 9.4.2.1 (General).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Memory Configuration Tag subfield indicates one of two recipient memory configurations indicated in ADDBA Response frame within which the EDMG Flow Control Extension Configuration element is included. Allowed values are 0 and 1.

The Buffer Unit Size subfield indicates the size, in octets, of the RBUFCAP to deliver information of the recipient's available memory space to the originator for MPDU delivery. This subfield is set to a value greater than 0 if the RBUFCAP Quantity Capable subfield is 1 and is set to 0 otherwise. The recipient's available memory space, in octets, is equal to RBUFCAP × Buffer Unit Size.

The subfields within the Recipient Memory Multiple Buffer Units Parameters indicate a recipient memory structure constructed from fixed size memory buffers used to store incoming MPDUs.

The Memory Unit Size subfield indicates the size, in octets, of each buffer unit in the recipient's memory.

The Maximum MPDU per Memory Unit subfield indicates the maximum number of MPDUs that can be held in a single buffer. Valid values are 1 through 255, where value 255 indicates that there is no limitation on the number of MPDUs that can be held in a single buffer.

The MPDU Split in Buffer subfield is set to 1 to indicate that an MPDU can be split between memory buffer units in the recipient's memory and is set to 0 otherwise.

The TID Grouping subfield is a bitmap where each bit corresponds to a TID (Figure 9-972 (TID Grouping subfield format(11ay))). By setting a bit to one in the TID Grouping subfield, it indicates the TID that correspond to a TID of an ADDBA Response frame within which the Recipient Memory Configuration subelement(s) is transmitted. The recipient memory configuration becomes applicable to all TIDs/TSIDs that have their bit in the TID Grouping subfield set to 1. The RBUFCAP field, No Memory Kept and Memory Configuration Tag subfields delivered in an EDMG Flow Control Extension Configuration element within an ADDBA Response frame and in a BlockAck frame are applicable to all TIDs/TSIDs that correspond to the TIDs/TSIDs of the ADDBA Response frame that contained the TID Grouping subfield. The Advanced Recipient Memory Length Exponent field delivered in an EDMG Flow Control Extension Configuration element of an ADDBA Response frame is applicable to all TIDs/TSIDs that correspond to the TIDs/TSIDs of the ADDBA Response frame that contained the TID Grouping subfield.

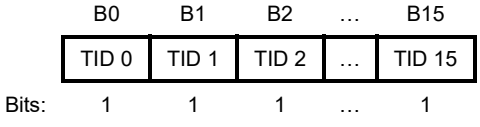

**Figure 9-972—TID Grouping subfield format(11ay)**

### 9.4.2.277 QoS-TU element(#1776)(11ay)

(#1776)The QoS triggered unscheduled (QoS-TU) element is used to communicate the QoS triggered unscheduled parameters between a non-AP and non-PCP EDMG STA and an EDMG AP or EDMG PCP.

(#1776)The QoS triggered unscheduled (QoS-TU) element is defined in Figure 9-973 (QoS Triggered Unscheduled element format(11ay)).

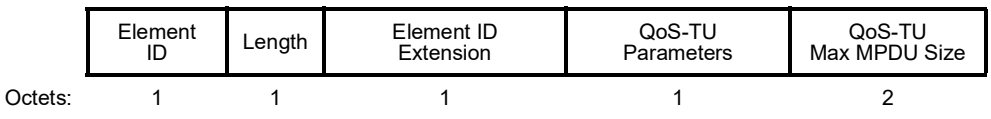

**Figure 9-973—QoS Triggered Unscheduled element format(11ay)**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1 (General).

The QoS-TU Parameters field contains the QoS-TU AC and the QoS-TU Max A-MPDU Length Exponent subfields as shown in Figure 9-974 (QoS-TU Parameters field format(11ay)).

| | B0 B3 | B4 | B5 | B6 | B7 |
|---|---|---|---|---|---|
| | QoS-TU Max A-MPDU Length Exponent | QoS-TU AC_VO Flag | QoS-TU AC_VI Flag | QoS-TU AC_BK Flag | QoS-TU AC_BE Flag |
| Bits: | 4 | 1 | 1 | 1 | 1 |

**Figure 9-974—QoS-TU Parameters field format(11ay)**

Each of the QoS-TU ACs Flag subfields is set to 1 to indicate that the corresponding AC (AC_BE, AC_BK, AC_VI, or AC_VO) is QoS triggered unscheduled enabled as described in 11.2.7.2.2 (Non-AP and non-PCP STA operation without a wakeup schedule); otherwise, it is set to 0.

When sent by a non-PCP and non-AP EDMG STA, the QoS-TU Max A-MPDU Length Exponent subfield is set according to the Maximum A-MPDU Length Exponent subfield described in Table 9-384 (A-MPDU Parameters field definition(11ay)). This subfield indicates the maximum A-MPDU size of buffered BUs the STA is prepared to receive during a QoS triggered unscheduled data transmission. When sent by an EDMG PCP or EDMG AP, this field is reserved.

When sent by a non-PCP and non-AP EDMG STA, the QoS-TU Max MPDU Size field indicates the maximum number of buffered BUs (MPDUs) that the STA is prepared to receive during a QoS triggered unscheduled data transmission. When sent by an EDMG PCP or EDMG AP, this field is reserved.

### 9.4.2.278 Unsolicited Block Ack Extension element(11ay)

The Unsolicited Block Ack Extension element includes information necessary to set up an unsolicited block ack extension agreement between a non-AP and non-PCP STA and an AP or PCP at the association establishment, or between a pair of non-AP and non-PCP STAs using an Information Request and Information Response frame exchange. The format of the element is shown in Figure 9-975 (Unsolicited Block Ack Extension element format(11ay)).

| | Element ID | Length | Element ID Extension | Unsolicited Block Ack Extension Parameters | Block Ack Timeout Value |
|---|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | 2 | 2 |

**Figure 9-975—Unsolicited Block Ack Extension element format(11ay)**

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1 (General).

The Unsolicited Block Ack Extension Parameters field is defined in Figure 9-976 (Unsolicited Block Ack Extension Parameters field format(11ay)).

| | B0 B7 | B8 | B9 B15 | B16 B26 | B27 | B28 B31 |
|---|---|---|---|---|---|---|
| | Reserved | A-MSDU Supported | Reserved | Buffer Size | Multi-TID Supported | Reserved |
| Bits: | 8 | 1 | 7 | 11 | 1 | 4 |

**Figure 9-976—Unsolicited Block Ack Extension Parameters field format(11ay)**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The A-MSDU Supported subfield is set to 1 to indicate that the STA supports an A-MSDU carried in a QoS Data frame sent under the unsolicited block ack extension. It is set to 0 otherwise.

The Buffer Size subfield is an integer ranging from 1 to 1024 that indicates the number of buffers available for each unsolicited block ack extension agreement.

The Multi-TID Supported subfield is set to 1 to indicate that the STA supports multiple TIDs in unsolicited block ack agreements. An EDMG STA that supports multi-TID in unsolicited block ack agreements also sets the EDMG Multi-TID Aggregation Support field defined in 9.4.2.264.6 (MAC Capabilities subelement) to a nonzero value. An EDMG STA that does not support multi-TID as indicated by the EDMG Multi-TID Aggregation Support field defined in 9.4.2.264.6 (MAC Capabilities subelement), sets the Multi-TID Supported subfield to 0.

The Block Ack Timeout Value field is defined in 9.4.1.14 (Block Ack Timeout Value field).

### 9.4.2.279 SAR Configuration element(11ay)

The Segmentation and Reassembly (SAR) Configuration element is formatted as shown in Figure 9-977 (SAR Configuration element format(11ay)). The SAR Configuration element can be included in the ADDBA Request and Response frames in case the ADDBA originator requests the recipient to use segmentation and reassembly for a corresponding TID. The SAR Configuration element indicates the specific segmentation parameters for the TID.

| | Element ID | Length | Element ID Extension | SAR Parameters | MSDU Buffer Size | MPDU Buffer Size | Maximum Segmented MSDU Exponent |
|---|---|---|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | 1 | 2 | 2 | 1 |

**Figure 9-977—SAR Configuration element format(11ay)**

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1 (General).

The SAR Parameters field is defined in Figure 9-978 (SAR Parameters field format(11ay)).

| | B0 | B1 B3 | B4 B7 |
|---|---|---|---|
| | SAR Enabled | MSDU Modulo | MPDU Modulo |
| Bits: | 1 | 3 | 4 |

**Figure 9-978—SAR Parameters field format(11ay)**

The SAR Enabled subfield set to 1 indicates that segmentation and reassembly is to be used with the parameters indicated in this element for the corresponding TID.

The MSDU Modulo subfield indicates the number of bits to be allocated to the length of the MSDU Sequence Number subfield within the Sequence Control field. The MPDU Modulo subfield indicates the number of bits to be allocated to the length of the MPDU Sequence Number subfield within the Sequence Control field. The sum of the values of the MSDU Modulo subfield and the MPDU Modulo subfield is equal to 14(#6303).

The MSDU Buffer Size field indicates the number of buffers available for this particular TID. Each buffer is capable of holding the number of octets equal to the value defined by the Maximum Segmented MSDU Exponent subfield.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The MPDU Buffer Size field indicates the number of buffers available for this particular TID. Each buffer is capable of holding a number of octets equal to the maximum MPDU size as indicated in Table 9-34 (Maximum data unit sizes and durations(#1327)(#4013)) for a DMG PPDU, or to the value of the last Maximum MSDU Size field of the TSPEC element agreed between the peers via an ADDTS Request and Response frame exchange for this TID, plus any security encapsulation overhead, MAC header and FCS.

The Maximum Segmented MSDU Exponent subfield specifies the maximum size of the segmented MSDU belonging to the TID under the BA agreement. This subfield is an integer in the range 0 to 9, occupying bit positions 0 through 3 in the Maximum Segmented MSDU Exponent subfield; other bit positions in the subfield are reserved. The maximum segmented MSDU size that is defined by this subfield is equal to $2^{(13 + \text{Maximum Segmented MSDU Exponent})} - 1$ octets.

### 9.4.2.280 TDD Slot Structure element(11ay)

The TDD Slot Structure element defines the structure of a TDD SP described in 10.38.6.2.2 (SP with TDD channel access(11ay)). The format of the TDD Slot Structure element is shown in Figure 9-979 (TDD Slot Structure element format(11ay)).

| | Element ID | Length | Element ID Extension | Slot Structure Control | Peer STA Address |
|---|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | 2 | 6 |

| | Slot Structure Start Time | Number of TDD Intervals | TDD Interval Duration | Number of TDD Slots per TDD Interval (*M*) | Slot Structure |
|---|---|---|---|---|---|
| Octets: | 4 | 2 | 2 | 1 | 4×*M* |

**Figure 9-979—TDD Slot Structure element format(11ay)**

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1 (General).

The Slot Structure Control field is defined in Figure 9-980 (Slot Structure Control field format(11ay)).

| | B0 B3 | B4 B11 | B12 B15 |
|---|---|---|---|
| | Allocation ID | Maximum Time Synchronization Error | Reserved |
| Bits: | 4 | 8 | 4 |

**Figure 9-980—Slot Structure Control field format(11ay)**

The Allocation ID subfield is set to the same value of the Allocation ID subfield in the Allocation Control field of the Extended Schedule element describing the TDD SP allocation.

The Maximum Time Synchronization Error subfield indicates the maximum time synchronization error, in microseconds, between a transmitter and receiver in either uplink or downlink direction.

The Peer STA Address field is any valid individual or broadcast address that specifies the MAC address of the STA that is the intended recipient of the TDD Slot Structure element. The broadcast address indicates that the TDD Slot Structure element is common for the entire BSS.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Slot Structure Start Time field indicates the lower 4 octets of the TSF timer at the start of the first TDD interval in which the slot structure takes effect.

The Number of TDD Intervals field indicates the time duration the slot structure holds, in units of TDD intervals.

The TDD Interval Duration field indicates the TDD interval duration in microseconds.

The Number of TDD Slots per TDD Interval field indicates the number of TDD slots in each TDD interval.

The Slot Structure field is defined in Figure 9-981 (Slot Structure field format(11ay)). The size of this field is 4×*M* octets, where *M* is equal to the value of the Number of TDD Slots per TDD Interval field.

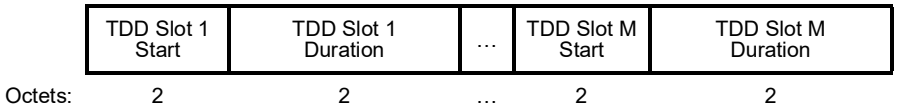

**Figure 9-981—Slot Structure field format(11ay)**

The TDD Slot *i* Start subfield, $1 \le i \le M$, indicates the start time, in microseconds, of the $i^{th}$ TDD slot relative to the beginning of each TDD interval.

The TDD Slot *i* Duration subfield, $1 \le i \le M$, indicates the duration, in microseconds, of the $i^{th}$ TDD slot in each TDD interval.

### 9.4.2.281 TDD Slot Schedule element(11ay)

The TDD Slot Schedule element defines the access assignment of DMG STAs to TDD slots within a TDD SP (see 10.38.6.2.2). The format of the TDD Slot Schedule element is shown in Figure 9-982 (TDD Slot Schedule element format(11ay)).

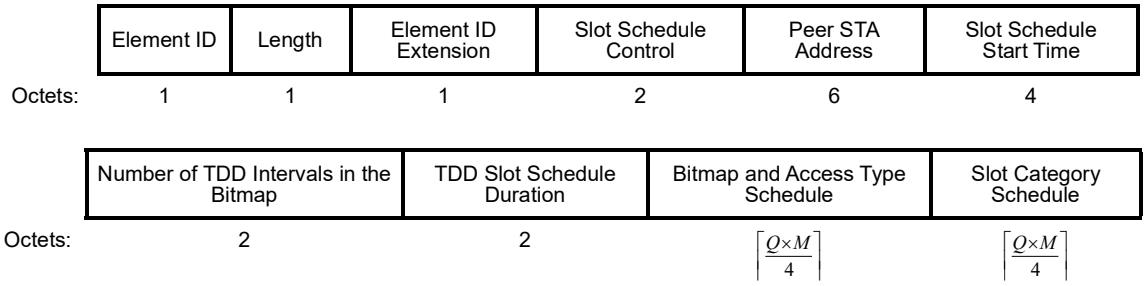

**Figure 9-982—TDD Slot Schedule element format(11ay)**

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1 (General).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Slot Schedule Control field is defined in Figure 9-983 (Slot Schedule Control field format(11ay)).

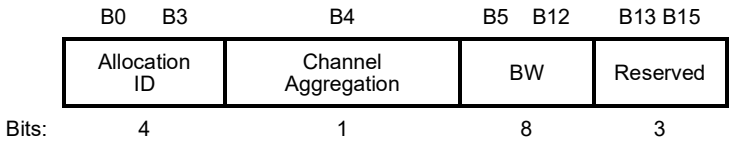

**Figure 9-983—Slot Schedule Control field format(11ay)**

The Allocation ID subfield is set to the same value of the Allocation ID subfield in Allocation Control field of the Extended Schedule element describing the SP allocation.

The Channel Aggregation and BW subfields are defined in Table 28-12 (EDMG-Header-A field structure and definition for an SU PPDU(11ay)).

The Peer STA Address field specifies the MAC address of the STA that is the intended recipient of the TDD Slot Structure element.

The Slot Schedule Start Time field indicates the lower 4 octets of the TSF timer at the start of the first TDD interval in which the schedule takes effect.

The Number of TDD Intervals in the Bitmap field indicates the number of TDD intervals described in the Bitmap and Access Type Schedule field following the time indicated by the Slot Schedule Start Time field.

The TDD Slot Schedule Duration field indicates the duration, in microseconds, from the start of the first TDD interval to the end of the last TDD interval in which the schedule takes effect.

The Bitmap and Access Type Schedule field defines the type of a TDD slot and the access permission of a DMG STA to the TDD slots covered by this bitmap. Each pair of consecutive 2 bits indicates the type and access permission of the TDD slot as specified in Table 9-398 (Bitmap and Access Type Schedule field encoding(11ay)) (see 10.38.6.2.2 (SP with TDD channel access(11ay)) and 11.2.7 (Power management in a PBSS and DMG infrastructure BSS)). The size of the Bitmap and Access Type Schedule field is a function of the value of the Number of TDD Slots per TDD Interval field in the TDD Slot Structure element, *M*, and the value of the Number of TDD Intervals in the Bitmap field, *Q*. If padding is required to make the size of this field an integer number, a TDD slot of type unassigned is used. The TDD slots defined by the Bitmap and Access Type Schedule field are repeated for the duration indicated by the TDD Slot Schedule Duration field value.

**Table 9-398—Bitmap and Access Type Schedule field encoding(11ay)**

| Encoding | Behavior of STA that transmits the TDD Slot Schedule element | Behavior of STA that receives the TDD Slot Schedule element |
|---|---|---|
| 0 | TDD slot unassigned | |
| 1 | Simplex TX | Simplex RX |
| 2 | Simplex RX | Simplex TX |
| 3 | Unavailable | |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Slot Category Schedule field defines the TDD slot category. Each pair of consecutive 2 bits indicates the frame type(s) that are allowed to be transmitted in the corresponding TDD slot defined by the Bitmap and Access Type Schedule field. A value of 0 indicates Basic TDD slot, a value of 1 indicates Data TDD slot and a value of 2 indicates a BF TDD slot. Value of 3 is reserved. The size of the Slot Category Schedule field is a function of the value of the Number of TDD Slots per TDD Interval field in the TDD Slot Structure element, *M*, and the value of the Number of TDD Intervals in the Bitmap field, *Q*. If padding is required to make the size of this field an integer number, a reserved TDD slot category is used.

### 9.4.2.282 TDD Route element(11ay)

The TDD Route element is used to communicate TDD beamforming results and sector switch configuration as described in 10.41.11 (TDD beamforming(11ay)) and 11.36 (DMG beamforming). The format of the TDD Route element is shown in Figure 9-984 (TDD Route element format(11ay)).

| | Element ID | Length | Element ID Extension | TDD Route Subelements |
|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | variable(M118) |

**Figure 9-984—TDD Route element format(11ay)**

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1 (General).

The TDD Route Subelements field is defined in Table 9-399 (TDD Route Subelements field format(11ay)). The TDD Route element contains one or more of the subelements indicated in Table 9-399 (TDD Route Subelements field format(11ay)).

**Table 9-399—TDD Route Subelements field format(11ay)**

| Subelement ID | Name | Length |
|---|---|---|
| 0 | TDD Sector Feedback | Variable |
| 1 | TDD Sector Setting | 25 |
| 2 | TDD Sector Config | Variable |
| 3–220 | Reserved | |
| 221 | Vendor specific | Vendor defined |
| 222–225 | Reserved | |

The TDD Sector Feedback subelement is used to communicate all the initiator TX Sector IDs as received by the responder during a TDD beamforming training procedure described in 10.41.11. The format of the TDD Sector Feedback element is shown in Figure 9-985 (TDD Sector Feedback subelement format(11ay)).

| | Subelement ID | Length | Number of Tx Beams | Tx Beam Feedback$_1$ | … | Tx Beam Feedback$_N$ |
|---|---|---|---|---|---|---|
| Octets: | 1 | 1 | 2 | variable(M118) | | variable(M118) |

**Figure 9-985—TDD Sector Feedback subelement format(11ay)**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Subelement ID subfield is defined in Table 9-399 (TDD Route Subelements field format(11ay)).

The Length subfield is defined in 9.4.2.1 (General).

The Number of Tx Beams subfield indicates the number of Tx Beam Feedback subfields, *N*, included in the subelement.

Each Tx Beam Feedback subfield has a variable size and is defined in Figure 9-986 (Tx Beam Feedback subfield format(11ay)).

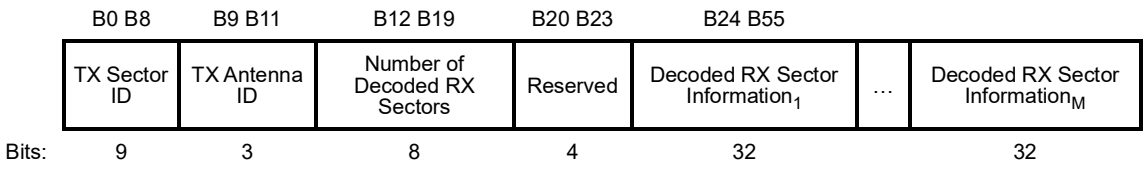

**Figure 9-986—Tx Beam Feedback subfield format(11ay)**

The TX Sector ID subfield contains the value of the TX Sector ID subfield in the TDD SSW frame to which the Tx Beam Feedback subfield applies.

The TX Antenna ID subfield contains the value of the TX Antenna ID subfield in the TDD SSW frame to which the Tx Beam Feedback subfield applies.

The Number of Decoded RX Sectors subfield indicates the number of Decoded RX Sector Information subfields, *M*, included in this subfield.

The Decoded RX Sectors Information subfield is defined in Figure 9-987 (Decoded RX Sectors Information subfield format(11ay)).

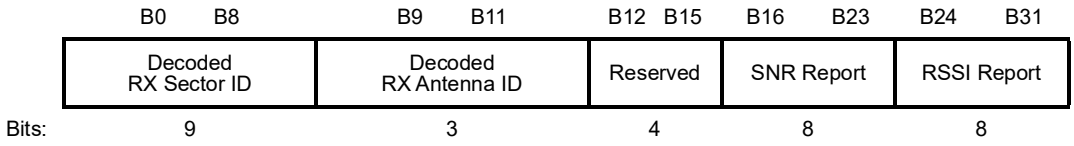

**Figure 9-987—Decoded RX Sectors Information subfield format(11ay)**

The Decoded RX Sector ID subfield indicates the receive sector index used by the responder when it decoded a TDD SSW frame with TX Sector ID and TX Antenna ID subfields matching the corresponding subfields in the Tx Beam Feedback subfield.

The Decoded RX Antenna ID subfield indicates the receive DMG antenna index used by the responder when it decoded a TDD SSW frame with TX Sector ID and TX Antenna ID subfields matching the corresponding subfields in the Tx Beam Feedback subfield.

The SNR Report subfield is set to the value of the SNR achieved while decoding TDD SSW frame(s) with TX Sector ID and TX Antenna ID subfields matching the corresponding subfields in the Tx Beam Feedback subfield. The SNR Report subfield is an unsigned integer referenced to a level of –8 dB. Each step is 0.25 dB. SNR values less than or equal to –8 dB are represented as 0. SNR values greater than or equal to 55.75 dB are represented as 0xFF.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The RSSI Report subfield is set to the value of the received power while receiving the L-STF field of TDD SSW frame(s) with TX Sector ID and TX Antenna ID subfields matching the corresponding subfields in the Tx Beam Feedback subfield. The RSSI Report is a signed integer in the range –128 dBm to 127 dBm and is measured by the PHY as the power observed at the input of the antenna plus the antenna gain, or the equivalent antenna gain for phased array antennas, used to receive the TDD SSW frame(s).

NOTE—When multiple TDD SSW frames are received for the same combination of transmit and receive DMG antennas, and transmit and receive sectors, the SNR and RSSI values reported in the SNR Report and RSSI Report subfields can be a combination of measurements taken over any subset of the received TDD SSW frames.

The TDD Sector Setting subelement is used to request the peer to configure its antenna to a specific receive and transmit sector combination as described in 11.36 (DMG beamforming). The format of the TDD Sector Setting subelement is shown in Figure 9-988 (TDD Sector Setting subelement format(11ay)).

| | Subelement ID | Length | TDD Sector Setting Control | Switch Timestamp | Revert Timestamp | TDD Switch Sectors |
|---|---|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | 8 | 8 | 6 |

**Figure 9-988—TDD Sector Setting subelement format(11ay)**

The Subelement ID subfield is defined in Table 9-399 (TDD Route Subelements field format(11ay)).

The Length subfield is defined in 9.4.2.1 (General).

The TDD Sector Setting Control subfield is defined in Figure 9-989 (TDD Sector Setting Control field format(11ay)).

| | B0 | B1 | B2 | B3 B7 |
|---|---|---|---|---|
| | Set Sector Request | Set Sector Response | Set Sector Acknowledge | Reserved |
| Bits: | 1 | 1 | 1 | 5 |

**Figure 9-989—TDD Sector Setting Control field format(11ay)**

The Set Sector Request subfield is set to 1 by the initiator to request the responder to change its receiver sector setting according to the Responder RX Sector ID subfield and its transmitter sector setting according to Responder TX Sector ID subfield, with both subfields indicated in the TDD Switch Sectors subfield.

The Set Sector Response subfield is set to 1 by the responder to indicate the reception of a successful TDD Sector Setting subelement with the Set Sector Request subfield equal to 1.

The Set Sector Acknowledge subfield is set to 1 by the initiator to acknowledge the reception of a successful TDD Sector Setting subelement with the Set Sector Response subfield equal to 1.

The Switch Timestamp subfield indicates a future TSF timer value in which the new sector configuration setting is to take effect.

The Revert Timestamp subfield indicates a future TSF timer value in which the previous sector configuration is restored in case sector switching fails.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The TDD Switch Sectors subfield is defined in Figure 9-990 (TDD Switch Sectors field format(11ay)).

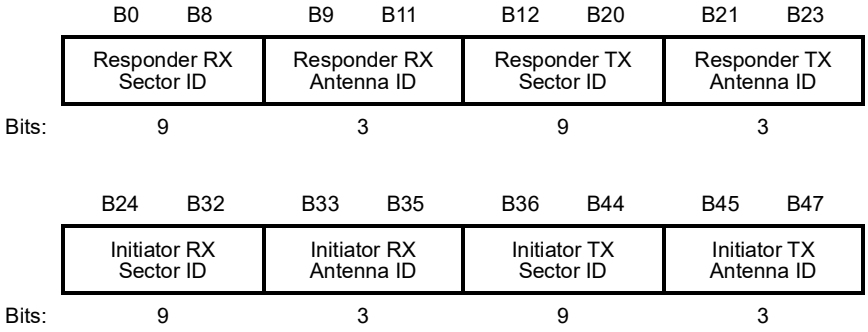

**Figure 9-990—TDD Switch Sectors field format(11ay)**

The Responder RX Sector ID subfield contains the value of the sector ID the responder uses to set its receive sector.

The Responder RX Antenna ID subfield contains the antenna ID the responder uses to set its receive DMG antenna.

The Responder TX Sector ID subfield contains the value of the sector ID the responder uses to set its transmit sector.

The Responder TX Antenna ID subfield contains the antenna ID the responder uses to set its transmit DMG antenna.

The Initiator RX Sector ID subfield contains the value of the sector index the initiator uses to set its receive sector.

The Initiator RX Antenna ID subfield contains the antenna ID the initiator uses to set its receive DMG antenna.

The Initiator TX Sector ID subfield contains the value of the sector index the initiator uses to set its transmit sector.

The Initiator TX Antenna ID subfield contains the antenna ID the initiator uses to set its transmit DMG antenna.

The TDD Sector Config subelement is used to communicate the RX Sector IDs and RX Antenna ID to be used by the responder during the next beam measurement procedure as described in 10.41.11 (TDD beamforming(11ay)). The format of the TDD Sector Config subelement is shown in Figure 9-991 (TDD Sector Config subelement format(11ay)).

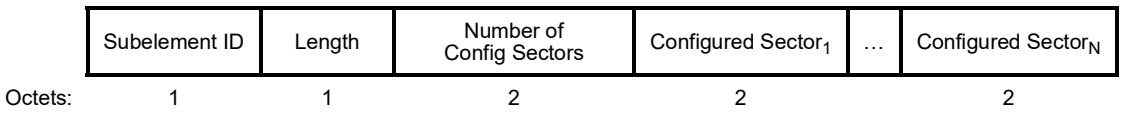

**Figure 9-991—TDD Sector Config subelement format(11ay)**

The Subelement ID subfield is defined in Table 9-399 (TDD Route Subelements field format(11ay)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Length subfield is defined in 9.4.2.1 (General).

The Number of Config Sectors subfield indicates the number of Configured Sector subfields, *N*, included in the subelement.

Each Configured Sector subfield is defined as indicated in Figure 9-992 (Configured Sector subfield format(11ay)).

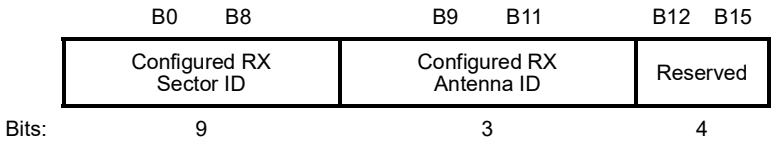

**Figure 9-992—Configured Sector subfield format(11ay)**

The Configured RX Sector ID subfield indicates the receive sector index to be used by the responder in the upcoming beam measurement procedure.

The Configured RX Antenna ID subfield indicates the receive DMG antenna index to be used by the responder in the upcoming beam measurement procedure.

### 9.4.2.283 Digital BF Feedback element(11ay)

The Digital BF Feedback element is transmitted in the MIMO BF Feedback frame and carries feedback information in the form of beamforming feedback matrices and differential SNRs. The feedback information (#2329)is used by a transmit beamformer to determine digital beamforming steering matrices, *Q*. This process is described in 10.41.10.2.4 (Hybrid beamforming for SU-MIMO and MU-MIMO). When the Digital BF Feedback element is transmitted in the MIMO BF Feedback frame, the SNR fields within the Channel Measurement Feedback element are interpreted as average SNR per stream, as defined in Table 9-264 (see 9.4.2.135 (Channel Measurement Feedback element)).

As specified in this subclause, the size and configuration of the Digital BF Feedback element depends on the field values in the MIMO Feedback Control element transmitted in the same frame that carries the Digital BF Feedback element. Therefore, all references to fields present in the MIMO Feedback Control element refer to the element transmitted in the same frame that carries the Digital BF Feedback element.

When the Feedback Type subfield within the Digital Fbck Control field is 0, the Digital Beamforming Feedback Information field in the Digital BF Feedback element contains $N_{SC}$ digital beamforming matrices. When $N_{SC} > 1$, a Tap Delay field indicating the tap to which each digital beamforming matrix corresponds to is additionally present. The digital beamforming information in time domain can be represented as a matrix function $V$ given by the following:

$$V\left(n\frac{T_c}{N_{CB}}\right)=\sum_{k=1}^{N_{SC}}\tilde{V}_k\delta\left(\frac{T_c}{N_{CB}}\left[n-n_k\right]\right)$$

where

$n_k$ is the delay of the $k^{\text{th}}$ tap and $n_k = 0$ for $k = 1$

$T_c/N_{CB}$ is defined in Table 28-47 (EDMG SC mode timing-related parameters(11ay))

$\tilde{V}_k$ is the digital beamforming matrix per tap

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$\delta(n) = \begin{cases} 1 & n = 0 \\ 0 & n \neq 0 \end{cases}$$

The components of the digital beamforming matrix per tap $\tilde{V}_k$ are contained in the Digital Beamforming Feedback Matrix *k* subfield, in uncompressed form, indexed such that the $(i, j)^{\text{th}}$ element of $\tilde{V}_k$ is the $(j - 1) \times Nr + (i - 1)^{\text{th}}$ entry of the $k^{\text{th}}$ Digital Beamforming Feedback Matrix field, shown in Table 9-993 (Description of the Digital Beamforming Feedback Matrix k subfield in SC mode(11ay)), and $i = 1 \ldots Nr$, $j = 1 \ldots Nc$, where *Nr* and *Nc* are defined by the Nr Index and Nc Index subfields, respectively, in the Digital Fbck Control field. Each digital feedback component is represented as an 8 bit real part, followed by an 8 bit imaginary part. The taps $n_k > 0$ for which each of the beamforming feedback matrices are computed are indicated in the Tap Delay field.

**Figure 9-993—Description of the Digital Beamforming Feedback Matrix *k* subfield in SC mode(11ay)**

| Subfield | | Size (bits) | Meaning |
|---|---|---|---|
| Digital Beamforming Feedback Matrix *k* | Digital Feedback Component 1 | 16 | Digital beamforming coefficient(s) for stream 1 to TX transmit chain 1 |
| | Digital Feedback Component 2 | 16 | Digital beamforming coefficient(s) for stream 1 to TX transmit chain 2 |
| | … | … | … |
| | Digital Feedback Component *Nr* × *Nc* | 16 | Digital beamforming coefficient for stream *Nr* to TX transmit chain *Nc*. |

When the Feedback Type within the Digital Fbck Control field is 1, the Digital Beamforming Feedback Information field contains the digital beamforming feedback matrices in compressed form with elements indexed, first, by matrix angles in the order shown in Table 9-103 (Order of angles in the compressed beamforming feedback matrix for MU type feedback when used in an S1G band) and, second, by data subcarrier index from lowest frequency to highest frequency. The explanation on how these angles are generated from the beamforming feedback matrix *V* is given in 19.3.12.3.6 (Compressed beamforming feedback matrix). For channel aggregation where the total number of spatial streams is evenly divided between the primary and secondary channels (see 28.3.3.3.2.3 (Definition for EDMG SC mode and EDMG OFDM mode PPDUs)), the number of rows and columns in beamforming feedback matrix is an even number. The number of rows in each aggregated channel's beamforming feedback matrix is *Nr*/2 and the number of columns in each aggregated channel's beamforming feedback matrix is *Nc*/2, where *Nr* and *Nc* are the values, respectively, indicated by the Nr Index and Nc Index subfields within the Digital Fbck Control field.

The Digital BF Feedback element has the structure and order defined in Table 9-400 (Digital BF Feedback element format (11ay)), where the value of $n_{bit}$ is defined in Table 9-401 (Definition of nbit (11ay)) as a function of the value of the Feedback Type subfield within the Digital Fbck Control field. For channel aggregation, the value of $n_{bit}$ is composed of feedback bits for each aggregated channel.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-400—Digital BF Feedback element format (11ay)**

| Field | Size (bits) | Meaning |
|---|---|---|
| Element ID | 8 | |
| Length | 8 | |
| Element ID Extension | 8 | |
| Digital Beamforming Feedback Information | | |
| Digital Beamforming Feedback Matrix 1 | $n_{bit}$ | If the Feedback Type subfield is 0, represents the beamforming matrix in time domain for the 1st tap as described above.<br><br>If Feedback Type subfield is 1, represents the beamforming matrix for the 1st subcarrier, indexed by matrix angles in the order shown in Table 9-103 (Order of angles in the compressed beamforming feedback matrix for MU type feedback when used in an S1G band). |
| … | … | |
| Digital Beamforming Feedback Matrix $N_{SC}$ | $n_{bit}$ | If the Feedback Type subfield is 0, represents the beamforming matrix in time domain for the $N_{SC}$th tap as described above.<br><br>If Feedback Type subfield is 1, represents the beamforming matrix for the $N_{SC}$th subcarrier, indexed by matrix angles in the order shown in Table 9-103 (Order of angles in the compressed beamforming feedback matrix for MU type feedback when used in an S1G band). |
| Differential Subcarrier Index | | |
| Differential subcarrier index $scidx(0) - scidx(1)$ | 3 | When the Grouping subfield is 3, this field represents the number of subcarriers between $scidx(0)$ and $scidx(1)$. Otherwise, it is not present.<br>It is set to $j$ to indicate the distance between the $scidx(0)$ and $scidx(1)$ is $2^j$.<br><br>Set to 0 to indicate 1.<br>Set to 1 to indicate 2.<br>Set to 2 to indicate 4.<br>Set to 3 to indicate 8.<br>Set to 4 to indicate 16.<br>Set to 5 to indicate 32.<br>Values 6 and 7 are reserved. |
| … | … | |
| Differential subcarrier index $scidx(N_{SC} - 2) - scidx(N_{SC} - 1)$ | 3 | When the Grouping subfield is 3, this field represents the number of subcarriers between $scidx(N_{SC} - 2)$ and $scidx(N_{SC} - 1)$. Otherwise, it is not present.<br>It is set to $j$ to indicate the distance between the $scidx(N_{SC} - 2)$ and $scidx(N_{SC} - 1)$ is $2^j$. |

This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-400—Digital BF Feedback element format *(continued)*(11ay)**

| Field | Size (bits) | Meaning |
|---|---|---|
| Tap Delay | | |
| Relative Tap Delay 2 | 12 | When the Feedback Type subfield is 0 and $N_{SC} > 1$, this field represents the delay of tap #2 in units of $T_c/N_{CB}$ relative to Tap 1. Otherwise, it is not present. |
| … | ... | … |
| Relative Tap Delay $N_{SC}$ | 12 | When the Feedback Type subfield is 0 and $N_{SC} > 1$, this field represents the delay of tap #$N_{SC}$ in units of $T_c/N_{CB}$ relative to Tap 1. Otherwise, it is not present. |
| MU Exclusive Beamforming Report | | |
| Differential SNR for space-time stream 1 for subcarrier $k = scidx(0)$ | 8 | $D\_SNR_{scidx(0),1}$ as defined in Equation (9-11) |
| … | … | … |
| Differential SNR for space-time stream *Nc* for subcarrier $k = scidx(0)$ | 8 | $D\_SNR_{scidx(0),Nc}$ as defined in Equation (9-11) |
| Differential SNR for space-time stream 1 for subcarrier $k = scidx(1)$ | 4 | $D\_SNR_{scidx(1),1}$ as defined in Equation (9-10) |
| … | … | … |
| Differential SNR for space-time stream *Nc* for subcarrier $k = scidx(1)$ | 4 | $D\_SNR_{scidx(1),Nc}$ as defined in Equation (9-10) |
| … | … | … |
| Differential SNR for space-time stream 1 for subcarrier $k = scidx(N_{SC} - 1)$ | 4 | $D\_SNR_{scidx(Nsc-1),1}$ as defined in Equation (9-10) |
| … | … | … |
| Differential SNR for space-time stream *Nc* for subcarrier $k = scidx(N_{SC} - 1)$ | 4 | $D\_SNR_{scidx(Nsc-1),Nc}$ as defined in Equation (9-10) |
| Padding | 0–7 | Zero padding to make the Digital BF Feedback element length a multiple of 8 bits |

When the Grouping subfield within the Digital Fbck Control field is less than or equal to 2, the subcarrier indices for which the beamforming matrices are computed are defined in Table 9-403 (Subcarriers for which a compressed beamforming feedback matrix is sent back(11ay)). When the Grouping subfield within the Digital Fbck Control field is 3, the Digital BF Feedback element includes the Differential Subcarrier Index field marking the number of subcarriers between each two adjacent subcarriers within the feedback report. The subcarrier index set is constructed such that it is a subset of the subcarrier index set defined for *Ng*=2 and the corresponding $N_{CB}$ in Table 9-403 (Subcarriers for which a compressed beamforming feedback matrix is sent back(11ay)), such that the edge subcarriers and the subcarriers with indices –2 and 2 are present within the feedback report and the distance between subcarriers within the feedback report is one of the values in {1, 2, 4, 8, 16, 32}.

**Table 9-401—Definition of $n_{bit}$ (11ay)**

| Feedback Type subfield value | $n_{bit}$ size (bits) | | |
|---|---|---|---|
| | 2.16 GHz, 4.32 GHz, 6.48 GHz, or 8.64 GHz channel | 2.16+2.16 GHz or 4.32+4.32 GHz channel | |
| 0 | $2\times 8\times N_c\times N_r$ | $2\times 8\times (N_c/2)\times (N_r/2)$ | 2.16 GHz or 4.32 GHz channel containing the primary channel |
| | | $2\times 8\times (N_c/2)\times (N_r/2)$ | 2.16 GHz or 4.32 GHz channel not containing the primary channel |
| 1 | $N_a\times (b_\psi + b_\varphi)/2$, with $N_\varphi = \left( N_r \times \frac{N_r+1}{2} - N_r \right)$ and $N_\psi = \left( N_r \times \frac{N_r-1}{2} \right)$, $N_a = N_\psi + N_\phi$ | $N_a\times (b_\psi + b_\varphi)/2$, with $N_\varphi = \left( (N_r/2)\times \frac{(N_r/2)+1}{2} - (N_r/2) \right)$ and $N_\psi = \left( (N_r/2)\times \frac{(N_r/2)-1}{2} \right)$, $N_a = N_\psi + N_\phi$ | 2.16 GHz or 4.32 GHz channel containing the primary channel |
| | | $N_a\times (b_\psi + b_\varphi)/2$ | 2.16 GHz or 4.32 GHz channel not containing the primary channel |

In Table 9-103 (Order of angles in the compressed beamforming feedback matrix for MU type feedback when used in an S1G band), *Nc* is the number of columns in a compressed beamforming feedback matrix determined by the Nc Index subfield within the Digital Fbck Control field, and *Nr* is the number of rows in a compressed beamforming feedback matrix determined by the Nr Index subfield within the Digital Fbck Control field.

The angles are quantized as defined in Table 9-402 (Quantization of angles(11ay)).

**Table 9-402—Quantization of angles(11ay)**

| Quantized Ψ | Quantized ϕ |
|---|---|
| $\psi = \frac{k\pi}{2^{b_\psi+1}} + \frac{\pi}{2^{b_\psi+2}}$ radians<br>where<br>$k = 0, 1, 2, \ldots, 2^{b_\psi} - 1$<br>$b_\psi$ is the number of bits used to quantize ψ (defined by the Codebook Information field of the MIMO Feedback Control element) | $\phi = \frac{k\pi}{2^{b_\phi-1}} + \frac{\pi}{2^{b_\phi}}$ radians<br>where<br>$k = 0, 1, 2, \ldots, 2^{b_\phi} - 1$<br>$b_\phi$ is the number of bits used to quantize ϕ (defined by the Codebook Information field of the MIMO Feedback Control element) |

The MU Exclusive Beamforming Report field carries explicit feedback information in the form of differential SNRs contained in the Differential SNR subfields. The MU Exclusive Beamforming Report field is included in the Digital BF Feedback element if the SU/MU field in MIMO Feedback Control element is 1 (MU transmission) and the Feedback Type subfield of the Digital Fbck Control field is 1 (EDMG OFDM mode).

The MU Exclusive Beamforming Report field consists of Differential SNR subfields for each space-time stream (1 to *Nc*) of a subset of the subcarriers spaced *Ng* apart, where *Ng* is the value of the Grouping subfield of the Digital Fbck Control field in the MIMO Feedback Control element, starting from the lowest frequency subcarrier and continuing to the highest frequency subcarrier. No padding is present between $D\_SNR_{k,i}$ in the MU Exclusive Beamforming Report field, even if they correspond to different subcarriers. The subset of subcarriers included is determined by the values of Table 9-403 (Subcarriers for which a compressed beamforming feedback matrix is sent back(11ay)). For each subcarrier included, the deviation

This is an unapproved IEEE Standards Draft, subject to change.

in dB of the SNR of that subcarrier for each column of $V$ relative to the adjacent subcarrier spaced $Ng$ apart of the corresponding space-time stream is computed using Equation (9-10)(#3360).

$$D\_SNR_{k,j} = min\left(max\left(round\left(10\log10\left(\frac{\left\|H_k V_{k,i}\right\|^2}{N}\right) - 10\log10\left(\frac{\left\|H_{\tilde{k}} V_{\tilde{k},i}\right\|^2}{N}\right)\right), -8\right), -7\right) \quad (9\text{-}10)$$

where

$k$ is the subcarrier index in the range $scidx(1)$, …, $scidx(N_{SC} - 1)$

$\tilde{k}$ is the subcarrier index in the range $scidx(0)$, …, $scidx(N_{SC} - 2)$

$i$ is the space-time stream index in the range 1, …, $Nc$

$H_k$ is the estimated MIMO channel for subcarrier $k$

$V_{k,i}$ is column $i$ of the beamforming matrix $V$ for subcarrier $k$

$N$ is the average noise plus interference power, measured at the responder

Each Differential SNR subfield contains the $D\_SNR_{k,i}$ computed using Equation (9-10) and quantized to 4 bits in the range –8 dB to 7 dB with 1 dB granularity, except for $k = scidx(0)$. $D\_SNR_{scidx(0),i}$ is computed using Equation (9-11) and quantized to 8 bits in the range –8 dB to 55.75 dB with 0.25 dB granularity(#3360).

$$D\_SNR_{scidx(0),i} = 10\log10\left(\frac{\left\|H_{scidx(0)} V_{scidx(0),i}\right\|^2}{N}\right) \quad (9\text{-}11)$$

### 9.4.2.284 TDD Bandwidth Request element(11ay)

The TDD Bandwidth Request element contains the information needed for bandwidth reservation request during TDD SPs. The format of the TDD Bandwidth Request element is shown in Figure 9-994 (TDD Bandwidth Request element format(11ay)).

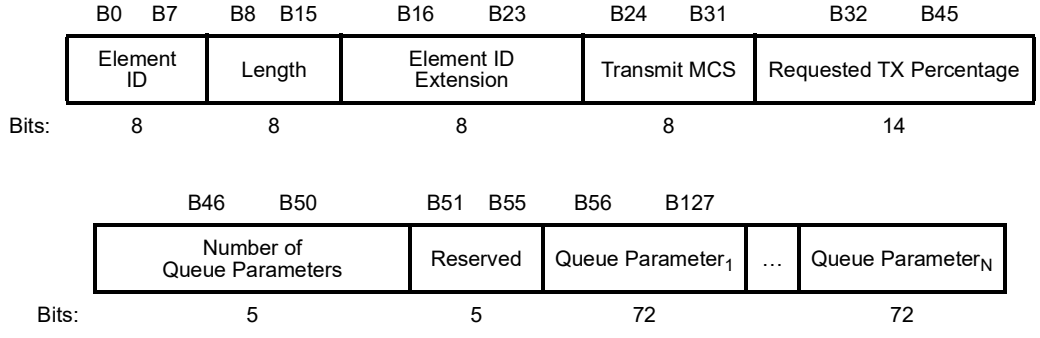

**Figure 9-994—TDD Bandwidth Request element format(11ay)**

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1 (General).

The Transmit MCS field indicates the recommended MCS value to be used for the upcoming non-AP and non-PCP STA to AP or PCP transmission(s).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Requested TX Percentage field indicates the requested transmit percentage of airtime from the non-AP and non-PCP STA to the AP or PCP in relation to the airtime occupied by the bidirectional traffic between the STA and the AP or PCP. The value is in units of 0.01 percent.

The Number of Queue Parameters field defines the integer number, *N*, of subsequent Queue Parameter fields.

Each Queue Parameter field is defined as shown in Figure 9-995 (Queue Parameter field format(11ay)).

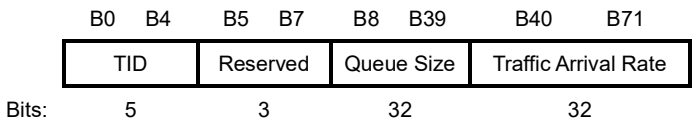

**Figure 9-995—Queue Parameter field format(11ay)**

For values from 0 to 15, the TID subfield indicates the TID corresponding to the queue. A value of 31 indicates that this field is not applicable. Other values are reserved.

The Queue Size subfield indicates the amount of queued traffic at the transmitter, in unit of octets(#8150), corresponding to the TID indicated by the TID subfield.

The Traffic Arrival Rate subfield indicates the arrival rate of the traffic since the last reporting event, in units of 1 kb/s. The method for computing the arrival rate is implementation dependent.

### 9.4.2.285 TDD Synchronization element(11ay)

The TDD Synchronization element contains the information needed for clock synchronization during TDD SPs. The format of the element is shown in Figure 9-996 (TDD Synchronization element format(11ay)).

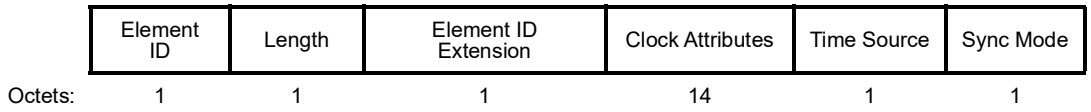

**Figure 9-996—TDD Synchronization element format(11ay)**

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1 (General).

The Clock Attributes field format is shown in Figure 9-997 (Clock Attributes field format(11ay)).

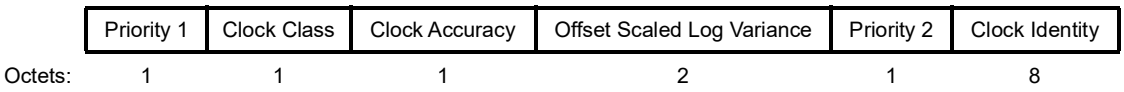

**Figure 9-997—Clock Attributes field format(11ay)**

The Priority 1, Clock Class, Clock Accuracy, Offset Scaled Log Variance, Priority 2 and Clock Identity subfields indicate attributes of the source of timing locally available to the STA that transmits the element, and are defined the same as priority1, clockClass, clockAccuracy, offsetSceledLogVariance, priority2, and clockIdentity attributes defined in 8.6.2 in IEEE Std 802.1AS-Rev/D8.0.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Time Source field indicates the type of clock available to the STA transmitting the element. It is defined the same as the timeSource attribute defined in 8.6.2 in IEEE Std 802.1AS-Rev/D8.0.

NOTE 1—The Clock Attributes field is defined similar to the IEEE 802.1AS systemIdentity attribute, as a metric to compare the local clock available to a STA and the clock available to the peer STA that transmits the TDD Clock Attributes element. While the comparison metric and logic are defined the same as IEEE 802.1AS for flexibility, using the IEEE 802.1AS protocol for TDD time synchronization is not required and is beyond the scope of this standard.

NOTE 2—DMG STAs that support TDD channel access can use external timing sources such as GNSS for accurate clock attributes. For example, for a STA with access to a clock that is synchronized to a primary reference time source such as GNSS (i.e., clockClass of 0x06), and has a precision of ±500 ps (i.e., clockAccuracy of 0x23) and a clock variance of 1.497e-22 $s^2$ (i.e., offsetScaledLogVariance 0x3780), the Clock Class, Clock Accuracy and Offset Scaled Log Variance fields are respectively set to 0x06, 0x23 and 0x3780. Refer to IEEE Std 802.1AS for details.

The Sync Mode field indicates access to a local source of timing (e.g., GNSS). The Sync Mode field is set to 1 to indicate that the STA does not have access to a local source of timing at the time of transmitting the element. The Sync Mode field is set to 0 to indicate that the local clock is used by the STA at the time of transmitting the element.

### 9.4.2.286 EDMG Wide Bandwidth Channel Switch element(11ay)

The EDMG Wide Bandwidth Channel Switch element is included in DMG Beacon frames, Announce frames, or Information Response frames, as defined in 11.8.8.7 (Selecting and advertising new channels in an EDMG BSS(11ay)). The format of the EDMG Wide Bandwidth Channel Switch element is shown in Figure 9-998 (EDMG Wide Bandwidth Channel Switch element format(11ay)).

| | Element ID | Length | Element ID Extension | EDMG New Operating Channel |
|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | 2 |

**Figure 9-998—EDMG Wide Bandwidth Channel Switch element format(11ay)**

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1 (General).

The EDMG New Operating Channel field is defined in Figure 9-999 (EDMG New Operating Channel field format(11ay)).

| | BSS Operating Channels | Operating Channel Width |
|---|---|---|
| Octets: | 1 | 1 |

**Figure 9-999—EDMG New Operating Channel field format(11ay)**

The BSS Operating Channels subfield and the Operating Channel Width subfield are defined in 9.4.2.265 (EDMG Operation element(11ay)).

### 9.4.2.287 DMG Discovery Assistance element(11ay)

The DMG Discovery Assistance element indicates parameters and attributes of the discovery assistance. This element is optionally present in FST Setup Request and FST Setup Response frames. The format of the

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

DMG Discovery Assistance element is shown in Figure 9-1000 (EDMG Discovery Assistance element format(11ay)).

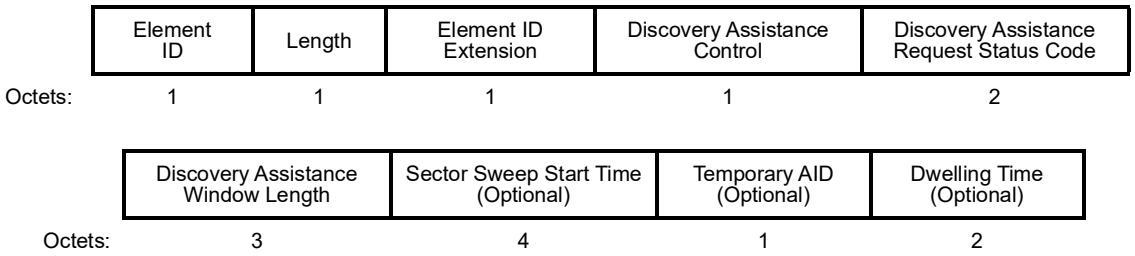

**Figure 9-1000—EDMG Discovery Assistance element format(11ay)**

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1 (General).

The format of the Discovery Assistance Control field is shown in Figure 9-1001 (Discovery Assistance Control field format(11ay)). This field is reserved when the element is contained in an FST Setup Request frame.

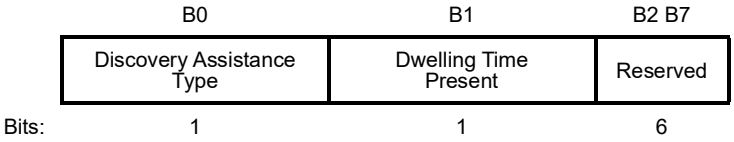

**Figure 9-1001—Discovery Assistance Control field format(11ay)**

The Discovery Assistance Type subfield is set to 0 to indicate that the Sector Sweep Start Time field is present in this element. When this field is set to 1, the schedule to perform discovery assistance is indicated in the Extended Schedule element and the Temporary AID field is present in this element. This field is reserved when the Discovery Assistance Request Status Code field is not equal to SUCCESS.

The Dwelling Time Present subfield is set to 1 to indicate that the Dwelling Time field is present in the element and is set to 0 otherwise.

The Discovery Assistance Request Status Code field contains the result of the discovery assistance request and is one of the status codes specified in Table 9-80 (Status codes) in 9.4.1.9 (Status Code field). This field is reserved when the element is contained in an FST Setup Request frame.

The Discovery Assistance Window Length field indicates the discovery assistance window length value, in microseconds, as confirmed by the STA transmitting this element. This field is reserved when the element is contained in an FST Setup Request frame.

The Sector Sweep Start Time field indicates the lower 4 octets of the TSF of the DMG BSS at the time the sector sweep transmission starts. This field is present if the Discovery Assistance Type subfield is 0. This field is reserved when the element is contained in an FST Setup Request frame.

The Temporary AID field indicates a temporary AID assigned by an AP or PCP to the STA receiving this element. The temporary AID is used for scheduling discovery assistance. This field is present if the Discovery Assistance Type subfield is 1.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Dwelling Time field indicates the recommended time, in microseconds, to sweep the receive sectors to scan for beamforming or discovery signals. This field is present if the Dwelling Time Present subfield is 1.

### 9.4.2.288 Extended Link Measurement element(11ay)

#### 9.4.2.288.1 General

The Extended Link Measurement element contains information used to solicit link measurement report and is optionally included in Link Measurement Request and Link Measurement Report frames. The format of Extended Link Measurement element is shown in Figure 9-1002 (Extended Link Measurement element format(11ay)).

| | Element ID | Length | Element ID Extension | Optional Subelements |
|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | variable(M118) |

**Figure 9-1002—Extended Link Measurement element format(11ay)**

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1 (General).

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3 (Subelements).

The Subelement ID field values for the defined subelements are shown in Table 9-404 (Optional subelement IDs(11ay)). A subelement does not appear more than once in the Extended Link Measurement element.

**Table 9-404—Optional subelement IDs(11ay)**

| Subelement ID | Name | Extensible |
|---|---|---|
| 0 | Periodic Report Request | Yes |
| 1 | Extended TPC Configuration | Yes |
| 2 | EDMG Transmit Power | Yes |
| 3 | Periodic Report | Yes |
| 4–255 | Reserved | |

#### 9.4.2.288.2 Periodic Report Request subelement

The Periodic Report Request subelement contains information to solicit periodic link measurement report and is optionally included in Link Measurement Request frame. The format of the Data field of the Periodic Report Request subelement is shown in Figure 9-1003 (Data field of the Periodic Report Request subelement format(11ay)).

| | Report Start Time | Report Interval | Report Count |
|---|---|---|---|
| Octets: | 4 | 2 | 2 |

**Figure 9-1003—Data field of the Periodic Report Request subelement format(11ay)**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Report Start Time subfield indicates the lower 4 octets of the TSF timer at the start of the first report interval.

The Report Interval subfield indicates the interval of time, in microseconds, at which the responding STA needs to take measurements and send an unsolicited Link Measurement Report frame to the requesting STA. Value zero is reserved.

The Report Count subfield indicates the number of report intervals. A responding STA sends an unsolicited Link Measurement Report frame to the requesting STA for every report interval. Value zero is reserved.

### 9.4.2.288.3 Extended TPC Configuration subelement

The Extended TPC Configuration subelement contains information for EDMG transmit power control configuration and is optionally included in a Link Measurement Request frame. The format of the Data field of the Extended TPC Configuration subelement is shown in Figure 9-1004 (Data field of the Extended TPC Configuration subelement format(11ay)).

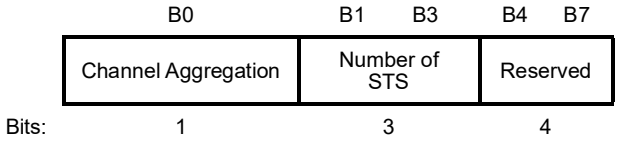

**Figure 9-1004—Data field of the Extended TPC Configuration subelement format(11ay)**

The Channel Aggregation field is set to 1 to indicate that the PPDU containing the Link Measurement Request frame is transmitted over a 2.16+2.16 GHz or a 4.32+4.32 GHz channel, and is set to 0 otherwise.

The Number of STS field indicates the number of STS used in the transmission of the PPDU containing the Link Measurement Request frame. If the Channel Aggregation field is 1, the Number of STS subfield is an even number.

### 9.4.2.288.4 EDMG Transmit Power subelement

The EDMG Transmit Power subelement contains information for transmit power in link measurement and is optionally included in a Link Measurement Request frame. The format of the Data field of the EDMG Transmit Power subelement is shown in Figure 9-1005 (Data field of the EDMG Transmit Power subelement format(11ay)).

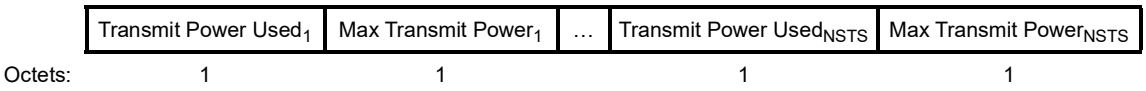

**Figure 9-1005—Data field of the EDMG Transmit Power subelement format(11ay)**

Each Transmit Power Used$_i$ field, $1 \le i \le N_{STS}$, indicates the transmit power used in the STS $i$ to transmit the PPDU containing the Link Measurement Request frame, as described in 9.4.1.20 (Transmit Power Used field). $N_{STS}$ represents the number of STS.

Each Max Transmit Power$_i$ field, $1 \le i \le N_{STS}$, indicates the upper limit on the transmit power of the STS $i$ measured at the output of the antenna connector to be used by the transmitting STA on its operating channel. This field is described in 9.4.1.19. (#1446)The value of each Max Transmit Power$_i$ field is equal to the

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

minimum of the maximum powers at which the STA is permitted to transmit in the operating channel by device capability, policy, and regulatory authority.

### 9.4.2.288.5 Periodic Report subelement

The Periodic Report subelement contains information in response to a periodic link measurement request and is optionally included in a Link Measurement Report frame. The format of the Data field of the Periodic Report subelement is shown in Figure 9-1006 (Data field of the Periodic Report subelement format(11ay)).

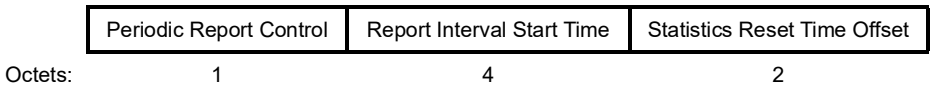

**Figure 9-1006—Data field of the Periodic Report subelement format(11ay)**

The Periodic Report Control field contains indications of whether the responding STA accepts or rejects the periodic link measurement request, and whether the Link Measurement Report frame includes optional fields used for periodic link measurement reports. The field is shown in Figure 9-1007 (Period Report Control field format(11ay)).

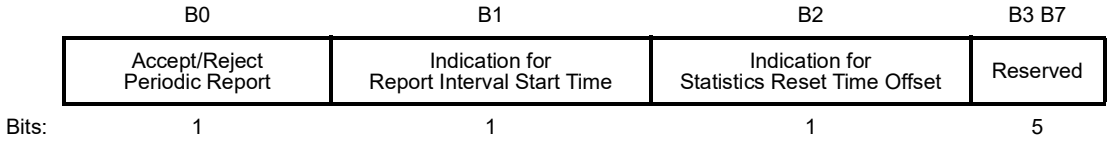

**Figure 9-1007—Period Report Control field format(11ay)**

The Accept/Reject Periodic Report subfield is set to 1 if the responding STA accepts periodic report, and is set to 0 if the responding STA rejects periodic report.

The Indication for Report Interval Start Time subfield is set to 1 if the Link Measurement Report frame contains the Report Interval Start Time field. It is set to 0 otherwise.

The Indication for Statistics Reset Time Offset subfield is set to 1 if the Link Measurement Report frame contains the Statistics Reset Time Offset field. It is set to 0 otherwise.

The Report Interval Start Time field is optionally present. If present, it indicates the lower 4 octets of the TSF timer at the start of the report interval of the corresponding Link Measurement Report frame.

The Statistics Reset Time Offset field is optionally present. If present, it indicates the relative time offset, in microseconds, of the last event when the reset condition (see 9.4.2.141.6 (LDPC Statistics field(11ay))) is met since the start of the corresponding report interval.

This is an unapproved IEEE Standards Draft, subject to change.

### 9.4.2.289 DMG STA Directional Transmit Activity Report element(11ay)

The format of DMG STA Directional Transmit Activity Report element is shown in Figure 9-1008 (DMG STA Directional Transmit Activity Report element format(11ay)).

| | Element ID | Length | Element ID Extension | Control | Link ID | Observation Period Start Time | Observation Period Duration |
|---|---|---|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | 2 | 1 | 4 | 4 |

| | Operating Class | Primary Channel | Operating Channels | Operating Channels Width | Optional Subelements |
|---|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | 1 | variable(M118) |

**Figure 9-1008—DMG STA Directional Transmit Activity Report element format(11ay)**

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1 (General).

The Control field is defined in Figure 9-1009 (Control field format(11ay)).

| | B0 B2 | B3 | B4 | B5 B7 |
|---|---|---|---|---|
| | Channel Access Type | TDD SP | Reciprocal Operation | Reserved |
| Octets: | 3 | 1 | 1 | 3 |

**Figure 9-1009—Control field format(11ay)**

The Channel Access Type subfield identifies the most used channel access mechanism during the observation period, i.e., the channel access mechanism used by one or more allocations with the largest total airtime inside the observation period. It has the same encoding as the Allocation Type subfield in the Extended Schedule element.

When the Channel Access Type subfield indicates SP channel access (0 or 2), the TDD SP field is set to 1 if majority of the airtime used by SP allocations during the observation period belongs to SPs with TDD Applicable SP subfield set to 1, and set to zero otherwise. The TDD SP subfield is reserved when the Channel Access Type subfield does not indicate SP channel access.

The Reciprocal Operation subfield is set to 1 to indicate that the transmitting STA is using or intends to use the same antenna pattern that it is using for transmission to also receive from other STAs, and is set to 0 otherwise.

The Link ID subfield is a locally unique identifier for data transmit activities targeting a given receiver, or a group of receivers, that are always transmitted data to through a common transmit antenna pattern and transmit power.

NOTE 1—Link ID helps a receiving STA correlate multiple DMG STA Directional Transmit Activity Report elements received through different frames. Specifically, elements with the same Link ID identify a unique transmit activity towards one or more intended receivers that are always using a common (not necessarily fixed) transmit antenna pattern. Link ID is independent of the specific antenna pattern used for transmission, i.e., changing the antenna pattern used to transmit data to the given receiver(s) does not change the Link ID associated with the DMG STA Directional Transmit Activity Report elements that are sent to report the corresponding transmit activity.

The Observation Period Start Time field is set to the lower 4 octets of the measuring STA's TSF timer at the beginning of the observation period.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Observation Period Duration field is set to the duration of the observation period that all reported metrics apply to, in μs.

The Operating Class field indicates an operating class value as defined in Annex E. The operating class is interpreted in the context of the country specified in the Country element included in the frame.

The Primary Channel field indicates the 2.16 GHz primary channel of the BSS to which the transmitting STA belongs.

The Operating Channels field indicates all 2.16 GHz channels occupied by PPDUs transmitted during the observation period, using the same DMG antenna and antenna pattern as the frame containing the element. The Operating Channels field has the same format as the BSS Operating Channels field in the EDMG Operation element.

The Operating Channels Width field indicates all bandwidths occupied by PPDUs transmitted during the observation period, using the same DMG antenna and antenna pattern as the frame containing the element. The Operating Channels Width field has the same format as the Operating Channels Width field in the EDMG Operation element.

The Optional Subelements field contains two or more subelements. The subelement format and ordering of subelements are defined in 9.4.3 (Subelements).

The Subelement ID field values for the defined subelements are listed in Table 9-405 (Optional subelement IDs(11ay)).

**Table 9-405—Optional subelement IDs(11ay)**

| Subelement ID | Name | Extensible |
|---|---|---|
| 0 | Directional Transmit Activity | Yes |
| 1 | Transceiver Parameters | Yes |
| 2–255 | Reserved | |

The Directional Transmit Activity subelement Data field format is shown in Figure 9-1010 (Directional Transmit Activity subelement Data field format(11ay)).

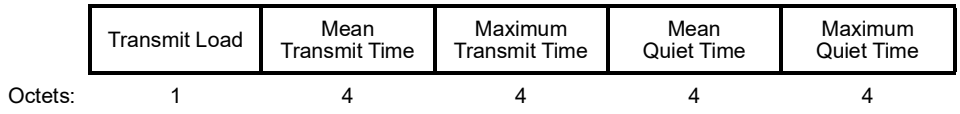

**Figure 9-1010—Directional Transmit Activity subelement Data field format(11ay)**

In the following, each 2.16 GHz channel that the frame containing the DMG STA Directional Transmit Activity Report element is transmitted on is referred to as a reported channel.

The Transmit Load subfield contains the percentage of time during the observation period that the local DMG PHY entity was in transmit state and was using the reported channel and Link ID. The subfield is encoded as an 8-bit unsigned integer, linearly scaled, with values of 0 and 255 representing 0% and 100%, respectively.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Mean Transmit Time and Maximum Transmit Time subfields respectively contain the arithmetic mean and maximum of all continuous transmission periods during the observation period, in μs. For the purpose of calculating these metrics, a continuous transmission period is a period during which the local DMG PHY entity was in transmit state using the reported channel and Link ID, except for short intervals not longer than SIFS.

The Mean Quiet Time and Maximum Quiet Time subfields contain, respectively, the arithmetic mean and maximum of all continuous quiet periods during the observation period, in μs. For the purpose of calculating these metrics, a continuous quiet period is a period longer than SIFS during which the local DMG PHY entity was not in transmit state using the reported channel and Link ID. In the absence of continuous quiet periods during the observation period both subfields are set to 0.

Figure 9-1011 (Examples of Maximum Transmit Time and Maximum Quiet Time: (a) operation during a TDD SP, (b) operation during other DMG allocations(11ay)) illustrates two examples of Maximum Transmit Time and Maximum Quiet Time calculation.

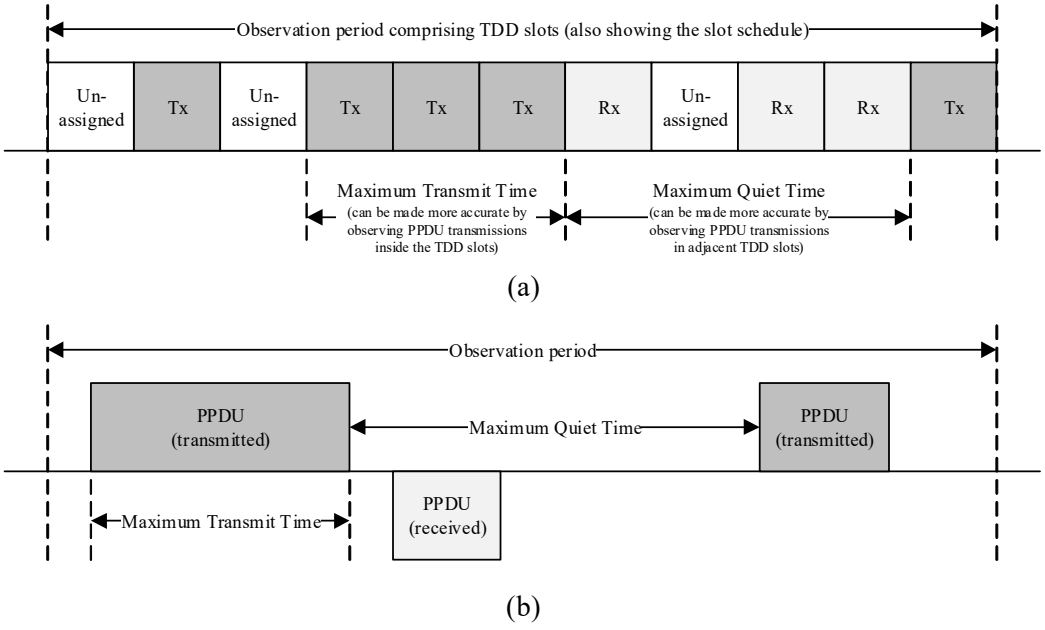

**Figure 9-1011—Examples of Maximum Transmit Time and Maximum Quiet Time: (a) operation during a TDD SP, (b) operation during other DMG allocations(11ay)**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Transceiver Parameters subelement Data field format is shown in Figure 9-1012 (Transceiver Parameters subelement Data field format(11ay)).

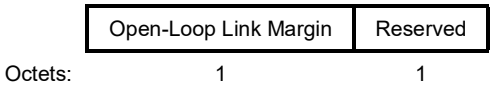

**Figure 9-1012—Transceiver Parameters subelement Data field format(11ay)**

The Open-Loop Link Margin field is calculated as follows:

$$OPLM = TRP + P_{sensitivity}$$

where

$TRP$ is the total radiated power, in dBm, used to transmit the PPDU that contains the element

$P_{sensitivity}$ is the actual receiver sensitivity for MCS 0, in dBm, and measured as defined in 20.3.3.8 (Receive minimum input level sensitivity(#256))

The Open-Loop Link Margin field is encoded as an 8-bit unsigned integer with values 0 through 255, representing –48 to 15.75 dBm in 0.25 dBm steps.

NOTE 2—A STA that receives a frame that contains the DMG STA Directional Transmit Activity Report element (activity report frame, for short) can use the TRP and Additional Sensitivity subfields in the frame to reduce the interference they cause to the frame transmitter. To illustrate, consider STA1 receiving an activity report frame transmitted by STA2, and assume the following definitions:

$G_{RX}^{STA1}(\phi)$ STA1 receive antenna gain in the direction $\phi$ towards STA2 when it received the activity report frame; if needed, STA1 can estimate $\phi$ using the TRN fields of the PPDU that contains the activity report frame.

$G_{TX}^{STA1}(\phi)$ STA1 transmit antenna gain in the direction $\phi$ towards STA2 for a given transmission, possibly using a different DMG antenna configuration from what STA1 was using when it received the activity report frame

$G_{RX}^{STA2}(\theta)$ STA2 receive antenna gain in the direction $\theta$ towards STA1, when STA2 uses the same DMG antenna configuration it was using when it transmitted the activity report frame

$G_{TX}^{STA2}(\theta)$ STA2 transmit antenna gain in the direction $\theta$ towards STA1

$TRP^{STA1}$ STA1 total radiated power

$TRP^{STA2}$ STA2 total radiated power, as indicated by the value of the TRP field

$P_{sensitivity}^{STA2}$ STA2 actual receiver sensitivity

$Loss$ Path loss between STA1 and STA2

The antenna gains are not necessarily the peak gains that STA1 and STA2 can achieve along $\phi$ and $\theta$ directions towards each other. The receive power at STA1 is $P_{RX}^{STA1} = TRP^{STA2} + G_{TX}^{STA2}(\theta) - Loss + G_{RX}^{STA1}(\phi)$. The receive power at STA2, if using the same DMG antenna configuration STA2 used to transmit the activity report frame, is $P_{RX}^{STA2} = TRP^{STA1} + G_{TX}^{STA1}(\phi) - Loss + G_{RX}^{STA2}(\theta)$. Assuming DMG antenna pattern reciprocity for STA2, and substituting $G_{RX}^{STA2}(\theta) - Loss = G_{TX}^{STA2}(\theta) - Loss = P_{RX}^{STA1} - TRP^{STA2} - G_{RX}^{STA1}(\phi)$, it is easy to see that STA1 can keep the receive power at STA2 below STA2 receiver sensitivity by limiting its total radiated power as $TRP^{STA1} \le (TRP^{STA2} + P_{sensitivity}^{STA2}) - (G_{TX}^{STA1}(\phi) - G_{RX}^{STA1}(\phi)) - P_{RX}^{STA1}$, where all parameters on the right-hand side of the inequality are known to STA1.

### 9.4.2.290 WUR Capabilities element(11ba)

A WUR STA declares that it is a WUR STA by transmitting the WUR Capabilities element. The WUR Capabilities element contains a number of fields that are used to advertise WUR capabilities of a WUR STA. The WUR Capabilities element is defined in Figure 9-1013 (WUR Capabilities element format(11ba)).

| | Element ID | Length | Element ID Extension | Supported Bands | WUR Capabilities Information |
|---|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | 1 | 2 |

**Figure 9-1013—WUR Capabilities element format(11ba)**

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1 (General).

When the WUR Capabilities element is transmitted by a WUR AP, the Supported Bands field of the WUR capabilities element is reserved.

When the WUR Capabilities element is transmitted by a WUR non-AP STA, the Supported Bands field of the WUR capabilities element indicates the supported bands for the WUR operation. The format of the Supported Bands field is shown in Figure 9-1013a ( Supported Bands field format(11ba)).

| | B0 | B1 | B2 B7 |
|---|---|---|---|
| | 2.4 GHz | 5 GHz | Reserved |
| Bits: | 1 | 1 | 6 |

**Figure 9-1013a— Supported Bands field format(11ba)**

The 2.4 GHz subfield of the Supported Bands field is set to 1 to indicate the support of the 2.4 GHz band for the WUR operation. Otherwise, the 2.4 GHz subfield of the Supported Bands field is set to 0. The 5 GHz subfield of the Supported Bands field is set to 1 to indicate the support of the 5 GHz band for the WUR operation. Otherwise, the 5 GHz subfield of the Supported Bands field is set to 0.

The format of the WUR Capabilities Information field is defined in Figure 9-1014 (WUR Capabilities Information field format(11ba)).

| | B0 B7 | B8 | B9 B10 | B11 | B12 | B13 | B14 | B15 |
|---|---|---|---|---|---|---|---|---|
| | Transition Delay | VL WUR Frame Support | WUR Group IDs Support | Reserved | 20 MHz WUR Basic PPDU with HDR Support | WUR FDMA Support | WUR Short Wake-up Frame Support | Reserved |
| Bits: | 8 | 1 | 2 | 1 | 1 | 1 | 1 | 1 |

**Figure 9-1014—WUR Capabilities Information field format(11ba)**

This is an unapproved IEEE Standards Draft, subject to change.

The subfields of the WUR Capabilities Information field is defined in Table 9-406 (Subfields of the WUR Capabilities Information field(11ba)).

**Table 9-406—Subfields of the WUR Capabilities Information field(11ba)**

| Subfield | Definition | Encoding |
|---|---|---|
| Transition Delay | Indicates the maximum time that the non-AP STA requires to transition from the doze state to the awake state. (see 11.2.1 (General)) | Set to (the indicated value minus 1)/256.<br><br>Reserved for a WUR AP. |
| VL WUR Frame Support | Indicates support for VL WUR frames. | For a WUR non-AP STA: Set to 1 to indicate support for the reception of VL WUR frames. Set to 0 otherwise.<br><br>For a WUR AP: Set to 1 to indicate support for the transmission of VL WUR frames. Set to 0 otherwise. |
| WUR Group IDs Support | Indicates WUR Group IDs support. | For a WUR non-AP STA:<br>— Set to 0 to indicate no support for WUR group IDs if the VL WUR Frame Support subfield is 0 and to indicate support for a single WUR group ID when the VL WUR Frame Support subfield is 1.<br>— Set to 1 to indicate support for 1 to 16 WUR group IDs.<br>— Set to 2 to indicate support for 1 to 32 WUR group IDs.<br>— Set to 3 to indicate support for 1 to 64 WUR group IDs.<br>NOTE—If the WUR Group IDs Support subfield is equal to a non-zero value, then it implies support of group addressed fixed-length (FL) WUR Wake-up frame.<br><br>For a WUR AP:<br>— Set to 0 to indicate no support for WUR group IDs if the variable-length (VL) WUR Frame Support subfield is 0 and to indicate support for single WUR group ID when the VL WUR Frame Support subfield is 1.<br>— Set to 1 to indicate support for WUR group IDs.<br>NOTE—If WUR Group IDs Support subfield is equal to 1, it also implies support of group addressed FL WUR Wake-up frame. |
| 20 MHz WUR Basic PPDU with HDR Support | Indicate support for the reception of 20 MHz WUR Basic PPDU with HDR. | Set to 1 to indicate support for the reception of 20 MHz WUR Basic PPDUs with HDR. Set to 0 otherwise.<br><br>Reserved for a WUR AP. |

This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-406—Subfields of the WUR Capabilities Information field(11ba) *(continued)***

| Subfield | Definition | Encoding |
|---|---|---|
| WUR FDMA Support | Indicates whether the WUR FDMA is supported or not (see 29.11 (WUR FDMA operation)). | For a WUR non-AP STA: Set to 1 if the WUR FDMA channel switching capability is supported. Set to 0 otherwise.<br><br>For a WUR AP: Set to 1 if the transmission of WUR FDMA PPDU is supported. Set to 0 otherwise. Set to 0 otherwise. |
| WUR Short Wake-up Frame Support | Indicates support for the WUR Short Wake-up frame. | For a WUR non-AP STA: Set to 1 to indicate support for the reception of WUR Short Wake-up frames. Set to 0 otherwise.<br><br>For a WUR AP: Set to 1 to indicate support for the transmission of WUR Short Wake-up frames. Set to 0 otherwise. |

### 9.4.2.291 WUR Operation element(11ba)

The WUR Operation element contains the set of parameters necessary to support the WUR operation. The format of the WUR Operation element is defined in Figure 9-1015 (WUR Operation element format(11ba)).

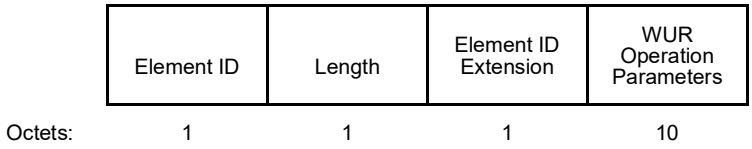

**Figure 9-1015—WUR Operation element format(11ba)**

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1 (General).

The format of the WUR Operation Parameters field is defined in Figure 9-1016 (WUR Operation Parameters field format(11ba)).

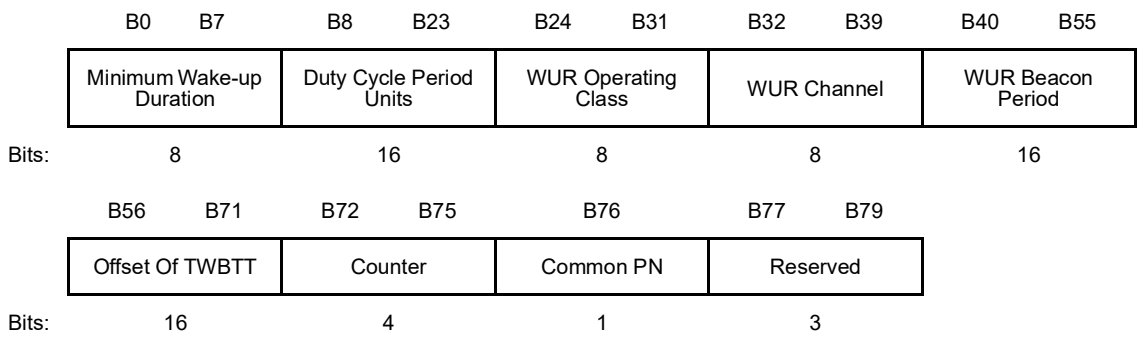

**Figure 9-1016—WUR Operation Parameters field format(11ba)**

The Minimum Wake-up Duration subfield indicates the minimum WUR duty cycle service period of the WUR duty cycle operation (see 29.7 (WUR duty cycle operation)) in units of 256 μs.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Duty Cycle Period Units subfield indicates the basic unit of the period of the WUR duty cycle operation (see 29.7 (WUR duty cycle operation)) in the unit of 4 μs.

The WUR Operating Class subfield indicates the operating class values of the WUR primary channel as defined in Annex E in use for transmission of WUR Beacon frames from the WUR AP to the WUR non-AP STA. The operating class is interpreted in the context of the country specified in the Beacon frame (see 29.2 (WUR channel, WUR primary channel, and WUR discovery channel)). The encoding is the same as the definition of Operating Class field in 9.4.1.22 (Operating Class And Channel field(#6181)).

The WUR Channel subfield indicates a channel number of the WUR primary channel, which is interpreted in the context of the indicated operating class as defined in Annex E in use for transmission of WUR Beacon frames from the WUR AP to the WUR non-AP STA (see 29.2 (WUR channel, WUR primary channel, and WUR discovery channel)). The encoding is the same as the definition of Channel field in 9.4.1.22 (Operating Class And Channel field(#6181)).

The WUR Beacon Period subfield represents the number of time units (TUs) between consecutive target WUR beacon transmission times (see 29.6.2 (WUR Beacon frame generation)).

The Offset Of TWBTT subfield indicates the time difference between the target WUR beacon transmission time with the smallest TSF time in units of TU and TSF 0 (see 29.6.2 (WUR Beacon frame generation)).

The Counter subfield indicates the current Counter subfield included in the broadcast WUR Wake-up frames (see 29.5.3 (Transmitter ID)) that are transmitted by the same AP.

The Common PN subfield indicates if a common PN is used for all protected WUR frames generated within the BSS. The Common PN subfield is set to 1 to indicate that a common PN is used for all protected WUR frames and is set to 0 to indicate that independent PNs are used for protected WUR frames addressed to different receivers (see 29.10.4 (Generation and construction of PN for WUR frames)).

### 9.4.2.292 WUR Mode element(11ba)

The WUR Mode element is used to negotiate the parameters related to WUR operation. The format of the WUR Mode element is shown in Figure 9-1017 (WUR Mode element format(11ba)).

| | Element ID | Length | Element ID Extension | Action Type | WUR Mode Response Status | WUR Parameters Control | WUR Parameters |
|---|---|---|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | 1 | 1 | 1 | variable |

**Figure 9-1017—WUR Mode element format(11ba)**

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1 (General).

The Action Type field contains a number that identifies the type of WUR mode operation. The Action Type values are shown in Table 9-407 (Action Type definitions(11ba)).

The WUR Mode Response Status field indicates the status returned by the WUR AP responding to the WUR non-AP STA's WUR mode request operation, and its values are defined in Table 9-408 (WUR Mode

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-407—Action Type definitions(11ba)**

| Action Type value | Meaning |
|---|---|
| 0 | Enter WUR Mode Request |
| 1 | Enter WUR Mode Response |
| 2 | Enter WUR Mode Suspend Request |
| 3 | Enter WUR Mode Suspend Response |
| 4 | Enter WUR Mode Suspend |
| 5 | Enter WUR Mode |
| 6–255 | Reserved |

Response Status Definition(11ba)). This field is valid when the Action Type field is equal to "Enter WUR Mode Response" or "Enter WUR Mode Suspend Response" and is reserved otherwise.

**Table 9-408— WUR Mode Response Status Definition(11ba)**

| Value | Meaning |
|---|---|
| 0 | Accept. |
| 1 | Denied. Due to unspecified reason. |
| 2 | Denied. The preferred duty cycle period is too large. |
| 3 | Denied. Cannot satisfy the request of generating keep-alive WUR frames every WUR duty cycle service period. |
| 4–255 | Reserved |

NOTE 1—The threshold and duration of duty cycle period and detail operation of the WUR AP when the WUR mode Response Status field is equal to 2 are implementation dependent.

The WUR Parameters Control field indicates the configuration of the following WUR Parameters field. The format of the WUR Parameters Control field when the Action Type field is equal to "Enter WUR Mode Response" or "Enter WUR Mode Suspend Response" and the WUR Mode Response Status field is equal to "Accept" or when sent by a WUR non-AP STA is shown in Figure 9-1018 (WUR Parameters Control field format(11ba)). Otherwise, the field is reserved.

The WUR Duty Cycle Start Time Present subfield is set to 1 if the WUR Duty Cycle Start Time subfield is present in the following WUR Parameters field and is set to 0 otherwise.

NOTE 2—WUR non-AP STA always sets the WUR Duty Cycle Start Time Present subfield to 0 (see 29.7 (WUR duty cycle operation)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

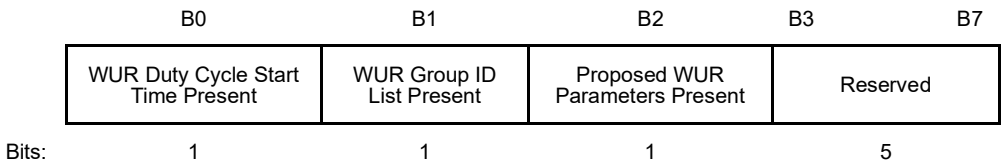

**Figure 9-1018—WUR Parameters Control field format(11ba)**

The WUR Group ID List Present subfield is set to 1 if the WUR Group ID List subfield is present in the following WUR Parameters field and is set to 0 otherwise. The WUR Group ID List Present subfield is reserved when the WUR Mode element is transmitted by a WUR non-AP STA.

The Proposed WUR Parameters Present subfield is set to 1 if the Proposed WUR Parameters subfield is present in the following WUR Parameters field and is set to 0 otherwise. The Proposed WUR Parameters Present subfield is reserved when the WUR Mode element is transmitted by a WUR AP.

The subfields of the WUR Parameters field sent from a WUR AP when the Action Type field is equal to "Enter WUR Mode Response" or "Enter WUR Mode Suspend Response" and the WUR Mode Response Status field is equal to "Accept" are defined in Figure 9-1019 (WUR Parameters field format if sent by a WUR AP(11ba)(#1729)(#1730)(M118)) and (#2317)Table 9-409 (Subfields of WUR Parameters field from WUR AP(11ba)). Otherwise, the WUR Parameters field sent from a WUR AP is reserved.

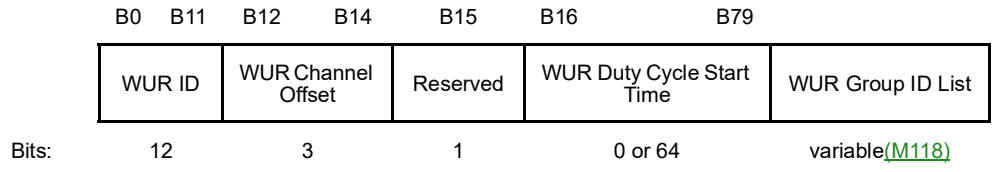

**Figure 9-1019—WUR Parameters field format if sent by a WUR AP(11ba)(#1729)(#1730)(M118)**

**Table 9-409—Subfields of WUR Parameters field from WUR AP(11ba)**

| Subfield | Definition | Encoding |
|---|---|---|
| WUR ID | A WUR identifier that uniquely identifies the WUR non-AP STA within the BSS of the AP | The size of the subfield is 12 bits. |
| WUR Channel Offset | Indicates the offset of the WUR channel on which WUR Short Wake-up frames or WUR Wake-up frames or WUR Vendor Specific frames are transmitted relative to the WUR primary channel (see 29.11 (WUR FDMA operation)). | The size of the subfield is 3 bits. The encoding is described in Table 9-410 (WUR Channel Offset subfield encoding(11ba)). |
| Reserved | Reserved field | The size of the subfield is 1 bit. |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-409—Subfields of WUR Parameters field from WUR AP(11ba)**

| Subfield | Definition | Encoding |
|---|---|---|
| WUR Duty Cycle Start Time | TSF time of the start point of the WUR duty cycle | The size of the subfield is 8 octets in units of μs. |
| WUR Group ID List | Indicates one or more WUR group IDs assigned to the WUR non-AP STA | The format is shown in Figure 9-1020 (WUR Group ID List subfield format(11ba)(M118)). This subfield is present if the WUR Group ID List Present subfield of the WUR Parameters Control field is equal to 1. Otherwise this subfield is not present. When this subfield is present, the size of this subfield in octets is 2, 4, 6 or 10 respectively when the WUR Group ID Bitmap Size field is 0, 1, 2 or 3. |

**Table 9-410—WUR Channel Offset subfield encoding(11ba)**

| WUR Channel Offset subfield | Meaning |
|---|---|
| 0 | The WUR Short Wake-up frames or the WUR Wake-up frames or the WUR Vendor Specific frames are to be transmitted in the WUR primary channel, which is indicated in the WUR Operation Class and the WUR Channel subfields in the WUR Operation element. |
| 1 | The WUR Short Wake-up frames or the WUR Wake-up frames or the WUR Vendor Specific frames are to be transmitted in first higher frequency 20 MHz channel relative to the WUR primary channel. |
| 2 | The WUR Short Wake-up frames or the WUR Wake-up frames or the WUR Vendor Specific frames are to be transmitted in first lower frequency 20 MHz channel relative to the WUR primary channel. |
| 3 | The WUR Short Wake-up frames or the WUR Wake-up frames or the WUR Vendor Specific frames are to be transmitted in second higher frequency 20 MHz channel relative to the WUR primary channel. |
| 4 | The WUR Short Wake-up frames or the WUR Wake-up frames or the WUR Vendor Specific frames are to be transmitted in second lower frequency 20 MHz channel relative to the WUR primary channel. |
| 5 | The WUR Short Wake-up frames or the WUR Wake-up frames or the WUR Vendor Specific frames are to be transmitted in third higher frequency 20 MHz channel relative to the WUR primary channel. |
| 6 | The WUR Short Wake-up frames or the WUR Wake-up frames or the WUR Vendor Specific frames are to be transmitted in third lower frequency 20 MHz channel relative to the WUR primary channel. |
| 7 | Reserved |

A WUR AP indicates the start time of a WUR duty cycle service period in the WUR Duty Cycle Start Time subfield of the WUR Parameters field in the WUR Mode element (see 29.7 (WUR duty cycle operation)).

The WUR Group ID Bitmap Size field is set to 0 to indicate that the WUR Group ID Bitmap field is not present. The WUR Group ID Bitmap Size field is set to 1 to indicate that the WUR Group ID Bitmap field contains a 16-bit bitmap. The WUR Group ID Bitmap Size field is set to 2 to indicate that the WUR Group

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

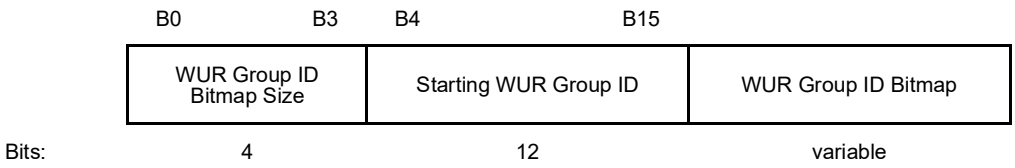

**Figure 9-1020—WUR Group ID List subfield format(11ba)(M118)**

ID Bitmap field contains a 32-bit bitmap.The WUR Group ID Bitmap Size field is set to 3 to indicate that the WUR Group ID Bitmap field contains a 64-bit bitmap. The values of 4 to 15 are reserved.

The Starting WUR Group ID field contains the starting WUR group ID of the WUR Group ID Bitmap field if the WUR Group ID Bitmap Size field is equal to a nonzero value. The Starting WUR Group ID field contains a single WUR group ID assigned by the WUR AP to the WUR non-AP STA if the WUR Group ID Bitmap Size field is equal to 0.

The WUR Group ID Bitmap field, if present, together with the Starting WUR Group ID field, indicates the WUR group IDs assigned by the WUR AP to the WUR non-AP STA. The first bit of the WUR Group ID Bitmap field corresponds to bit position 0. Bit position n of the WUR Group ID Bitmap field, if equal to 1, indicates the WUR group ID with a value equal to (the starting WUR group ID+ n) mod 4096 is assigned to the WUR non-AP STA. Bit position n of the WUR Group ID Bitmap field, if equal to 0, indicates the WUR group ID with a value equal to (the starting WUR group ID+ n) mod 4096 is not assigned to the WUR non-AP STA.

The subfields of the WUR Parameters field sent from a WUR non-AP STA when the Action Type field is equal to “Enter WUR Mode Request” or “Enter WUR Mode Suspend Request” are defined in 9-1021 (WUR Parameters field format if sent by a WUR non-AP STA(11ba)(M118)) and Table 9-411 (Subfields of the WUR Parameters field if sent by a WUR non-AP STA(11ba)(M118)). Otherwise, the WUR Parameters field sent from a WUR non-AP STA is reserved.

**Table 9-411—Subfields of the WUR Parameters field if sent by a WUR non-AP STA(11ba)(M118)**

| Subfield | Definition | Encoding |
|---|---|---|
| WUR Duty Cycle Service Period | Indicates the preferred WUR duty cycle service period that the WUR power state of the WUR non-AP STA is in the WUR awake state for each WUR duty cycle period (see 29.7 (WUR duty cycle operation)). | The size of the field is 4 octets. The unit of the field is 4 μs. |
| Duty Cycle Period | Indicates the preferred elapsed time between the start times of two successive WUR duty cycle service periods (see 29.7 (WUR duty cycle operation)). | The size of the field is 2 octets. The unit of the field is indicated by the Duty Cycle Period Units field in the most recently received WUR Operation element from the associated WUR AP. |
| Proposed WUR Parameters | Indicates one or more proposed WUR Parameters | The format is shown in Figure 9-1022 (Proposed WUR Parameters subfield format(11ba)). |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

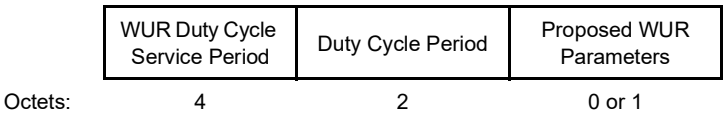

**Figure 9-1021—WUR Parameters field format if sent by a WUR non-AP STA(11ba)(M118)**

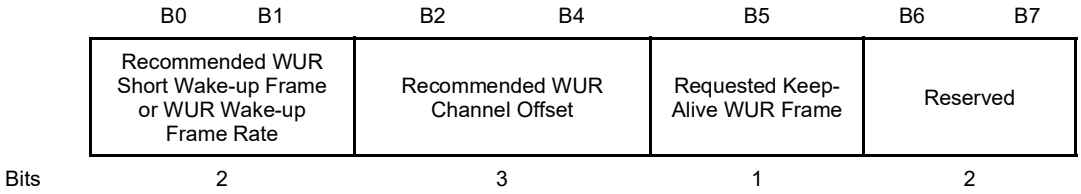

**Figure 9-1022—Proposed WUR Parameters subfield format(11ba)**

The format of the Proposed WUR Parameters subfield is shown in Figure 9-1022 (Proposed WUR Parameters subfield format(11ba)). This field is present if the Proposed WUR Parameters Present subfield of the WUR Parameter Control field is equal to 1. Otherwise this field is not present.

The Recommended WUR Short Wake-up Frame or WUR Wake-up Frame Rate field is set to 0 to indicate that the WUR non-AP STA has no recommendation on the data rate to be used for WUR Short Wake-up frames or WUR Wake-up frames. The Recommended WUR Short Wake-up Frame or WUR Wake-up Frame Rate field is set to 1 to indicate that LDR is recommended to be used for WUR Short Wake-up frames or individually or group addressed WUR Wake-up frames transmitted to the WUR non-AP STA. The Recommended WUR Short Wake-up Frame or WUR Wake-up Frame Rate field is set to 2 to indicate that HDR is recommended to be used for WUR Short Wake-up frames or individually or group addressed WUR Wake-up frames transmitted to the WUR non-AP STA. 3 is reserved.

The Recommended WUR Channel Offset field is used by a WUR non-AP STA to indicate a recommended value for the WUR Channel Offset field, with the same encoding as described in Table 9-410 (WUR Channel Offset subfield encoding(11ba)), except that the value 7 indicates that the WUR non-AP STA has no recommendation regarding the WUR channel assigned to the WUR non-AP STA.

The Requested Keep-Alive WUR Frame field is set to 1 if the WUR non-AP STA requests the WUR AP to transmit a keep-alive WUR frame during the WUR duty cycle service periods that are negotiated with the WUR non-AP STA. Otherwise, it is set to 0.

### 9.4.2.293 WUR Discovery element(11ba)

The WUR Discovery element is used to advertise the WUR discovery channels on which WUR APs transmit WUR Discovery frames. The format of the WUR Discovery element is shown in Figure 9-1023 (WUR Discovery element format(11ba)).

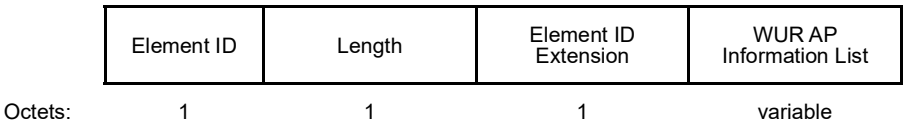

**Figure 9-1023—WUR Discovery element format(11ba)**

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1 (General).

The WUR AP Information List field contains one or more WUR AP Information subfields. Each WUR AP Information subfield identifies the WUR APs that transmit WUR Discovery frames on a particular WUR

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Discovery channel. The format of the WUR AP Information subfield is shown in Figure 9-1024 (WUR AP Information subfield format(11ba)).

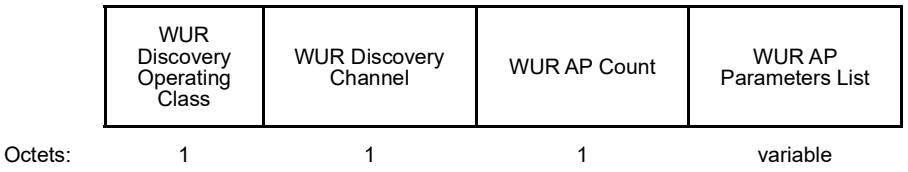

**Figure 9-1024—WUR AP Information subfield format(11ba)**

The WUR Discovery Operating Class field indicates the operating class in use for transmission of WUR Discovery frames by WUR APs listed in this subfield. The encoding is the same as the definition of Operating Class field in 9.4.1.22 (Operating Class And Channel field(#6181)).

The WUR Discovery Channel field indicates the channel in use for transmission of WUR Discovery frames by WUR APs listed in this subfield. The encoding is the same as the definition of Channel field in 9.4.1.22 (Operating Class And Channel field(#6181)).

The WUR AP Count field specifies the number of WUR AP Parameters subfields that are included in the WUR AP Parameters List field, minus one. 0 indicates that one WUR AP Parameters subfield is present.

The WUR AP Parameters List field contains one or more WUR AP Parameters subfields. Each WUR AP Parameters subfield identifies one WUR AP, which might be the WUR AP transmitting this WUR Discovery element itself or might be a neighboring WUR AP. The format of the WUR AP Parameters subfield is shown in Figure 9-1025 (WUR AP Parameters subfield format(11ba)).

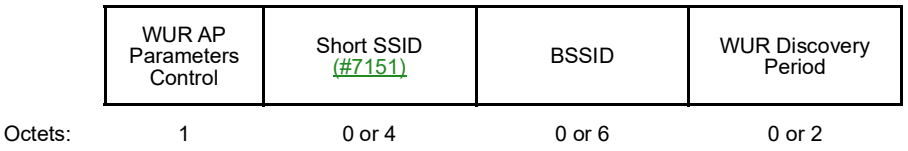

**Figure 9-1025—WUR AP Parameters subfield format(11ba)**

The WUR AP Parameters Control field indicates the presence of the (#7151)Short SSID field, the BSSID field, and the WUR Discovery Period field. The format of the WUR AP Parameters Control is shown in Figure 9-1026 (WUR AP Parameters Control field format(11ba)).

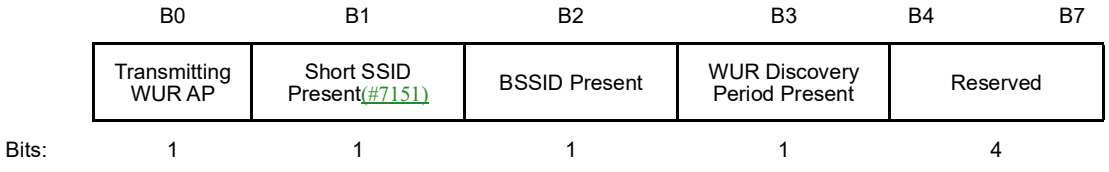

**Figure 9-1026—WUR AP Parameters Control field format(11ba)**

The Transmitting WUR AP subfield is set to 1 if the WUR AP Information subfield identifies the WUR AP's own WUR discovery channel and is set to 0, otherwise.

The (#7151)Short SSID Present subfield is set to 1 if the (#7151)Short SSID field is present in the WUR AP Parameters subfield and is set to 0, otherwise.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The BSSID Present subfield is set to 1 if the BSSID field is present in the WUR AP Parameters subfield and is set to 0, otherwise.

The WUR Discovery Period Present subfield is set to 1 if the WUR Discovery Period is present in the WUR AP Parameters subfield. Otherwise, the WUR Discovery Period Present subfield is set to 0.

The (#7151)Short SSID field is defined in 9.4.1.71 (Short SSID field(#7151)) and contains the short SSID of the WUR AP identified by the WUR AP Parameters subfield.

The BSSID field contains the BSSID of the WUR AP identified by the WUR AP Parameters subfield as defined in 9.2.4.3.4 (BSSID field).

The WUR Discovery Period field contains the number of time units (TUs) between consecutive WUR Discovery frames transmitted by the WUR AP identified by the WUR AP Parameters subfield. 0 is reserved.

### 9.4.2.294 WUR PN Update element(11ba)

The WUR PN Update element is used to update the PN maintained by a WUR non-AP STA. The format of the WUR PN Update element is shown in Figure 9-1027 (WUR PN Update element format(11ba)).

| | Element ID | Length | Element ID Extension | Key Info | PN |
|---|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | 1 | 0 or 6 |

**Figure 9-1027—WUR PN Update element format(11ba)**

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1 (General).

(M118)The format of the Key Info field is shown in Figure Figure 9-1028 (Key Info field format(11ba)).

| | B0 B3 | B4 | B5 B7 |
|---|---|---|---|
| | Key ID | PN Present | Reserved |
| Bits: | 4 | 1 | 3 |

**Figure 9-1028—Key Info field format(11ba)**

The Key ID subfield contains the (#3493)key ID corresponding to the WTK or WIGTK.

The PN Present subfield is set to 1 if the PN field is present in the WUR PN Update element and is set to 0 otherwise.

(M118)The format of the PN field is shown in Figure 9-1029 (PN field format(11ba)).

| | B0 B7 | B8 B15 | B16 B23 | B24 B31 | B32 B39 | B40 B47 |
|---|---|---|---|---|---|---|
| | PN0 | PN1 | PN2 | PN3 | PN4 | PN5 |
| Bits: | 8 | 8 | 8 | 8 | 8 | 8 |

**Figure 9-1029—PN field format(11ba)**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The PN field contains the PN corresponding to the integrity key indicated by the Key ID subfield in the Key Info field.

### 9.4.2.295 AKM Suite Selector element(M67)

The AKM Suite Selector element is used to indicate the intended AKM in SAE.

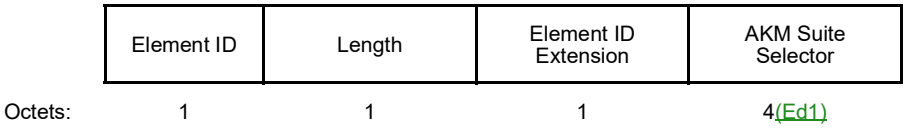

**Figure 9-1030—AKM Suite Selector element format(M67)**

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1 (General).

The AKM Suite Selector field has the format shown in Figure 9-368 (Suite selector format), where the suite type is defined in Table 9-190 (AKM suite selectors).

### 9.4.2.296 Originator Preferred MCS element(#1444)

The Originator Preferred MCS element is used to signal the preferred MCS used for eliciting A-MPDUs from the data originator. The format of the Originator Preferred MCS element is shown in Figure 9-1031 (Originator Preferred MCSelement format(#1444)).

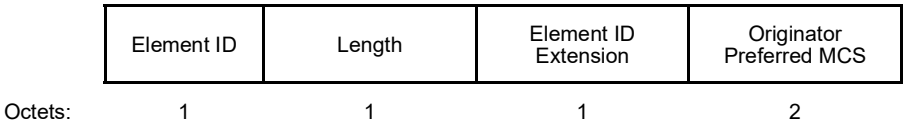

**Figure 9-1031—Originator Preferred MCSelement format(#1444)**

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1 (General).

The Originator Preferred MCS field is defined in 9.4.1.15 (Originator Preferred MCS field).

### 9.4.2.297 Known STA Identification element(#4069)

The Known STA Identification element is used to demonstrate possession of a recently used PTK-KCK to allow a (re)associating STA to be identified in an RSN. The format of the Known STA Identification element is shown in Figure 9-1032 (Known STA Identification element format(#4069)).

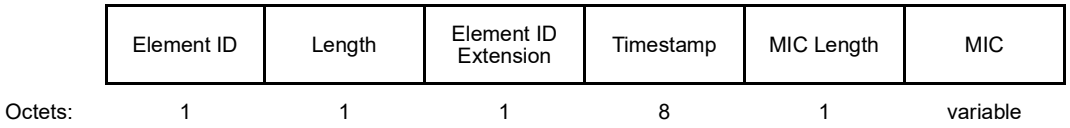

**Figure 9-1032—Known STA Identification element format(#4069)**

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1 (General).

The Timestamp field contains the value of the most recently received Timestamp field from the AP to which the Known STA Identification element is being sent.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The MIC Length field contains the length of the MIC field in octets.

The MIC field contains a MIC calculated as specified in 11.13 (SA Query procedures).

### 9.4.2.298 ISTA Availability Window element(11az)

The format of the ISTA Availability Window element is shown in Figure 9-1033 (ISTA Availability Window element format(11az)).

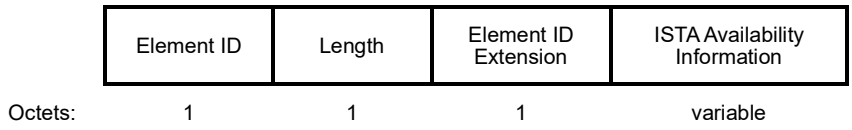

**Figure 9-1033—ISTA Availability Window element format(11az)**

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1 (General).

The ISTA Availability Information field format is shown in Figure 9-1034 (ISTA Availability Information field format(11az)).

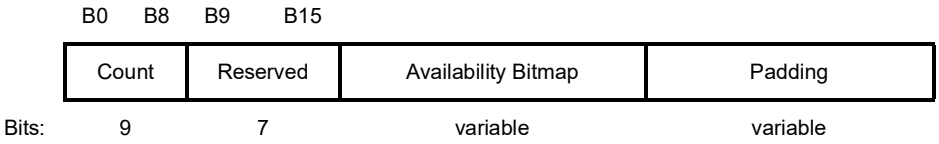

**Figure 9-1034—ISTA Availability Information field format(11az)**

The Count subfield in the ISTA Availability Information field indicates the size in bits of the Availability Bitmap subfield. The value of this subfield is denoted as "count".

Each Availability Bit in the Availability Bitmap subfield indicates the ISTA's availability for TB ranging with the recipient RSTA. The value indicated by each bit in the Availability Bitmap subfield is in units of 10 TUs. Bit $B_k$ (where $0 \le k \le \text{count} - 1$) represents the ISTA's periodic availability for TB ranging with the RSTA in the interval $[t_{start,k}, t_{end,k}]$ repeated every $N$ TUs; see Equation (9-12):

$$\begin{aligned} t_{start,k} &= t_{start,0} + 10k \text{ TU} \\ t_{end,k} &= t_{start,0} + 10(k+1) \text{ TU} \\ t_{start,0} &= \text{time 0 per RSTA's TSF} \\ N &= 10 \times \text{count} \end{aligned} \tag{9-12}$$

A value of 1 in an Availability Bit indicates the ISTA's availability at time $t_{start,k}$ for a duration of 10 TUs, while a value of 0 indicates the ISTA's unavailability at time $t_{start,k}$ for a duration of 10 TUs.

The Padding subfield (#8251)is optionally present to render the length of the Availability Bitmap subfield to be a multiple of eight. The value of the bits in the Padding field is reserved.

### 9.4.2.299 RSTA Availability Window element(11az)

The format of the RSTA Availability Window element is shown in Figure 9-1035 (RSTA Availability Window element format(11az)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

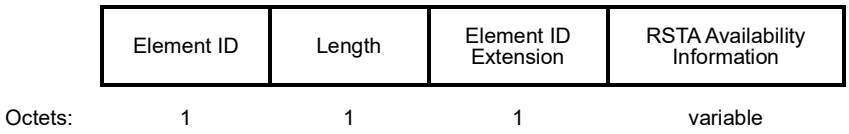

**Figure 9-1035—RSTA Availability Window element format(11az)**

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1 (General).

The RSTA Availability Information field format is shown in Figure 9-1036 (RSTA Availability Information field format(11az)).

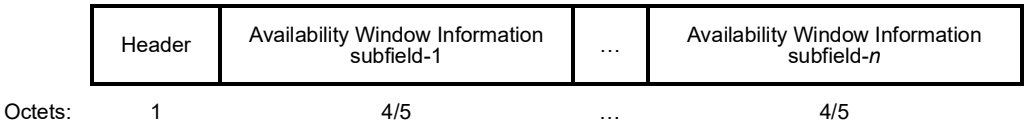

**Figure 9-1036—RSTA Availability Information field format(11az)**

The Header subfield format in the RSTA Availability Information field is shown in Figure 9-1037 (Header subfield format(11az)).

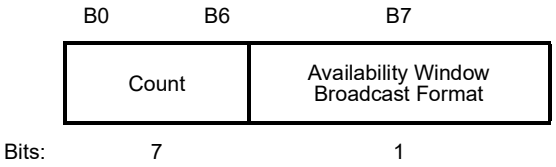

**Figure 9-1037—Header subfield format(11az)**

The Count subfield in the Header subfield indicates the number of Availability Window Information subfields included in the RSTA Availability information field.

The Availability Window Broadcast Format subfield indicates the format of the Availability Window Information subfields.

When the Availability Window Broadcast Format subfield is set to 0, the format of each Availability Window Information subfield is shown in Figure 9-1038 (Availability Window Information field format when the Availability Window Broadcast Format subfield is set to 0(11az)).

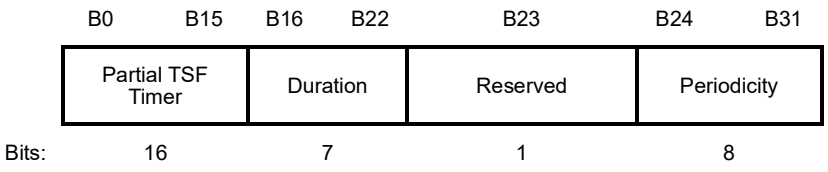

**Figure 9-1038—Availability Window Information field format when the Availability Window Broadcast Format subfield is set to 0(11az)**

The Partial TSF Timer subfield is derived as described in 9.4.2.166 (FTM Parameters element(11az)) and indicates the TSF timer of the RSTA at the start of first availability window.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Duration subfield in the Availability Window Information field indicates the duration of the corresponding availability window in units of 100 μs (giving it a value from 0 to ~12.7 ms). The value 0 is Reserved.

The Periodicity subfield in an Availability Window Information subfield indicates the periodicity of that availability window in units of 100 TU (Giving it a value from 0 to ~26.1 s).

When the Availability Window Broadcast Format subfield is set to one, the format of each Availability Window Information subfield is shown in Figure 9-1039 (Availability Window Information field format when the Availability Window Broadcast Format subfield is set to 1(11az)).

**Figure 9-1039—Availability Window Information field format when the Availability Window Broadcast Format subfield is set to 1(11az)**

The format of the Partial TSF Timer, Duration, and Periodicity subfields when the Availability Window Broadcast Format subfield is set to 1 are the same as the formats of the subfields when the Availability Window Broadcast Format subfield is set to 0. The Passive TB Ranging Parameters subfield format is shown in Figure 9-1040 (Passive TB Ranging Parameters subfield format(11az)).

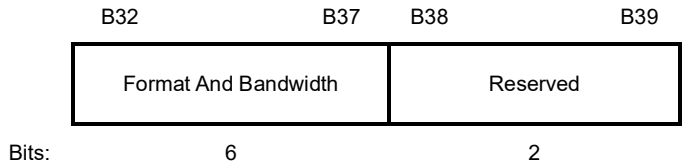

**Figure 9-1040—Passive TB Ranging Parameters subfield format(11az)**

The Format And Bandwidth subfield is defined in Table 9-412 (Format And Bandwidth subfield(11az)), and indicates the requested or allocated PPDU format and nominal bandwidth used to transmit the I2R/R2I NDP exchange as part of the passive TB ranging measurement exchange in the passive TB ranging availability window. Depending on the medium availability, the bandwidth used for the exchanged frames is equal to or smaller than the nominal bandwidth.

### 9.4.2.300 Ranging Parameters element(11az)

The Ranging Parameters element is optionally included in the IFTMR frame, as described in 9.6.7.32 (FTM(11az) Request frame format), and the IFTM frame, as described in 9.6.7.33 (FTM(11az) frame format). The use of the Ranging Parameters element is described in 11.21.6 (FTM procedure(#7065)).

The format of the Ranging Parameters element is shown in Figure 9-1041 (Ranging Parameters element format(11az)).

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1 (General).

The format of the Ranging Parameters field is shown in Figure 9-1042 (Ranging Parameters field format(11az)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

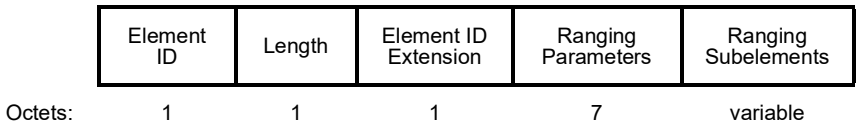

**Figure 9-1041—Ranging Parameters element format(11az)**

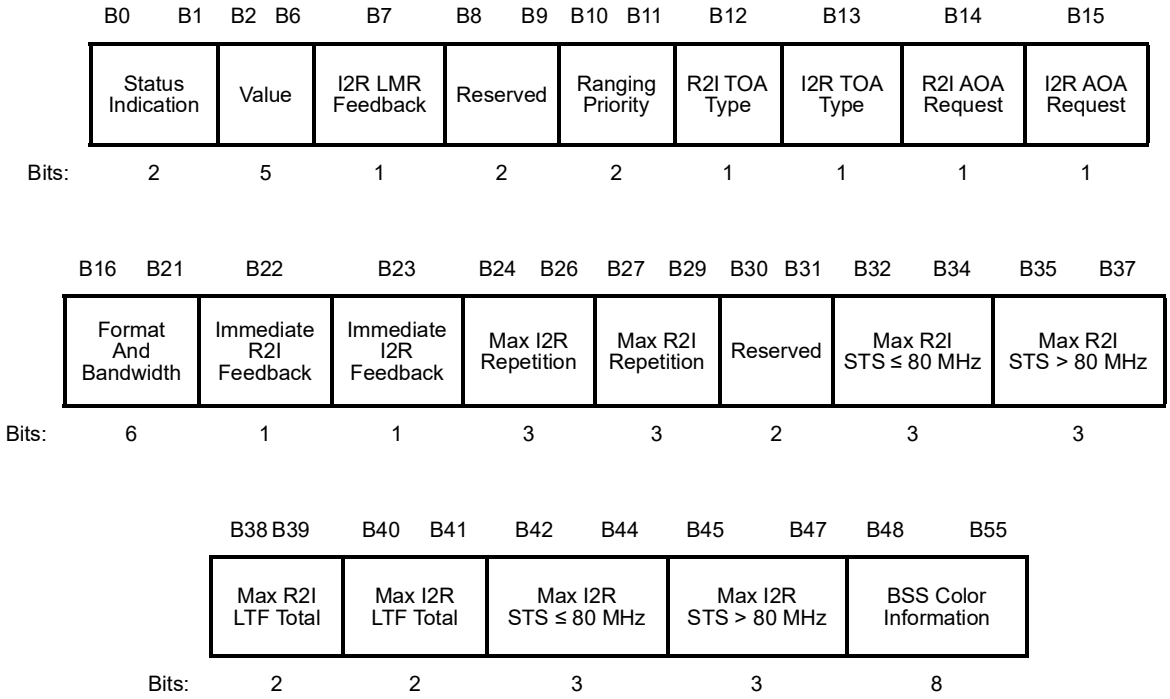

**Figure 9-1042—Ranging Parameters field format(11az)**

The Status Indication subfield indicates the RSTA's response to the Fine Timing Request. The encoding of the Status Indication subfield is shown in Table 9-321 (Status Indication subfield values).

The Status Indication subfield and Value subfield are reserved in the IFTMR frame. When the Status Indication subfield is set to 3 by the RSTA, the Value subfield contains a duration in units of seconds; otherwise the Value subfield is reserved.

The I2R LMR Feedback subfield in the Ranging Parameters element in the IFTMR frame is set to indicate whether it transmits I2R LMR feedback to the RSTA, if requested by the RSTA; (see 11.21.6.3.3 (Negotiation for TB and non-TB ranging measurement exchange)).

The RSTA sets the I2R LMR Feedback subfield in the Ranging Parameters element in the IFTM frame to 1 to indicate it requests the ISTA to transmit I2R LMR feedback to the RSTA and sets it to 0 otherwise (see 11.21.6.3.3 (Negotiation for TB and non-TB ranging measurement exchange), 11.21.6.4.3.4 (Reporting phase of TB ranging measurement(11az)), and 11.21.6.4.4.3 (Non-TB ranging measurement reporting phase(11az))).

The R2I TOA Type subfield is set to 1 in the IFTMR frame by the ISTA to indicate that it requests phase shift TOA feedback in the R2I LMR and is set to 0 otherwise. The R2I TOA Type subfield is set to 1 in the

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

IFTM frame by the RSTA to indicate that it reports phase shift TOA feedback in the R2I LMR and is set to 0 otherwise; see 11.21.6.3.3 (Negotiation for TB and non-TB ranging measurement exchange).

The I2R TOA Type subfield is set to 1 in the IFTMR frame by the ISTA to indicate that it supports phase shift TOA feedback in the I2R LMR and is set to 0 otherwise. The I2R TOA type subfield is set to 1 in the IFTM frame by the RSTA to assign phase shift TOA feedback in the I2R LMR and is set to 0 otherwise; see 11.21.6.3.3 (Negotiation for TB and non-TB ranging measurement exchange).

The R2I AOA Requested subfield is set to 1 in the IFTMR frame by the ISTA when it requests the RSTA to include AOA measurements in the AOA Feedback field of the R2I LMR. The R2I AOA Requested subfield is set to 1 in the IFTM frame to indicate that the RSTA includes the AOA measurements in the R2I LMR.

The I2R AOA Requested subfield in the IFTMR frame is set to 1 to indicate that the ISTA supports AOA measurement feedback in the I2R LMR. The I2R AOA Requested subfield in the IFTM frame is set to 1 to request the ISTA to include the AOA measurement feedback in the I2R LMR and is set to 0 otherwise.

The Format And Bandwidth subfield indicates the requested or allocated PPDU format and bandwidth used to transmit the I2R/R2I NDP exchange as part of the non-TB ranging, or TB ranging measurement exchange; see 11.21.6.4.3 (TB ranging measurement exchange(11az)) and 11.21.6.4.4 (Non-TB ranging measurement exchange(11az)). The encoding of this subfield is given in Table 9-412 (Format And Bandwidth subfield(11az)).

**Table 9-412—Format And Bandwidth subfield(11az)**

| Field value | Format | Bandwidth |
|---|---|---|
| 0 | HE | 20 |
| 1 | HE | 40 |
| 2 | HE | 80 |
| 3 | HE | 80+80 |
| 4 | HE (two separate RF LOs) | 160 |
| 5 | HE (single RF LO) | 160 |
| 6(11bd) | NGV | 10 |
| 7(11bd) | NGV | 20 |
| 8–63 | Reserved | Reserved |
| NOTE—Values 6 and 7 are supported only when dot11NGVOptionImplemented is true.(11bd) | | |

The values of 3, 4, and 5 indicate STA support for 160 MHz operation as either 80+80, 160 two-LO, or 160 single-LO, respectively in addition to supporting 80 MHz, 40 MHz, and 20 MHz bandwidths (e.g., a field value of 5 does not mean the device supports all 160 MHz options but rather 160 MHz single LO).

The Max I2R Repetition subfield indicates the maximum number of HE-LTF repetitions that the ISTA uses in the preamble of the I2R NDP and is set to the number of HE-LTF repetitions minus 1.

The Max R2I Repetition subfield indicates the maximum number of HE-LTF repetitions that the RSTA uses in the preamble of the R2I NDP and is set to the number of HE-LTF repetitions minus 1.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

NOTE—The values of 0 to 7 contained in the Max I2R Repetition and Max R2I Repetition subfields are mapped to the values 1 to 8 for the number of HE-LTF repetitions, respectively.

The Ranging Priority subfield of the Ranging Parameters field of the Ranging Parameters element in the IFTMR frame contains the ISTA's ranging priority request, which indicates the time sensitivity of a ranging operation, and it is set according to Table 9-323 (Definition of the EDMG Ranging Priority subfield when included in the IFTMR frame(11az)).

For TB ranging, the Ranging Priority subfield of the Ranging Parameters field of the Ranging Parameters element in the IFTM frame contains the RSTA's ranging priority response, which indicates whether the RSTA accommodates the ranging priority request of the ISTA, and it is set according to Table 9-324 (Definition of the EDMG Ranging Priority subfield when included in the IFTM frame(11az)) in 9.4.2.166 (FTM Parameters element(11az)).

For non-TB ranging, the Ranging Priority subfield of the Ranging Parameters field of the Ranging Parameters element in the IFTM frame is reserved.

The Immediate R2I Feedback and Immediate I2R Feedback subfields indicate if the measurement results from the current measurement exchange are reported immediately by setting it to 1 (from the current measurement) or delayed by setting it to 0 (from the previous measurement) in the R2I and I2R LMR frame respectively.

The Immediate R2I Feedback subfield is reserved in the IFTMR frame. In the IFTM frame the Immediate R2I Feedback field is set to 1 to indicate that the R2I LMR will be immediate feedback and to 0 to indicate delayed feedback.

The Immediate I2R Feedback field in the IFTMR frame is set to 1 to indicate immediate feedback in the I2R LMR and is set to 0 to indicate delayed feedback. In the IFTM frame the Immediate I2R Feedback field is set to the same value as in the IFTMR frame.

The Max R2I STS ≤ 80 MHz subfield indicates for bandwidths less than or equal to 80 MHz the maximum number of space-time streams to be used in the R2I NDP in the session.

The Max R2I STS > 80 MHz subfield indicates for bandwidths greater than 80 MHz the maximum number of space-time streams to be used in the R2I NDP in the session.

The BSS Color Information subfield has the same format as in the BSS Color Information field in the HE Operation element. Each subfield of the BSS Color Information field is set to the same value, as in the HE Operation element transmitted by an RSTA. The BSS Color Information subfield is reserved in the IFTMR frame.

The Max R2I LTF Total and Max I2R LTF Total subfields indicate the maximum number of HE-LTFs to be destined to an ISTA in the R2I NDP and an RSTA in an I2R NDP, respectively, the encoding is given in Table 9-413 (Max R2I/I2R LTF Total subfields(11az)). The maximum number of HE-LTFs limits the allowed combinations of number of space-time streams and HE-LTF repetitions.

**Table 9-413—Max R2I/I2R LTF Total subfields(11az)**

| Field value | Max number of HE-LTFs |
|---|---|
| 0 | 4 |
| 1 | 8 |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-413—Max R2I/I2R LTF Total subfields(11az)**

| Field value | Max number of HE-LTFs |
|---|---|
| 2 | 16 |
| 3 | 64 |

The Max I2R STS ≤ 80 MHz subfield indicates for bandwidths less than or equal to 80 MHz the maximum number of space-time streams to be used in the I2R NDP in the session.

The Max I2R STS > 80 MHz subfield indicates for bandwidths greater than 80 MHz the maximum number of space-time streams to be used in the I2R NDP in the session.

The Ranging Subelements field contains one or more subelements. The format and ordering of the subelements are defined in 9.4.3 (Subelements). The Subelement ID field values for the defined subelements are shown in Table 9-414 (Ranging Subelement IDs for Ranging Parameters(11az)).

**Table 9-414—Ranging Subelement IDs for Ranging Parameters(11az)**

| Subelement ID field | Name | Extensible |
|---|---|---|
| 0 | Non-TB Specific subelement | Yes |
| 1 | TB-specific subelement | Yes |
| 2 | Secure HE-LTF subelement | Yes |
| 3–220 | Reserved | |
| 221 | Vendor Specific | |
| 222–255 | Reserved | |

If the initiator and the responder successfully negotiate an FTM session, and the negotiated ranging protocol is non-TB, then the Non-TB Specific subelement is included in both the IFTMR frame, to describe the requested set of parameters that the initiator proposes to use, and in the IFTM frame.

The format of the Non-TB Specific subelement is as shown in Figure 9-1043 (Non-TB Specific subelement format(11az)).

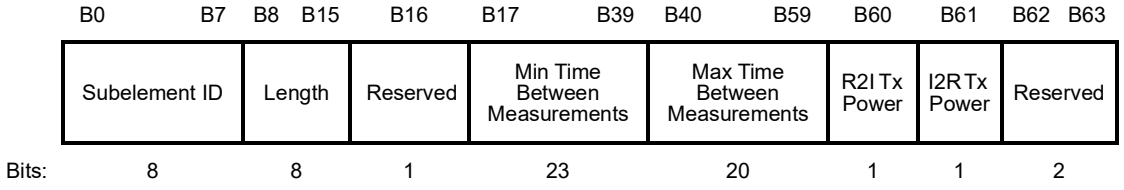

**Figure 9-1043—Non-TB Specific subelement format(11az)**

The Subelement ID and Length fields are defined in 9.4.3 (Subelements).

The R2I Tx Power field in the IFTMR frame is set to 1 to indicate that the ISTA requests the RSTA to report the TX power of the R2I NDPs in the (#8066)R2I NDP Tx Power field in the following LMR, and 0

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

otherwise. In the IFTM frame, the R2I Tx Power field is set to 1 by the RSTA to indicate that it will report the TX power of the R2I NDPs in the (#8066)R2I NDP Tx Power field of the following LMR, and 0 otherwise.

The I2R Tx Power field in the IFTMR frame is set to 1 to indicate that the ISTA supports announcing the TX power of the I2R NDPs in the STA Info field with the AID11 subfield set to 2045 of the preceding NDP Announcement frame, and 0 otherwise. In the IFTM frame, the I2R Tx Power field is set to 1 by the RSTA to request the ISTA to announce the TX power of the I2R NDPs in the STA Info field with the AID11 subfield set to 2045 of the preceding NDP Announcement frame, and 0 otherwise.

The Min Time Between Measurements field is requested by the ISTA in the IFTMR frame and assigned by RSTA in the IFTM frame, and indicates the minimum time between two consecutive range measurements initiated by an ISTA, in units of 100 μs.

The Max Time Between Measurements field is requested by the ISTA in the IFTMR frame and assigned by RSTA in the IFTM frame, and indicates the latest time by which the ISTA needs to complete the next round of measurements, in units of 10 ms.

If the initiator and the responder successfully negotiate an FTM session where the negotiated ranging protocol is TB, then the TB Specific subelement is included in both the IFTMR frame, to describe the requested set of parameters that the initiator proposes to use, and in the IFTM frame.

The format of the TB Specific subelement is as shown in Figure 9-1044 (TB Specific subelement format(11az)).

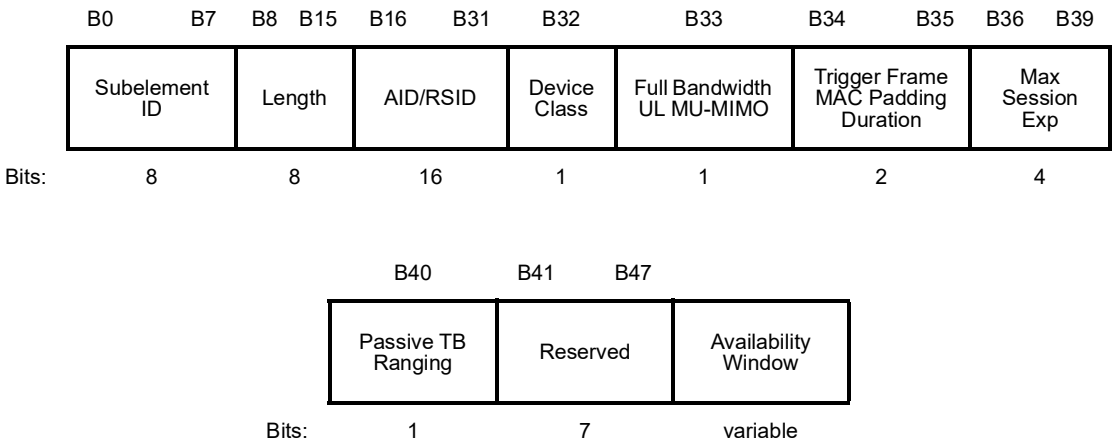

**Figure 9-1044—TB Specific subelement format(11az)**

The Subelement ID and Length fields are defined in 9.4.3 (Subelements).

The AID/RSID field is reserved in the IFTMR frame. In the IFTM frame it contains an identifier for the ISTA for the duration of the FTM session. If the ISTA is associated with the RSTA, the value is set to the ISTA's AID. If the ISTA is not associated with the RSTA, the AID/RSID field is set to the RSID, which is assigned by the responder to identify the unassociated ISTA, and has the same length as the AID.

The Device Class and Full Bandwidth UL MU-MIMO fields correspond to the Device Class and Full Bandwidth UL MU-MIMO fields defined in Table 9-376 (Subfields of the HE PHY Capabilities Information field(11ax)). For associated STAs, the values of the Device Class and Full Bandwidth UL MU-

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

MIMO subfields are equal to the values of the Device Class and Full Bandwidth UL MU-MIMO fields, respectively, that are exchanged during association.

The Trigger Frame MAC Padding Duration field correspond to the Trigger Frame MAC Padding Duration field defined in Table 9-375 (Subfields of the HE MAC Capabilities Information field(11ax)). For associated STAs, the value of the Trigger Frame MAC Padding Duration field is equal to the value that was exchanged during association.

The Max Session Exp field indicates the time before which a new measurement exchange between the ISTA and RSTA should be initiated and completed. This value is computed as $2^{(\text{Max Session Exp} + 8)}$ ms. The Max Session Exp field is reserved in an IFTMR frame.

The Passive TB Ranging field is set to 1 by the initiator to request passive TB ranging operation, otherwise it is set to 0. The Passive TB Ranging field is set to 1 by the Responder to grant passive TB ranging operation, otherwise it is set to 0.

The Availability Window field (#8252)contains either an ISTA Availability Window element, see Figure 9-1033 (ISTA Availability Window element format(11az)), when the containing Ranging Parameters element is in an IFTMR frame; or an RSTA Availability Window element, see Figure 9-1035 (RSTA Availability Window element format(11az)), when the containing Ranging Parameters element is in an FTM frame.

Figure 9-1045 (Example of a bitmap with 200 TU periodicity signaled in the ISTA Availability Window element(11az)), Figure 9-1046 (Example of mapping of ISTA's availability bitmap to RSTA's TSF(11az)), and Figure 9-1047 (Example of how an RSTA assigns an Availability Window to an ISTA(11az)) together show an example of how an RSTA assigns an availability window from the received Availability Window element of the ISTA. Figure 9-1045 (Example of a bitmap with 200 TU periodicity signaled in the ISTA Availability Window element(11az)) shows the bitmap in the ISTA Availability Information field of the ISTA Availability Window element included with an IFTMR frame. The bitmap has periodicity of 200 TUs and the RSTA Beacon Interval is 100 TUs. Figure 9-1046 (Example of mapping of ISTA's availability bitmap to RSTA's TSF(11az)) shows how the RSTA calculates ISTA's periodic availability from this bitmap relative to RSTA TSF. Finally, Figure 9-1047 (Example of how an RSTA assigns an Availability Window to an ISTA(11az)) shows how the RSTA constructs an availability window with periodicity of 200 TUs

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

requested by the ISTA and with a window duration of 10 TUs. The shaded region indicates the location of the assigned availability windows.

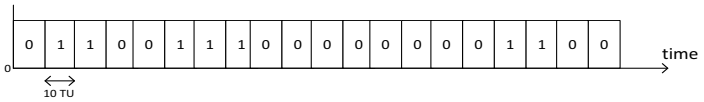

**Figure 9-1045—Example of a bitmap with 200 TU periodicity signaled in the ISTA Availability Window element(11az)**

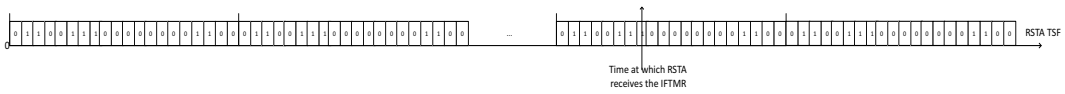

**Figure 9-1046—Example of mapping of ISTA's availability bitmap to RSTA's TSF(11az)**

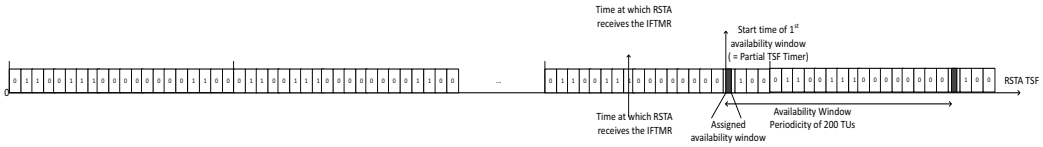

**Figure 9-1047—Example of how an RSTA assigns an Availability Window to an ISTA(11az)**

The Ranging Parameters element in the IFTMR frame includes a Non-TB Specific subelement and/or a TB specific subelement; and the Ranging Parameters element in the corresponding IFTM frame includes either a Non-TB Specific subelement or a TB specific subelement, if the Status Indication subfield in the Ranging Parameters field is set to Success to indicate the range measurement protocol selected by the responder for the negotiated FTM session.

The Secure HE-LTF subelement is included in the IFTMR frame to indicate that the initiator supports use of secure HE-LTF and the associated parameters; it is included in the IFTM, if the initiator and the responder successfully negotiate an FTM session where secure HE-LTF is used.

The format of the Secure HE-LTF subelement is as shown in Figure 9-1048 (Secure HE-LTF subelement format(11az)).

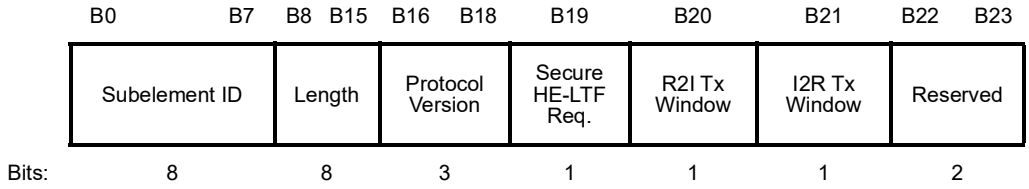

**Figure 9-1048—Secure HE-LTF subelement format(11az)**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Subelement ID and Length fields are defined in Figure 9.4.3 (Subelements).

The Protocol Version field in the IFTMR frame is set to the value 0 by the ISTA, with values 1 to 7 reserved for future use; see Table 9-415 (Secure HE-LTF protocol section identifier(11az)). In the IFTM frame the Version field is set to the value 0 by the RSTA, with values 1 to 7 reserved for future use. The interpretation of the version field in the IFTMR frame and IFTM frame, and the possible resulting actions, are described in 11.21.6.3.4 (Negotiation for secure HE-LTF in the TB and non-TB ranging measurement exchange).

The Secure HE-LTF Required field is set to 1 by the ISTA to indicate it requires secure HE-LTF to be enabled and is set to 1 by the RSTA to enable a secure HE-LTF measurement exchange between an ISTA and an RSTA. Otherwise the Secure HE-LTF Required field is set to 0.

The R2I Tx Window field in the IFTMR frame is set to 1 to indicate the ISTA requests use of the optional frequency domain Tx Window in the R2I NDPs, and 0 to indicate the default frequency domain Tx window. In the IFTM frame, the R2I Tx Window field is set to 1 to indicate the RSTA will use the optional frequency domain Tx window in the R2I NDPs, and 0 to indicate the default frequency domain Tx window; see Table 9-415 (Secure HE-LTF protocol section identifier(11az)).

The I2R Tx Window field in the IFTMR frame is set to 1 to indicate that the ISTA supports use of the optional frequency domain Tx window in the I2R NDPs, and 0 to indicate the default frequency domain Tx window. In the IFTM frame, the I2R Tx Window field is set to 1 by the RSTA to request that the ISTA use the optional frequency domain Tx window in the I2R NDPs, and 0 to indicate the default frequency domain Tx window; see Table 9-415 (Secure HE-LTF protocol section identifier(11az)).

**Table 9-415—Secure HE-LTF protocol section identifier(11az)**

| Protocol Version | Secure HE-LTF PHY sections |
|---|---|
| 0 | 27.3.19 (HE Ranging NDP and HE TB Ranging NDP(11az))(#7104) |
| 1–7 | Reserved |

### 9.4.2.301 Secure HE-LTF Parameters element(11az)

The Secure HE-LTF Parameters element is optionally included in the IFTM frame, as described in 9.6.7.33 (FTM(11az) frame format), and the LMR frame, as described in 9.6.7.49 (LMR frame format(11az)(#8216)) for a secure HE-LTF measurement exchange mode of the non-TB ranging and TB ranging measurement exchange (see 11.21.6.4.5 (Secure HE-LTF in the TB and non-TB ranging measurement exchange protocol(11az))). The use of the Secure HE-LTF Parameters element is described in 11.21.6 (FTM procedure(#7065)).

The format of the Secure HE-LTF Parameters element is shown in Figure 9-1049 (Secure HE-LTF Parameters element format(#8016)(11az)).

| | Element ID | Length | Element ID Extension | Secure LTF Counter | Validation SAC | Measurement SAC | Measurement Result LTF Offset |
|---|---|---|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | 6 | 2 | 2 | 1 |

**Figure 9-1049—Secure HE-LTF Parameters element format(#8016)(11az)**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1 (General).

The (#8016)Secure LTF Counter field is used to determine the randomized LTF sequence of an I2R NDP and R2I NDP in one of the following secure HE-LTF measurement exchange sequences:

— An I2R NDP and an R2I NDP immediately following a Ranging NDP Announcement frame, in a non-TB ranging measurement exchange (11.21.6.4.4 (Non-TB ranging measurement exchange(11az))).

— A sequence of an I2R NDP, a Ranging NDP Announcement frame, an R2I NDP, in a TB ranging measurement exchange (11.21.6.4.3 (TB ranging measurement exchange(11az))).

The (#8016)Secure LTF Counter field is used in the IFTM frame and the R2I LMR frame when part of a secure HE-LTF measurement exchange; it is reserved otherwise.

The Validation SAC field is a nonzero value associated with the (#8016)secure LTF counter carried in the same Secure HE-LTF Parameters element and validates the randomized LTF sequence; see 11.21.6.3.4 (Negotiation for secure HE-LTF in the TB and non-TB ranging measurement exchange). This field is used in the initial protected FTM frame, the R2I protected LMR frame and is reserved otherwise.

The Measurement SAC field is used to verify that range measurement results contained in the LMR frame are calculated using the same LTF sequence between ISTA and RSTA. The Measurement SAC field is the same value as the SAC subfield in the STA Info field with AID equal to 2043 in the Ranging NDP Announcement frame that solicited the I2R NDP and the R2I NDP in the non-TB ranging measurement exchange or the SAC subfield in the Trigger Dependent User Info of the Secure Sounding Ranging Trigger frame in the TB ranging measurement exchange; see 11.21.6.4.5 (Secure HE-LTF in the TB and non-TB ranging measurement exchange protocol(11az)). This field is reserved in the IFTM frame.

The Measurement Results LTF Offset field is used in TB ranging to verify that the measurement results contained in the LMR frame are calculated using the same LTF Offset for the R2I NDP between RSTA and ISTA. The Measurement Result LTF Offset field has the same value as the LTF Offset subfield in the corresponding STA Info field of the Ranging NDP Announcement frame preceding the R2I NDP, which was used for estimating the measurement results contained in the LMR frame. The Measurement Result LTF Offset field is structured as shown in Figure 9-1050 (Measurement Result LTF Offset field format(11az)). This field is not used in the IFTM frame nor in the LMR frames in non-TB ranging.

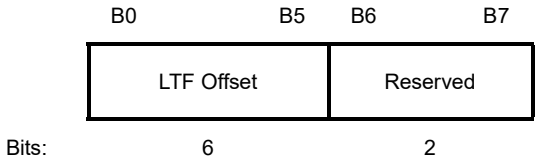

**Figure 9-1050—Measurement Result LTF Offset field format(11az)**

### 9.4.2.302 Direction Measurement Results element(11az)

The Direction Measurement Results element is used to send angle of arrival (AOA) and angle of departure (AOD) measurement results and is defined in Figure 9-1051 (Direction Measurement Results element(11az)).

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1 (General).

The AOA Results field is as shown in Figure 9-1052 (AOA Results field format(11az)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

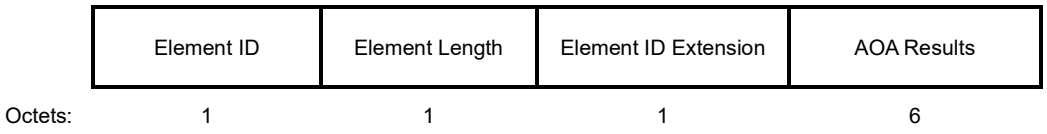

**Figure 9-1051—Direction Measurement Results element(11az)**

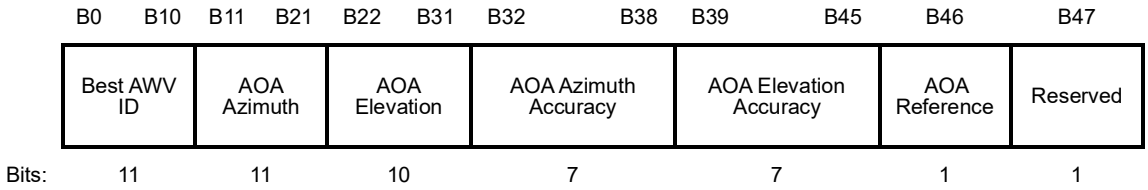

**Figure 9-1052—AOA Results field format(11az)**

The AOA Azimuth subfield contains the AOA azimuth result in 360º/2048 resolution. This subfield is an unsigned 2s complement number taking values between 0 and 2047. When the AOA Reference subfield is set to 1, the AOA Azimuth subfield is in earth coordinates (i.e., direction 0 is north). When the AOA Reference subfield is set to 0, the AOA Azimuth subfield is in coordinates relative to the orientation of the STA measuring the AOA azimuth.

The AOA Elevation subfield contains the AOA elevation result in 180º/1024 resolution. This subfield is a signed 2s complement number taking values between –512 and 511.

The AOA Azimuth Accuracy subfield contains the AOA azimuth result's estimated accuracy in 360º/2048 resolution. An accuracy larger than 125 × 360º/2048 is represented by the value of 125. A value of 126 indicates no azimuth measurement. A value of 127 indicates no ability to estimate azimuth accuracy.

The AOA Elevation Accuracy subfield contains the AOA elevation result's estimated accuracy in 360º/2048 resolution. An accuracy larger than 125 × 360º/2048 is represented by the value 125. A value of 126 indicates no elevation measurement. A value of 127 indicates no ability to estimate elevation accuracy.

When the AOA Reference subfield is set to 1, the AOA Elevation subfield is in earth coordinates (i.e., elevation 0 is the horizon). When the AOA Reference subfield is set to 0, the AOA elevation is in coordinates relative to the orientation of the STA measuring the AOA elevation.

If the STA sending the frame containing the element is a DMG STA, and the frame containing the Direction Measurement Result element follows an ISTA PPDU that enabled AOD by containing TRN-T subfields, the Best AWV ID subfield contains the index of the TRN-T subfield that was received with the highest SNR. If the ISTA PPDU that enabled AOD contained EDMG TRN-T subfields, then the AWV ID field contains the AWV ID (see 28.9.2.2.5) of the TRN subfields that were received with the highest SNR. If the STA sending the frame containing the element is a non-DMG STA, the Best AWV ID subfield is reserved.

### 9.4.2.303 Multiple Best AWV ID element(11az)

The Multiple Best AWV ID element is used to send multiple TRN subfields indices/AWV IDs from an ISTA to an RSTA and is defined in Figure 9-1053 (Multiple Best AWV ID element(11az)). The Multiple Best AWV ID element is carried in an FTM frame.

The Number Of Best AWV ID field indicates the number of attached Best AWV ID fields. Each Best AWV ID field is 16 bits long. Bits B0–B4 are reserved. It indicates the index of either the TRN subfield index or the AWV ID of the TRN subfield(s) received with highest SNR. The choice of whether TRN subfield index

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

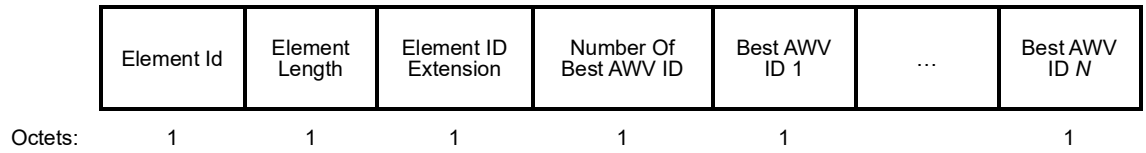

**Figure 9-1053—Multiple Best AWV ID element(11az)**

or AWV ID is used depends on whether the PPDU over which the TRN subfield(s) were selected contained a DMG TRN field or an EDMG TRN field.

### 9.4.2.304 Multiple AOD Feedback element(11az)

The Multiple AOD Feedback element is used to send multiple angle of departure (AOD) results from an RSTA to an ISTA and is defined in Figure 9-1054 (Multiple AOD Feedback element(11az)). The Multiple AOD Feedback element is carried in an FTM frame.

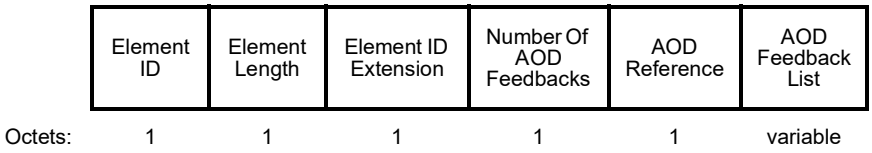

**Figure 9-1054—Multiple AOD Feedback element(11az)**

The value contained in the Number Of AOD Feedbacks field indicates the number of AOD Feedback fields present in the AOD Feedback List field, and is set to the Number Of Best AWV ID fields present in the last received Multiple Best AWV ID element from the ISTA.

When the AOD Reference field is set to 1, the AOD Elevation subfield is in earth coordinates (i.e., elevation 0 is horizon). When the AOD Reference field is set to 0, the AOD Elevation subfield is in coordinates relative to the orientation of the STA transmitting the measurement signal. When the AOD Reference field is set to 1, the AOD Azimuth subfield is in earth coordinates (i.e., direction 0 is north). When the AOD Reference field is set to 0, the AOD Azimuth subfield is in coordinates relative to the orientation of the STA transmitting the measurement signal.

The AOD Feedback List field is composed of a set of AOD Feedback fields. Each AOD Feedback field has the structure in Figure 9-1055 (AOD Feedback field format(11az)).

**Figure 9-1055—AOD Feedback field format(11az)**

The AOD Azimuth subfield contains the angle of departure (AOD) azimuth result in 360º/2048 resolution. This subfield is an unsigned 2s complement number taking values between 0 and 2047.

The AOD Azimuth Accuracy subfield contains the AOD azimuth result's estimated accuracy in 360º/2048 resolution. An accuracy larger than 125 × 360º/2048 is represented by the value of 125. A value of 126 indicates no azimuth measurement. A value of 127 indicates no ability to estimate azimuth accuracy.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The AOD Elevation subfield contains the AOD elevation result in 180º/1024 resolution. This subfield is a signed 2s complement number taking values between –512 and 511.

The AOD Elevation Accuracy subfield contains the AOD elevation result's estimated accuracy in 360º/2048 resolution. An accuracy larger than 125 × 360º/2048 is represented by the value of 125. A value of 126 indicates no elevation measurement. A value of 127 indicates no ability to estimate elevation accuracy.

### 9.4.2.305 PASN Parameters element(11az)

The Control field, see Figure 9-1057 (PASN Parameters element Control Info field format(11az)), indicates the presence or absence of other fields in the PASN Parameters element; see Figure 9-1056 (PASN Parameters element format(11az)).

| | Element ID | Length | Element ID Extension | Control | Wrapped Data Format | Comeback Info | Finite Cyclic Group ID | Ephemeral Public Key Length | Ephemeral Public Key |
|---|---|---|---|---|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | 1 | 1 | variable | 0 or 2 | 0 or 1 | variable |

**Figure 9-1056—PASN Parameters element format(11az)**

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1 (General).

| | B0 | B1 | B2 B7 |
|---|---|---|---|
| | Comeback Info Present | Group and Key Present | Reserved |
| Bits: | 1 | 1 | 6 |

**Figure 9-1057—PASN Parameters element Control Info field format(11az)**

The Comeback Info Present subfield indicates if the Comeback Info field is included in the PASN Parameters element. The Group and Key Present subfield indicates if the PASN Parameters element includes the Finite Cyclic Group ID, the Ephemeral Public Key Length, and the Ephemeral Public Key fields.

The Wrapped Data Format field indicates the format of data in the Wrapped Data element included along with the PASN Parameters element. The values defined for this format are:

- 0: No wrapped data
- 1: Fast BSS Transition Wrapped Data; see 12.13.6 (PASN authentication with FT)
- 2: FILS Shared Key authentication without PFS Wrapped Data; see 12.13.4 (PASN authentication with FILS shared key)
- 3: SAE Wrapped Data; see 12.13.5 (PASN authentication with SAE)
- 4–255: Reserved

The Comeback Info field, present only when the corresponding Comeback Info Present subfield in the Control field is set to 1, is of variable length and is formatted as shown in Figure 9-1058 (Comeback Info field format(11az)).

The Comeback After subfield value is the time in TUs after which the non-AP STA is requested to retry the PASN authentication. The Comeback After subfield is set to 0 to indicate that the operation can be retried

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

| | Comeback After | Cookie Length | Cookie |
|---|---|---|---|
| Octets: | 2 | 1 | variable |

**Figure 9-1058—Comeback Info field format(11az)**

with a cookie of nonzero length in the Cookie subfield. The Comeback After subfield is reserved in PASN Authentication frames from a non-AP STA.

The Cookie Length subfield (#7224)contains the length in octets of the Cookie subfield. If the Cookie Length subfield is 0, it indicates that there is no Cookie subfield.

The Cookie subfield contains a cookie, which is an opaque sequence of octets generated by an AP STA in an implementation dependent manner; see 12.13.10 (Comeback cookies).

The Finite Cyclic Group ID, Ephemeral Public Key Length, and Ephemeral Public Key fields are present if the Group and Key Present subfield in the Control field is set to 1.

The Finite Cyclic Group ID field indicates the group used in PASN authentication. It has the same semantics as the field Finite Cyclic Group field (9.4.1.40 (Finite Cyclic Group field)).

The Ephemeral Public Key Length field is set to the length in octets of the Ephemeral Public Key field.

(#8253)The Ephemeral Public Key field contains the public key encoded using IETF RFC 5480 conventions, in either compressed or uncompressed form.

### 9.4.2.306 ISTA Passive TB Ranging Measurement Report element(11az)

The ISTA Passive TB Ranging Measurement Report element, defined in Figure 9-1059 (ISTA Passive TB Ranging Measurement Report element format(11az)), is used to convey measurement results and associated parameters from an ISTA to the RSTA in a passive TB ranging exchange.

| | Element ID | Element Length | Element ID Extension | Sounding Dialog Token Number | CFO | More & N Timestamp Measurement Reports | Timestamp Measurement Reports |
|---|---|---|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | 1 | 2 | 1 | variable |

**Figure 9-1059—ISTA Passive TB Ranging Measurement Report element format(11az)**

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1 (General).

The value of the Sounding Dialog Token Number field is the value of the Sounding Dialog Token Number subfield in the Ranging NDP Announcement frame of the corresponding measurement sounding phase in which the reported ISTA's timestamps were measured; see 11.21.6.4.3 (TB ranging measurement exchange(11az)) and 11.21.6.4.8 (Measurement exchange in passive TB ranging mode(11az)).

The CFO field indicates the reporting ISTA's carrier frequency offset with respect to the RSTA, as a signed integer in 2s complement format in units of 0.01 ppm.

The More & N Timestamp Measurement Reports field is defined as depicted in Figure 9-1060 (More & N Timestamp Measurement Reports field format(11az)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

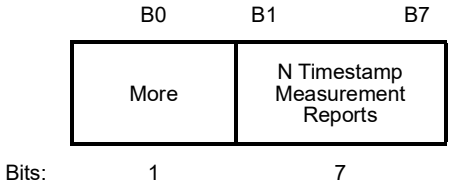

**Figure 9-1060—More & N Timestamp Measurement Reports field format(11az)**

The More subfield is used to indicate that the ISTA has more timestamps ready to report but is not able to fit them in its allocated resources as given by the RSTA.

The N Timestamp Measurement Reports subfield is an unsigned integer indicating the number of Timestamp Measurement Report subfields present in the Timestamp Measurement Reports field. The value 0 of the N Timestamp Measurement Reports field is reserved.

The Timestamp Measurement Reports field contains one or more Timestamp Measurement Report subfields defined as in Figure 9-1061 (Timestamp Measurement Report subfield format(11az)).

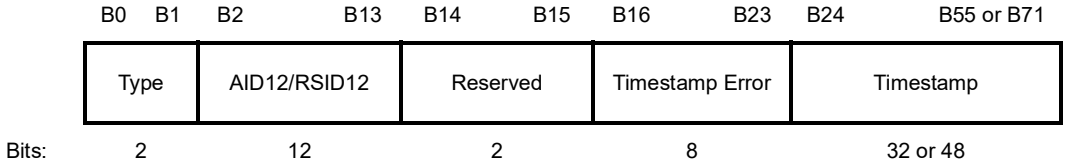

**Figure 9-1061—Timestamp Measurement Report subfield format(11az)**

The Type subfield is set according to Table 9-416 (Type subfield(11az)).

**Table 9-416—Type subfield(11az)**

| Field value | Timestamp type | Description |
|---|---|---|
| 00 | TOD | Time of departure timestamp |
| 01 | TOA | Time of arrival timestamp |
| 10 | PSTOA | Phase shift TOA |
| 11 | Reserved | Reserved |

The AID12/RSID12 subfield contains the 12 LSBs of the AID, for an associated ISTA, or the 12 LSBs of the RSID, for an unassociated ISTA, of the STA that transmitted the NDP that the timestamp is reported for. When the STA that transmitted the NDP is the RSTA the value zero is reported in the AID12/RSID12 subfield.

The Timestamp Error field is structured as shown in Figure 9-1062 (Timestamp Error subfield format(11az)).

The maximum errors in the timestamp values are represented using the function defined in Equation (9-13).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

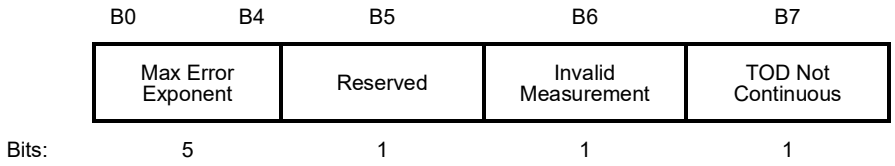

**Figure 9-1062—Timestamp Error subfield format(11az)**

$$E_{max} = \begin{cases} \text{unknown}, & F = 0 \\ 2^{F-1}, & 1 \le F \le 30 \\ \ge 2^{30}, & F = 31 \end{cases} \quad (9\text{-}13)$$

where

$F$ is the Max Error Exponent

$E_{max}$ is the maximum timestamp error, respectively, in units of picoseconds

The Max Error Exponent subfield contains the Max Error Exponent, $F$, in Equation (9-13) for the value specified in the Timestamp subfield.

The Invalid Measurement field is set to 1 to indicate that the timestamp is invalid and set to 0 to indicate that the timestamp is valid.

For a timestamp of type TOD, the TOD Not Continuous subfield indicates that the TOD value is with respect to a different underlying time base than the last transmitted TOD value. It is set to 1 when a discontinuity is present. Otherwise, it is set to 0. For other timestamp types, this field is reserved.

The Timestamp subfield contains a TOD, TOA, or a PSTOA timestamp. The TOD timestamps are represented with 48 bits in units of 1 ps. The TOA and PSTOA timestamps are represented with 32 bits in units of 16 ps.

The TOD timestamp represents the time, with respect to the ISTA's time base, at which the start of the preamble of the NDP in question appeared at the transmit antenna connector.

The TOA timestamp represents the time, with respect to the ISTA's time base, at which the start of preamble of the NDP in question arrived at the receive antenna connector.

The PSTOA timestamp represents the time, with respect to the ISTA's time base, at which the start of preamble of the NDP in question arrived at the receive antenna connector, calculated based on the average linear phase shift between two adjacent tones normalized by the tone spacing. An example of calculation of the phase shift is shown in Annex AD.

### 9.4.2.307 RSTA Passive TB Ranging Measurement Report element(11az)

The RSTA Passive TB Ranging Measurement Report element, defined in Figure 9-1062a (RSTA Passive TB Ranging Measurement Report element format), is used to broadcast measurement results and associated parameters from an RSTA to STAs that want to use this information.

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1 (General).

The value of the Sounding Dialog Token Number field is the value of the Sounding Dialog Token Number subfield in the Ranging NDP Announcement frame corresponding to the measurement sounding phase in

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

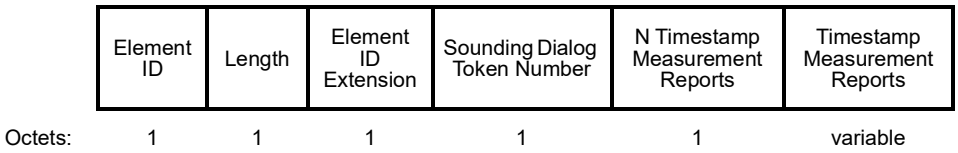

**Figure 9-1062a—RSTA Passive TB Ranging Measurement Report element format**

which the reported RSTA timestamps were measured; see 11.21.6.4.3 (TB ranging measurement exchange(11az)) and 11.21.6.4.8 (Measurement exchange in passive TB ranging mode(11az)).

The N Timestamp Measurement Reports field is an unsigned integer indicating the number of Timestamp Measurement Reports. The value 0 of the N Timestamp Measurement Reports field is reserved.

The Timestamp Measurement Reports field contains one or more Timestamp Measurement Report fields defined as in Figure 9-1061 (Timestamp Measurement Report subfield format(11az)) with definitions as detailed in 9.4.2.308 (Passive TB Ranging LCI Table element(11az)).

### 9.4.2.308 Passive TB Ranging LCI Table element(11az)

The Passive TB Ranging LCI Table Report element, defined in Figure 9-1063 (Passive TB Ranging LCI Table Report element format(11az)), is used by an RSTA to broadcast LCI data for the ISTAs participating in its passive TB ranging exchanges.

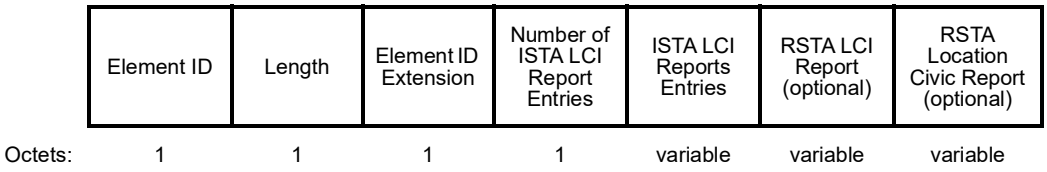

**Figure 9-1063—Passive TB Ranging LCI Table Report element format(11az)**

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1 (General).

The number of ISTA LCI Reports contained in the ISTA LCI Reports field is indicated by the Number of ISTA LCI Reports ISTA LCI Report field. The format of the ISTA LCI Report field is defined in Figure 9-1064 (ISTA LCI Report Entry field format(11az)).

The RSTA LCI Report field is present if the RSTA has never transmitted it before or its content has changed, and it is periodically present otherwise. If present, it contains a Measurement Report element with Measurement Type field equal to LCI, see Table 9-163 (Measurement Type field definitions for measurement reports), which either indicates the LCI of the RSTA and can include the Z subelement, Usage Rules/Policy subelement, and Antenna Placement And Calibration subelement, or indicates an unknown LCI; see 11.21.6.7 (LCI and Location Civic retrieval using FTM procedure).

The RSTA Location Civic Report field is optionally present. If present, it contains a Measurement Report element with Measurement Type field equal to Location Civic, see Table 9-163 (Measurement Type field definitions for measurement reports), which either indicates the Civic address of the ISTA or an unknown Civic address; see 11.21.6.7 (LCI and Location Civic retrieval using FTM procedure).

The ISTA RSID/AID subfield contains the ranging ID of the ISTA reported on.

The ISTA MAC ADDRESS subfield contains the MAC address of the ISTA reported on.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

| | ISTA RSID/AID | ISTA MAC ADDRESS | ISTA LCI Report (optional) | ISTA Location Civic Report (optional) |
|---|---|---|---|---|
| Octets: | 2 | 6 | variable | variable |

**Figure 9-1064—ISTA LCI Report Entry field format(11az)**

The ISTA LCI Report subfield is present if the RSTA has never transmitted it before or its content has changed and it is periodically present otherwise. If present, it contains a Measurement Report element with Measurement Type field equal to LCI (see Table 9-163 (Measurement Type field definitions for measurement reports)), which either indicates the LCI of the ISTA and can include the Z subelement, Usage Rules/Policy subelement, and Antenna Placement And Calibration subelement, or indicates an unknown LCI; see 11.21.6.7 (LCI and Location Civic retrieval using FTM procedure).

The ISTA Location Civic Report field is optionally present. If present, it contains a Measurement Report element with Measurement Type field equal to Location Civic (see Table 9-163 (Measurement Type field definitions for measurement reports)), which either indicates the Civic address of the ISTA or an unknown Civic address; see 11.21.6.7 (LCI and Location Civic retrieval using FTM procedure).

An ISTA LCI Report Entry includes at least one of ISTA LCI Report or ISTA Location Civic Report.

NOTE—To shorten the LCI reporting, the 'Relative Compact LCI' Measurement Type can be used in the ISTA's LCI reporting. In this case the ISTA's location is reported in relation to the location reported for the RSTA in the Passive TB Ranging LCI Table Report within which the ISTA's LCI report is contained. See 9.4.2.20.10 (LCI report (Location configuration information report)).

### 9.4.2.309 LOS Likelihood element(11az)

The LOS Likelihood field contains the estimated log likelihood that measurements contained in the Direction Measurement Results element or in the TOD field of the same FTM frame, are line of sight (LOS) measurements. The method to estimate the likelihood is implementation dependent. The format of the LOS Likelihood element is shown in Figure 9-1065 (LOS Likelihood element format(11az)).

| | Element ID | Element Length | Element ID Extension | LOS Log Likelihood Ratio |
|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | 1 |

**Figure 9-1065—LOS Likelihood element format(11az)**

The LOS Log Likelihood Ratio field is a signed 2s complement 8-bit number containing $40 \times \log_{10}$ of the estimated ratio between the probability that measurement is on a LOS path and the probability is on a non-LOS path. This covers the range –31.75 dB to +31.75 dB. If this field has a value equal to 255, it indicates that the LOS Log Likelihood Ratio is not available.

### 9.4.2.310 DMG OCB element(11bd)

The format of the DMG OCB element is shown in Figure 9-1066 (DMG OCB element format(11bd)).

| | Element ID | Length | Element ID Extension | DMG OCB Parameters |
|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | 1 |

**Figure 9-1066—DMG OCB element format(11bd)**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1 (General).

The DMG OCB Parameters field is defined in Figure 9-1067 (DMG OCB Parameters field format(11bd)).

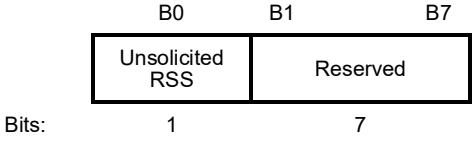

**Figure 9-1067—DMG OCB Parameters field format(11bd)**

The Unsolicited RSS subfield is defined in 9.5.5 (Beamforming Control field).

### 9.4.2.311 Non-AP STA Regulatory Connectivity element(#6076)

The format of the Non-AP STA Regulatory Connectivity element is defined in Figure 9-1068 (Non-AP STA Regulatory Connectivity element format(#6076)).

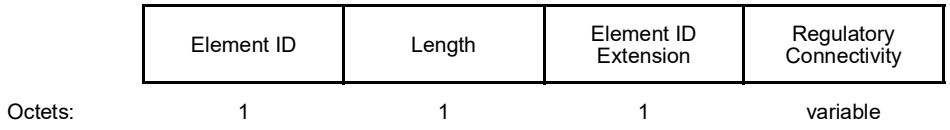

**Figure 9-1068—Non-AP STA Regulatory Connectivity element format(#6076)**

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1 (General).

The Regulatory Connectivity field indicates certain regulatory capabilities of the non-AP STA transmitting the element. The Regulatory Connectivity field is defined in Table 9-417 (Regulatory Connectivity field(#6076)).

NOTE—The length of the Regulatory Connectivity field is variable and is liable to increase as additional connectivity capabilities are defined.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-417—Regulatory Connectivity field(#6076)**

| Subfield bit or bits | Subfield name | Interpretation |
|---|---|---|
| 0 | Connectivity With Indoor AP Valid | Indicates whether the Connectivity With Indoor AP subfield is reserved or not:<br>Set to 0 if the Connectivity With Indoor AP subfield is reserved.<br>Set to 1 if the Connectivity With Indoor AP subfield is valid. |
| 1 | Connectivity With Indoor AP | Indicates whether operating under the control of an indoor AP and an indoor standard power AP is implemented (see E.2.7 (6 GHz band(11ax)(#600))).<br><br>For a non-SP STA:<br>Set to 0 if not implemented.<br>Set to 1 if implemented.<br><br>Reserved for a non-AP STA that is incapable of operating as a STA 6G in the current regulatory domain and for an AP.<br><br>Reserved if the Connectivity With Indoor AP Valid subfield is set to 0.<br><br>See NOTE. |
| 2 | Connectivity With SP AP Valid | Indicates whether the Connectivity With SP AP subfield is reserved or not:<br>Set to 0 if the Connectivity With SP AP subfield is reserved.<br>Set to 1 if the Connectivity With SP AP subfield is valid. |
| 3 | Connectivity With SP AP | Indicates whether at least one of the following is implemented: operating under the control of an SP AP and an indoor standard power AP and operating as a fixed client device (see E.2.7 (6 GHz band(11ax)(#600))).<br><br>For a non-AP STA:<br>Set to 0 if not implemented.<br>Set to 1 if implemented.<br><br>Reserved for a non-AP STA that is incapable of operating as a STA 6G in the current regulatory domain and for an AP.<br><br>Reserved if the Connectivity With SP AP Valid subfield is set to 0.<br><br>See NOTE. |
| 4 to<br>8 × (Length – 1) – 1 | Pad | Reserved |
| NOTE—This field is informative (e.g., for troubleshooting), has no regulatory purpose, and does not imply a need for any action by a peer STA. | | |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 9.4.2.312 Diffie-Hellman Parameter element(#6088)

The Diffie-Hellman Parameter element contains a Diffe-Hellman public value and an indicator of the finite cyclic group from which it was obtained. See Figure 9-1069 (Diffie-Hellman Parameter element format(#6088)).

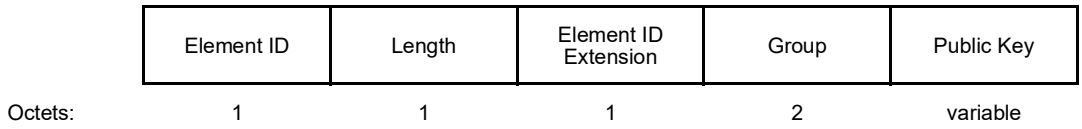

**Figure 9-1069—Diffie-Hellman Parameter element format(#6088)**

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1 (General).

The Group field is a 16-bit unsigned integer that maps an identifying number from the "Group Description" registry maintained by IANA for IETF RFC 2409 (IKE) to a complete domain parameter set.

The Public Key field is a Diffie-Hellman public key, an element in the group described by the domain parameter set indicated by the value in the Group field.

### 9.4.2.313 EBCS Parameters element(11bc)

An EBCS AP advertises its EBCS operational parameters in the EBCS Parameters element.

The format of the EBCS Parameters element is shown in Figure 9-1070 (EBCS Parameters element format(11bc)).

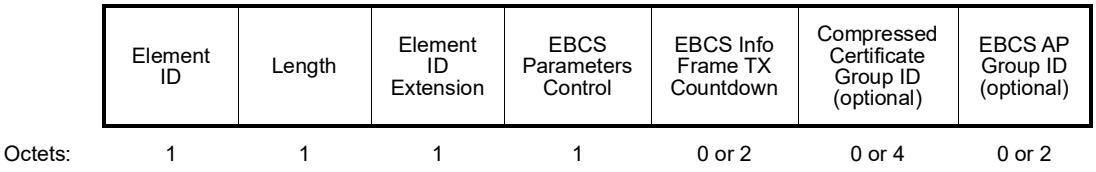

**Figure 9-1070—EBCS Parameters element format(11bc)**

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1 (General).

The format of the EBCS Parameters Control field is shown in Figure 9-1071 (EBCS Parameters Control field format(11bc)).

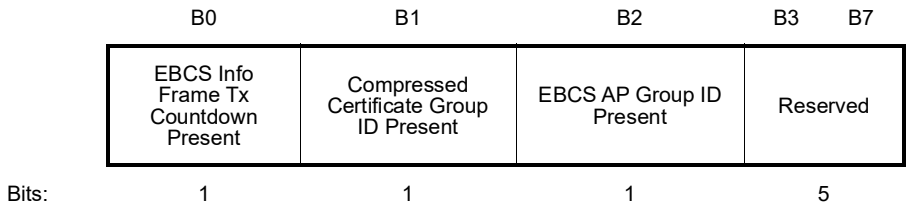

**Figure 9-1071—EBCS Parameters Control field format(11bc)**

The EBCS Info Frame Tx Countdown Present subfield is set to 1 if the EBCS Info Frame Tx Countdown subfield is present and is set to 0 otherwise.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Compressed Certificate Group ID Present subfield is set to 1 if the Compressed Certificate Group ID field is present and is set to 0 otherwise.

The EBCS AP Group ID Present subfield is set to 1 if the EBCS AP Group ID field is present and is set to 0 otherwise.

The EBCS Info Frame Tx Countdown field is defined in 9.4.1.70 (EBCS Info Frame Tx Countdown field(11bc)).

The Compressed Certificate Group ID field indicates a 32-bit CRC calculated over the certificate of the AP.

The EBCS AP Group ID field contains the EBCS AP Group ID of the AP.

### 9.4.2.314 EBCS TIM element(11bc)

The EBCS TIM element is used to signal the availability of EBCS traffic stream frames. The format of this element is shown in Figure 9-1072 (EBCS TIM element format(11bc)).

| | Element ID | Length | Element ID Extension | Content ID Bitmap Control | Content ID Bitmap |
|---|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | 1 | 1-32 |

**Figure 9-1072—EBCS TIM element format(11bc)**

The Element ID, Length and Element ID Extension fields are defined in 9.4.2.1 (General).

The format of the Content ID Bitmap Control field is shown in Figure 9-1073 (Content ID Bitmap Control field format(11bc)).

| | B0 | B1 | B5 | B6 | B7 |
|---|---|---|---|---|---|
| | Bitmap Mode | Bitmap Offset | | Reserved | |
| Bits | 1 | 5 | | 2 | |

**Figure 9-1073—Content ID Bitmap Control field format(11bc)**

The EBCS traffic indication virtual bitmap, maintained by the EBCS AP that generates an EBCS TIM, consists of 256 bits and is organized into 32 octets such that bit number $N$ ($0 \le N \le 255$) in the bitmap corresponds to bit number $N$ mod 8 in octet number, $\lfloor N/8 \rfloor$, where the low order bit of each octet is bit number 0, and the high order bit is bit number 7. A bit value 1 means the corresponding EBCS traffic stream is buffered at the AP.

The format of the Content ID Bitmap field is identified by the Bitmap Mode subfield.

If the Bitmap Mode subfield is 0, the Content ID Bitmap field consists of octets numbered $N_1$ to $N_2$ of the EBCS traffic indication virtual bitmap, where $N_1$ is the largest integer such that each of the bits 0 to $((N_1 \times 8) - 1)$ is equal to 0. If such a value does not exist, $N_1 = 0$. Additionally, $N_2$ is the smallest integer such that each of the bits $(N_2 + 1) \times 8$ to 255 is equal to 0. If such a value does not exist, that is, when not all bits in the last octet of the EBCS traffic indication virtual bitmap are equal to 0, $N_2 = 31$. The Bitmap Offset subfield contains $N_1$, and the Length field is set to $(N_2 - N_1) + 4$.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

If the Bitmap Mode subfield is 1, the Bitmap Offset subfield is set to 0 and the Content ID Bitmap field contains a set of octets indicating the content IDs of EBCS traffic streams buffered at the AP.

### 9.4.2.315 Tunneled PASN element(#7096)

The Tunneled PASN element is present in tunneled PASN frames (12.13.7 (Tunneled PASN(#7096))). The format of the Tunneled PASN element is shown in Figure 9-1074 (Tunneled PASN element format(#7096)).

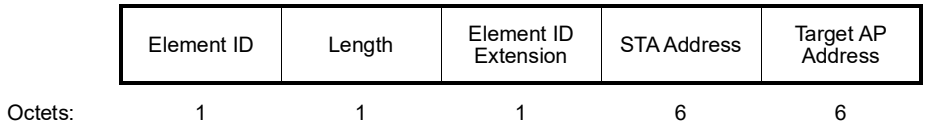

**Figure 9-1074—Tunneled PASN element format(#7096)**

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1 (General).

The STA address is the address that the STA intends to use with the target AP. The Target AP Address field is the BSSID of the BSS of the AP with which the STA performs tunneled PASN.

### 9.4.3 Subelements

(#3428)Subelements have a common general format shown in Figure 9-1075 (Subelement format). Each subelement is assigned a subelement ID that is unique within the containing element or subelement. The Length field specifies the number of octets in the Data field.

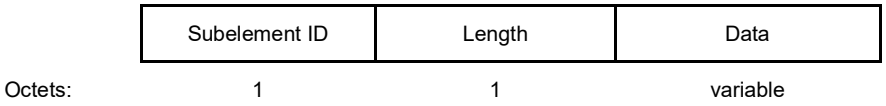

**Figure 9-1075—Subelement format**

At the location in this standard that a subelement is defined, the definition might indicate if the subelement is extensible, typically using a table column called Extensible in the table in which subelement IDs are defined. A subelement that is indicated as extensible (typically with Yes in the Extensible column) might be extended in future revisions or amendments of this standard. A subelement that is indicated as extensible through subelements (typically with Subelements in the Extensible column) might be extended in future revisions or amendments of this standard by defining (additional) subelements within the subelement.

If the definition of a subelement does not indicate whether it is extensible (e.g., there is no Extensible column in a table defining it) that subelement is not extensible.

A subelement that is not defined as extensible will not be extended in future revisions or amendments of this standard.

(#524)Subelements within an element and subelements in a field outside of an element are in each case ordered by nondecreasing Subelement ID. See 10.28.9 (Extensible subelement parsing).

Unless stated otherwise, no more than one subelement with the same Subelement ID, apart from Vendor Specific subelements, is present within an element.

This is an unapproved IEEE Standards Draft, subject to change.

### 9.4.4 TLV encodings

#### 9.4.4.1 General

The following TLV encodings are used to convey parameters within (#8152)Management frames (9.3.3 ((PV0) Management frames), 9.4 (Management and Extension frame body components), and 9.5.7 (EDMG BRP field(11ay))). TLV tuples with type values that are unknown, not specified in this subclause, or specified as "reserved" are discarded upon receipt. The form of TLVs is shown in Table 9-418 (General TLV format).

**Table 9-418—General TLV format**

| Name | Type | Length (octets) | Value | Scope/ Country code |
|---|---|---|---|---|
| The name of the TLV | 1 | variable | Single Octet, Single Value, or Compound TLV tuples. | |

NOTE—This standard is complete regarding the endianness of multi-octet fields as they are covered by 9.2.2 (Conventions). Be aware that most protocols above the MAC operate in the opposite endianness.

The Name field is the name of the TLV tuple.

The '*m.n*' syntax in the Type field means that the TLV has type *n*, an unsigned 1-octet integer, and is embedded in the Value field of a TLV of type *m*. The length of the Type field is 1 octet.

The format of the Length field is an unsigned number of size 1 octet, and the value in the Length field specifies the number of octets in the Value field.

A single octet TLV has a Value field that is 1 octet, a single value TLV has a Value field larger than 1 octet(#3431), and a compound TLV has a Value field that represents more than 1-octet fields.

When a Scope field entry contains two characters, it identifies the country or other entity to which the STA's operation is bound. If the two-character value stands for a country or other entity, then the value matches a code defined in ISO 3166-1. When a Scope field entry contains more than two characters, it identifies a scope for the TLV tuple.

#### 9.4.4.2 Common TLVs

##### 9.4.4.2.1 General

The general form of common TLVs is shown in Table 9-418 (General TLV format) and is used in 9.4.4.2.2 (Device Class) to 9.4.4.2.6 (WSM information values).

##### 9.4.4.2.2 Device Class

This parameter contains the intended class of device for operation in TVWS band after it receives the available channel list at its location. The Device Class field format is shown in Table 9-419 (Device Class field definition).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-419—Device Class field definition**

| Name | Type | Length (octets) | Value | Scope/ Country code |
|---|---|---|---|---|
| Device Class | 2 | 1 | The Device Class field contains an integer that indicates the device's TVWS band mode of operation as follows:<br>0: GDD non-AP STA<br>1: GDD geolocated non-AP STA<br>2: GDD AP<br>3: GDD fixed STA<br>4–255: Reserved | CAQ, GDDENABLEMENT, WSM |

#### 9.4.4.2.3 Device Identification Information

This parameter contains the identification information of the device initiating the channel availability query. The Device Identification Information field format is shown in Table 9-420 (Device Identification Information field definition) and related Device Identification Information Value fields tables in E.2 (Band-specific operating requirements) for specific regulatory domains.

**Table 9-420—Device Identification Information field definition**

| Name | Type | Length (octets) | Value | Scope/ Country code |
|---|---|---|---|---|
| Device Identification Information | 3 | variable | One or more TLV fields as defined in Table E-9 (Device Identification Information Value fields) for a specific regulatory domain. | CAQ, GDDENABLEMENT, CSM |

#### 9.4.4.2.4 Device Location Information

This parameter contains the location information of the device initiating the channel availability query. The Device Location Information field format is shown in Table 9-421 (Device Location Information field definition).

**Table 9-421—Device Location Information field definition**

| Name | Type | Length (octets) | Value | Scope/ Country code |
|---|---|---|---|---|
| Device Location Information | 10 | 16 | The Device Location Information field contains the latitude, longitude, and altitude information of the device in the format specified by the Device Location Information Body fields in Figure 9-191 (Device Location Information Body field format). When the Device Type subfield (see Table 9-419 (Device Class field definition)) is not GDD fixed STA, the altitude information (Altitude Type, Altitude Uncertainty, and Altitude subfields) of the Device Location Information field remain unused. | CAQ |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

#### 9.4.4.2.5 Channel Schedule Descriptor

This parameter contains the channel number associated with channel schedule information used for channel schedule management. The Channel Schedule Descriptor Tuple attribute format is shown in Table 9-422 (Channel Schedule Descriptor Tuple attribute definition) and Table 9-423 (Channel Schedule Descriptor Value fields). Channel Schedule Descriptor field is constructed with either Channel Availability Starting Time field or Channel Availability Starting Timestamp field present or neither of these two fields present.

**Table 9-422—Channel Schedule Descriptor Tuple attribute definition**

| Name | Type | Length (octets) | Value | Scope/ Country code |
|---|---|---|---|---|
| Channel Schedule Descriptor | 11 | variable | Compound TLVs in Table 9-423 (Channel Schedule Descriptor Value fields). | CSM |

**Table 9-423—Channel Schedule Descriptor Value fields**

| Name | Subtype | Length (octets) | Value | Scope/ Country code |
|---|---|---|---|---|
| Operating Class | 1 | 1 | The Operating Class field is the number of the operating class of the channel, which is defined in E.1 (Country information and operating classes). | CSM |
| Channel Number | 2 | 1 | The Channel Number field is the number of the channel, which is the subject of the value of Channel Schedule Management Mode field. If the Channel Schedule Management Mode field indicates the schedule information is based on WLAN channels, the Channel Number is a channel from the operating class of the STA(#3181) as defined in E.1 (Country information and operating classes); otherwise, the Operating Class compound TLV is not present, and the Channel Number is a positive integer value as defined in D.1 (External regulatory references) to indicate the available TV channel for WLAN operation. | CSM |
| Channel Availability Starting Time | 3 | 8 | The Channel Availability Starting Time field indicates the starting time in Coordinated Universal Time (UTC) from when the channel indicated in the Channel Number field is available for operation. When neither this field nor a Channel Availability Starting Timestamp is present, the STA takes the time that the response element is received as the starting time of the channel availability.<br>NOTE—The Channel Availability Starting Time field follows the UTC time definition of the Time Value field of the Time Advertisement element in 9.4.2.59 (Time Advertisement element), and the first 6 octets are used to indicate the UTC time until minutes. The left 2 octets are reserved. | CSM |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-423—Channel Schedule Descriptor Value fields *(continued)***

| Name | Subtype | Length (octets) | Value | Scope/ Country code |
|---|---|---|---|---|
| Channel Availability Starting Timestamp | 4 | 8 | The Channel Availability Starting Timestamp field indicates the starting timestamp from when the channel indicated in the Channel Number field is available for operation. When neither this field nor a Channel Availability Starting Time field is present, the STA takes the time that the response element is received as the starting time of the channel availability. | CSM |
| Channel Availability Offset Time | 5 | 2 | The Channel Availability Offset Time field indicates the offset of channel availability time with respect to the time that the Channel Schedule Descriptor is received. This field is present when the Channel Availability Starting Time field is not present in the response TLV and the channel is not available at the moment the TLV is received. | CSM |
| Channel Availability Duration | 6 | 2 | The Channel Availability Duration field indicates the duration in minutes of the availability of the channel that indicated in the Channel Number field. | CSM |

#### 9.4.4.2.6 WSM information values

The format of the WSM information values is shown in Table 9-424 (WSM information values). If the WSM Type field of the White Space Map element (9.4.1.55 (WSM Type field and WSM Information field)) is set to 1, the WSM Information field specifies available channel information for TVWS, which is country-specific.

**Table 9-424—WSM information values**

| Name | Type | Length (octets) | Value | Scope/ Country code |
|---|---|---|---|---|
| WSM Information | 12 | variable | Single value TLV comprising fields in related table in E.2 (Band-specific operating requirements) for a specific regulatory domain. | WSM |

The format of the WSM Information Value fields is shown in Table 9-425 (WSM Information Value fields).

The Device Class field is defined in 9.4.4.2.2 (Device Class) and identifies the device class used by the WSM. It determines the length of the channel availability tuple consisting of the Channel Number, Maximum Power Level, and Validity fields, which is repeated as indicated by the Length field of the WSM element. If the Device Class field is 0, the Validity field in WSM Information Value field is not present. Otherwise, the Validity field exists in the WSM Information Value field.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-425—WSM Information Value fields**

| Name | Length (octets) | Value | Scope/ Country code |
|---|---|---|---|
| Device Class | 1 | Single octet TLV comprising fields in Table 9-419 (Device Class field definition). | WSM |
| Map ID | 1 | Bit 0: Type bit indicates whether the following channel list is a full channel list or a partial channel list. If the Type bit is 1, the following channel list is a full channel list; and if the Type bit is 0, the following channel list is a partial channel list.<br>Bits 1–7: Map version identifies the version of the WSM. | WSM |
| Channel Number | 1 | Channel Number field in related WSM Information Value fields table in E.2 (Band-specific operating requirements). | WSM |
| Maximum Power Level | 1 | Maximum Power Level field in related WSM Information Value fields table in E.2 (Band-specific operating requirements). | WSM |
| Validity | 1 | The Validity field indicates the duration in minutes for which the Channel Number is available with the allowed maximum power level, where the Validity field is provided for each available Channel Number. | WSM, UK |
| Maximum Channel Bandwidth | 2 | Limits on the maximum contiguous and maximum noncontiguous instantaneous bandwidths of STA specified as $n \times 0.1$ MHz, where $n > 0$. | WSM, UK |

### 9.4.5 Access network query protocol (ANQP)-elements(M118)

#### 9.4.5.1 General

(#3428)ANQP-elements have a common format shown in Figure 9-1076 (ANQP-element format). Each element is assigned a unique Info ID as defined in this standard. See R.2 (Network discovery and selection) for the ANQP usage.

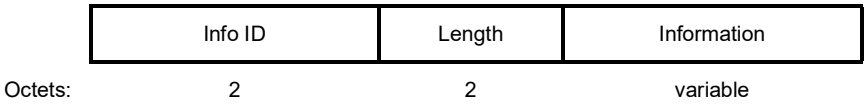

**Figure 9-1076—ANQP-element format**

Each ANQP-element in 9.4.5 (Access network query protocol (ANQP)-elements(M118)) is assigned a unique 2-octet Info ID. The set of valid Info IDs are defined in Table 9-426 (ANQP-element definitions).

**Table 9-426—ANQP-element definitions**

| ANQP-element name | Info ID(#6161) | ANQP-element (subclause) |
|---|---|---|
| Reserved | 0–255 | — |
| Query List | 256 | 9.4.5.2 (Query List ANQP-element) |
| Capability List | 257 | 9.4.5.3 (Capability List ANQP-element) |
| Venue Name | 258 | 9.4.5.4 (Venue Name ANQP-element) |
| Emergency Call Number | 259 | 9.4.5.5 (Emergency Call Number ANQP-element) |
| Network Authentication Type | 260 | 9.4.5.6 (Network Authentication Type ANQP-element) |

| Vendor Specific | 56 797 | 9.4.5.8 (Vendor Specific ANQP-element) |
| Reserved | 56 798–65 535 | — |

The Length field specifies the number of octets in the Information field.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

(#4066)The ANQP-elements with type S in Table 11-20 (ANQP usage) can be configured. If information is not configured for a particular ANQP-element with type S, then that ANQP-element is not included in the response.

NOTE—Some STAs might return a queried ANQP-element for which information is not configured with all optional fields not present.(#4066)

### 9.4.5.2 Query List ANQP-element

The Query List ANQP-element provides a list of identifiers of ANQP-elements for which the requesting STA is querying; see 11.22.3.3.2 (Query list procedure).

The format of the Query List ANQP-element is shown in Figure 9-1077 (Query List ANQP-element format(#1363)).

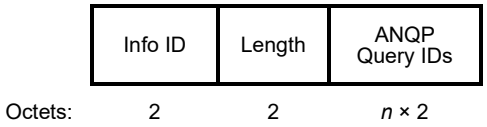

**Figure 9-1077—Query List ANQP-element format(#1363)**

The Info ID and Length fields are defined in 9.4.5.1 (General).

The ANQP Query IDs field contains one or more 2-octet ANQP Query ID subfields.

Each ANQP Query ID subfield value is an Info ID drawn from Table 9-426 (ANQP-element definitions). Including an Info ID in the Query List ANQP-element declares that the STA performing the ANQP request is requesting the ANQP-element corresponding to that Info ID be returned in the ANQP response. The Info IDs included in the Query List ANQP-element are ordered by monotonically increasing Info ID value. The ANQP response is defined in 11.22.3.3.1 (General).

### 9.4.5.3 Capability List ANQP-element

The Capability List ANQP-element provides a list of information/capabilities that has been configured on a STA. The Capability List ANQP-element is returned in response to a Query List ANQP-element containing the Info ID of the Capability List ANQP-element.

The format of the Capability List ANQP-element is shown in Figure 9-1078 (Capability List ANQP-element format).

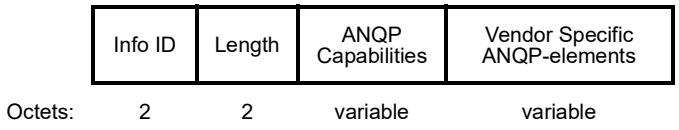

**Figure 9-1078—Capability List ANQP-element format**

The Info ID and Length fields are defined in 9.4.5.1 (General).

The ANQP Capabilities field contains one or more 2-octet ANQP Capability subfields.

Each ANQP Capability subfield value is an Info ID drawn from Table 9-426 (ANQP-element definitions). If included in the Capability List ANQP-element, it declares that a Query List ANQP-element including that

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Info ID will return the requested ANQP-element. The Info ID for Capability List ANQP-element is always included in the Capability List ANQP-element returned in a GAS query response(#7054). The list does not include any duplicate Info IDs, except possibly the Info ID for each Vendor Specific ANQP-element. The Info IDs returned in the Capability List ANQP-element are ordered by nondecreasing Info ID value.

The Vendor Specific ANQP-elements field contains one or more variable length Vendor Specific ANQP-elements.

The Vendor Specific ANQP-element is defined in 9.4.5.8 (Vendor Specific ANQP-element). The Vendor Specific ANQP-element is structured such that the first 2 octets of the Vendor Specific ANQP-element is the Info ID whose value corresponds to the Vendor Specific ANQP-element (see Table 9-426 (ANQP-element definitions)). When a Vendor Specific ANQP-element is present in the Capability List ANQP-element, the Vendor Specific ANQP-element contains the capabilities of that vendor-specific query protocol.

### 9.4.5.4 Venue Name ANQP-element

The Venue Name ANQP-element provides zero or more venue names associated with the BSS. The format of the Venue Name ANQP-element is shown in Figure 9-1079 (Venue Name ANQP-element format). The Venue Name ANQP-element might be used to provide additional metadata on the BSS. For example, the information might be used to assist a user in selecting the appropriate BSS of which to become a member.

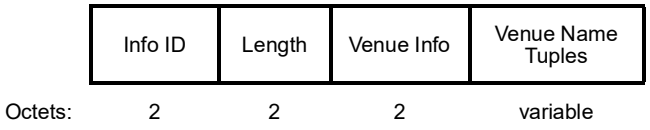

**Figure 9-1079—Venue Name ANQP-element format**

The Info ID and Length fields are defined in 9.4.5.1 (General).

The Venue Info field is defined in 9.4.1.32 (Venue Info field).

The Venue Name Tuples field contains zero or more variable length Venue Name Tuple subfields.

The format of the Venue Name Tuple subfield is shown in Figure 9-1080 (Venue Name Tuple subfield).

— The Length field is equal to 3 plus the number of octets in the Venue Name field.
— The Language Code field contains an ASCII-encoded language code selected from ISO 639, and defines the language used in the Venue Name field. A two character language code has 0 (ASCII NUL) appended.
— The Venue Name field is a UTF-8 string containing the venue's name. The maximum length of this field is 252 octets.

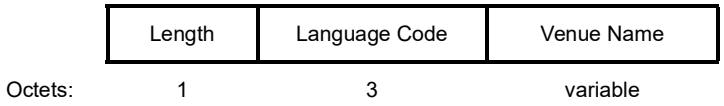

**Figure 9-1080—Venue Name Tuple subfield**

A URL associated with the Venue Name field can be specified by the Venue URL ANQP-element defined in 9.4.5.20 (Venue URL ANQP-element).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 9.4.5.5 Emergency Call Number ANQP-element

The Emergency Call Number ANQP-element provides a list of emergency phone numbers to an emergency responder, such as directed by a public safety answering point (PSAP), that is used in the geographic location of the STA. The format of the Emergency Call Number ANQP-element is shown in Figure 9-1081 (Emergency Call Number ANQP-element format).

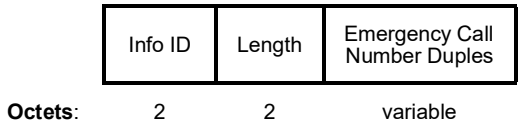

**Figure 9-1081—Emergency Call Number ANQP-element format**

The Info ID and Length fields are defined in 9.4.5.1 (General).

The Emergency Call Number Duples field contains zero or more variable length Emergency Call Number Duple subfields.

Each Emergency Call Number Duple subfield has the structure shown in Figure 9-1082 (Emergency Call Number Duple subfield format).

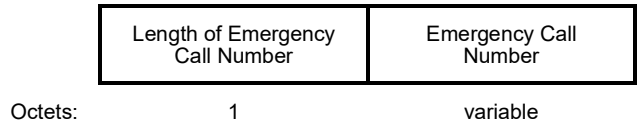

**Figure 9-1082—Emergency Call Number Duple subfield format**

The Length of Emergency Call Number field (#7224)contains the length in octets of the Emergency Call Number field.

The Emergency Call Number field is a UTF-8 string containing information, used to reach emergency services, from the network [e.g., dialed digits, emergency service URN label (IETF RFC 5031 [B46])]. When this field is transmitted by an AP, with the intention of the field being received by a STA in a 3GPP capable device, the recommended format and content of this field is defined in Annex I of 3GPP TS 24.302.

### 9.4.5.6 Network Authentication Type ANQP-element

The Network Authentication Type ANQP-element provides a list of authentication types when ASRA is set to 1. The format of the Network Authentication Type ANQP-element is shown in Figure 9-1083 (Network Authentication Type ANQP-element format).

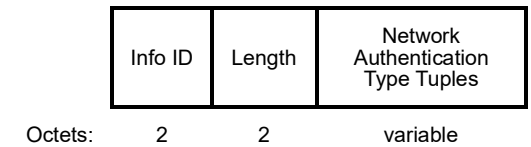

**Figure 9-1083—Network Authentication Type ANQP-element format**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Info ID and Length fields are defined in 9.4.5.1 (General).

The Network Authentication Type Tuples field contains zero or more variable length Network Authentication Type Tuple subfields.

Each Network Authentication Type Tuple subfield has the structure shown in Figure 9-1084 (Network Authentication Type Tuple subfield format).

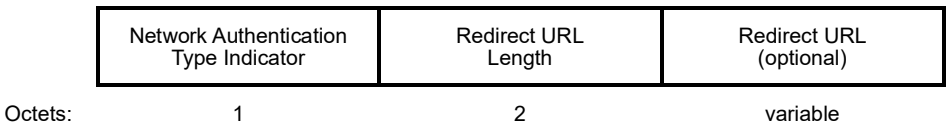

**Figure 9-1084—Network Authentication Type Tuple subfield format**

The Network Authentication Type Indicator field is set to one of the values shown in Table 9-427 (Network Authentication Type Indicator definitions).

**Table 9-427—Network Authentication Type Indicator definitions**

| Value | Meaning |
|---|---|
| 0 | Acceptance of terms and conditions |
| 1 | On-line enrollment supported |
| 2 | http/https redirection |
| 3 | DNS redirection |
| 4–255 | Reserved |

Each Network Authentication Type Indicator field defines additional information that can be communicated.

(#8097)The Redirect URL Length field contains the length (#7224)in octets of the Redirect URL field. The Redirect URL Length field is set to 0 whenever the Redirect URL field(#8098) is not present.

(#8097)(#8099)The Redirect URL field is a variable length field that is optionally included if the Network Authentication Type Indicator field is either 0 or 2; otherwise, it is not included. The URL is formatted in accordance with IETF RFC 3986.

If the Network Authentication Type Indicator field is 0, the network requires the user to accept terms and conditions. The (#7224)Redirect URL field can be used by the non-AP STA to obtain the terms and conditions.(#8098)

If the Network Authentication Type Indicator field is 1, the network supports on-line enrollment. Higher layer protocols on the non-AP STA might indicate to the user that accounts might be created. When the Network Authentication Type Indicator is 1, (#8097)the (#7224)Redirect URL field is not present.

If the Network Authentication Type Indicator field is 2, the network infrastructure performs http/https redirect. The (#7224)Redirect URL field is used by the non-AP STA to perform additional steps required for network access.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

If the Network Authentication Type Indicator field is 3, the network supports DNS redirection. Higher layer software on the non-AP STA exchanges credentials with the network, (#8097)the (#7224)Redirect URL field is not present.

### 9.4.5.7 Roaming Consortium ANQP-element

The Roaming Consortium ANQP-element provides a list of information about the Roaming Consortium and/or SSPs whose networks are accessible via this AP. This list can be returned in response to a GAS query request(#7052) using procedures in 11.22.3.3.3 (Roaming Consortium procedure). The format of the Roaming Consortium ANQP-element is shown in Figure 9-1085 (Roaming Consortium ANQP-element format).

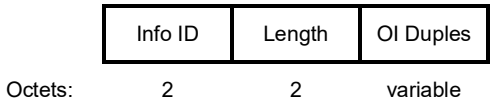

**Figure 9-1085—Roaming Consortium ANQP-element format**

The Info ID and Length fields are defined in 9.4.5.1 (General).

OIs contained within the Roaming Consortium element (see 9.4.2.94 (Roaming Consortium element)) are also included in this ANQP-element. The value of the OI subfield(s) in this ANQP-element are equal to the values of the OI(s) in the dot11RoamingConsortiumTable.

The OI Duples field contains zero or more variable length OI Duple subfields.

The format of the OI Duple subfield is shown in Figure 9-1086 (OI Duple subfield format).

— The OI Length field is set to the number of octets in the OI field.

— The OI field is defined in 9.4.1.29 (Organization Identifier field). Each OI identifies a roaming consortium (group of SSPs with inter-SSP roaming agreement) or a single SSP.

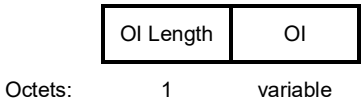

**Figure 9-1086—OI Duple subfield format**

### 9.4.5.8 Vendor Specific ANQP-element

The Vendor Specific ANQP-element is used to query for information not defined in this standard within a single defined format, so that reserved Info IDs are not usurped for nonstandard purposes and interoperability is more easily achieved in the presence of nonstandard information. The ANQP-element is in the format shown in Figure 9-1087 (Vendor Specific ANQP-element format).

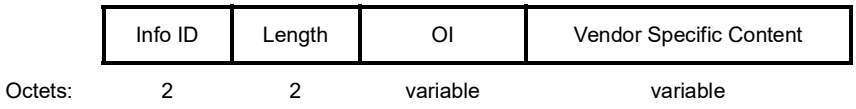

**Figure 9-1087—Vendor Specific ANQP-element format**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Info ID and Length fields are defined in 9.4.5.1 (General).

The OI field is defined in 9.4.1.29 (Organization Identifier field).

The Vendor Specific Content field is a variable length field whose content is defined by the entity identified in the OI field.

### 9.4.5.9 IP Address Type Availability ANQP-element

The IP Address Type Availability ANQP-element provides STA with the information about the availability of IP address version and type that could be allocated to the STA after successful association. The format of the IP Address Type Availability ANQP-element is shown in Figure 9-1088 (IP Address Type Availability ANQP-element).

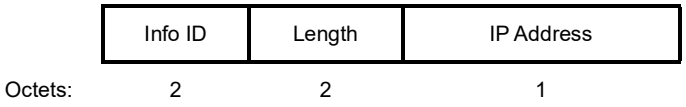

**Figure 9-1088—IP Address Type Availability ANQP-element**

The Info ID and Length fields are defined in 9.4.5.1 (General).

The format of the IP Address field shown in Figure 9-1089 (IP Address field format).

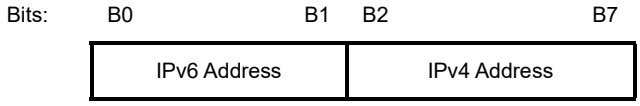

**Figure 9-1089—IP Address field format**

The IPv6 Address field values are shown in Table 9-428 (IPv6 Address field values).

**Table 9-428—IPv6 Address field values**

| Address value | Meaning |
|---|---|
| 0 | Address type not available |
| 1 | Address type available |
| 2 | Availability of the address type not known |
| 3 | Reserved |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The IPv4 Address field values are shown in Table 9-429 (IPv4 Address field values).

**Table 9-429—IPv4 Address field values**

| Address value | Meaning |
|---|---|
| 0 | Address type not available |
| 1 | Public IPv4 address available |
| 2 | Port-restricted IPv4 address available |
| 3 | Single NATed private IPv4 address available |
| 4 | Double NATed private IPv4 address available |
| 5 | Port-restricted IPv4 address and single NATed IPv4 address available |
| 6 | Port-restricted IPv4 address and double NATed IPv4 address available |
| 7 | Availability of the address type is not known |
| 8–63 | Reserved |

### 9.4.5.10 NAI Realm ANQP-element

The NAI Realm ANQP-element provides a list of network access identifier (NAI) realms corresponding to SSPs or other entities whose networks or services are accessible via this AP; optionally included for each NAI realm is a list of one or more EAP Method subfields, which that NAI realm uses for authentication. The format of the NAI Realm ANQP-element is shown in Figure 9-1090 (NAI Realm ANQP-element format).

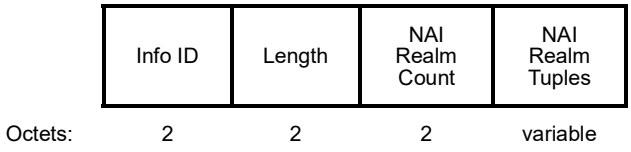

**Figure 9-1090—NAI Realm ANQP-element format**

The Info ID and Length fields are defined in 9.4.5.1 (General).

(#1612)The NAI Realm Count field specifies the number of NAI Realm Tuple subfields included in the NAI Realm ANQP-element.

The NAI Realm Tuples field contains zero or more variable length NAI Realm Tuple subfields.

The format of the NAI Realm Tuple subfield is shown in Figure 9-1091 (NAI Realm Tuple subfield format).

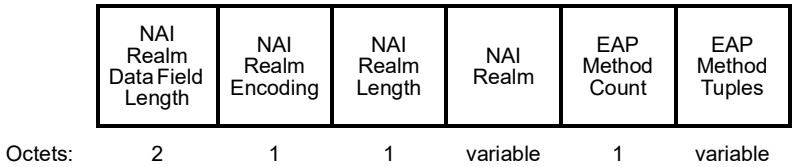

**Figure 9-1091—NAI Realm Tuple subfield format**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The NAI Realm Data Field Length subfield is equal to 3 plus the length (#7224)in octets of the NAI Realm subfield plus the length in octets of the EAP Method Tuples subfield.(#1611)

The NAI Realm Encoding subfield is shown in Figure 9-1092 (NAI Realm Encoding subfield format).

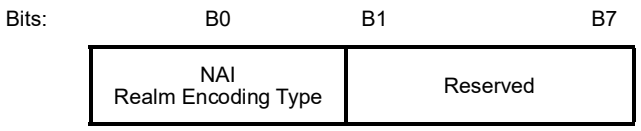

**Figure 9-1092—NAI Realm Encoding subfield format**

The NAI Realm Encoding Type subfield is set to 0 to indicate that each NAI realm in the NAI Realm subfield is formatted in accordance with IETF RFC 4282. It is set to 1 to indicate that each NAI realm is a UTF-8 string that (#1624)might not be formatted in accordance with IETF RFC 4282.(#1613)

NOTE—This encoding is to facilitate roaming consortium or other entities that use nonstandard NAI realm(#3235) formats.

The NAI Realm Length subfield is the length in octets of the NAI Realm subfield.

The NAI Realm subfield is one or more NAI realms(#3235) formatted as defined in the NAI Realm Encoding Type subfield(#1610) of the NAI Realm Encoding subfield. If there is more than one NAI realm(#3235) in this subfield, the NAI realms are delimited by a semicolon character (i.e., ";", which is encoded in UTF-8 as 0x3B). All of the realms included in the NAI Realm subfield support all of the EAP methods identified by the EAP Method subfields, if present. The maximum length of this subfield is 255 octets.

The EAP Method Count subfield specifies the number of EAP methods subfields for the NAI realm. If the count is 0, there is no EAP method information provided for the NAI realm.

The EAP Method Tuples field contains zero or more variable length EAP Method Tuple subfields.

The format of the optional EAP Method Tuple subfield is shown in Figure 9-1093 (EAP Method Tuple subfield format). Each EAP Method subfield contains a set of Authentication Parameters associated with the EAP-Method.

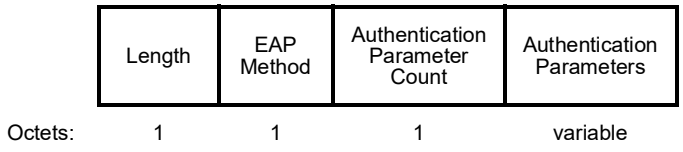

**Figure 9-1093—EAP Method Tuple subfield format**

The Length subfield is 2 plus the length (#7224)in octets of the Authentication Parameters subfield.

The EAP method subfield is set to the EAP Type value as given in IANA EAP Method Type Numbers.

The Authentication Parameter Count indicates how many additional Authentication Parameter subfields are specified for the supported EAP Method. If the Authentication Parameters Count subfield is 0, there are no Authentication Parameters subfields present, meaning no additional Authentication Parameters are specified for the EAP Method.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Authentication Parameters field contains zero or more variable length Authentication Parameter subfields.

The format of the Authentication Parameter subfield is shown in Figure 9-1094 (Authentication Parameter subfield format).

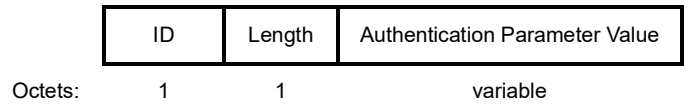

**Figure 9-1094—Authentication Parameter subfield format**

The ID subfield indicates the type of authentication information provided.

The Length subfield indicates the length (#7224)in octets of the Authentication Parameter Value subfield.

The Authentication Parameter Value subfield is a variable length subfield containing the value of the parameter indicated by the ID.

The ID and its associated formats are specified in Table 9-430 (Authentication Parameter types). Each ID indicates a different type of information. Use of multiple Authentication Parameter subfields allows all of the required authentication parameter requirements to be provided.

**Table 9-430—Authentication Parameter types**

| Authentication information | ID | Description | Length (octets) |
|---|---|---|---|
| Reserved | 0 | | |
| Expanded EAP Method | 1 | Expanded EAP Method Subfield | 7 |
| Non-EAP Inner Authentication Type | 2 | Enum (0 - Reserved, 1 - PAP, 2 - CHAP, 3 - MSCHAP, 4 - MSCHAPV2) | 1 |
| Inner Authentication EAP Method Type | 3 | Value drawn from IANA EAP Method Type Numbers | 1 |
| Expanded Inner EAP Method | 4 | Expanded EAP Method Subfield | 7 |
| Credential Type | 5 | Enum (1 - SIM, 2 - USIM, 3 - NFC Secure Element, 4 - Hardware Token, 5 - Softoken, 6 - Certificate, 7 - username/password, 8 - none (#4181)(see NOTE), 9 - Reserved, 10 - Vendor Specific) | 1 |
| Tunneled EAP Method Credential Type | 6 | Enum (1 - SIM, 2 - USIM, 3 - NFC Secure Element, 4 - Hardware Token, 5 - Softoken, 6 - Certificate, 7 - username/password, 8 - Reserved, 9 - Anonymous, 10 - Vendor Specific) | 1 |
| Reserved | 7–220 | | |
| Vendor Specific | 221 | Variable | variable |
| Reserved | 222–255 | | |
| NOTE—None means server-side authentication only. | | | |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

If the EAP Method type is an Expanded EAP type (the EAP Method value is 254), the Authentication Parameter is used to specify additional information on the EAP method. Table 9-431 (Authentication Parameter format for the Expanded EAP method) describes the Authentication Parameter format for the Expanded EAP method; values for the Vendor ID and Vendor Type are specified in IETF RFC 3748. The Vendor ID and Vendor Type fields are expressed in big endian octet order.

**Table 9-431—Authentication Parameter format for the Expanded EAP method**

| Parameters | Length (octets) |
|---|---|
| ID | 1 |
| Length | 1 |
| Vendor ID | 3 |
| Vendor Type | 4 |

The Non-EAP Inner Authentication Type is specified as a single enumerated value given in Table 9-430 (Authentication Parameter types). This Authentication Information type is used for non-EAP Inner Authentication methods. The possible values are PAP (as specified in IETF RFC 1334 [B23]), CHAP (as specified in IETF RFC 1994 [B24]), MSCHAP (as specified in IETF RFC 2433 [B28]), and MSCHAPv2 (as specified in IETF RFC 2759 [B32]).

The Inner Authentication EAP Method Type is specified as the EAP number as defined in IANA EAP Method Type Numbers. This Authentication Information type is used when the Inner Authentication method is an EAP method. If the Inner Authentication EAP Method Type is equal to 254 indicating an Expanded EAP Type, then the Expanded EAP Method Authentication Parameter is included.

A Credential Type is specified as a single enumerated value as shown in Table 9-430 (Authentication Parameter types). If the value is equal to the "Vendor Specific" value, then a Vendor-Specific Authentication Parameter is included.

Vendor-Specific Authentication Parameters are specified as shown in Table 9-432 (Vendor Specific Authentication Parameters).

**Table 9-432—Vendor Specific Authentication Parameters**

| Parameters | Length (octets) |
|---|---|
| ID | 1 |
| Length | 1 |
| OI | variable |
| Authentication Parameter Value | variable(#1726) |

#### 9.4.5.11 3GPP Cellular Network ANQP-element

The 3GPP Cellular Network ANQP-element contains cellular information such as network advertisement information e.g., network codes and country codes to assist a non-AP STA in selecting an AP to access 3GPP networks. The format of the 3GPP Cellular Network ANQP-element is shown in Figure 9-1095 (3GPP Cellular Network ANQP-element format).

**Figure 9-1095—3GPP Cellular Network ANQP-element format**

The Info ID and Length fields are defined in 9.4.5.1 (General).

The Payload field is a variable length field and is a generic container. An example of the format and content is defined in Annex H of 3GPP TS 24.302.

#### 9.4.5.12 AP Geospatial Location ANQP-element

The AP Geospatial Location ANQP-element provides the AP's location in LCI format; see 9.4.2.20.10 (LCI report (Location configuration information report)). This information is taken from dot11APLCITable.

The format of the AP Geospatial Location ANQP-element is shown in Figure 9-1096 (AP Geospatial Location ANQP-element format).

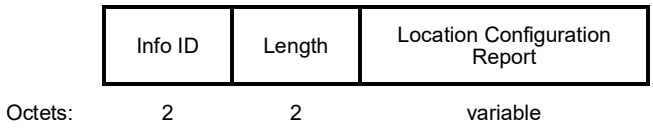

**Figure 9-1096—AP Geospatial Location ANQP-element format**

The Info ID and Length fields are defined in 9.4.5.1 (General).

The Location Configuration Report field is of variable length and defined in 9.4.2.20.10 (LCI report (Location configuration information report)). The Z and Usage Rules/Policy subelements are optionally present in the Location Configuration Report field, when it is used in the AP Geospatial Location ANQP element. The (#2210)Colocated BSSID List subelement is present when there is at least one other BSS that is (#2210)colocated within the same physical device as the reporting BSS.

#### 9.4.5.13 AP Civic Location ANQP-element

The AP Civic Location ANQP-element provides the AP's location in civic format. The format of the AP Civic Location ANQP-element is shown in Figure 9-1097 (AP Civic Location ANQP-element format).

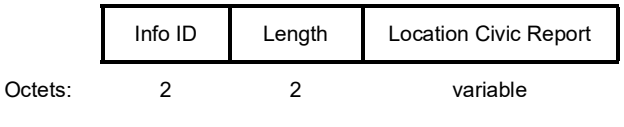

**Figure 9-1097—AP Civic Location ANQP-element format**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Info ID and Length fields are defined in 9.4.5.1 (General).

The Location Civic Report field is a variable length field and the format is provided in 9.4.2.20.13 (Location Civic report). This information is taken from dot11APCivicLocationTable. The Colocated BSSID List subelement is present when there is at least one other BSS that is (#2210)colocated within the same physical device as the reporting BSS and the (#2210)Colocated BSSID List subelement is not present in the (#7176)AP Geospatial Location ANQP-element; this subelement is not present otherwise.

### 9.4.5.14 AP Location Public Identifier URI/FQDN ANQP-element

The AP Location Public Identifier URI/FQDN ANQP-element provides an indirect reference to the location information for the AP. This list element can be returned in response to a GAS query request(#7052) using the procedures in 11.22.3.3 (ANQP procedures). The format of the AP Location Public Identifier URI/FQDN ANQP-element is shown in Figure 9-1098 (AP Location Public Identifier URI/FQDN ANQP-element format).

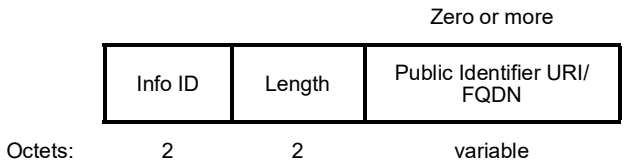

**Figure 9-1098—AP Location Public Identifier URI/FQDN ANQP-element format**

The Info ID and Length fields are defined in 9.4.5.1 (General).

The Public Identifier URI/FQDN field is a variable length field containing zero or more Public Identifier URI/FQDN subelements, as defined in 9.4.2.20.14 (Location Identifier report).

### 9.4.5.15 Domain Name ANQP-element

The Domain Name ANQP-element provides a list of one or more domain names of the entity operating the IEEE 802.11 access network. Domain Names in this ANQP-element are taken from dot11DomainNameTable. The format of the Domain Name ANQP-element is shown in Figure 9-1099 (Domain Name ANQP-element format).

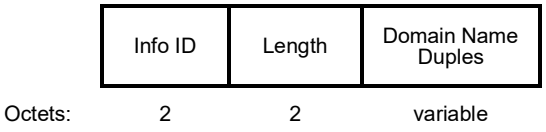

**Figure 9-1099—Domain Name ANQP-element format**

The Info ID and Length fields are defined in 9.4.5.1 (General).

The Domain Name Duples field contains zero or more variable length Domain Name Duple subfields.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The format of the Domain Name Duple subfield is shown in Figure 9-1100 (Domain Name Duple subfield format).

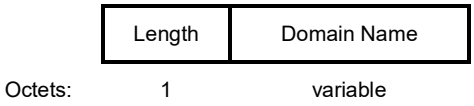

**Figure 9-1100—Domain Name Duple subfield format**

The Length subfield indicates the length in octets of the Domain Name subfield.

The Domain Name subfield is of variable length and contains a domain name compliant with the "Preferred Name Syntax" as defined in IETF RFC 1035. The maximum length of this field is 255 octets.

#### 9.4.5.16 Emergency Alert URI ANQP-element

The Emergency Alert URI ANQP-element provides a URI for EAS message retrieval.

The format of the Emergency Alert URI ANQP-element is shown in Figure 9-1101 (Emergency Alert URI ANQP-element format).

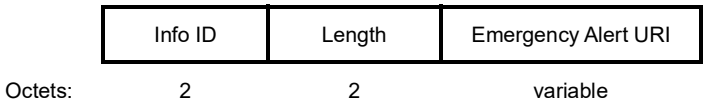

**Figure 9-1101—Emergency Alert URI ANQP-element format**

The Info ID and Length fields are defined in 9.4.5.1 (General).

The Emergency Alert URI field is a variable length field used to indicate the URI at which an EAS message can be retrieved as described in 11.22.7 (Interworking procedures: emergency alert system (EAS) support). The Emergency Alert URI field is formatted in accordance with IETF RFC 3986.

#### 9.4.5.17 Emergency NAI ANQP-element

The Emergency NAI ANQP-element contains an emergency string that is available for use by a STA as its identity to indicate emergency access request. The format of the Emergency NAI ANQP-element is shown in Figure 9-1102 (Emergency NAI ANQP-element format).

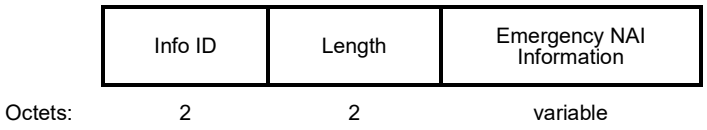

**Figure 9-1102—Emergency NAI ANQP-element format**

The Info ID and Length fields are defined in 9.4.5.1 (General).

The Emergency NAI Information field is a UTF-8 string formatted in accordance with IETF RFC 4282.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 9.4.5.18 TDLS Capability ANQP-element

The TDLS Capability ANQP-element is used by a STA to discover the TDLS capabilities of a peer STA. The format of the TDLS Capability ANQP-element is shown in Figure 9-1103 (TDLS Capability ANQP-element format).

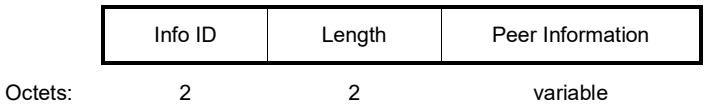

**Figure 9-1103—TDLS Capability ANQP-element format**

The Info ID and Length fields are defined in 9.4.5.1 (General).

The Peer Information field is a variable length field containing information that a STA can use to establish a (#2152)TDLS direct link and is defined as an XML schema (see R.6 (Peer information)). An example of the peer information is described in 11.22.3.3.10 (TDLS Capability procedure).

### 9.4.5.19 Neighbor Report ANQP-element

The Neighbor Report ANQP-element provides zero or more neighbor reports about neighboring APs. This is of benefit to a STA in a preassociated state. The format of the Neighbor Report ANQP-element is defined in Figure 9-1104 (Neighbor Report ANQP-element format).

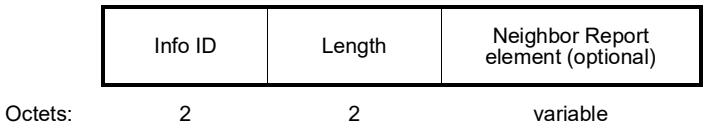

**Figure 9-1104—Neighbor Report ANQP-element format**

The Info ID and Length fields are defined in 9.4.5.1 (General).

The format of the Neighbor Report element is shown in Figure 9-416 (Neighbor Report element format) defined in 9.4.2.35 (Neighbor Report element). The (#2210)Colocated BSSID List subelement is present in the Measurement Report subelement when there is at least one other BSS that is (#2210)colocated within the same physical device as the reporting BSS.

### 9.4.5.20 Venue URL ANQP-element

The Venue URL ANQP-element provides a list of one or more URLs that can be used for web page advertising services or providing information, particular to a venue's BSS, to a STA. The format of the Venue URL ANQP-element is defined in Figure 9-1105 (Venue URL ANQP-element format).

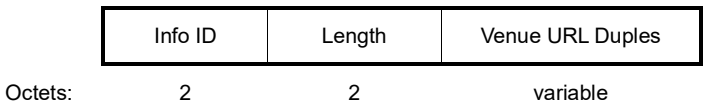

**Figure 9-1105—Venue URL ANQP-element format**

The Info ID and Length fields are defined in 9.4.5.1 (General).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Venue URL Duples field contains one or more Venue URL Duple fields as shown in Figure 9-1106 (Venue URL Duple field).

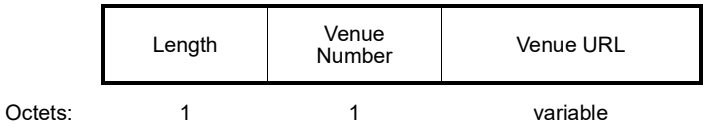

**Figure 9-1106—Venue URL Duple field**

The Length field is set to 1 plus the number of octets in the Venue URL field.

The Venue Number field identifies the position (1 = 1st, 2 = 2nd, and so on) of the corresponding Venue Name Tuple subfield in the Venue Name ANQP-element from the same STA, as defined in 9.4.5.4 (Venue Name ANQP-element). If that same STA does not advertise a Venue Name ANQP-element, or does not advertise any Venue Name Tuple subfields in the Venue Name ANQP-element, then the Venue Number field is set to 0.

The Venue URL field is a variable length field that indicates the URL at which information relevant to the corresponding Venue Name Tuple subfield, indicated by the Venue Number, might be retrieved. This is further described in 11.22.3.3.11 (Venue URL procedure). If no Venue URL is provided this field is left empty. The Venue URL field is formatted in accordance with IETF RFC 3986.

### 9.4.5.21 Advice of Charge ANQP-element

The Advice of Charge ANQP-element provides a list of one or more financial advice of charges related to access to a BSS. The format of the Advice of Charge ANQP-element is defined in Figure 9-1107 (Advice of Charge ANQP-element format).

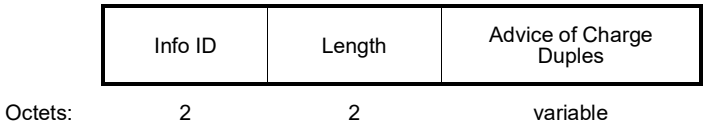

**Figure 9-1107—Advice of Charge ANQP-element format**

The Info ID and Length fields are defined in 9.4.5.1 (General).

The Advice of Charge Duples field contains one or more Advice of Charge Duple fields as shown in Figure 9-1108 (Advice of Charge Duple field).

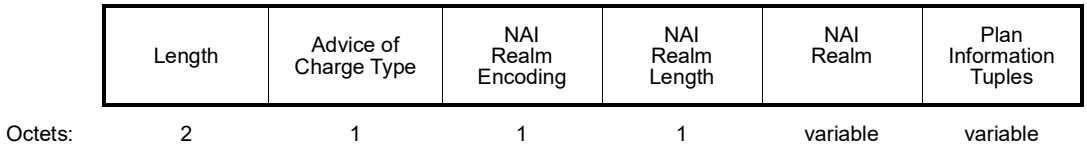

**Figure 9-1108—Advice of Charge Duple field**

The Length field is set to 3 plus the number of octets in the NAI Realm and Plan Information Tuples fields.

The Advice of Charge Type field is set to one of the values defined in Table 9-433 (Advice of Charge Type field values).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-433—Advice of Charge Type field values**

| Advice of Charge Type Value | Description |
|---|---|
| 0 | Time-based |
| 1 | Data-volume-based |
| 2 | Time-and-data-volume-based |
| 3 | Unlimited |
| 4–255 | Reserved |

The NAI Realm Encoding and NAI Realm Length are defined in 9.4.5.10 (NAI Realm ANQP-element). The NAI Realm subfield is one or more NAI realms(#3235) formatted as defined in 9.4.5.10 (NAI Realm ANQP-element).

The format of the Plan Information Tuples field is defined in Figure 9-1109 (Plan Information Tuple field format).

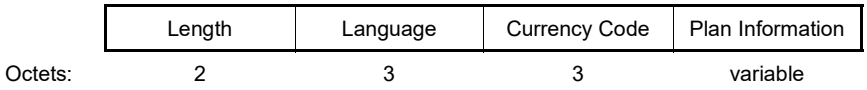

**Figure 9-1109—Plan Information Tuple field format**

The Length field is set to the number of octets in the Language, Currency Code, and Plan Information fields.

The Language Code field contains an ASCII-encoded language code selected from ISO 639, and defines the language used in the Cost Information field. A two character language code has 0 (ASCII NUL) appended.

The Currency Code field is an(#2047) ASCII string representing an ISO 4217 currency alphabetic or numeric code (e.g., “USD”).(#366)

The Plan Information field is a UTF-8 string that carries an XML description of an (#338)advice of charge plan. The schema and semantics of this description are outside the scope of this standard.

### 9.4.5.22 Local Content ANQP-element

The Local Content ANQP-element provides a list of one or more URLs that can be used to display local content related to the BSS. The format of the Local Content ANQP-element is defined in Figure 9-1110 (Local Content ANQP-element format).

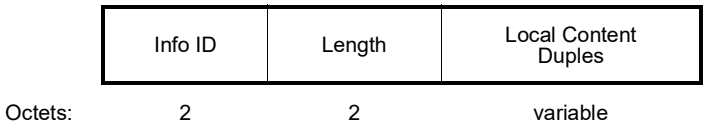

**Figure 9-1110—Local Content ANQP-element format**

The Info ID and Length fields are defined in 9.4.5.1 (General).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Local Content Duples field contains one or more Local Content Duple fields as shown in Figure 9-1111 (Local Content Duple field format).

| | Length | State | Local Content URL Length | Local Content URL | Label Length (optional) | Label (optional) |
|---|---|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | variable | 0 or 1 | variable |

**Figure 9-1111—Local Content Duple field format**

The Length field is set to 2 plus the number of octets in the Local Content URL, Label Length and Label fields.

The State field is defined in Table 9-434 (Local Content State values).

**Table 9-434—Local Content State values**

| State | Name |
|---|---|
| 0 | Not authenticated |
| 1 | Authenticated |
| 2 | Failure during authentication |
| 3 | Incorrect credentials |
| 4 | Credentials expired |
| 5–255 | Reserved |

The Local Content URL Length field contains the length of the Local Content URL field in octets.

The Local Content URL field is a variable length field containing a URL that is used for directing the device to local content. The Local Content URL field is formatted in accordance with IETF RFC 3986.

The Label Length field contains the value of the length of the Label field in octets. If the Label field is not present, this field is not present.

The Label field is a UTF-8 string containing a text description of the URL suitable for display on a user interface. It provides the type and potential usage of the URL.

### 9.4.5.23 Network Authentication Type with Timestamp ANQP-element

The Network Authentication Type with Timestamp ANQP-element provides similar information to that of the Network Authentication Type as defined in 9.4.5.6 (Network Authentication Type ANQP-element). In addition, a timestamp field is optionally provided to indicate to the requesting STA a timestamp corresponding to the time at which the received terms and conditions were most recently modified. With this timestamp, the requesting STA can determine if previously received information is stale.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The format of the Network Authentication Type with Time ANQP-element is shown in Figure 9-1112 (Network Authentication Type with Timestamp ANQP-element format).

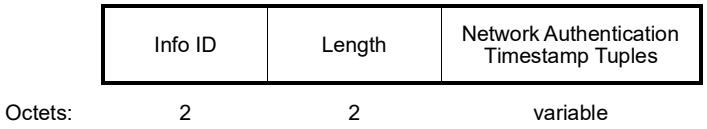

**Figure 9-1112—Network Authentication Type with Timestamp ANQP-element format**

The Info ID and Length fields are defined in 9.4.5.1 (General).

The Network Authentication Timestamp Tuples field contains zero or more variable length Network Authentication Timestamp Tuple subfields.

Each Network Authentication Timestamp Tuple subfield has the structure shown in Figure 9-1113 (Network Authentication Timestamp Tuple subfield format).

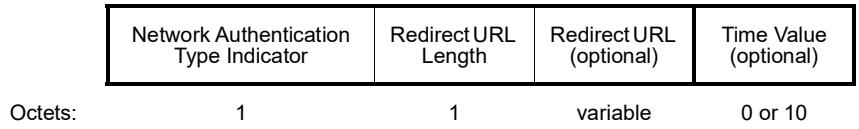

**Figure 9-1113—Network Authentication Timestamp Tuple subfield format**

The Network Authentication Type Indicator field is defined in 9.4.5.6 (Network Authentication Type ANQP-element)

The Redirect URL Length field and the Redirect URL field are defined in 9.4.5.6 (Network Authentication Type ANQP-element).

The Time Value field is defined in Table 9-232 (Time Value field format when Timing Capabilities is 2) using the Timing Capability equal to 2 encoding. This field is used by the responding STA to set a time of the ANQP response.

### 9.4.5.24 Query AP List ANQP-element

The Query AP List ANQP-element provides a list of APs and a list of Info IDs of ANQP-elements that the requesting STA is requesting from each AP in the list. The Query AP List ANQP-element declares that the STA performing the ANQP request is requesting that the ANQP-element corresponding to each Info ID be returned in the AP List Response ANQP-element. This element allows an optimization of the single ANQP request procedure (see 9.4.5.2 (Query List ANQP-element)) by having multiple ANQP requests in a single ANQP-element thus reducing the time necessary for network discovery and selection. See 11.22.3.3.14 (Query AP List procedure) for information on the Query AP list procedure.

The format of the Query AP List ANQP-element is shown in Figure 9-1114 (Query AP List ANQP-element format).

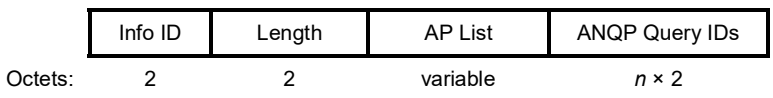

**Figure 9-1114—Query AP List ANQP-element format**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Info ID and Length fields are defined in 9.4.5.1 (General).

The AP List field is a variable length field defined in Figure 9-1115 (AP List field format) that contains the list of BSSIDs for requested information.

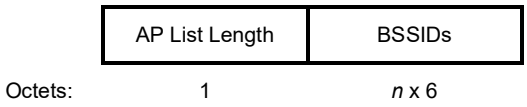

**Figure 9-1115—AP List field format**

The AP List Length field indicates the length (#7224)in octets of the BSSIDs field.

The BSSIDs field contains one or more BSSID fields. Each BSSID field(#261) indicates the BSSID of the BSS of an AP that the requesting STA wants to query.

The ANQP Query IDs field contains one or more ANQP Query ID fields that are ordered by increasing info ID value. Each ANQP Query ID field is an unsigned integer of length two octets.

The ANQP Query ID field value is drawn from Table 9-426 (ANQP-element definitions).

### 9.4.5.25 AP List Response ANQP-element

The AP List Response ANQP-element provides the response to the Query AP List ANQP-element request. The ANQP response is defined in 11.22.3.3 (ANQP procedures). The format of the AP List Response ANQP-element is defined in Figure 9-1116 (AP List Response ANQP-element format).

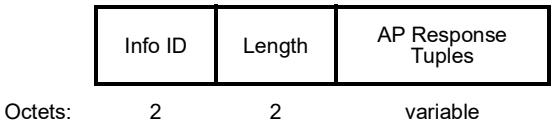

**Figure 9-1116—AP List Response ANQP-element format**

The Info ID and Length fields are defined in 9.4.5.1 (General).

The AP Response Tuples field contains zero or more AP Response Tuple fields.

The format of the AP Response Tuple field is defined in Figure 9-1117 (AP Response Tuple field format).

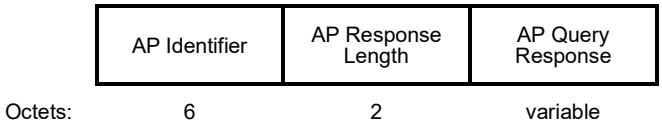

**Figure 9-1117—AP Response Tuple field format**

The AP Identifier field indicates the BSSID of the BSS of the AP that the requesting STA queries.

The AP Response Length field indicates the number of octets in the following AP Query Response field.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The AP Query Response field contains an ANQP response corresponding to the ANQP Query ID in the received Query AP List ANQP-element as specified in 9.4.5.24 (Query AP List ANQP-element). Each ANQP response comprises one or more ANQP-elements (Table 9-426 (ANQP-element definitions)).

### 9.4.5.26 CAG ANQP-element

The CAG ANQP-element provides the info IDs for the ANQP-elements contained within a CAG associated with ANQP, or ANQP with Service Information Registry, and the current value of the ANQP CAG version, indicating the version of information within the CAG associated with ANQP, or ANQP with Service Information Registry. The format of the CAG ANQP-element is defined in Figure 9-1118 (CAG ANQP-element format). The selection of the specific number of info IDs and the specific values of info IDs in a CAG associated with ANQP is left to the implementation and is beyond the scope of this standard.

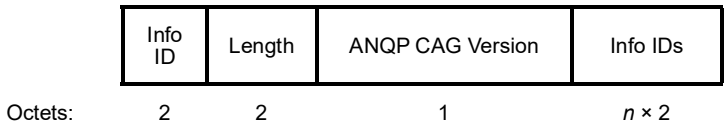

**Figure 9-1118—CAG ANQP-element format**

The Info ID and Length fields are defined in 9.4.5.1 (General).

The ANQP CAG Version field indicates the current version of the CAG associated with ANQP, or ANQP with Service Information Registry.

The Info IDs field contains zero or more Info ID fields. (#1496)The Info ID field contains the info ID of an ANQP-element Info ID specified in Table 9-343 (DNS Info Control subfield settings).

### 9.4.5.27 Service Information Request ANQP-element

The Service Information Request ANQP-element contains a generic request for service information associated with the service hash(es) provided.

The format of the Service Information Request ANQP-element is shown in Figure 9-1119 (Service Information Request ANQP-element format).

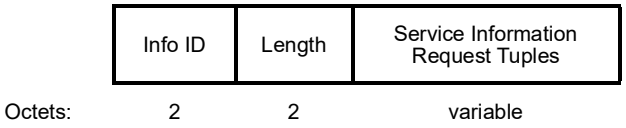

**Figure 9-1119—Service Information Request ANQP-element format**

The Info ID and Length fields are defined in 9.4.5.1 (General).

The Service Information Request Tuples field contains one or more Service Information Request Tuple subfields. The format of the Service Information Request Tuple subfield is shown in Figure 9-1120 (Service Information Request Tuple subfield format).

The Service Hash field contains a (#1496)service hash value. See 11.23.4 (Service hash procedure) for procedures for generating a service hash.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

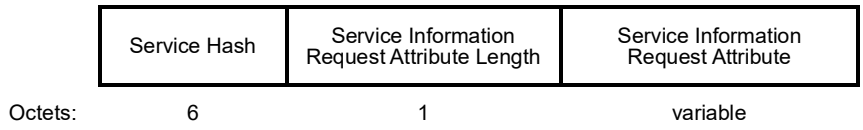

**Figure 9-1120—Service Information Request Tuple subfield format**

The Service Information Request Attribute Length subfield indicates the length (#7224)in octets of the Service Information Request Attribute subfield.

The Service Information Request Attribute subfield contains a service-specific query. The value of this subfield is out of the scope of this standard.

### 9.4.5.28 Service Information Response ANQP-element

The Service Information Response ANQP-element contains the detailed service information in response to a Service Information Request ANQP-element.

The format of the Service Information Response ANQP-element is shown in Figure 9-1121 (Service Information Response ANQP-element format).

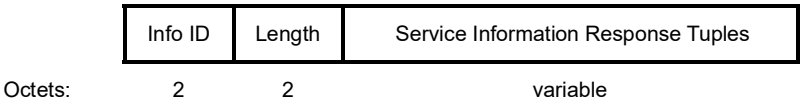

**Figure 9-1121—Service Information Response ANQP-element format**

The Info ID and Length fields are defined in 9.4.5.1 (General).

The Service Information Response Tuples field contains zero or more Service Information Response Tuple subfields.

The format of the Service Information Response Tuple subfield is shown in Figure 9-1122 (Service Information Response Tuple subfield format).

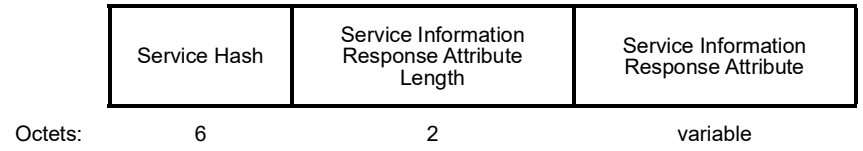

**Figure 9-1122—Service Information Response Tuple subfield format**

The Service Hash field contains a (#1496)service hash value. See 11.23.4 (Service hash procedure) for procedures for generating a service hash.

The Service Information Response Attribute Length subfield indicates the length (#7224)in octets of the Service Information Response Attribute subfield.

The content of the Service Information Response Attribute subfield is service specific based on the corresponding Service Information Request Attribute subfield in the Service Information Request Tuples of the Service Information Request ANQP-element as described in 9.4.5.27 (Service Information Request ANQP-element).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 9.4.5.29 Local MAC Address Policy ANQP-element

The Local MAC Address Policy ANQP-element provides an indication of the local MAC address policy of the ESS.

The format of the Local MAC Address Policy ANQP-element is specified in Figure 9-1123 (Local MAC Address Policy ANQP-element format).

| | Info ID | Length | Local MAC Address Policy | Number Of Restricted Prefixes | Restricted Address Prefix |
|---|---|---|---|---|---|
| Octets: | 2 | 2 | 1 | 1 | variable |

**Figure 9-1123—Local MAC Address Policy ANQP-element format**

The Info ID and Length fields are specified in 9.4.5.1 (General).

The Local MAC Address Policy field is a bitmap advertising policies supported by the ESS regarding its support for local MAC address. The values of the bits are specified in Table 9-435 (Local MAC Address Policy field bits).

**Table 9-435—Local MAC Address Policy field bits**

| Bitmap value | Description |
|---|---|
| Bit 0 (MSB) | Reserved |
| Bit 1 | Randomization subject to Restricted Address Prefixes supported in SLAP Quadrant 00 |
| Bit 2 | Randomization subject to Restricted Address Prefixes supported in SLAP Quadrant 01 |
| Bit 3 | Randomization subject to Restricted Address Prefixes supported in SLAP Quadrant 10 |
| Bit 4 | Randomization subject to Restricted Address Prefixes supported in SLAP Quadrant 11 |
| Bit 5 | Reserved |
| Bit 6 | Reserved |
| Bit 7 | Reserved |

The bitmap values provided in Table 9-435 (Local MAC Address Policy field bits) indicate, to the receiving STA, aspects of the local MAC address policy of the ESS. The bits are independent and not mutually exclusive. They make reference to the Structured Local Address Plan (SLAP) introduced into IEEE Std 802 via the amendment IEEE Std 802c-2017. The bit value indications are as follows:

— Bit 0 is reserved.

— Bit 1, when set to 1, indicates the support of an address chosen by the STA randomly, in SLAP Quadrant 00 (i.e., the SLAP AAI quadrant, with 0100 as the M, X, Y, and Z bits, respectively) but avoiding addresses beginning with any prefix specified in the Restricted Address Prefix field. Bit 1,

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

when set to 0, indicates that the ESS provides no rules on MAC address use within SLAP Quadrant 00.

— Bit 2, when set to 1, represents the support of an address chosen by the STA randomly, in SLAP Quadrant 01 (i.e., the SLAP ELI quadrant, with 0101 as the M, X, Y, and Z bits, respectively) but avoiding addresses beginning with any prefix specified in the Restricted Address Prefix field. Bit 2, when set to 0, indicates that the ESS provides no rules on MAC address use within SLAP Quadrant 01.

— Bit 3, when set to 1, represents the support of an address chosen by the STA randomly, in SLAP Quadrant 10 (i.e., the SLAP Reserved quadrant, with 0110 as the M, X, Y, and Z bits, respectively) but avoiding addresses beginning with any prefix specified in the Restricted Address Prefix field. Bit 3, when set to 0, indicates that the ESS provides no rules on MAC address use within SLAP Quadrant 10.

— Bit 4, when set to 1, represents the support of an address chosen by the STA randomly, in SLAP Quadrant 11 (i.e., the SLAP SAI quadrant, with 0111 as the M, X, Y, and Z bits, respectively) but avoiding addresses beginning with any prefix specified in the Restricted Address Prefix field. Bit 4, when set to 0, indicates that the ESS provides no rules on MAC address use within SLAP Quadrant 11.

The Number Of Restricted Prefixes field specifies the number of Restricted Address Prefix subfields in the Restricted Address Prefix field.

NOTE 1—If Local MAC Address Policy field bits 1-4 are set to 1 and Number Of Restricted Prefixes to 0, the Local MAC Address Policy ANQP-element indicates that the ESS supports randomized address throughout local address range. In this case, the AP STA sets the Local MAC Address Policy field in the Extended Capabilities field to 0, indicating that local MAC addresses are not restricted, and consequently the Local MAC Address Policy ANQP-element is redundant.

The Restricted Address Prefix field contains zero or more Restricted Address Prefix subfields, each specifying the prefix of local MAC addresses supported in the ESS. Each such prefix indicates support for MAC addresses assigned as extensions of the indicated prefix, provided that the assignment is made according to the procedures specified for the use of that prefix, or, in the case that a MAC address is an extension of multiple indicated prefixes, the longest of those prefixes.

NOTE 2—The detailed specification of the use of local MAC addresses is provided in IEEE Std 802. Per its amendment IEEE Std 802c-2017, an SAI is assigned by a protocol specified in an IEEE 802 standard, and specification of the use of ELI addresses is provided by the assignee of a CID duly assigned by the IEEE Registration Authority.

The format of the Restricted Address Prefix subfield is described in Figure 9-1124 (Restricted Address Prefix subfield format).

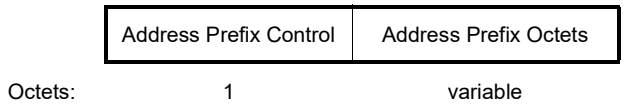

**Figure 9-1124—Restricted Address Prefix subfield format**

The format of the Address Prefix Control subfield is described in Figure 9-1125 (Address Prefix Control subfield format).

The Length Of Address Prefix Octets subfield indicates the length (in octets) of the Address Prefix Octets field. Values 0 and 7 are reserved.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

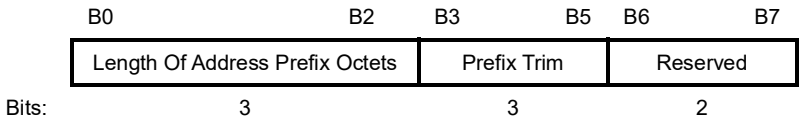

**Figure 9-1125—Address Prefix Control subfield format**

The Prefix Trim subfield indicates the number of bits to be truncated from the end of the value of the Address Prefix Octets subfield in order to obtain the MAC address prefix. In other words, the MAC address prefix is the value of the Address Prefix Octets subfield after truncation of some of the most significant bits of the last octet, with the number of truncated bits equal to the value of the Prefix Trim subfield. If the Length of Address Prefix Octets subfield is set to 1, then the value of the Prefix Trim subfield is not be set to 7; this provides that the length of the MAC address prefix is at least two bits. The bit and octet ordering of the MAC address prefix is per Figure 9-1 (Representation of a 48-bit MAC address).

### 9.4.5.30 EBCS ANQP-element(11bc)

The EBCS ANQP-element provides a list of zero or more enhanced broadcast services that are available from the STA transmitting this element. The format of the EBCS ANQP-element is defined in Figure 9-1126 (EBCS ANQP-element format(11bc)).

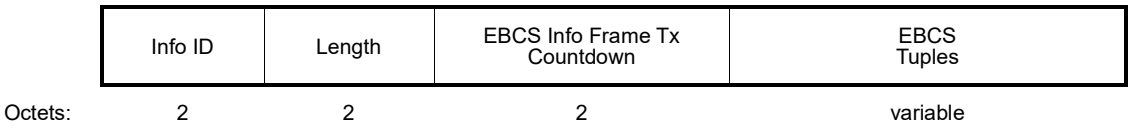

**Figure 9-1126—EBCS ANQP-element format(11bc)**

The Info ID and Length fields are defined in 9.4.5.1 (General).

The EBCS Info Frame Tx Countdown field is defined in 9.4.1.70 (EBCS Info Frame Tx Countdown field(11bc)).

If present, the EBCS Tuples field contains one or more EBCS Tuple fields as defined in Figure 9-1127 (EBCS Tuple field format(11bc))..

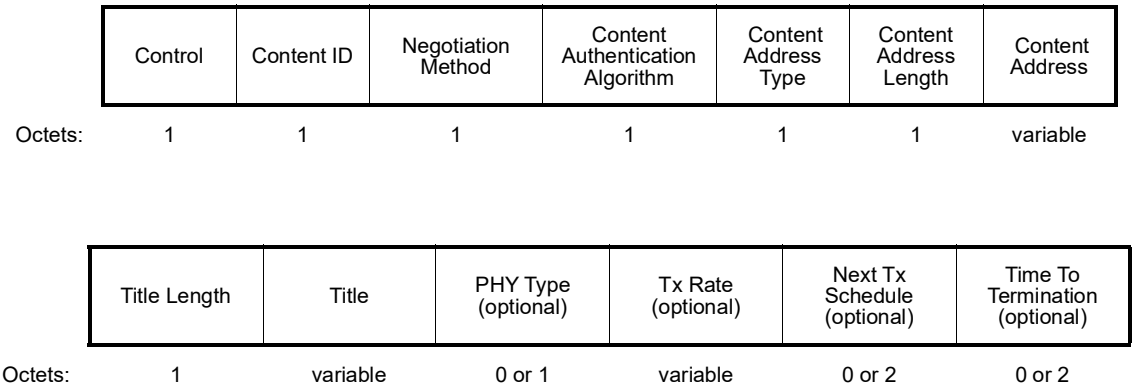

**Figure 9-1127—EBCS Tuple field format(11bc)**

The Control field defines which of the optional fields are present in the EBCS Tuple field and is defined in Figure 9-1128 (Control field format(11bc)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

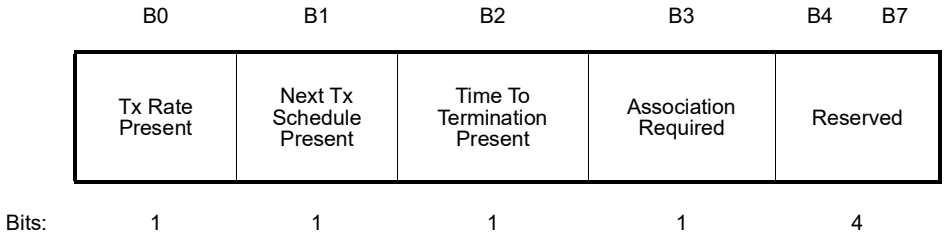

**Figure 9-1128—Control field format(11bc)**

The Tx Rate Present subfield is set to 1 if the PHY Type subfield and the Tx Rate subfield are present and is set to 0 otherwise.

The Next Tx Schedule Present subfield is set to 1 by a STA to indicate that the EBCS Tuple field contains a Next Tx Schedule field. This subfield is set to 0 to indicate that there is no Next Tx Schedule field.

The Time To Termination Present subfield is set to 1 by a STA to indicate that the EBCS Tuple field contains a Time To Termination field. This subfield is set to 0 to indicate that there is no Time To Termination field.

A value of 1 in the Association Required subfield indicates that association is required to consume the EBCS traffic stream identified by the content ID contained in the Content ID subfield. A value of 0 indicates that association is not required to consume the EBCS traffic stream identified by the content ID contained in the Content ID subfield.

The Content ID subfield indicates the identifier of the content.

The format of the Negotiation Method subfield is shown in Figure 9-1129 (Negotiation Method subfield format(11bc)).

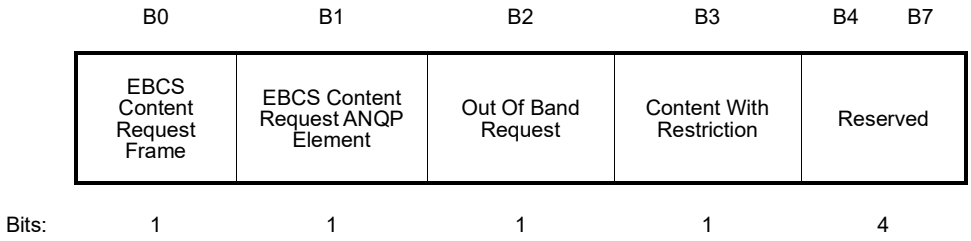

**Figure 9-1129—Negotiation Method subfield format(11bc)**

The EBCS Content Request Frame subfield is set to 1 if the EBCS traffic stream identified by the Content ID subfield included in the same EBCS Tuple field can be requested using EBCS Content Request frames, otherwise it is set to 0.

The EBCS Content Request ANQP Element subfield is set to 1 if the EBCS traffic stream identified by the Content ID subfield included in the same EBCS Tuple field can be requested using the EBCS Content Request ANQP-element, otherwise it is set to 0.

The Out Of Band Request subfield is set to 1 if the EBCS traffic stream, identified by the Content ID subfield included in the same EBCS Tuple field, can be requested using an out of band method, otherwise it is set to 0. The URL to be used for the out of band negotiation method is contained in the EBCS Info frame.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

If the Association Required bit in the Control field included in the same EBCS Tuple field is equal to 1, the only allowed request method is through EBCS Content Request/Response frames, therefore the EBCS Content Request Frame bit is set to 1 and EBCS Content Request ANQP Element bit is set to 0.

The Content With Restriction subfield is set to 1 if the content requires offline registration to be consumed and is set to 0 otherwise. The registration process is outside of the scope of this standard. The URL used for offline registration is contained in the Service URL subfield in the EBCS Info frame.

When the EBCS Content Request Frame subfield, the EBCS Content Request ANQP Element subfield, and the Out Of Band Request subfield are all set to 0, the EBCS traffic stream will be transmitted without any STA requesting it.

The Content Authentication Algorithm field indicates the authentication algorithm used for this EBCS traffic stream.

The Content Authentication Algorithm subfield is defined in Table 9-436 (Content Authentication Algorithms(11bc)).

**Table 9-436—Content Authentication Algorithms(11bc)**

| Value | Content Authentication Algorithms |
|---|---|
| 0 | HLSA (see 12.15.4 (No frame authentication with mandatory higher layer source authentication (HLSA))) |
| 1 | PKFA (see 12.15.2 (EBCS public key frame authentication (PKFA))) |
| 2 | HCFA without instant authentication (see 12.15.3 (EBCS hash chain frame authentication (HCFA))) |
| 3 | HCFA with instant authentication (see 12.15.3 (EBCS hash chain frame authentication (HCFA))) |
| 4–255 | Reserved |

The Content Address Type subfield is defined in Table 9-437 (Content Address Type subfield(11bc)).

**Table 9-437—Content Address Type subfield(11bc)**

| Value | Address Type |
|---|---|
| 0 | UDP/IPv4 |
| 1 | UDP/IPv6 |
| 2 | MAC address |
| 3–255 | Reserved |

The Content Address Length subfield contains the length of the Content Address subfield in octets.

The Content Address subfield contains the addresses and the port to select the content, encoded as follows.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

If the Content Address Type subfield indicates UDP/IPv4, the format of the Content Address subfield is shown in Figure 9-1130 (Content Address subfield format for UDP/IPv4(11bc)).

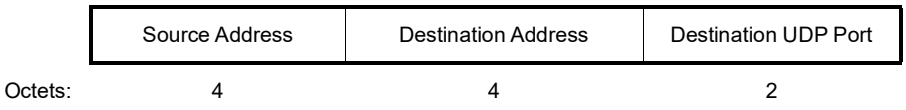

**Figure 9-1130—Content Address subfield format for UDP/IPv4(11bc)**

The Source Address subfield contains the source IPv4 address of the content. If the value of the Source Address subfield is 0, the source address of the content is not specified.

The Destination Address subfield indicates the IPv4 address used as the destination address (typically a multicast IPv4 address) in the broadcast frames for the EBCS traffic stream identified by the Content ID field. The Destination Port subfield indicates the UDP port associated with the IPv4 address indicated in the Destination Address subfield.

NOTE—The UDP port is encoded per the conventions defined in 9.2.2 (Conventions). IPv4 addresses correspond to the identically named fields of the IPv4 header.

If the Content Address Type subfield indicates UDP/IPv6, the format of the Content Address subfield is shown in Figure 9-1131 (Content Address subfield format for UDP/IPv6(11bc)).

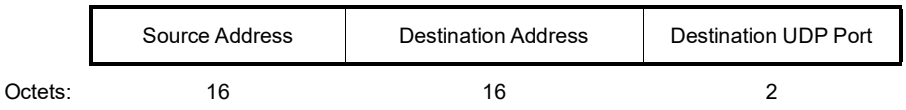

**Figure 9-1131—Content Address subfield format for UDP/IPv6(11bc)**

The Source Address subfield contains the source IPv6 address of the content. If the value of the Source Address subfield is 0, the source address of the content is not specified.

The Destination Address subfield indicates the IPv6 address used as the destination address (typically a multicast IPv6 address) in the broadcast frames for the EBCS traffic stream identified by the Content ID field. The Destination Port subfield indicates the UDP port associated with the IPv6 address indicated in the Destination Address subfield.

NOTE—The UDP port is encoded per the conventions defined in 9.2.2 (Conventions). IPv6 addresses correspond to the identically named fields of the IPv6 header.

If the Content Address Type subfield indicates MAC address, the format of the Content Address subfield is shown in Figure 9-1132 (Content Address subfield format for MAC Address(11bc)). The Content Address subfields contain MAC addresses.

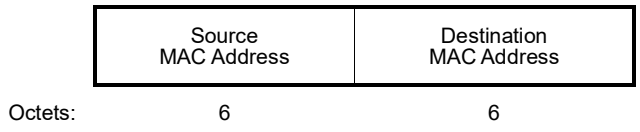

**Figure 9-1132—Content Address subfield format for MAC Address(11bc)**

The Source MAC Address subfield contains the source MAC address of the content. If the value of the Source MAC Address subfield is 0, the source MAC address of the content is not specified.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Destination MAC Address subfield contains the destination MAC address of the content that is a group address.

The Title Length field indicates the length of the Title field in octets.

The Title field is a human readable title of the content as a UTF-8 string.

The PHY Type subfield indicates the PHY type of the EBCS Data frames of the EBCS traffic stream. The PHY type is encoded as defined in Table 9-438 (PHY Type subfield(11bc)).

**Table 9-438—PHY Type subfield(11bc)**

| Value | Operating band | | | |
|---|---|---|---|---|
| | Sub 1 GHz | 2.4 GHz | 5 GHz | 6 GHz |
| 0 | S1G | DSSS / HR/DSSS / OFDM / ERP | OFDM | Reserved |
| 1 | Reserved | HT | HT | Reserved |
| 2 | Reserved | Reserved | VHT | Reserved |
| 3 | Reserved | HE | HE | HE |
| 4–255 | Reserved | Reserved | Reserved | Reserved |

The PHY Type subfield value depends on the operating band of the EBCS AP. If the PHY Type subfield is not present, the PHY type and the transmission rate of the EBCS Data frames of the EBCS traffic stream is same as the PHY type and the transmission rate of the EBCS Info frame (dot11EBCSInfoTxRate).

The Tx Rate subfield indicates the transmission rate of the EBCS Data frames of the EBCS traffic stream.

The format of the TX Rate subfield for DSSS, HR/DSSS, OFDM, or ERP is shown in Figure 9-1133 (DSSS / HR/DSSS / OFDM / ERP TX Rate subfield format(11bc)). The Data Rate subfield indicates the transmission rate multiplied by 2 in units of megabits per second.

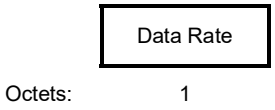

**Figure 9-1133—DSSS / HR/DSSS / OFDM / ERP TX Rate subfield format(11bc)**

The format of the TX Rate subfield for HT is defined in Figure 9-1134 (HT TX Rate subfield format(11bc)).

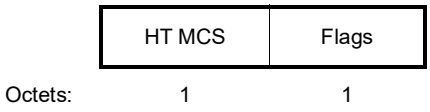

**Figure 9-1134—HT TX Rate subfield format(11bc)**

The MCS subfield indicates the HT MCS index. The format of the Flags subfield is shown in Figure 9-1135 (Flags subfield format(11bc)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

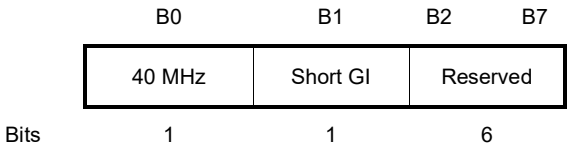

**Figure 9-1135—Flags subfield format(11bc)**

The 40 MHz subfield is set to 1 when the channel bandwidth is 40 MHz. Otherwise, the subfield is set to 0. The Short GI subfield is set to 1 when a short GI is used. Otherwise the subfield is set to 0.

The format of the TX Rate subfield for VHT is defined in Figure 9-1136 (VHT TX Rate subfield format(11bc)).

**Figure 9-1136—VHT TX Rate subfield format(11bc)**

The format of the VHT MCS subfield is defined in Figure 9-1137 (VHT MCS subfield format(11bc)).

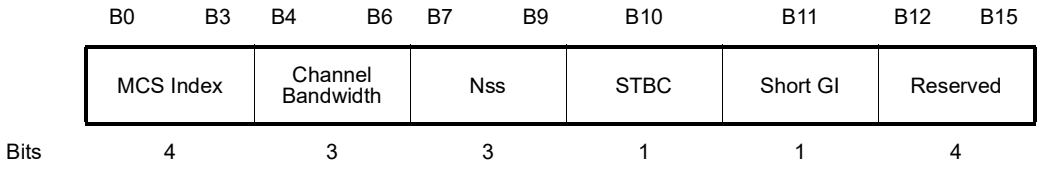

**Figure 9-1137—VHT MCS subfield format(11bc)**

The MCS Index subfield indicates the VHT MCS index.

The Channel Bandwidth subfield value is encoded as defined in Table 9-439 (VHT Channel Bandwidth subfield(11bc)).

**Table 9-439—VHT Channel Bandwidth subfield(11bc)**

| Value | Channel bandwidth |
|---|---|
| 0 | 20 MHz |
| 1 | 40 MHz |
| 2 | 80 MHz |
| 3 | 160 MHz |
| 4 | 80+80 MHz |
| 5–7 | Reserved |

The Nss subfield value indicates the $N_{ss}$ minus 1.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The STBC subfield is set to 1 when STBC is used. Otherwise, the subfield is set to 0.

The Short GI subfield is set to 1 when a short GI is used. Otherwise, the subfield is set to 0.

The format of the TX Rate subfield for TVHT is shown in Figure 9-1138 (TVHT TX Rate subfield format(11bc)).

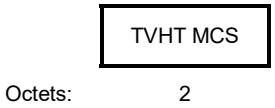

**Figure 9-1138—TVHT TX Rate subfield format(11bc)**

The format of the TVHT MCS subfield is shown in Figure 9-1139 (TVHT MCS Subfield format(11bc)).

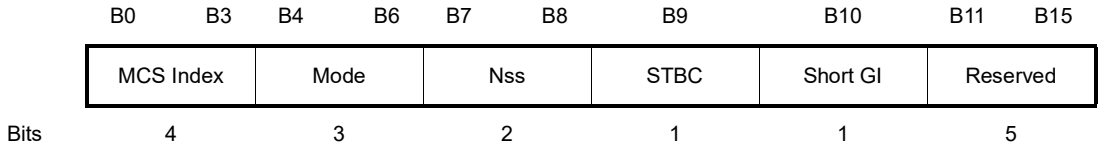

**Figure 9-1139—TVHT MCS Subfield format(11bc)**

The MCS Index subfield indicates the TVHT MCS index.

The Mode subfield value is encoded as defined in Table 9-440 (Mode subfield values(11bc)).The Nss

**Table 9-440—Mode subfield values(11bc)**

| Value | Mode |
|---|---|
| 0 | TVHT MODE 1 |

This is an unapproved IEEE Standards Draft, subject to change.

**Figure 9-1140—S1G TX Rate subfield format(11bc)**

The format of the S1G MCS subfield is shown in Figure 9-1141 (S1G MCS Subfield format(11bc)).

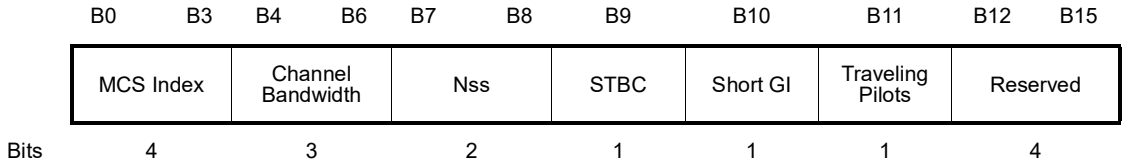

**Figure 9-1141—S1G MCS Subfield format(11bc)**

The MCS Index subfield indicates the S1G MCS index.

The Channel Bandwidth subfield value is encoded as defined in Table 9-441 (S1G Channel Bandwidth subfield values(11bc)).

**Table 9-441—S1G Channel Bandwidth subfield values(11bc)**

| Value | Channel Bandwidth |
|---|---|
| 0 | 1 MHz |
| 1 | 2 MHz |
| 2 | 4 MHz |
| 3 | 8 MHz |
| 4 | 16 MHz |
| 5–7 | Reserved |

The Nss subfield value indicates the $N_{ss}$ minus 1.

The STBC subfield is set to 1 when STBC is used. Otherwise, the subfield is set to 0.

The Short GI subfield is set to 1 when a short GI is used. Otherwise, the subfield is set to 0.

The Traveling Pilots subfield is set to 1 when traveling pilots are used. Otherwise, the subfield is set to 0.

The format of the TX Rate subfield for CMMG is defined in Figure 9-1142 (CMMG TX Rate subfield format(11bc)).

The format of the CMMG MCS subfield is shown in Figure 9-1143 (CMMG MCS subfield format(11bc)).

The MCS Index subfield indicates the CMMG MCS index.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

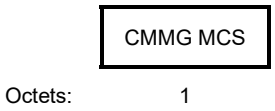

**Figure 9-1142—CMMG TX Rate subfield format(11bc)**

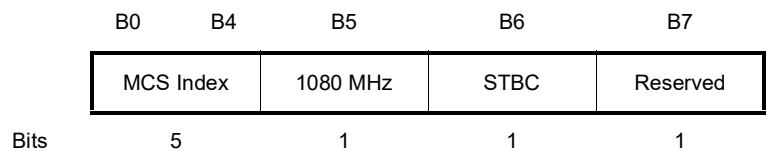

**Figure 9-1143—CMMG MCS subfield format(11bc)**

The 1080 MHz subfield is set to 1 when the channel bandwidth is 1080 MHz. Otherwise, the subfield is set to 0.

The STBC subfield is set to 1 when STBC is enabled. Otherwise, the subfield is set to 0.

The format of the HE TX Rate subfield is defined in Figure 9-1144 (HE TX Rate subfield format(11bc)).

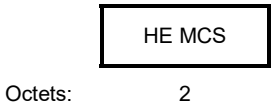

**Figure 9-1144—HE TX Rate subfield format(11bc)**

The format of the HE MCS subfield is defined in Figure 9-1145 (HE MCS Subfield format(11bc)).

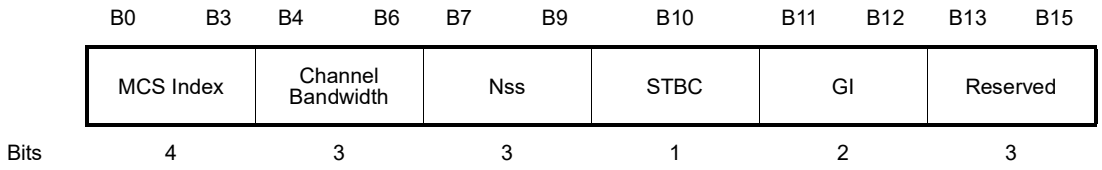

**Figure 9-1145—HE MCS Subfield format(11bc)**

The MCS Index subfield indicates the HE MCS index.

The Channel Bandwidth subfield value is encoded as shown in Table 9-439 (VHT Channel Bandwidth subfield(11bc)).

The Nss subfield value indicates the $N_{SS}$ minus 1.

The STBC subfield is set to 1 when STBC is used. Otherwise, the subfield is set to 0.

The GI subfield value is encoded as defined in Table 9-442 (HE GI subfield values(11bc)).

The Channel Configuration subfield indicates the channel configuration number.

The Time To Termination subfield is defined in 9.4.1.69 (EBCS Content Response field(11bc)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-442—HE GI subfield values(11bc)**

| Value | Guard interval |
|---|---|
| 0 | 0.8 μs |
| 1 | 1.6 μs |
| 2 | 3.2 μs |
| 3 | Reserved |

The Next Tx Schedule subfield indicates the number of TBTTs until the beacon interval in which the next frame belonging to the EBCS traffic stream, identified by the Content ID subfield, is transmitted. A value of 0 indicates that this transmission occurs in the beacon interval that starts at the next TBTT. A value of 1 indicates that it occurs in the beacon interval that follows that beacon interval. A value of 65 535 indicates that there is no specific transmission starting time.

### 9.4.5.31 EBCS Content Request ANQP-element(11bc)

The EBCS Content Request ANQP-element transmits a register (or unregister) request from a STA to a peer STA to receive (or stop receiving) enhanced broadcast services that are available from the peer STA. The format of the EBCS Content Request ANQP-element is defined in Figure 9-1146 (EBCS Content Request ANQP-element format(11bc)).

**Figure 9-1146—EBCS Content Request ANQP-element format(11bc)**

The Info ID and Length fields are defined in 9.4.5.1 (General).

The EBCS Content Request Info subfield is defined in 9.4.1.68 (EBCS Content Request field(11bc)).

### 9.4.5.32 EBCS Content Response ANQP-element(11bc)

The EBCS Content Response ANQP-element provides a list of zero or more enhanced broadcast services that are available from a peer STA. The format of the EBCS Content Response ANQP-element is defined in Figure 9-1147 (EBCS Content Response ANQP-element format(11bc)).

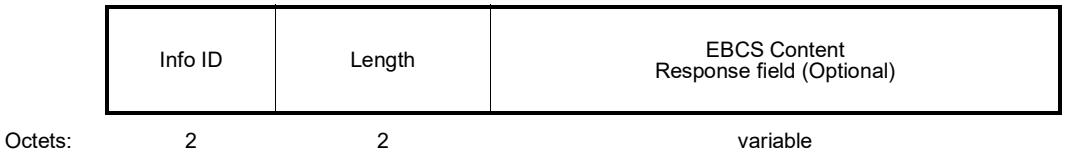

**Figure 9-1147—EBCS Content Response ANQP-element format(11bc)**

The Info ID and Length fields are defined in 9.4.5.1 (General).

The EBCS Content Response field is defined in 9.4.1.69 (EBCS Content Response field(11bc)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 9.4.5.33 Credential Types ANQP-element(#93)

The Credential Types ANQP-element provides a STA with information about the types of credentials accepted via that AP. The format of the Credential Types ANQP-element is shown in Figure 9-1148 (Credential Types ANQP-element format(#93)).

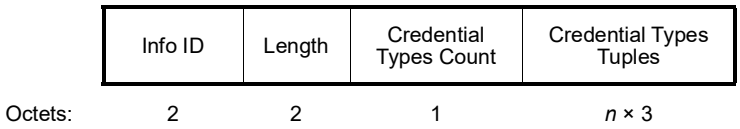

**Figure 9-1148—Credential Types ANQP-element format(#93)**

The Info ID and Length fields are defined in 9.4.5.1 (General).

The Credential Types Count field specifies the number *n* of Credential Types Tuple subfields.

The Credential Types Tuples subfield contains zero or more Credential Types Tuple subfields.

The format of the(M118) Credential Types Tuple subfield is shown in Figure 9-1149 (Credential Types Tuple subfield format(#93)).

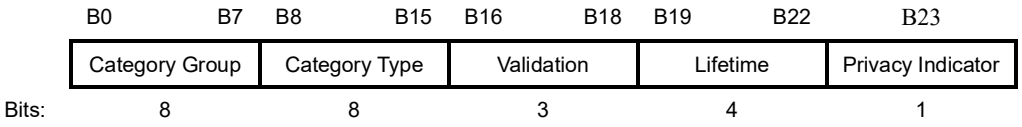

**Figure 9-1149—Credential Types Tuple subfield format(#93)**

The Category Group and Category Type subfields specify the credential issuer(s) accepted via the AP, mapped to the Venue group code and the Venue type code in Table 9-96 (Venue type assignments(#1595)), respectively.

The Validation subfield indicates the minimum type of credential validation (M118)for the credentials to be deemed valid. The values of the subfield are defined in Table 9-443 (Validation subfield values(#93)).

**Table 9-443—Validation subfield values(#93)**

| Value | Validation method | Notes |
|---|---|---|
| 0 | No verification | Credentials do not need to be verified |
| 1 | Any method allowed | |
| 2 | Email verification | |
| 3 | SMS verification | |
| 4 | Government ID | e.g., account obtained by showing a government ID |
| 5 | Government issued credentials | e.g., a certificate issued by a government |
| 6–7 | Reserved | |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Lifetime subfield indicates the minimum age required for the credentials to be acceptable, in units of year quarters.

The Privacy Indicator subfield is set to 1 if this AP requires the user to expose a contactable identity to the AP (usually for legal purposes). It is set to 0 if this AP accepts anonymous roaming.

### 9.4.5.34 Service Level Agreement ANQP-element(#93)(#1090)

The Service Level Agreement ANQP-element provides a STA with information about the type of roaming supported by the AP, and the service level agreement (SLA) offered by the AP for a given roaming type. The format of the SLA ANQP-element is shown in Figure 9-1150 (Service Level Agreement ANQP-element format(#93)).

| | Info ID | Length | Venue SLA Policy Count | Venue SLA Policy Tuples |
|---|---|---|---|---|
| Octets: | 2 | 2 | 1 | variable |

**Figure 9-1150—Service Level Agreement ANQP-element format(#93)**

The Info ID and Length fields are defined in 9.4.5.1 (General).

The Venue SLA Policy Count field specifies the number of Venue SLA Policy Tuple subfields.

The Venue SLA Policy Tuples subfield contains zero or more Venue SLA Policy Tuple subfields.

The format of a Venue SLA Policy Tuple subfield is shown in Figure 9-1151 (Venue SLA Policy Tuple subfield format(#93)(#1090)).

| | Length | Indicators | SLA Details |
|---|---|---|---|
| Octets: | 2 | 1 | variable |

**Figure 9-1151—Venue SLA Policy Tuple subfield format(#93)(#1090)**

The Length field contains the length of the remaining fields in octets.(#1090)

The Indicators subfield indicates the roaming services accepted by the venue and their associated SLAs. The format of the Indicators subfield is shown in Figure 9-1152 (Indicators subfield format(#93)).

| | B0 B1 | B2 B3 | B4 B5 | B6 B7 |
|---|---|---|---|---|
| | First Settlement Indicator | First SLA Indicator | Second Settlement Indicator | Second SLA Indicator |
| Bits: | 2 | 2 | 2 | 2 |

**Figure 9-1152—Indicators subfield format(#93)**

The First Settlement Indicator and Second Settlement Indicator subfields each indicate a type of roaming service accepted by the venue. The values of the First Settlement Indicator and Second Settlement Indicator subfields are specified in Table 9-444 (Settlement indicator values(#93)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-444—Settlement indicator values(#93)**

| Value | Settlement Type |
|---|---|
| 0 | All |
| 1 | Free services |
| 2 | Paid services |
| 3 | Reserved |

The First SLA Indicator and Second SLA Indicator subfields each indicate the SLA that the AP offers for the respective settlement type. The values of the First SLA Indicator and Second SLA Indicator subfields are specified in Table 9-445 (SLA indicator values(#93)) and follow the Olympic model defined in IETF RFC 2597([B31]).

**Table 9-445—SLA indicator values(#93)**

| Value | SLA |
|---|---|
| 0 | No Olympic SLA |
| 1 | Bronze |
| 2 | Silver |
| 3 | Gold |

If the First SLA Indicator subfield is set to 0, the Second Settlement Indicator and Second SLA Indicator subfields are reserved. Otherwise, the First SLA Indicator and Second SLA Indicator subfields differ, and a nonzero value in the First SLA Indicator subfield takes precedence over a value of 0 in the Second SLA Indicator subfield, for the settlement type indicated by the First SLA Indicator subfield.

The SLA Details subfield is an optional vendor specific UTF-8 string that can be used to indicate the details of the SLA (e.g., minimum bandwidth, max jitter or delay, etc.). The content of this subfield is beyond the scope of this standard(#1560).

### 9.4.5.35 Excluded NAI Realm ANQP-Element(#93)

The Excluded NAI Realm ANQP-element provides a list of network access identifier (NAI) realms corresponding to SSPs or other entities whose networks or services are not accessible via this AP, even if they are members of a roaming consortium advertised by this AP. The format of the Excluded NAI Realm ANQP-element is shown in Figure 9-1153 (Excluded NAI Realm ANQP-element format(#93)).

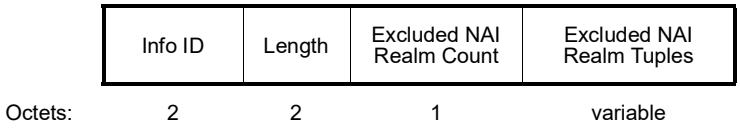

**Figure 9-1153—Excluded NAI Realm ANQP-element format(#93)**

The Info ID and Length fields are defined in 9.4.5.1 (General).

The Excluded NAI Realm Count field specifies the number of Excluded NAI Realm Tuple subfields.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Excluded NAI Realm Tuples field contains zero or more Excluded NAI Realm Tuple subfields.

The format of an Excluded NAI Realm Tuple subfield is shown in Figure 9-1154 (Excluded NAI Realm Tuples subfield format(#93)).

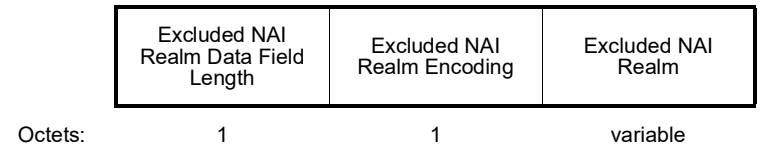

**Figure 9-1154—Excluded NAI Realm Tuples subfield format(#93)**

The Excluded NAI Realm Data Field Length subfield is equal to 1 plus the length in octets of the Excluded NAI Realm subfield.(#7224)

The Excluded NAI Realm Encoding subfield is shown in Figure 9-1155 (Excluded NAI Realm Encoding subfield format(#93)).

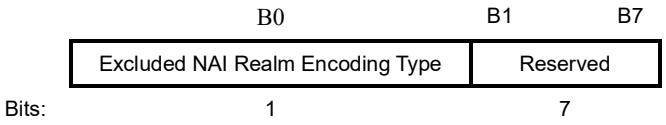

**Figure 9-1155—Excluded NAI Realm Encoding subfield format(#93)**

The Excluded NAI Realm Encoding Type subfield is set to 0 to indicate that the NAI realm(s) in the Excluded NAI Realm subfield is/are formatted in accordance with IETF RFC 4282. It is set to 1 to indicate that it/they might not be formatted in accordance with IETF RFC 4282.

The Excluded NAI Realm subfield contains one NAI realm formatted as defined in the Excluded NAI Realm Encoding Type subfield.

### 9.4.6 Registered location query protocol (RLQP) elements

#### 9.4.6.1 General

(#3428)RLQP-elements have a common format shown in Figure 9-1156 (RLQP-element format). Each element is assigned a unique Info ID as defined in this standard.

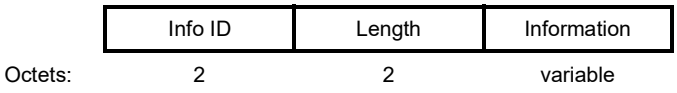

**Figure 9-1156—RLQP-element format**

Each RLQP-element in 9.4.6 (Registered location query protocol (RLQP) elements) is assigned a unique 2-octet Info ID. The set of valid Info IDs is defined in Figure 9-1156 (RLQP-element format).

The Length field indicates the number of octets in the Information field.

The RLQP-elements are shown in Table 9-446 (RLQP-element definitions).(#3380)

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-446—RLQP-element definitions**

| RLQP-element name | Info ID | RLQP-element (subclause) |
|---|---|---|
| Reserved | 0–272 | N/A |
| Channel Availability Query | 273 | 9.4.6.2 (Channel Availability Query RLQP-element) |
| Channel Schedule Management | 274 | 9.4.6.3 (Channel Schedule Management RLQP-element) |
| Network Channel Control | 275 | 9.4.6.4 (Network Channel Control RLQP-element) |
| Reserved | 276–56 796 | N/A |
| Vendor Specific | 56 797 | 9.4.6.5 (Vendor Specific RLQP-element) |
| Reserved | 56 798–65 535 | N/A |

### 9.4.6.2 Channel Availability Query RLQP-element

The Channel Availability Query element is used to exchange the requests and responses for the channel availability query process using the GAS protocol. The Channel Availability Query RLQP-element is included in a GAS query request(#7052) or returned in a response to a GAS query request(#7052).

The element is in the format shown in Figure 9-1157 (Channel Availability Query RLQP-element format).

| | Info ID | Length | Requester STA Address | Responder STA Address | Reason Result Code | Channel Query Info | Device Class | Device Identification Information | Device Location Information | WSM Information |
|---|---|---|---|---|---|---|---|---|---|---|
| Octets: | 2 | 2 | 6 | 6 | 1 | 1 | variable | variable | variable | variable |

**Figure 9-1157—Channel Availability Query RLQP-element format**

The Info ID and Length fields are defined in 9.4.6.1 (General).

The RequesterSTAAddress field is the MAC address of the requesting STA that initiates the channel query process(#6293).

The ResponderSTAAddress field is the MAC address of the responding STA that responds to the channel query requesting STA(#6293).

The Reason Result Code field is used to indicate the reason that a channel availability query was generated. It also indicates the result of the query as successful or not and the reason when the query is not successful. (#8141)The Reason Result Code field values that have been allocated are shown in Table 9-447 (Reason Result Code field values).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-447—Reason Result Code field values**

| Reason Result Code field value | Name | Description |
|---|---|---|
| 0 | | Reserved. |
| 1 | | Channel availability list requested. |
| 2 | SUCCESS | Success with the available channel list result for a Device Location Information field. |
| 3 | SUCCESS_MULTIPLE | Success with an available channel list result for a bounded geographic area defined by multiple Device Location Information fields. |
| 4 | REFUSED | Request declined. |
| 5 | DEVICE_VERIFICATION_FAILURE | Request not successful because of device identification verification failure.<br>NOTE—Failure of providing an authorized identification of the corresponding regulatory organization can cause the responding STA to reject the query and return such a Reason Result Code. |
| 6 | Continuation frame | This frame continues the fields from the previous CAQ frame. |
| 7–255 | | Reserved. |

The Channel Query Info field is used to indicate the type of Channel Query request and associated parameters. The format of the Channel Query Info field is shown in Figure 9-1158 (Channel Query Info field format).

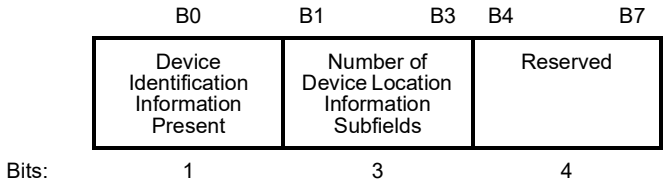

**Figure 9-1158—Channel Query Info field format**

The Device Identification Information Present subfield value is set to 1 to indicate that the Device Identification Information field is present in the Channel Availability Query element; otherwise it is set to 0 to indicate that the Device Identification Information field is not provided.

The Number of Device Location Information Subfields subfield indicates the number of device location information subfields presented in the Channel Availability Query element. When no device location is present, the Number of Device Location Information Subfields subfield is set to 0.

The Device Class field is used to indicate the characteristics of STA requesting the channel availability query. The format of the Device Class field is specified in 9.4.4.2.2 (Device Class). The Device Class field is present only when the Reason Result Code field value is 1.

The Device Identification Information field is used to indicate the identification of the STA requesting the channel availability query. The format of the Device Identification Information field is specified in 9.4.4.2.3 (Device Identification Information).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Device Location Information field is used to provide the location of the STA requesting the channel availability query, which is provided in the format specified in 9.4.4.2.4 (Device Location Information).

The WSM Information field is defined in the White Space Map element (see 9.4.2.168 (White Space Map element)). The WSM Information field is present only when the Reason Result Code field value is 2 or 3, as the successful result of the query.

### 9.4.6.3 Channel Schedule Management RLQP-element

The Channel Schedule Management element is used by an GDD enabling STA to query the RLSS or another GDD enabling STA for channel schedule information. The element is in the format shown in Figure 9-1159 (Channel Schedule Management RLQP-element format).

| | Info ID | Length | Requester STA Address | Responder STA Address | Reason Result Code | Channel Schedule Management Mode | Device Identification Information | Channel Schedule Descriptor |
|---|---|---|---|---|---|---|---|---|
| Octets: | 2 | 2 | 6 | 6 | 1 | 1 | variable | variable |

**Figure 9-1159—Channel Schedule Management RLQP-element format**

The Info ID and Length fields are defined in 9.4.6.1 (General).

The Requester STA Address field is the MAC address of the requesting STA that initiates the channel schedule management process.

The Responder STA Address field is the MAC address of the STA that responds to the STA that requested channel schedule management.

The remaining fields are as defined in the Channel Schedule Management element (see 9.6.7.26 (Channel Schedule Management frame format)).

### 9.4.6.4 Network Channel Control RLQP-element

The Network Channel Control element is used to request network channel control and respond to network channel requests using the GAS protocol. The element is in the format shown in Figure 9-1160 (Network Channel Control RLQP-element format).

| | | | | | | | a Network Channel Control triplet | | |
|---|---|---|---|---|---|---|---|---|---|
| | Info ID | Length | Requester STA Address | Responder STA Address | Reason Result Code | Number of Network Channel Control Triplets | Operating Class | Channel Number | Maximum Transmit Power |
| Octets: | 2 | 2 | 6 | 6 | 1 | 1 | 1 | 1 | 1 |

**Figure 9-1160—Network Channel Control RLQP-element format**

The Info ID and Length fields are defined in 9.4.6.1 (General).

The RequesterSTAAddress field is the MAC address of the requesting STA that initiates the network channel control process.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The ResponderSTAAddress field is the MAC address of the STA that responds to the STA that requested network channel control.

The Reason Result Code field is used to indicate the reason that a Network Channel Control frame was generated. (#8141)The encoding of the Reason Result Code field is shown in Table 9-448 (Reason Result Code field values).

**Table 9-448—Reason Result Code field values**

| Reason Result Code field value | Name | Description |
|---|---|---|
| 0 | REQUEST | Network channel request. |
| 1 | SUCCESS | Success. |
| 2 | REFUSED | Request declined. |
| 3 | TOO_MANY_SIMULTANEOUS_REQUESTS | Network channel request denied because the GDD enabling STA is unable to handle additional GDD dependent STAs. |
| 4 | Continuation frame | This frame continues the fields from the previous NCC frame. |
| 5–255 | | Reserved. |

The Number of Network Channel Control Triplets field indicates the number of triplets of Operating Class, Channel Number, and Transmit Power Constraint fields.

The Operating Class field indicates the channel set for which the network channel control request applies. The Operating Class field and Channel Number field are used together to specify the channel frequency and channel bandwidth for which the network channel control applies. Values for the Operating Class field are shown in E.1 (Country information and operating classes).

In a request, the Channel Number field of a Network Channel Control frame indicates the channel that the requesting STA intends to operate on. In a response, the Channel Number field in the Network Channel Control frame indicates the channels that the responding STA permits the requesting STA to operate on. The Channel Number is defined within an Operating Class as shown in E.1 (Country information and operating classes).

The Maximum Transmit Power field gives the intended maximum transmit power in dBm for operation in the request frame and indicates the maximum allowable transmit power in dBm for operation in the response frame. The field is coded as a 2s complement signed integer in units of 0.5 dBm. The field is set to –128 when a requesting STA requests a responding STA to provide a network channel control response without specifying in the request the intended maximum transmit power.

### 9.4.6.5 Vendor Specific RLQP-element

The Vendor Specific RLQP-element is used to carry information not defined in this standard within a single defined format, so that reserved Info IDs are not usurped for nonstandard purposes and so that interoperability is more easily achieved in the presence of nonstandard information. The RLQP-element is in the format shown in Figure 9-1161 (Vendor Specific RLQP-element format).

The Info ID and Length fields are defined in 9.4.6.1 (General).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

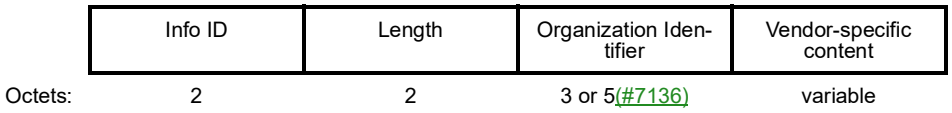

**Figure 9-1161—Vendor Specific RLQP-element format**

The Organization Identifier field contains the identity of the entity that has defined the content of the Vendor Specific RLQP-element (see 9.4.1.29 (Organization Identifier field) for a description of the Organization Identifier field contents and length).(#7136)

(#3376)The Vendor-specific content field contains vendor specific content.

## 9.5 Fields used in Management and Extension frame bodies and Control frames

### 9.5.1 SSW field(#4303)

(11ay)When the SSW field(#4303) is not transmitted in a DMG Beacon frame, the format of the SSW field is shown in Figure 9-1162 (SSW field format when not transmitted in a DMG Beacon frame(11ay)).

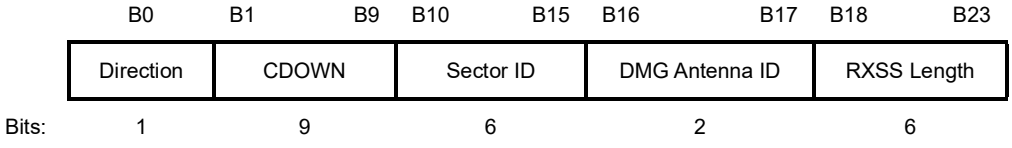

**Figure 9-1162—SSW field format when not transmitted in a DMG Beacon frame(11ay)**

(11ay)The format of the field when transmitted in a DMG Beacon frame is shown in Figure 9-1163 (SSW field format when transmitted in a DMG Beacon frame(11ay)).

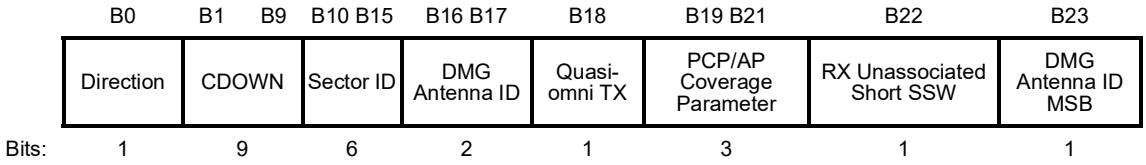

**Figure 9-1163—SSW field format when transmitted in a DMG Beacon frame(11ay)**

The Direction subfield is set to 0 to indicate that the frame is transmitted by the beamforming initiator and set to 1 to indicate that the frame is transmitted by the beamforming responder.

The CDOWN subfield is a down counter indicating the number of remaining DMG Beacon frame transmissions to the end of the TXSS, or the number of remaining SSW frame transmissions to the end of the TXSS/RXSS. This subfield is set to 0 in the last frame DMG Beacon and SSW frame transmission. Possible values range from 0 to 511.

The Sector ID subfield is set to indicate the sector number through which the frame containing this SSW field is transmitted.

The DMG Antenna ID subfield indicates the antenna (for a CMMG STA) or DMG antenna (for a DMG STA) the transmitter is currently using for this transmission.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The RXSS Length subfield is valid only when transmitted in a CBAP and is reserved otherwise. The RXSS Length subfield specifies the length of a receive sector sweep as required by the transmitting STA and is defined in units of an SSW frame. The length of the sector sweep is given by $(\text{RXSS Length} + 1) \times 2$.

(11ay)The Quasi-omni TX subfield is set to 1 to indicate that the frame containing the SSW field(#4303) is transmitted with a quasi-omni antenna pattern and is set to 0 to indicate that the frame is not transmitted with a quasi-omni antenna pattern.

(11ay)The PCP/AP Coverage Parameter subfield contains the composite value describing the PCP or AP related link budget parameter specific for the sector and DMG antenna defined in Sector ID and DMG Antenna ID fields. For values 1 through 7, the value of this field is interpreted as (4×PCP/AP Coverage Parameter + 14) and is measured in dBm. This covers a range from 18 dBm to 42 dBm in 4 dBm steps. A value of 0 in the PCP/AP Coverage Parameter subfield indicates that this field to be ignored. The usage of PCP/AP Coverage Parameter subfield is described in 10.38.12.6 (“Near-Far” self classification).

NOTE—An EDMG PCP or EDMG AP can set the PCP/AP Coverage Parameter subfield to EIRP – $G_{omni\_rx}$ – $G_{add\_gain}$, where (a) EIRP is equal to $P + G_{tx}$, and $P$ and $G_{tx}$ are the transmit power and antenna gain, respectively, used in the DMG Beacon frame transmission; (b) $G_{omni\_rx}$ is the antenna gain of the AP or PCP receiver when in quasi-omni receive mode; and (c) $G_{add\_gain}$ is equal to $P_{min\_sensitivity} - P_{sensitivity}$, where $P_{min\_sensitivity}$ is the receiver sensitivity for MCS 0 defined in Table 20-3 and $P_{sensitivity}$ is the actual PCP or AP receiver sensitivity. Since the values of $G_{omni\_rx}$ and $G_{tx}$ can change for different directions, the value of the PCP/AP Coverage Parameter subfield in DMG Beacon frames transmitted through different sectors can be different.

(11ay)The RX Unassociated Short SSW subfield is set to 1 to indicate that the EDMG STA supports reception of Short SSW PPDUs from unassociated STAs during a CBAP. Otherwise, it is set to 0.

(11ay)The DMG Antenna ID MSB subfield is prepended to the DMG Antenna ID subfield to create a single 3-bit field.

### 9.5.2 Dynamic Allocation Info field

The format of the Dynamic Allocation Info field is shown in Figure 9-1164 (Dynamic Allocation Info field format).

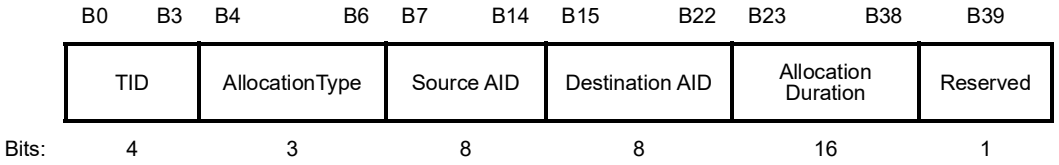

**Figure 9-1164—Dynamic Allocation Info field format**

The TID subfield identifies the TC or TS for the allocation request or grant.

NOTE—Unlike pseudo-static allocations, nonpseudo-static allocations are not labeled with an allocation ID, and are associated to a TID.

The AllocationType subfield is defined in 9.4.2.130 (Extended Schedule element).

The Source AID subfield identifies the STA that is the source of the allocation.

The Destination AID subfield identifies the STA that is the destination of the allocation.

When the Dynamic Allocation Info field is transmitted within an SPR frame, the Allocation Duration subfield contains the requested duration in microseconds. When the Dynamic Allocation Info subfield is transmitted within a Grant frame by an AP or PCP in an ATI or GP, the Allocation Duration subfield

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

contains the granted duration of the SP or CBAP allocation in microseconds (see 10.38.3 (ATI transmission rules), 10.38.7 (Dynamic allocation of service period), 10.38.8 (Dynamic truncation of service period), and 10.38.9 (Dynamic extension of service period)). Possible values range from 0 to 32 767 for an SP allocation and a CBAP allocation. Setting the Allocation Duration subfield transmitted to 0 within a Grant frame means that the STA can transmit one PPDU followed by any relevant acknowledgment plus one RTS/DMG CTS handshake.

When the Dynamic Allocation Info subfield is transmitted within a Grant frame in a CBAP, the value of the Allocation Duration field indicates the purpose of the Grant frame transmission. Two purposes are possible:

a) Beyond current TXOP: in this case, the Allocation Duration subfield values range from 0 to 32 767. The value of the Allocation Duration field plus the Duration field of the Grant frame indicates the time offset from the PHY-TXEND.indication primitive of the Grant frame when the STA transmitting the Grant frame will attempt to initiate access for communication with the STA indicated by the RA field of the Grant frame.

b) Within current TXOP: in this case, the Allocation Duration subfield is set to 32 768.

When the Dynamic Allocation Info subfield is transmitted within a Grant frame with RA set to broadcast address by a source or destination STA of an SP, the Allocation Duration subfield values range from 0 to 32 767.

When the Dynamic Allocation Info subfield is transmitted within a Grant frame with RA set to individual address by a source STA of an SP, the Allocation Duration subfield is set to 32 768.

### 9.5.3 SSW Feedback field(#4303)

When the SSW Feedback field is transmitted as part of an ISS, the format of the field is as shown in Figure 9-1165 (SSW Feedback field format when transmitted as part of an ISS). Otherwise, the format of the SSW Feedback field is as shown in Figure 9-1166 (SSW Feedback field format when not transmitted as part of an ISS and the EDMG Extension Flag subfield is 1(11ay)) (11ay)when the EDMG Extension Flag subfield is 1 and in Figure 9-1167 (SSW Feedback field format when not transmitted as part of an ISS and the EDMG Extension Flag subfield is 0(11ay)) when the EDMG Extension Flag subfield is 0(#3061).

| | B0 B8 | B9 B10 | B11 B15 | B16 | B17 | B18 B21 | B22 | B23 |
|---|---|---|---|---|---|---|---|---|
| | Total Sectors in ISS | Number of RX DMG Antennas | Reserved | Poll Required | OCB(11bd) | Reserved | Unsolicited RSS Enabled(11ay) | Reserved |
| Bits: | 9 | 2 | 5 | 1 | 1 | 4 | 1 | 1 |

**Figure 9-1165—SSW Feedback field format when transmitted as part of an ISS**

| | B0B5 | B6B7 | B8B15 | B16 | B17 B21 | B22 | B23 |
|---|---|---|---|---|---|---|---|
| | Sector Select | DMG Antenna Select | SNR Report | Poll Required | Sector Select MSB(11ay) | DMG Antenna Select MSB(11ay) | EDMG Extension Flag(11ay) |
| Bits: | 6 | 2 | 8 | 1 | 5 | 1 | 1 |

**Figure 9-1166—SSW Feedback field format when not transmitted as part of an ISS and the EDMG Extension Flag subfield is 1(11ay)**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

| | B0 B5 | B6 B7 | B8 B15 | B16 | B17 | B18 B21 | B22 | B23 |
|---|---|---|---|---|---|---|---|---|
| | Sector Select | DMG Antenna Select | SNR Report | Poll Required | OCB(11bd) | Reserved | Unsolicited RSS Enabled | EDMG Extension Flag |
| Bits: | 6 | 2 | 8 | 1 | 1 | 4 | 1 | 1 |

**Figure 9-1167—SSW Feedback field format when not transmitted as part of an ISS and the EDMG Extension Flag subfield is 0(11ay)**

The Total Sectors in ISS subfield indicates the total number of sectors that the initiator uses in the ISS, including any repetition performed as part of multi-antenna beamforming. Possible values range from 0 to 511, representing 1 to 512 sectors.

The Number of RX DMG Antennas subfield indicates the number of receive DMG antennas the initiator uses during the following RSS. This subfield is set to the number of receive DMG antennas used minus 1.

(11ay)The EDMG Extension Flag subfield is 0 when the (#4303)SSW Feedback field is transmitted within an SSW frame, and when transmitted within an SSW-Feedback and SSW-Ack frame sent in response to an ISS or an RSS that used the SSW frame. Otherwise, the EDMG Extension Flag subfield is 1.

(11ay)The selected sector depends on the value of the EDMG Extension Flag subfield.

(11ay)If the EDMG Extension Flag subfield is 0, the Sector Select subfield contains the value of the Sector ID subfield of the SSW field within the frame that was received with best quality in the immediately preceding sector sweep. The determination of which frame was received with best quality is implementation dependent.

(11ay)If the EDMG Extension Flag subfield is 1, the Sector Select MSB subfield is prepended to the Sector Select subfield to form a single 11-bit subfield representing the value of the CDOWN field within the Short SSW PPDU that was received with the best quality in the immediately preceding sector sweep. The determination of which PPDU was received with the best quality is implementation dependent.

(11ay)The interpretation of the DMG Antenna Select subfield depends on the value of the EDMG Extension Flag subfield.

(11ay)If the EDMG Extension Flag subfield is 0, the DMG Antenna Select subfield indicates the value of the DMG Antenna ID subfield of the SSW field within the frame that was received with best quality in the immediately preceding sector sweep. The determination of which frame was received with best quality is implementation dependent.

(11ay)If the EDMG Extension Flag subfield is 1, the DMG Antenna Select MSB subfield is prepended to the DMG Antenna Select subfield to form a single 3-bit subfield representing the value of the RF Chain ID field within the Short SSW PPDU that was received with the best quality in the immediately preceding sector sweep. The determination of which PPDU was received with the best quality is implementation dependent.

(11ay)The Unsolicited RSS Enabled subfield is set to 1 to indicate that the STA is capable of receiving an unsolicited RSS and completing the SLS with any other STA that opportunistically receives this ISS or RSS, but that is not the STA addressed by this ISS or RSS (see 10.41.6.4 (BRP phase execution)). This subfield is set to 0 otherwise.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The SNR Report subfield is set to the value of the SNR from the frame that was received with best quality during the immediately preceding sector sweep and is indicated in the Sector Select field. This subfield is encoded as 8-bit 2s complement value of 4×(SNR-19), where SNR is measured in dB. This covers from –13 dB to 50.75 dB in 0.25 dB steps.

The Poll Required subfield is set to 1 by a non-AP and non-PCP STA to indicate that it requires the AP or PCP to initiate communication with the non-AP and non-PCP. This subfield is set to 0 to indicate that the non-AP and non-PCP has no preference about whether the AP or PCP initiates the communication. This subfield is reserved when transmitted by an AP or PCP.

(11bd)The OCB subfield is set to 1 if dot11DMGOCBActivated is true, and is set to 0 otherwise. If equal to 1, this subfield indicates that the STA is operating outside the context of a BSS.

### 9.5.4 BRP Request field

The BRP Request field is defined in Figure 9-1168 (BRP Request field format).

| | B0 B4 | B5 | B6 | B7 | B8 | B9 | B10 | B11 B16 |
|---|---|---|---|---|---|---|---|---|
| | L-RX | TX-TRN-REQ | MID-REQ | BC-REQ | MID-Grant | BC-Grant | Chan-FBCK-CAP | TX Sector ID |
| Bits: | 5 | 1 | 1 | 1 | 1 | 1 | 1 | 6 |

| | B17 B24 | B25 B26 | B27 | B28 | B29 B31 |
|---|---|---|---|---|---|
| | Other_AID | TX DMG Antenna ID | EDMG-SHORT-BRP(11ay) | EDMG-SHORT-FBCK(11ay) | Reserved |
| Bits: | 8 | 2 | 1 | 1 | 3 |

**Figure 9-1168—BRP Request field format**

If the MID-REQ subfield is set to 0, the L-RX subfield indicates the number of TRN units requested by the transmitting STA for RX training as part of beam refinement. The L-RX subfield contains an unsigned integer between 0 and 16. Values outside this range are reserved. The number of requested TRN-R subfields is equal to the value of the L-RX subfield multiplied by 4. Other values are reserved. If the subfield is set to 0, the transmitting STA does not request receive training as part of beam refinement. If the MID-REQ subfield is set to 1, the L-RX subfield indicates the number of TRN units the STA uses during the MID phase for each TX sector/AWV.

The TX-TRN-REQ subfield is set to 1 to indicate that the STA requests transmit training as part of beam refinement. Otherwise, it is set to 0.

A STA sets the MID-REQ subfield to 1 in SSW-Feedback or BRP frames to indicate a request for an I-MID subphase or R-MID subphase; otherwise, the STA sets the subfield to 0 to indicate it is not requesting an I-MID subphase or R-MID subphase. In case an R-MID subphase is requested, the STA can include information on the TX sector IDs to be used by the STA receiving this request. The STA receiving this request sets the MID-grant subfield in SSW-Ack or BRP frames to 1 to grant this request or otherwise sets it to 0.

A STA sets the BC-REQ subfield to 1 in SSW-Feedback or BRP frames to indicate a request for an I/R-BC subphase; otherwise, the STA sets the subfield to 0 to indicate it is not requesting an I/R-BC subphase. In case an R-BC subphase is requested, the STA can include information on the TX sector IDs to be used by

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

the STA receiving this request. The STA receiving this request sets the BC-grant subfield in SSW-Ack or BRP frames to 1 to grant this request; otherwise, the STA sets it to 0 to reject the request.

The Chan-FBCK-CAP subfield is set to 1 to indicate the STA is capable to return channel measurement during beam refinement. The Chan-FBCK-CAP subfield is set to 0 to indicate the STA is able to return only BS-FBCK during beam refinement.

NOTE—Regardless of the value of the Chan-FBCK-CAP subfield, 10.41.6.4 (BRP phase execution) requires a DMG STA to return the SNR values from the last TXSS if it receives a BRP frame with the TXSS-FBCK-REQ field and the SNR Requested subfield within the FBCK-REQ field both set to 1.

The TX Sector ID subfield indicates the sector ID that is used when transmitting the PPDU. If the PPDU is transmitted using a pattern that is not a sector that has been used in the sector sweep, this subfield is set to 0x63. This subfield is reserved if the BRP Request field is transmitted within an SSW-Feedback frame with the EDMG Extension Flag subfield set to 1 or within an SSW-Ack frame with the EDMG Extension Flag subfield set to 1.(11ay)

The Other_AID subfield is set to the AID of an additional STA referenced in the BRP procedure as described in 10.41.6.4.4 (Antenna configuration setting during a beam refinement transaction) and 20.9.2.2.6 (TRN field). Otherwise, if the additional STA is not used, this subfield is set to 0.

The TX DMG Antenna ID subfield indicates the DMG antenna ID that is used when transmitting the PPDU.This subfield is reserved if the BRP Request field is transmitted within an SSW-Feedback frame with the EDMG Extension Flag subfield set to 1 or within an SSW-Ack frame with the EDMG Extension Flag subfield set to 1.(11ay)

(11ay)The EDMG-SHORT-BRP subfield is set to 1 to indicate that an EDMG BRP field is present following the BRP Request field. Otherwise, this field is set to 0.

(11ay)The EDMG-SHORT-FBCK subfield is set to 1 to indicate that an EDMG Short FBCK field is present in the frame following the EDMG BRP field. Otherwise, this field is set to 0. This subfield is reserved if the EDMG-SHORT-BRP subfield is 0.

### 9.5.5 Beamforming Control field

The Beamforming Control field is formatted as shown in Figure 9-1169 (BF Control field format when both IsInitiatorTXSS and IsResponderTXSS subfields are equal to 1 and the BF Control field is transmitted in Grant or Grant Ack frames(#1729)) when both the IsInitiatorTXSS and IsResponderTXSS subfields are equal to 1, and the Beamforming Control field is transmitted in either a Grant or Grant Ack frames. In all other cases, the Beamforming Control field is formatted as shown in Figure 9-1170 (BF Control field format in all other cases(#1729)).

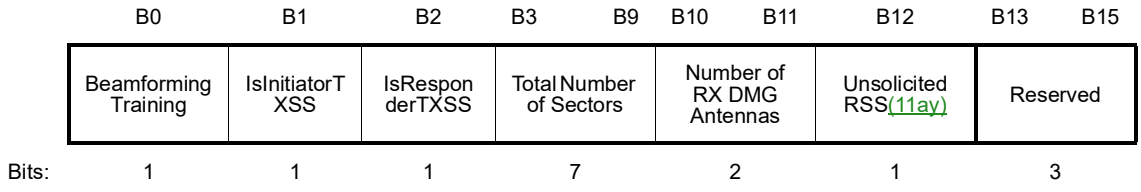

**Figure 9-1169—BF Control field format when both IsInitiatorTXSS and IsResponderTXSS subfields are equal to 1 and the BF Control field is transmitted in Grant or Grant Ack frames(#1729)**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

| | B0 | B1 | B2 | B3 B8 | B9 | B10 B11 | B12 | B13 B15 |
|---|---|---|---|---|---|---|---|---|
| | Beamforming Training | IsInitiatorTXSS | IsResponderTXSS | RXSS Length | RXSSTxRate | Reserved | Unsolicited RSS(11ay) | Reserved |
| Bits: | 1 | 1 | 1 | 6 | 1 | 2 | 1 | 3 |

**Figure 9-1170—BF Control field format in all other cases(#1729)**

The Beamforming Training subfield is set to 1 to indicate that the source DMG STA intends to initiate beamforming training with the destination DMG STA at the start of the allocation and is set to 0 otherwise. If the Beamforming Training subfield is set to 0, all other subfields of the Beamforming Control field are reserved.

The IsInitiatorTXSS subfield is set to 1 to indicate that the source DMG STA starts the beamforming training with an initiator TXSS. This subfield is set to 0 to indicate that the source DMG STA starts the BF training with an initiator RXSS. The IsInitiatorTXSS subfield is ignored if the Unsolicited RSS field is set to 1.(11ay)

The IsResponderTXSS subfield is set to 1 to indicate that the destination DMG STA, or the source EDMG STA if the Unsolicited RSS subfield is set to 1, starts the RSS with a responder TXSS. This subfield is set to 0 to indicate that the destination DMG STA, or the source EDMG STA if the Unsolicited RSS subfield is set to 1, is to initiate the RSS with a responder RXSS.(11ay)

(11ay)The Unsolicited RSS subfield is set to 1 to indicate the source EDMG STA intends to initiate an unsolicited RSS at the start of the TXOP or SP. This subfield is set to 0 to indicate the source EDMG STA intends to initiate an SLS with the ISS at the start of the allocation.

(11ay)The interpretation of the IsInitiatorTXSS, IsResponderTXSS, and Unsolicited RSS subfields are indicated in Table 9-449 (IsInitiatorTXSS, IsResponderTXSS, and Unsolicited RSS subfields(11ay)).

**Table 9-449—IsInitiatorTXSS, IsResponderTXSS, and Unsolicited RSS subfields(11ay)**

| Bit 1 | Bit 2 | Bit 12 | Meaning |
|---|---|---|---|
| 1 | 0 | 0 | Initiator TXSS and Responder RXSS |
| 0 | 1 | 0 | Initiator RXSS and Responder TXSS |
| 1 | 1 | 0 | Initiator TXSS and Responder TXSS |
| 0 | 0 | 0 | Initiator RXSS and Responder RXSS |
| N/A | 1 | 1 | Responder TXSS only (no ISS) |
| N/A | 0 | 1 | Responder RXSS only (no ISS) |

When the Beamforming Control field is transmitted within an Extended Schedule element, either the IsInitiatorTXSS subfield or the IsResponderTXSS subfield is set to 0, but not both.

The RXSS Length subfield is valid only if at least one of IsInitiatorTXSS subfield or IsResponderTXSS subfield is equal to 0 and is reserved otherwise. The value represented by the RXSS Length subfield specifies the total number of receive sectors combined over all receive DMG antennas of the STA, including any LBIFS as necessary for DMG antenna switching. The value represented by this subfield is in the range 2 to 128 and is given by (RXSS Length+1)×2.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The RXSSTxRate subfield is valid only if the RXSS Length subfield is valid and the value of the RXSS Length subfield is greater than 0. Otherwise, the RXSSTxRate subfield is reserved. The RXSSTxRate subfield is set to 0 to indicate that all frames transmitted as part of the RXSS use the DMG Control modulation class (10.6.7.1 (Usage of DMG Control modulation class)). The RXSSTxRate subfield is set to 1 to indicate that only the first frame transmitted as part of the RXSS use the DMG Control modulation class and the remaining frames use MCS 1 of the DMG SC modulation class. If both the IsInitiatorTXSS and IsResponderTXSS subfields are set to 0 and the BF Control field is sent within a Grant frame, the RXSSTxRate subfield refers to the RSS only. If both the IsInitiatorTXSS and IsResponderTXSS subfields are set to 0 and the BF Control field is sent within a Grant Ack frame, the RXSSTxRate subfield refers to the ISS only.

When the BF Control field is transmitted in a Grant frame, the Total Number of Sectors subfield indicates the total number of sectors the initiator uses during the ISS, including any LBIFS required for DMG antenna switching (see 10.41 (DMG beamforming)). When the BF Control field is transmitted in a Grant Ack frame, the Total Number of Sectors subfield indicates the total number of sectors the responder uses during the RSS. In both cases, this field is set to the total number of sectors used minus 1.

When the BF Control field is transmitted in a Grant frame, the Number of RX DMG Antennas subfield indicates the number of receive DMG antennas the initiator uses during the RSS. When the BF Control field is transmitted in a Grant Ack frame, the Number of RX DMG Antennas subfield indicates the number of receive DMG antennas the responder uses during the ISS. In both cases, this subfield is set to the number of receive DMG antennas used minus 1.

When the BF Control field is transmitted in a Grant Ack frame in response to a Grant frame with the Beamforming Training field equal to 0, the following fields are reserved: IsInitiatorTXSS, IsResponderTXSS, Total Number of Sectors, and Number of RX DMG Antennas.

### 9.5.6 Beamformed Link Maintenance field

The Beamformed Link Maintenance field is shown in Figure 9-1171 (Beamformed Link Maintenance field format) and provides a DMG STA with the value of dot11BeamLinkMaintenanceTime.

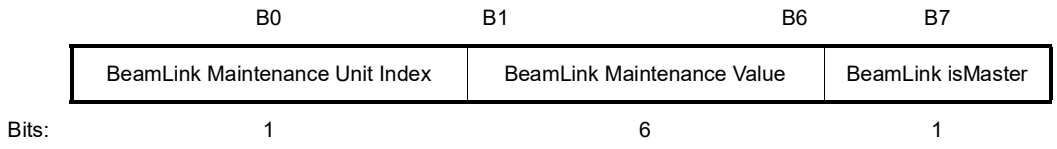

**Figure 9-1171—Beamformed Link Maintenance field format**

The encoding of the BeamLink Maintenance Unit Index subfield is specified in Table 9-450 (Encoding of BeamLink Maintenance Unit Index).

**Table 9-450—Encoding of BeamLink Maintenance Unit Index**

| BeamLink Maintenance Unit Index | BeamLink Maintenance Unit (μs) |
|---|---|
| 0 | 32 |
| 1 | 2000 |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

If the content of the BeamLink Maintenance Value subfield is greater than 0, it is used to calculate dot11BeamLinkMaintenanceTime as follows:

$$dot11BeamLinkMaintenanceTime = BLMU \times BLMV$$

where

*BLMU* is the value of the BeamLink Maintenance Unit corresponding to the value of the BeamLink Maintenance Unit Index subfield (see Table 9-450 (Encoding of BeamLink Maintenance Unit Index))

*BLMV* is the value of the BeamLink Maintenance Value subfield

Otherwise, if the BeamLink Maintenance Value subfield is set to 0, the dot11BeamLinkMaintenanceTime is left undefined. An undefined value of the dot11BeamLinkMaintenanceTime indicates that the STA does not participate in beamformed link maintenance.

The BeamLink isMaster subfield is set to 1 to indicate that the STA is the master of the data transfer and set to 0 otherwise. The STAs use the BeamLink isMaster subfield to negotiate the dot11BeamLinkMaintenanceTime as specified in Table 9-451 (The Beamformed Link Maintenance negotiation).

NOTE—In Table 9-451 (The Beamformed Link Maintenance negotiation), STA-A and STA-B refer to any of the STAs performing the Beamformed Link Maintenance negotiation procedure in no particular order.

**Table 9-451—The Beamformed Link Maintenance negotiation**

| BeamLink isMaster subfield (STA-A) | BeamLink isMaster subfield (STA-B) | dot11BeamLinkMaintenanceTime (STA-A) vs. dot11BeamLinkMaintenanceTime (STA-B) | Result |
|---|---|---|---|
| 0 | 0 | ≥ | dot11BeamLinkMaintenanceTime (STA-A) |
| 1 | 0 | >, <, = | dot11BeamLinkMaintenanceTime (STA-A) |
| 1 | 1 | = | dot11BeamLinkMaintenanceTime (STA-A) |
| 0 or 1 | 0 or 1 | If either dot11BeamLinkMaintenanceTime (STA-A) or dot11BeamLinkMaintenanceTime (STA-B) is undefined | Undefined |

This is an unapproved IEEE Standards Draft, subject to change.

### 9.5.7 EDMG BRP field(11ay)

The EDMG BRP field combines the EDMG BRP Request element and the DMG Beam Refinement element into a fixed size field for use in a fixed sized version of the BPR frame (see 9.6.21.3 (BRP frame format)). The EDMG BRP field is defined in Figure 9-1172 (EDMG BRP field format(11ay)).

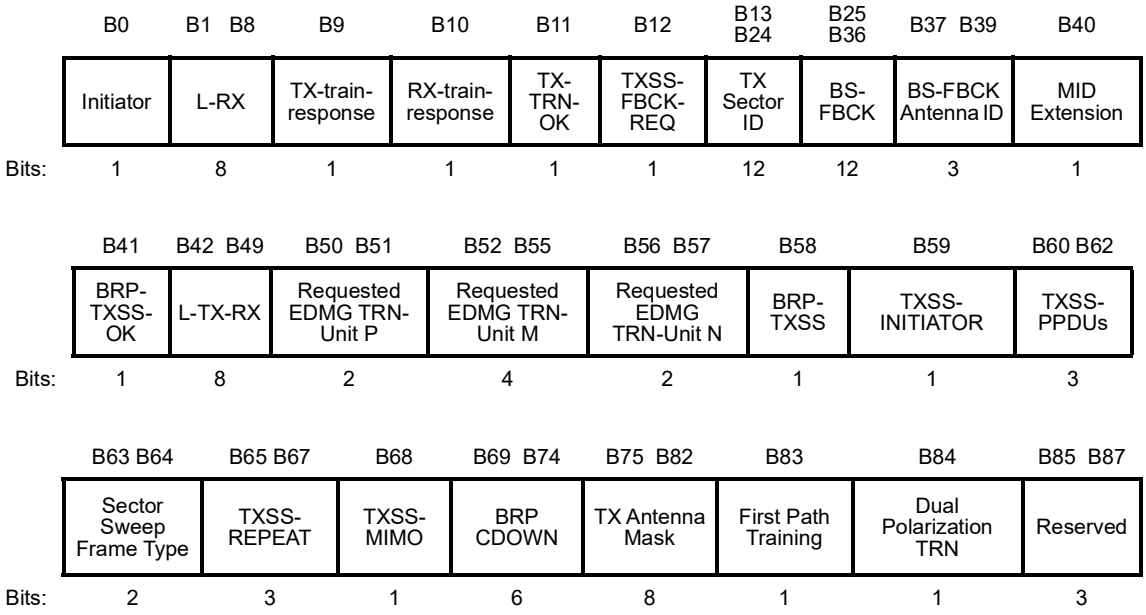

**Figure 9-1172—EDMG BRP field format(11ay)**

The Initiator, TX-train-response, RX-train-response, TX-TRN-OK, TXSS-FBCK-REQ, BS-FBCK, BS-FBCK Antenna ID, Sector Sweep Frame Type, and MID Extension subfields are defined in 9.4.2.128 (DMG Beam Refinement element).

The L-RX, TX Sector ID, L-TX-RX, Requested EDMG TRN-Unit P, Requested EDMG TRN-Unit M, Requested EDMG TRN-Unit N, BRP-TXSS, TXSS-INITIATOR, TXSS-PPDUs, TXSS-REPEAT, TXSS-MIMO, BRP CDOWN, TX Antenna Mask, First Path Training, and Dual Polarization TRN subfields are defined in 9.4.2.269 (EDMG BRP Request element(11ay)).

### 9.5.8 Short BRP Feedback field(11ay)

The Short BRP Feedback field carries feedback information of up to 16 sectors and is defined in Figure 9-1173 (Short BRP Feedback field format(11ay)).

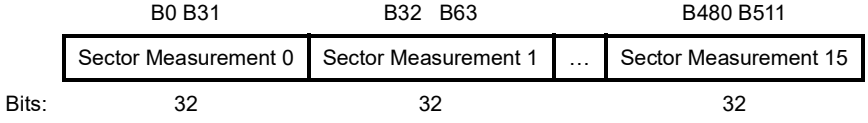

**Figure 9-1173—Short BRP Feedback field format(11ay)**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Each Sector Measurement *i* subfield, $0 \le i \le 15$, has the same format and is defined in Figure 9-1174 (Sector Measurement subfield format(11ay)).

| | B0 B10 | B11 B16 | B17 B19 | B20 B22 | B23 B30 | B31 |
|---|---|---|---|---|---|---|
| | Sector ID/CDOWN/AWV ID | BRP CDOWN | TX Antenna ID | RX Antenna ID | SNR | Reserved |
| Bits: | 11 | 6 | 3 | 3 | 8 | 1 |

**Figure 9-1174—Sector Measurement subfield format(11ay)**

If the Sector Measurement subfield contains the feedback for a sector sweep performed using SSW frames, or Short SSW PPDUs, or DMG Beacon frames, the Sector ID/CDOWN/AWV ID subfield indicates the Sector ID of a PPDU received in the sector sweep, the TX Antenna ID subfield indicates the DMG antenna ID indicated in the PPDU, and the RX Antenna ID subfield indicates the receive DMG antenna through which the SNR contained in the SNR subfield was measured.

If the Sector Measurement subfield contains the feedback for a sector sweep performed using BRP-TX PPDUs, the Sector ID/CDOWN/AWV ID subfield contains the AWV feedback ID of the TRN subfields over which the SNR in the SNR subfield was measured. The BRP CDOWN field contains the value of the BRP CDOWN field in the BRP frame through in which the SNR in the SNR subfield was measured. The TX Antenna ID subfield has the value of the TX Antenna Mask field in the received BRP frame and the RX Antenna ID subfield indicates the receive DMG antenna through which the SNR in the SNR subfield was measured.

The encoding of the SNR subfield is defined in 9.4.2.135 (Channel Measurement Feedback element). A value of 254 in the SNR subfield indicates SNR values greater than or equal to 55.5 dB. A value of 255 indicates that this Sector Measurement subfield is invalid.

### 9.5.9 Sector Feedback field(11ay)

The Sector Feedback field is defined in Figure 9-1175 (Sector Feedback field format(11ay)).

| | RA | SSW Feedback | BRP Request | Beamformed Link Maintenance |
|---|---|---|---|---|
| Octets: | 6 | 3 | 4 | 1 |

**Figure 9-1175—Sector Feedback field format(11ay)**

The RA field contains the MAC address of the STA that is the intended destination of the Sector Feedback field.

The SSW Feedback field is defined in Figure 9-1165 (SSW Feedback field format when transmitted as part of an ISS).

The BRP Request field is defined in 9.5.4 (BRP Request field).

The Beamformed Link Maintenance field is defined in 9.5.6 (Beamformed Link Maintenance field).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

## 9.6 Action frame format details

### 9.6.1 General(11ax)

Subclause 9.6 (Action frame format details)(#1623) describes the Action field formats allowed in each of the action categories defined in Table 9-81 (Category values) in 9.4.1.11 (Action field). The frames defined in this subclause are Action frames, unless stated explicitly to be Action No Ack frames.

In the Action field formats defined in 9.6 (Action frame format details)(#1623), the fields and elements listed are always present unless stated otherwise.

### 9.6.2 Spectrum Management Action frame details(#3729)

#### 9.6.2.1 Spectrum Management Action field(#3729)

Five Action frame formats are defined for spectrum management. A Spectrum Management Action field, in the field immediately after the Category field, differentiates the five formats. The Spectrum Management Action field values associated with each frame format are defined in Table 9-452 (Spectrum Management Action field values).

**Table 9-452—Spectrum Management Action field values**

| Spectrum Management Action field value | Description |
|---|---|
| 0 | Spectrum Measurement Request |
| 1 | Spectrum Measurement Report |
| 2 | TPC Request |
| 3 | TPC Report |
| 4 | Channel Switch Announcement |
| 5–255 | Reserved |

#### 9.6.2.2 Spectrum Measurement Request frame format

The Spectrum Measurement Request frame is transmitted to request another STA to measure one or more channels. The format of the Spectrum Measurement Request frame Action field is shown in Figure 9-1176 (Spectrum Measurement Request frame Action field format).

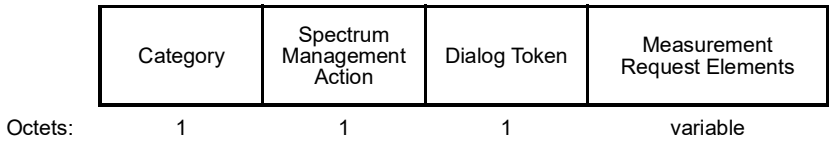

**Figure 9-1176—Spectrum Measurement Request frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The Spectrum Management Action field is defined in 9.6.2.1 (Spectrum Management Action field(#3729)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is set to a nonzero value chosen by the STA sending the measurement request to identify the request/report transaction.

The Measurement Request Elements field contains one or more of the Measurement Request elements described in 9.4.2.19 (Measurement Request element). The number and length of the Measurement Request elements in a Spectrum Measurement Request frame are limited by the maximum allowed MMPDU size.

### 9.6.2.3 Spectrum Measurement Report frame format

The Spectrum Measurement Report frame is transmitted in response to a Spectrum Measurement Request frame or transmitted autonomously providing measurement information. The format of the Spectrum Measurement Report frame Action field is shown in Figure 9-1177 (Spectrum Measurement Report frame Action field format).

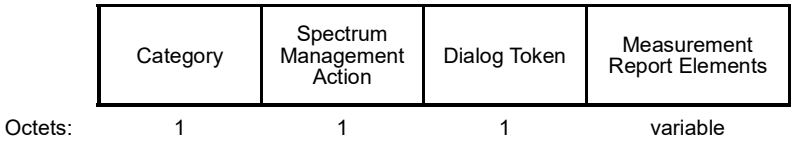

**Figure 9-1177—Spectrum Measurement Report frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The Spectrum Management Action field is defined in 9.6.2.1 (Spectrum Management Action field(#3729)).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is set to the same value as the Dialog Token field of the corresponding Spectrum Measurement Request frame. If the Spectrum Measurement Report frame is not being transmitted in response to a Spectrum Measurement Request frame, then the dialog token is set to 0.

The Measurement Report Elements field contains one or more of the Measurement Report elements described in 9.4.2.20 (Measurement Report element). The number and length of the Measurement Report elements in a Spectrum Measurement Report frame are limited by the maximum allowed MMPDU size.

### 9.6.2.4 TPC Request frame format

The TPC Request frame is transmitted requesting another STA for transmit power and link margin information. The format of the TPC Request frame Action field is shown in Figure 9-1178 (TPC Request frame Action field format).

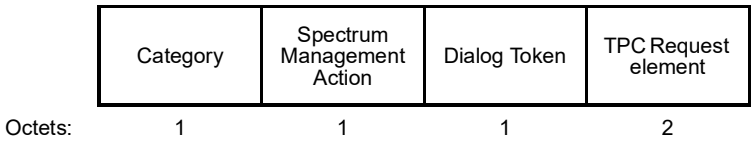

**Figure 9-1178—TPC Request frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The Spectrum Management Action field is defined in 9.6.2.1 (Spectrum Management Action field(#3729)).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is set to a nonzero value chosen by the STA sending the request to identify the transaction.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The TPC Request element is set as described in 9.4.2.14 (TPC Request element).

### 9.6.2.5 TPC Report frame format

The TPC Report frame is transmitted in response to a TPC Request frame. The format of the TPC Report frame Action field is shown in Figure 9-1179 (TPC Report frame Action field format).

| | Category | Spectrum Management Action | Dialog Token | TPC Report element |
|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | 4 |

**Figure 9-1179—TPC Report frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The Spectrum Management Action field is defined in 9.6.2.1 (Spectrum Management Action field(#3729)).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is set to the value of the Dialog Token field in the corresponding TPC Request frame.

The TPC Report element is set as described 9.4.2.15 (TPC Report element).

### 9.6.2.6 Channel Switch Announcement frame format

The Channel Switch Announcement frame is transmitted by a non-DMG AP, non-DMG IBSS STA, or mesh STA to advertise a channel switch. The format of the Channel Switch Announcement frame Action field is shown in Figure 9-1180 (Channel Switch Announcement frame Action field format).

| | Category | Spectrum Management Action | Channel Switch Announcement element | Secondary Channel Offset element |
|---|---|---|---|---|
| Octets: | 1 | 1 | 5 | 0 or 3 |
| | | Optional | Zero or more | Zero or one |
| | Mesh Channel Switch Parameters element | Wide Bandwidth Channel Switch element | New Transmit Power Envelope Element (M118) | Max Channel Switch Time Element (#7160) |
| Octets: | 0 or 8 | 0 or 5 | variable | 0 or 6 |

**Figure 9-1180—Channel Switch Announcement frame Action field format**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Category field is defined in 9.4.1.11 (Action field).

The Spectrum Management Action field is defined in 9.6.2.1 (Spectrum Management Action field(#3729)).

The Channel Switch Announcement element is set as described 9.4.2.17 (Channel Switch Announcement element).

The Secondary Channel Offset element is defined in 9.4.2.18 (Secondary Channel Offset element). This element is present when switching to a 40 MHz or wider channel. It can be present when switching to a 20 MHz channel (in which case the Secondary Channel Offset field is set to SCN); see 11.38.4 (Channel switching methods for a VHT BSS).

The Mesh Channel Switch Parameters element is defined in 9.4.2.101 (Mesh Channel Switch Parameters element). This element is present when a mesh STA performs MBSS channel switching. Otherwise, the Mesh Channel Switch Parameters element is not present.

The Wide Bandwidth Channel Switch element is defined in 9.4.2.159 (Wide Bandwidth Channel Switch element). This element is present when switching to a channel width wider than 40 MHz.

Each New Transmit Power Envelope element that is present is defined to have the same format as the Transmit Power Envelope element (see 9.4.2.160 (Transmit Power Envelope element)) and includes a distinct value of the Local Maximum Transmit Power Unit Interpretation subfield. If present, the New Transmit Power Envelope element indicates the local maximum transmit powers for the BSS for the indicated bandwidths with an indicated unit interpretation after channel switching (see 11.38.1 (Basic VHT BSS functionality)).

(#7160)(#8094)The Max Channel Switch Time Element field, if present, contains a Max Channel Switch Time element as defined in 9.4.2.216 (Max Channel Switch Time element).

### 9.6.3 QoS Action frame details

#### 9.6.3.1 QoS Action field(#3729)

Several Action frame formats are defined for QoS purposes. These frames are identified by the single octet QoS Action field, which follows immediately after the Category field. The values of the QoS Action field are defined in Table 9-453 (QoS Action field values).

**Table 9-453—QoS Action field values**

| QoS Action field value | Meaning |
|---|---|
| 0 | ADDTS Request |
| 1 | ADDTS Response |
| 2 | DELTS |
| 3 | Schedule |
| 4 | QoS Map Configure |
| 5 | ADDTS Reserve Request |
| 6 | ADDTS Reserve Response |
| 7–255 | Reserved |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Two variants are defined for the ADDTS frames: a Basic ADDTS frame variant and a DMG ADDTS frame variant. These variants use different TSPEC formats. The variant of the frame is indicated by the Element ID in the fourth field of the ADDTS Request frame Action field format (see Table 9-456 (Basic ADDTS Request frame variant Action field format) and Table 9-457 (DMG ADDTS Request frame variant Action field format)) and sixth field of the ADDTS Response frame Action field format (see Table 9-458 (Basic ADDTS Response frame variant Action field format) and Table 9-459 (DMG ADDTS Response frame variant Action field format)). The Element ID is the first octet of each of these fields. The encoding of the ADDTS frame variants is shown in Table 9-454 (Encoding of the ADDTS Request frame variant) and Table 9-455 (Encoding of the ADDTS Response frame variant).

**Table 9-454—Encoding of the ADDTS Request frame variant**

| Element ID of fourth field of ADDTS Request frame | ADDTS Request frame variant |
|---|---|
| 13 (TSPEC) | Basic ADDTS Request frame |
| 146 (DMG TSPEC) | DMG ADDTS Request frame |

**Table 9-455—Encoding of the ADDTS Response frame variant**

| Element ID of sixth field of ADDTS Response frame | ADDTS Response frame variant |
|---|---|
| 13 (TSPEC) | Basic ADDTS Response frame |
| 146 (DMG TSPEC) | DMG ADDTS Response frame |

### 9.6.3.2 Basic and DMG ADDTS Request frame format

#### 9.6.3.2.1 Basic ADDTS Request frame variant

The ADDTS frames are used to carry TSPEC and optionally TCLAS elements to set up and maintain TSs using the procedures defined in 11.4 (TS operation).

The Action field of the ADDTS Request frame contains the information shown in Table 9-456 (Basic ADDTS Request frame variant Action field format).

**Table 9-456—Basic ADDTS Request frame variant Action field format**

| Order | Information | Notes |
|---|---|---|
| 1 | Category | |
| 2 | QoS Action | |
| 3 | Dialog token | |
| 4 | TSPEC | |
| 5 | TCLAS | Optional |
| 6 | TCLAS Processing | Optional |
| 7 | U-APSD Coexistence | Optional |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-456—Basic ADDTS Request frame variant Action field format**

| | | |
|---|---|---|
| 8 | Expedited Bandwidth Request | Optional |
| 9 | Intra-Access Category Priority | Optional |
| 10 | Higher Layer Stream ID | Only in AP-initiated TS setup |
| 11 | Multi-band | Optional |
| 12 | U-PID | Optional |
| 13 | Multiple MAC Sublayers | Optional |

The Category field is defined in 9.4.1.11 (Action field).

The QoS Action field is defined in 9.6.3.1 (QoS Action field(#3729)).

The values of the Dialog Token, TCLAS, and subsequent fields of this frame are the same as the values of the corresponding parameters in the invocation of the MLME-ADDTS.request primitive that causes the frame to be sent. Some of the TSPEC parameters have the same values as the corresponding parameters in the invocation of the MLME-ADDTS.request primitive, while the values of the other fields (i.e., Surplus Bandwidth Allowance, Minimum Service Interval, Maximum Service Interval, and Minimum PHY Rate) are generated within the MAC.

The TSPEC element, defined in 9.4.2.28 (TSPEC element), and the optional TCLAS element, defined in 9.4.2.29 (TCLAS element), contain the QoS parameters that define the TS. The TS is identified by the TSID and Direction fields within the TSPEC element. The TCLAS element is optional at the discretion of the STA that sends the ADDTS Request frame, regardless of the setting of the access policy (EDCA, SPCA, or HCCA). There are zero or more TCLAS elements in the ADDTS frame. The TCLAS Processing element is present when there is more than one TCLAS element and is defined in 9.4.2.31 (TCLAS Processing element). An Expedited Bandwidth Request element is optionally present, which is defined in 9.4.2.92 (Expedited Bandwidth Request element).

The U-APSD Coexistence element, defined in 9.4.2.89 (U-APSD Coexistence element), contains the coexistence parameters requested by the non-AP STA when using the U-APSD coexistence capability as described in 11.2.3.5.2 (U-APSD coexistence). The U-APSD Coexistence element is optionally present.

An Intra-Access Category Priority element is optionally present, which is defined in 9.4.2.119 (Intra-Access Category Priority element) and described in 11.4.1 (Introduction).

The Higher Layer Stream ID element (9.4.2.123 (Higher Layer Stream ID element)) provides the stream identifier from a higher layer protocol. The Higher Layer Stream ID element is present only in the AP-initiated TS setup (11.4.4.3 (AP-initiated TS setup)).

When present in an ADDTS Request frame, the Multi-band element indicates the frequency band, operating class, and channel number to which the ADDTS Request frame applies and contains band-specific information.

When present in the ADDTS Request frame, the U-PID element indicates the upper layer protocol associated with the TID/TSID specified within the TSPEC element contained in this frame.

When present in the ADDTS Request frame, the Multiple MAC Sublayers element is used to establish an MMSL cluster.

This is an unapproved IEEE Standards Draft, subject to change.

#### 9.6.3.2.2 DMG ADDTS Request frame variant

The DMG ADDTS Request frame is used by DMG STAs in a PBSS and in an infrastructure BSS. The Action field of the DMG ADDTS Request frame contains the information shown in Table 9-457 (DMG ADDTS Request frame variant Action field format).

**Table 9-457—DMG ADDTS Request frame variant Action field format**

| Order | Information | Notes |
|---|---|---|
| 1 | Category | |
| 2 | Action | |
| 3 | Dialog Token | |
| 4 | DMG TSPEC | |
| 5 | TSPEC | Optional |
| 6 | TCLAS | Optional |
| 7 | TCLAS Processing | Optional |
| 8 | Multi-band | Optional |
| 9 | U-PID | Optional |
| 10 | Multiple MAC Sublayers | Optional |
| 11 | Higher Layer Stream ID | Optional |

The values of the Dialog Token, DMG TSPEC, TSPEC, TCLAS, and subsequent fields of this frame are the same as the values of the corresponding parameters in the invocation of the MLME-ADDTS.request primitive that causes the frame to be sent.

The DMG TSPEC element contains the parameters that define an allocation. The allocation uniquely identified by the Source AID, Allocation ID, and Destination AID subfields within the DMG TSPEC element.

The optional TSPEC element defines a TS that can use the allocation if the allocation is created successfully.

The optional TCLAS element is used to identify the destination non-AP and non-PCP DMG STA of the ADDTS Request frame. If a TSPEC element is not present, then the TCLAS element is not present. There can be one or more TCLAS elements in the DMG ADDTS Request frame. The TCLAS Processing element is present if there is more than one TCLAS element.

When present in a DMG ADDTS Request frame, the Multi-band element indicates the frequency band, operating class, and channel number to which the TS identified by the optional TSPEC element applies.

When present in the DMG ADDTS Request frame, the U-PID element indicates the upper layer protocol associated with the TS identified by the optional TSPEC element contained in this frame. If a TSPEC element is not present in the frame, the U-PID element is not present in the frame.

When present in the DMG ADDTS Request frame, the Multiple MAC Sublayers element is used to establish an MMSL cluster.

### 9.6.3.3 Basic and DMG ADDTS Response frame format

#### 9.6.3.3.1 Basic ADDTS Response frame variant

The ADDTS Response frame is transmitted in response to an ADDTS Request frame. The Action field of the ADDTS Response frame contains the information shown in Table 9-458 (Basic ADDTS Response frame variant Action field format).

**Table 9-458—Basic ADDTS Response frame variant Action field format**

| Order | Information | Notes |
|---|---|---|
| 1 | Category | |
| 2 | QoS Action | |
| 3 | Dialog Token | |
| 4 | Status Code | |
| 5 | TS Delay | |
| 6 | TSPEC | |
| 7 | TCLAS | Optional |
| 8 | TCLAS Processing | Optional |
| 9 | Schedule | Optionally present if the status code is equal to SUCCESS; otherwise not present |
| 10 | Expedited Bandwidth Request | Optional |
| 11 | Higher Layer Stream ID | Only in AP-initiated TS setup |
| 12 | Multi-band | Optional |
| 13 | U-PID | Optional |
| 14 | Multiple MAC Sublayers | Optional |

The Category field is defined in 9.4.1.11 (Action field).

The QoS Action field is defined in 9.6.3.1 (QoS Action field(#3729)).

The Status Code field is defined in 9.4.1.9 (Status Code field).

The values the Dialog Token, TS Delay, TSPEC, TCLAS, and subsequent fields in this frame are the same as the values of the corresponding parameters in the invocation of the MLME-ADDTS.response primitive that causes the frame to be sent. The TS Delay element is present in an ADDTS Response frame only if the status code is equal to REJECTED_FOR_DELAY_PERIOD.

The Schedule element, defined in 9.4.2.32 (Schedule element), is present in an ADDTS Response frame only if the status code is equal to SUCCESS(i.e., when the TS is admitted).

The Higher Layer Stream ID element is present only in AP-initiated TS setup. The Higher Layer Stream ID element (9.4.2.123 (Higher Layer Stream ID element)) contains the stream identifier provided by a higher layer protocol.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

When present in an ADDTS Response frame, the Multi-band element indicates the frequency band, operating class, and channel number to which the ADDTS Response frame applies and contains band-specific information.

When present in the ADDTS Response frame, the U-PID element indicates the upper layer protocol associated with the TID/TSID specified within the TSPEC contained in this frame.

When present in the ADDTS Response frame, the Multiple MAC Sublayers element is used to establish an MMSL cluster (see 11.32 (MMSL cluster operation)).

#### 9.6.3.3.2 DMG ADDTS Response frame variant

The DMG ADDTS Response frame is used by DMG STAs in a PBSS and in an infrastructure BSS. The Action field of the DMG ADDTS Response frame contains the information shown in Table 9-459 (DMG ADDTS Response frame variant Action field format).

**Table 9-459—DMG ADDTS Response frame variant Action field format**

| Order | Information | Notes |
|---|---|---|
| 1 | Category | |
| 2 | Action | |
| 3 | Dialog Token | |
| 4 | Status Code(#3326) | |
| 5 | TS Delay | |
| 6 | DMG TSPEC | |
| 7 | TSPEC | Optional |
| 8 | TCLAS | Optional |
| 9 | TCLAS Processing | Optional |
| 10 | Multi-band | Optional |
| 11 | U-PID | Optional |
| 12 | Multiple MAC Sublayers | Optional |
| 13 | Higher Layer Stream ID | Optional |

The values of the Dialog Token, TS Delay, DMG TSPEC, TSPEC, TCLAS, and subsequent fields in this frame are the same as the values of the corresponding parameters in the invocation of the MLME-ADDTS.response primitive that causes the frame to be sent. The TS Delay element is present in a DMG ADDTS Response frame only if the status code is set to REJECTED_FOR_DELAY_PERIOD (9.4.1.9 (Status Code field)).

When present in a DMG ADDTS Response frame, the Multi-band element indicates the frequency band, operating class, and channel number to which the TS identified by the optional TSPEC element applies.

When present in the DMG ADDTS Response frame, the U-PID element indicates the upper layer protocol associated with the TS identified by the optional TSPEC contained in this frame. If a TSPEC element is not present in the frame, the U-PID element is not present in the frame.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

When present in the DMG ADDTS Response frame, the Multiple MAC Sublayers element is used to establish an MMSL cluster (see 11.32 (MMSL cluster operation)).

#### 9.6.3.4 DELTS frame format

The DELTS frame is used to delete a TS or an allocation using the procedures defined in 11.4.8 (TS deletion).

The Action field of a DELTS frame contains the information shown in Table 9-460 (DELTS frame Action field format).

**Table 9-460—DELTS frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | QoS Action |
| 3 | TS Info |
| 4 | Reason Code |
| 5 | DMG Allocation Info (optional) |
| 6 | Multi-band (optional) |

The Category field is defined in 9.4.1.11 (Action field).

The QoS Action field is defined in 9.6.3.1 (QoS Action field(#3729)).

The TS Info field is defined in 9.4.2.28 (TSPEC element). Either the field identifies an existing TS created using the TSPEC element, or all its subfields are set to 0. The DMG Allocation Info field, defined in 9.4.2.132 (DMG TSPEC element), is present when an existing DMG allocation is being deleted. When a DMG allocation is being deleted, the DMG Allocation Info field identifies an existing allocation created using the DMG TSPEC element. When a DMG allocation is not being deleted, all subfields in the DMG Allocation Info field are set to 0.

The Reason Code field is defined in 9.4.1.7 (Reason Code field).

A DELTS frame is used to delete a TS characterized by the TS Info field or to delete a DMG allocation identified by the DMG Allocation Info field in the frame. A DELTS frame can be sent from the HC or PCP to the source STA of that TS, or vice versa, to indicate an imperative request, to which no response is required from the recipient STA.

When present in an DELTS frame, the Multi-band element indicates the frequency band, operating class, and channel number to which the DELTS frame applies.

#### 9.6.3.5 Schedule frame format

The Schedule frame is transmitted by the HC to announce the schedule of delivery of data and polls. The Action field of the Schedule frame contains the information shown in Table 9-461 (Schedule frame Action field format).

The Category field is defined in 9.4.1.11 (Action field).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-461—Schedule frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | QoS Action |
| 3 | Schedule |

The QoS Action field is defined in 9.6.3.1 (QoS Action field(#3729)).

The Schedule element is defined in 9.4.2.32 (Schedule element).

### 9.6.3.6 QoS Map Configure frame format

The QoS Map Configure frame is used by an AP to provide the QoS Map information to a non-AP STA using the procedures defined in 11.22.9 (Interworking procedures: support for QoS mapping from external networks).

The Action field of the QoS Map Configure frame contains the information shown in Table 9-462 (QoS Map Configure frame Action field format).

**Table 9-462—QoS Map Configure frame Action field format**

| Order | Information |
|---|---|
| 0 | Category |
| 1 | QoS Action |
| 2 | QoS Map |
| 3 | Intra-Access Category Priority elements (optional) |

The Category field is defined in 9.4.1.11 (Action field).

The QoS Action field is defined in 9.6.3.1 (QoS Action field(#3729)).

The QoS Map element is defined in 9.4.2.93 (QoS Map element).

Zero or more Intra-Access Category Priority elements are present, which are defined in 9.4.2.119 (Intra-Access Category Priority element).

### 9.6.3.7 ADDTS Reserve Request frame format

The ADDTS Reserve Request frame is transmitted by an AP to a non-AP STA in response to a higher layer protocol. See 11.4.4.3 (AP-initiated TS setup).

The Action field of the ADDTS Reserve Request frame contains the information shown in Table 9-463 (ADDTS Reserve Request frame Action field format).

The Category field is defined in 9.4.1.11 (Action field).

The QoS Action field is defined in 9.6.3.1 (QoS Action field(#3729)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-463—ADDTS Reserve Request frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | QoS Action |
| 3 | TSPEC |
| 4 | Schedule |
| 5 | Higher Layer Stream ID |

The TSPEC element contains the QoS parameters that define the TS. The QoS parameters in the TSPEC are equivalent to the QoS parameters of the higher level stream identified by the Higher Level Stream ID. The TS is identified by the TSID and Direction fields within the TSPEC element.

The Schedule element is defined in 9.4.2.32 (Schedule element) and set to reflect schedule information corresponding to the TSPEC specification.

The Higher Layer Stream ID element (defined in 9.4.2.123 (Higher Layer Stream ID element)) provides the stream identifier from a higher layer protocol.

### 9.6.3.8 ADDTS Reserve Response frame format

An ADDTS Reserve Response frame is used by a non-AP STA to indicate the completion of an AP-initiated TS setup procedure (11.4.4.3 (AP-initiated TS setup)). The Action field of the ADDTS Reserve Response frame contains the information shown in Table 9-464 (ADDTS Reserve Response frame Action field format).

**Table 9-464—ADDTS Reserve Response frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | QoS Action |
| 3 | Higher Layer Stream ID |
| 4 | Status Code |

The Category field is defined in 9.4.1.11 (Action field).

The QoS Action field is defined in 9.6.3.1 (QoS Action field(#3729)).

The Higher Layer Stream ID field contains a Higher Layer Stream ID element (see 9.4.2.123 (Higher Layer Stream ID element)).

The Status Code field is defined in 9.4.1.9 (Status Code field).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 9.6.4 Block Ack Action frame details

#### 9.6.4.1 Block Ack Action field(#3729)

ADDBA Request and ADDBA Response frames are used to set up or to modify block ack operation(#3518) for a specific TC, TS, or GCR group address. (#4341)A Block Ack Action field, in the octet immediately after the Category field, differentiates the Block Ack Action frame formats. The Block Ack Action frames are used to negotiate several parameters of a block ack agreement and the type of BlockAck frames that are used: BlockAck, NDP BlockAck and Block Acknowledgment TWT frames (see 10.25.2 (Setup and modification of the block ack parameters)). The Block Ack Action field values associated with each frame format within the Block Ack category are defined in Table 9-465 (Block Ack Action field values).

**Table 9-465—Block Ack Action field values**

| Block Ack Action field values | Meaning |
|---|---|
| 0 | ADDBA Request |
| 1 | ADDBA Response |
| 2 | DELBA |
| 3(#3014) | PBAC WinStart Update |
| 4–127 | Reserved |
| 128 | NDP ADDBA Request |
| 129 | NDP ADDBA Response |
| 130 | NDP DELBA |
| 131 | Reserved |
| 132 | BAT ADDBA Request |
| 133 | BAT ADDBA Response |
| 134 | BAT DELBA |
| 135–255 | Reserved |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 9.6.4.2 ADDBA Request frame format

An ADDBA Request frame is sent by an originator of block ack to another STA. The Action field of an ADDBA Request frame contains the information shown in Table 9-466 (ADDBA Request frame Action field format).

**Table 9-466—ADDBA Request frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | Block Ack Action |
| 3 | Dialog Token |
| 4 | Block Ack Parameter Set |
| 5 | Block Ack Timeout Value |
| 6 | Block Ack Starting Sequence Control |
| 7 | GCR Group Address element (optional) |
| 8 | Multi-band (optional) |
| 9 | TCLAS (optional) |
| 10 | ADDBA Extension (optional) |
| 11(11ay) | EDMG Flow Control Extension Configuration (optional) |
| 12(11ay) | SAR Configuration (optional) |

The Category field is defined in 9.4.1.11 (Action field).

The Block Ack Action field is defined in 9.6.4.1 (Block Ack Action field(#3729)) for each of the ADDBA request variants.(#4199)

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). For an unsolicited block ack extension agreement, the Dialog Token field is set to 0. Otherwise, it is set to a nonzero value chosen by the STA. (11ay)

The Block Ack Parameter Set field is defined in 9.4.1.13 (Block Ack Parameter Set field).

The Block Ack Timeout Value field is defined in 9.4.1.14 (Block Ack Timeout Value field).

The Starting Sequence Number subfield of the Block Ack Starting Sequence Control field (see Figure 9-48 (Block Ack Starting Sequence Control subfield format)) contains the sequence number of the first or next (in the case of a renegotiation of a block ack agreement) (#4194)MSDU (not in an A-MSDU) or A-MSDU to be sent under this block ack agreement. The Fragment Number subfield is set to 0.

If the GCR Group Address element is present, the TID field within the Block Ack Parameter Set field is reserved.

The GCR Group Address element contains the group address for which a block ack agreement is requested.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

When present in an ADDBA Request frame, the Multi-band element indicates the frequency band, operating class, and channel number to which the ADDBA Request frame applies and contains band-specific information.

The ADDBA Extension element is defined in 9.4.2.138 (ADDBA Extension element).

(11ay)The EDMG Flow Control Extension Configuration element is defined in 9.4.2.276 (EDMG Flow Control Extension Configuration element(11ay)).

(11ay)The SAR Configuration element is defined in 9.4.2.279 (SAR Configuration element(11ay)).

### 9.6.4.3 ADDBA Response frame format

The ADDBA Response frame is sent in response to an ADDBA Request frame. The Action field of an ADDBA Response frame contains the information shown in Table 9-467 (ADDBA Response frame Action field format).

**Table 9-467—ADDBA Response frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | Block Ack Action |
| 3 | Dialog Token |
| 4 | Status Code |
| 5 | Block Ack Parameter Set |
| 6 | Block Ack Timeout Value |
| 7 | GCR Group Address element (optional) |
| 8 | Multi-band (optional) |
| 9 | TCLAS (optional) |
| 10 | ADDBA Extension (optional) |
| 11(#1444) | Reserved |
| 12(11ay) | EDMG Flow Control Extension Configuration (optional) |
| 13(11ay) | SAR Configuration (optional) |
| 14(#1444) | Originator Preferred MCS element (optional) |

The Category field is defined in 9.4.1.11 (Action field).

The Block Ack Action field is defined in 9.6.4.1 (Block Ack Action field(#3729)) for each of the ADDBA response variants.(#4199)

The Dialog Token field value is copied from the corresponding received ADDBA Request frame.

The Status Code field is defined in 9.4.1.9 (Status Code field).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Block Ack Parameter Set field is defined in 9.4.1.13 (Block Ack Parameter Set field).

The Block Ack Timeout Value field is defined in 9.4.1.14 (Block Ack Timeout Value field).

If the GCR Group Address element is present, the TID field within the Block Ack Parameter Set field is reserved.

The GCR Group Address element contains the group address for which a block ack agreement is requested.

When present in an ADDBA Response frame, the Multi-band element indicates the frequency band ID, operating class, and channel number to which the ADDBA Response frame applies and contains band-specific information.

The ADDBA Extension element is defined in 9.4.2.138 (ADDBA Extension element).(#8255)

(#1444)The Originator Preferred MCS field element (#8254)is optionally present if dot11S1GOptionImplemented is true, and the Block Ack Action field is 1. Otherwise, it is not present.

(11ay)The EDMG Flow Control Extension Configuration element is defined in 9.4.2.276 (EDMG Flow Control Extension Configuration element(11ay)).

(11ay)The SAR Configuration element is defined in 9.4.2.279 (SAR Configuration element(11ay)) and is included in the frame if a SAR Configuration element was included in the corresponding ADDBA Request frame.

### 9.6.4.4 DELBA frame format

The DELBA frame is sent by either the originator of the traffic or the recipient to terminate the block ack agreement(#6171). The Action field of a DELBA frame contains the information shown in Table 9-468 (DELBA frame Action field format).

**Table 9-468—DELBA frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | Block Ack Action |
| 3 | DELBA Parameter Set |
| 4 | Reason Code |
| 5 | DELBA GCR Group Address |
| 6 | Multi-band (optional) |
| 7 | TCLAS (optional) |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Category field is defined in 9.4.1.11 (Action field).

The Block Ack Action field is defined in 9.6.4.1 (Block Ack Action field(#3729)) for each of the DELBA variants.(#4199)

The DELBA Parameter Set field is defined in 9.4.1.16 (DELBA Parameter Set field).

The Reason Code field is defined in 9.4.1.7 (Reason Code field).

The DELBA GCR Group Address field is defined in 9.4.2.124 (GCR Group Address element) and contains the GCR group address whose block ack agreement is being terminated.

When present in an DELBA frame, the Multi-band element indicates the frequency band, operating class, and channel number to which the DELBA frame applies.

#### 9.6.4.5 PBAC WinStart Update frame format(#3014)

The PBAC WinStart Update frame is sent by an originator to update(#6304) $WinStart_B$ and $WinStart_R$ at the recipient for a protected block ack agreement (see 10.25.7 (Protected block ack agreement)). The Action field of a PBAC WinStart Update frame contains the information shown in Table 9-469 (PBAC WinStart Update frame Action field format(#3014)).

**Table 9-469—PBAC WinStart Update frame Action field format(#3014)**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | Block Ack Action |
| 3 | Block Ack Parameter Set |
| 4 | Block Ack Starting Sequence Control |

The Category field is defined in 9.4.1.11 (Action field).

The Block Ack Action field is defined in 9.6.4.1 (Block Ack Action field(#3729)).(#4199)

The Block Ack Parameter Set field is defined in 9.4.1.13 (Block Ack Parameter Set field).

The Starting Sequence Number subfield of the Block Ack Starting Sequence Control field (see Figure 9-48 (Block Ack Starting Sequence Control subfield format)) contains the sequence number of the next (#4194)MSDU (not in an A-MSDU) or A-MSDU to be sent under this block ack agreement. The Fragment Number subfield is set to 0.

### 9.6.5 Vendor Specific Action frame and Vendor Specific Protected Action frame details(#3729)(#4065)

(#4065)Vendor Specific Action and Vendor Specific Protected Action frames are defined for vendor-specific signaling. The format of the Action field of these frames is shown in Figure 9-1181 (Action field format of Vendor Specific Action and Vendor Specific Protected Action frames(#4065-Ed)).

NOTE—If management frame protection is negotiated, then Vendor Specific Protected Action frames (see Table 9-81 (Category values)) are protected; otherwise they are unprotected.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

| Category | Organization Identifier | Vendor Specific Content |
|---|---|---|
| Octets: 1 | 3 or 5(#7136) | variable |

**Figure 9-1181—Action field format of Vendor Specific Action and Vendor Specific Protected Action frames(#4065-Ed)**

The Category field is defined in 9.4.1.11 (Action field).

The Organization Identifier field contains(#4065) the identity of the entity that has defined the content of the Vendor Specific Action and Vendor Specific Protected Action frames (see 9.4.1.29 (Organization Identifier field) for a description of the Organization Identifier field contents and length).(#7136)

The Vendor Specific Content field contains vendor-specific field(s). The length of the vendor specific content in a (#4065)Vendor Specific Action and Vendor Specific Protected Action frame is limited by the maximum allowed MMPDU size.

### 9.6.6 Radio Measurement Action frame details(#3729)

#### 9.6.6.1 Radio Measurement Action field(#3729)

Several Action frame formats are defined for radio measurement purposes. A Radio Measurement Action field, in the field immediately after the Category field, differentiates the formats. The Radio Measurement Action field values associated with each frame format are defined in Table 9-470 (Radio Measurement Action field values).

**Table 9-470—Radio Measurement Action field values**

| Radio Measurement Action field value | Description |
|---|---|
| 0 | Radio Measurement Request |
| 1 | Radio Measurement Report |
| 2 | Link Measurement Request |
| 3 | Link Measurement Report |
| 4 | Neighbor Report Request |
| 5 | Neighbor Report Response |
| 6–255 | Reserved |

#### 9.6.6.2 Radio Measurement Request frame format

The Radio Measurement Request frame is transmitted to another STA to request that it makes one or more measurements on one or more channels. The format of the Action field in the Radio Measurement Request frame is shown in Figure 9-1182 (Radio Measurement Request frame Action field format).

The Category field is defined in 9.4.1.11 (Action field).

The Radio Measurement Action field is defined in 9.6.6.1 (Radio Measurement Action field(#3729)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Figure 9-1182—Radio Measurement Request frame Action field format**

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is set to a nonzero value chosen by the STA sending the radio measurement request to identify the request/report transaction.

The Number of Repetitions field contains the requested number of repetitions for all of the Measurement Request elements in this frame. Setting the Number of Repetitions field to 0 indicates Measurement Request elements are executed once without repetition. Setting the Number of Repetitions field to 65 535 indicates Measurement Request elements are repeated until the measurement is canceled or superseded.

The Measurement Request Elements field contains zero or more of the Measurement Request elements described in 9.4.2.19 (Measurement Request element). The number and length of the Measurement Request elements in a Measurement Request frame are limited by the maximum allowed MMPDU size.

### 9.6.6.3 Radio Measurement Report frame format

The Radio Measurement Report frame is transmitted in response to a Radio Measurement Request frame or by a STA providing a triggered autonomous measurement report. The format of the Action field in the Radio Measurement Report frame is shown in Figure 9-1183 (Radio Measurement Report frame Action field format).

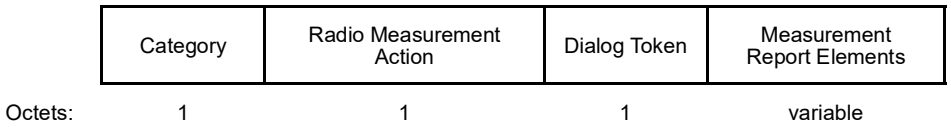

**Figure 9-1183—Radio Measurement Report frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The Radio Measurement Action field is defined in 9.6.6.1 (Radio Measurement Action field(#3729)).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is set to the value in the corresponding Radio Measurement Request frame. If the Radio Measurement Report frame is not being transmitted in response to a Radio Measurement Request frame then the dialog token is set to 0.

The Measurement Report Elements field contains one or more Measurement Report elements described in 9.4.2.20 (Measurement Report element). The number and length of the Measurement Report elements in a single Radio Measurement Report frame are limited by the maximum allowed MMPDU size. Subclause 11.10.6 (Requesting and reporting of measurements) describes the required behavior for multiframe Radio Measurement Report frame responses.

### 9.6.6.4 Link Measurement Request frame format

The Link Measurement Request frame is transmitted by a STA to request another STA to respond with a Link Measurement Report frame to enable measurement of link path loss and estimation of link margin. In a non-DMG BSS, a Link Measurement Request frame is an Action frame and in a DMG BSS, a Link Measurement Request frame is an Action or an Action No Ack frame. The format of the Action field in the

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Link Measurement Request frame is shown in Figure 9-1184 (Link Measurement Request frame Action field format).

| | Category | Radio Measurement Action | Dialog Token | Transmit Power Used | Max Transmit Power | Extended Link Measurement(11ay) |
|---|---|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | 1 | 1 | variable |

**Figure 9-1184—Link Measurement Request frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The Radio Measurement Action field is defined in 9.6.6.1 (Radio Measurement Action field(#3729)).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is set to a nonzero value chosen by the STA sending the request to identify the transaction.

The Transmit Power Used field is set to the transmit power used to transmit the frame containing the Link Measurement Request, as described in 9.4.1.20 (Transmit Power Used field).

The Max Transmit Power field provides the upper limit on the transmit power as measured at the antenna connector to be used by the transmitting STA on its operating channel. This field is described in 9.4.1.19 (Max Transmit Power field). (#1446)The Max Transmit Power field is set to the minimum of the maximum powers at which the STA is permitted to transmit in the operating channel by device capability, policy, and regulatory authority.

(11ay)The Extended Link Measurement field is optionally present. When present, it contains an Extended Link Measurement element.

### 9.6.6.5 Link Measurement Report frame format

The Link Measurement Report frame is transmitted in response to a Link Measurement Request frame. In a non-DMG BSS, a Link Measurement Report frame is an Action frame and in a DMG BSS, a Link Measurement Report frame is an Action or an Action No Ack frame. The format of the Action field in the Link Measurement Report frame is shown in Figure 9-1185 (Link Measurement Report frame Action field format).

| | Category | Radio Measurement Action | Dialog Token | TPC Report element | Receive Antenna ID | Transmit Antenna ID | RCPI |
|---|---|---|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | 4 | 1 | 1 | 1 |

| | RSNI | DMG Link Margin | DMG Link Adaptation Acknowledgment | Extended Link Measurement(11ay) |
|---|---|---|---|---|
| Octets: | 1 | variable | variable | variable |

**Figure 9-1185—Link Measurement Report frame Action field format**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Category field is defined in 9.4.1.11 (Action field).

The Radio Measurement Action field is defined in 9.6.6.1 (Radio Measurement Action field(#3729)).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is set to the value of the Dialog Token field in the last received(11ay) corresponding Link Measurement Request frame.

The TPC Report element is set as described in 9.4.2.15 (TPC Report element).

The Receive Antenna ID field contains the identifying number for the antenna(s) or DMG antenna used to receive the corresponding Link Measurement Request frame or the last received frame from the requesting STA within the corresponding report interval.(11ay) The antenna ID or DMG antenna ID is defined in 9.4.2.38 (Antenna element).

The Transmit Antenna ID field contains the identifying number for the antenna(s) or DMG antenna used to transmit this Link Measurement Report frame. The antenna ID or DMG antenna ID is defined in 9.4.2.38 (Antenna element).

The RCPI field indicates the received channel power of the corresponding Link Measurement Request frame, which is a logarithmic function of the received signal power or the last received frame from the requesting STA within the corresponding report interval,(11ay) as defined in 9.4.2.36 (RCPI element).

The RSNI field indicates the received signal-to-noise indication for the corresponding Link Measurement Request frame or the last received frame from the requesting STA within the corresponding report interval,(11ay) as described in 9.4.2.39 (RSNI element).

The DMG Link Margin field is optionally present. When present, it contains a DMG Link Margin element (see 9.4.2.141 (DMG Link Margin element)).

The DMG Link Margin Adaptation Acknowledgment field is optionally present. When present, it contains a DMG Link Margin Adaptation Acknowledgment element (see 9.4.2.141.3 (Rate Adaptation Control/ Extended TPC field(11ay))).

(11ay)The Extended Link Measurement field is optionally present. When present, it contains an Extended Link Measurement element.

### 9.6.6.6 Neighbor Report Request frame format

The Neighbor Report Request frame is transmitted requesting information in the neighbor report about neighboring APs. The format of the Action field in the Neighbor Report Request frame is shown in Figure 9-1186 (Neighbor Report Request frame Action field format).

| | Category | Radio Measurement Action | Dialog Token | SSID (optional) | LCI Measurement Request (optional) | Location Civic Measurement Request (optional) | Neighbor DMG Request (optional)(11az) |
|---|---|---|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | variable | variable | variable | variable |

**Figure 9-1186—Neighbor Report Request frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The Radio Measurement Action field is defined in 9.6.6.1 (Radio Measurement Action field(#3729)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is set to a nonzero value chosen by the STA sending the measurement request to identify the request/report transaction.

The SSID field is optionally present. If present, it contains an SSID element. The presence of an SSID element in a Neighbor Report Request frame indicates a request for a list of neighbor reports for the specified SSID in the SSID element. The absence of an SSID element indicates the request is for the ESS of which the transmitting STA is a member.

The LCI Measurement Request field is optionally present. If present, it contains a Measurement Request element with Measurement Type field equal to LCI (see Table 9-136 (Measurement type definitions for measurement requests)), which indicates a request for a Measurement Report subelement with Measurement Type field equal to LCI for each Neighbor Report element (see 11.10.10.2 (Requesting a neighbor report)). The Enable subfield(#291) in the Measurement Request Mode field in the Measurement Request element is set to 0. The Location Subject field in the Measurement Request field of the Measurement Request element is set to Location Subject Remote (see Table 9-148 (Location Subject field definition)). The Request, Report and Duration Mandatory subfield(#291) within the Measurement Request Mode field in the Measurement Request element are reserved (see 9.4.2.19.1 (General)).

The Location Civic Measurement Request field is optionally present. If present, it contains a Measurement Request element with Measurement Type field equal to Location Civic (see Table 9-136 (Measurement type definitions for measurement requests)). The element indicates a request for a Measurement Report subelement with Measurement Type field equal to Location Civic for each Neighbor Report element (see 11.10.10.2 (Requesting a neighbor report)). The Enable subfield(#291) in the Measurement Request Mode field within the Measurement Request element is set to 0. The Location Subject field in the Measurement Request field of the Measurement Request element is equal to Location Subject Remote (see Table 9-148 (Location Subject field definition)). The Location Service Interval Units field in the Measurement Request field of the Measurement Request element is set to 0. The Request, Report and Duration Mandatory subfield(#291) in the Measurement Request Mode field in the Measurement Request element are reserved (see 9.4.2.19.1 (General)).

(11az)The Neighbor DMG Request field is optionally present. If present, it contains a Measurement Request element with Measurement Type field equal to neighboring DMG APs; see Table 9-136 (Measurement type definitions for measurement requests). The element indicates a request for Neighbor Report elements containing information about neighboring DMG APs supporting location services. The Enable bit in the Measurement Request Mode field within the Measurement Request element is set to 0.

### 9.6.6.7 Neighbor Report Response frame format

The Neighbor Report Response frame is transmitted in response to a Neighbor Report Request frame. The format of the Action field in the Neighbor Report Response frame is shown in Figure 9-1187 (Neighbor Report Response frame Action field format).

| | Category | Radio Measurement Action | Dialog Token | Neighbor Report Elements |
|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | variable |

**Figure 9-1187—Neighbor Report Response frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The Radio Measurement Action field is defined in 9.6.6.1 (Radio Measurement Action field(#3729)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Dialog Token field set to the value in the corresponding Neighbor Report Request frame. If the Neighbor Report Response frame is not being transmitted in response to a Neighbor Report Request frame, then the dialog token is set to 0.

The Neighbor Report Elements field contains the Neighbor Report elements for validated APs described in 9.4.2.35 (Neighbor Report element). If the STA has no information in response to the Neighbor Report Request, the Neighbor Report elements are omitted. The number and length of the Neighbor Report elements in a Neighbor Report Response frame is limited by the maximum allowed MMPDU size.

NOTE—Under some circumstances, a Neighbor Report element is included for the STA transmitting the frame. See 11.10.10.3 (Responding to a neighbor report request).

### 9.6.7 Public Action frame details(#3729)

#### 9.6.7.1 Public Action field(#3729)

The Public Action frame is defined to allow the following:

— Inter-BSS and AP to unassociated-STA communications
— Intra-BSS communication
— GAS

A Public Action field, in the octet immediately after the Category field, differentiates the Public Action frame formats. The defined Public Action frames are listed in Table 9-471 (Public Action field values).

**Table 9-471—Public Action field values**

| Public Action field value | Description |
|---|---|
| 0 | 20/40 BSS Coexistence Management |
| 1 | DSE Enablement |
| 2 | DSE Deenablement |
| 3 | DSE Registered Location Announcement |
| 4 | Extended Channel Switch Announcement |
| 5 | DSE Measurement Request |
| 6 | DSE Measurement Report |
| 7 | Measurement Pilot |
| 8 | DSE Power Constraint |
| 9 | Vendor Specific |
| 10 | GAS Initial Request |
| 11 | GAS Initial Response |
| 12 | GAS Comeback Request |
| 13 | GAS Comeback Response |
| 14 | TDLS Discovery Response |
| 15 | Location Track Notification |

### 9.6.7.2 20/40 BSS Coexistence Management frame format

The format of the 20/40 BSS Coexistence Management frame Action field is defined in Table 9-472 (20/40 BSS Coexistence Management frame Action field format).

**Table 9-472—20/40 BSS Coexistence Management frame Action field format**

| Order | Information | Notes |
|---|---|---|
| 1 | Category | |
| 2 | Public Action | |
| 3 | 20/40 BSS Coexistence (see 9.4.2.58 (20/40 BSS Coexistence element)) | |
| 4 | 20/40 BSS Intolerant Channel Report (see 9.4.2.56 (20/40 BSS Intolerant Channel Report element)) | Appears zero or more times |

The Category field is defined in 9.4.1.11 (Action field).

The Public Action field is defined in 9.6.7.1 (Public Action field(#3729)).

### 9.6.7.3 Measurement Pilot frame format

The format of the Action field of the Measurement Pilot frame is shown in Figure 9-1188 (Measurement Pilot frame Action field format).

The Category field is defined in 9.4.1.11 (Action field).

The Public Action field is defined in 9.6.7.1 (Public Action field(#3729)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

| | Category | Public Action | Condensed Capability Information | Condensed Country String | Operating Class | Channel | Measurement Pilot Interval | Optional Subelements |
|---|---|---|---|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | 2 | 1 | 1 | 1 | variable |

**Figure 9-1188—Measurement Pilot frame Action field format**

The Condensed Capability Information field contains two subfields as shown in Figure 9-1189 (Condensed Capability Information field).

| | B0 | B1 | B2 | B7 |
|---|---|---|---|---|
| | Spectrum Management | Short Slot Time | Reserved | |
| Bits: | 1 | 1 | 6 | |

**Figure 9-1189—Condensed Capability Information field**

The Spectrum Management subfield is set to 1 if dot11SpectrumManagementRequired is true; otherwise, it is set to 0.

The Short Slot Time subfield is set to 1 to indicate the short slot time value is currently used within this BSS. Otherwise, the Short Slot Time subfield is set to 0. See 10.3.2.16 (Operation of aSlotTime) and 11.1.3.2 (Beacon generation in non-DMG infrastructure networks).(#1761)

The Condensed Country String field is set to the first two octets of the value contained in dot11CountryString.

If the Wide Bandwidth Channel Switch subelement is not included, the Operating Class field indicates the operating class value for the operating channel. The Country, Operating Class, and Channel Number fields together specify the channel frequency and spacing for the operating channel. Valid operating classes are listed in Annex E, excluding Operating Classes that encompass a primary channel but do not identify the location of the primary channel. The Channel Number field indicates the operating channel. Channel number is defined within an operating class as shown in Annex E.

If the Wide Bandwidth Channel Switch subelement is included, the fields in the Wide Bandwidth Channel Switch subelement indicate the operating channel, and the Operating Class and Channel Number fields(#6181) together specify the primary channel and primary 40 MHz channel within the channel identified by the Wide Bandwidth Channel Switch subelement.

The Measurement Pilot Interval field is set to the value contained in dot11RMMeasurementPilotPeriod.

(#524)The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3 (Subelements).

The Subelement ID field values for the defined subelements are shown in Table 9-473 (Optional subelement IDs for Measurement Pilot frame).

The Wide Bandwidth Channel Switch subelement has the same format as the corresponding element (see 9.4.2.159 (Wide Bandwidth Channel Switch element)) with the constraint that the New Channel Width field indicates an 80 MHz, 160 MHz, or 80+80 MHz BSS bandwidth.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-473—Optional subelement IDs for Measurement Pilot frame**

| Subelement ID | Name | Extensible |
|---|---|---|
| 0–70 | Reserved | |
| 71 | Multiple BSSID | Subelements |
| 72–162 | Reserved | |
| 163 | Wide Bandwidth Channel Switch | Yes |
| 164–220 | Reserved | |
| 221 | Vendor Specific | Vendor defined |
| 222–255 | Reserved | |

The Multiple BSSID and Vendor Specific subelements have the same format as the Multiple BSSID and Vendor Specific elements (see 9.4.2.44 (Multiple BSSID element) and 9.4.2.24 (Vendor Specific element), respectively). Zero or more Vendor Specific subelements are included in the list of optional subelements.

### 9.6.7.4 DSE Enablement frame format

The DSE Enablement frame is transmitted as part of enablement. The format of the DSE Enablement frame Action field is shown in Figure 9-1190 (DSE Enablement frame Action field format).

| | Category | Public Action | Requester STA Address | Responder STA Address | Reason Result Code | Enablement Identifier |
|---|---|---|---|---|---|---|
| Octets: | 1 | 1 | 6 | 6 | 1 | 2 |

**Figure 9-1190—DSE Enablement frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The Public Action field is defined in 9.6.7.1 (Public Action field(#3729)).

The RequesterSTAAddress field is the MAC address of the requesting STA that initiates the enablement process(#6293).

The ResponderSTAAddress field is the MAC address of the enablement responder(#6293).

The Reason Result Code field is used to indicate the reason that a DSE Enablement frame was generated. (#8141)The reason result codes that have been allocated are shown in Table 9-474 (Reason Result Code field values).

**Table 9-474—Reason Result Code field values**

| Reason Result Code field value | Name | Description |
|---|---|---|
| 0 | | Reserved |
| 1 | | Reserved |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-474—Reason Result Code field values *(continued)***

| Reason Result Code field value | Name | Description |
|---|---|---|
| 2 | | Enablement requested |
| 3 | SUCCESS | Success |
| 4 | REFUSED | Request declined |
| 5 | INVALID_PARAMETERS | Request not successful as one or more parameters have invalid values |
| 6 | TOO_MANY_ SIMULTANEOUS_REQUESTS | Enablement denied because the enabling STA is unable to handle additional dependent STAs |
| 7–255 | | Reserved |

The Enablement Identifier field is (#4162)assigned by an enabling STA to a dependent STA; otherwise, it is 0, set using the procedures defined in 11.11 (DSE procedures).

### 9.6.7.5 DSE Deenablement frame format

The DSE Deenablement frame is transmitted as part of deenablement. The format of the DSE Deenablement frame Action field is shown in Figure 9-1191 (DSE Deenablement frame Action field format).

| | Category | Public Action | Requester STA Address | Responder STA Address | Reason Result Code |
|---|---|---|---|---|---|
| Octets: | 1 | 1 | 6 | 6 | 1 |

**Figure 9-1191—DSE Deenablement frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The Public Action field is defined in 9.6.7.1 (Public Action field(#3729)).

The RequesterSTAAddress field is the MAC address of the requesting STA that initiates the deenablement process(#6293).

The ResponderSTAAddress field is the MAC address of the responding STA that becomes deenabled.(#6293)

The Reason Result Code field is used to indicate the reason that a DSE Deenablement frame was generated. (#8141)The reason result codes that have been allocated are shown in Table 9-475 (Reason Result Code field values).

**Table 9-475—Reason Result Code field values**

| Reason Result Code field value | Description |
|---|---|
| 0 | Reserved |
| 1 | Reserved |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-475—Reason Result Code field values**

| Reason Result Code field value | Description |
|---|---|
| 2 | Deenablement requested |
| 3–255 | Reserved |

### 9.6.7.6 DSE Registered Location Announcement frame format

The DSE Registered Location Announcement frame is transmitted by a dependent STA to advertise the registered location of its enabling STA. The format of the DSE Registered Location Announcement frame Action field is shown in Figure 9-1192 (DSE Registered Location Announcement frame Action field format).

| | Category | Public Action | DSE Registered Location Information |
|---|---|---|---|
| Octets: | 1 | 1 | 20 |

**Figure 9-1192—DSE Registered Location Announcement frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The Public Action field is defined in 9.6.7.1 (Public Action field(#3729)).

The DSE Registered Location Information field is defined in 9.4.2.50 (DSE Registered Location element).

### 9.6.7.7 Extended Channel Switch Announcement frame format

The Extended Channel Switch Announcement frame is transmitted by an AP, IBSS STA, or mesh STA to advertise a channel switch. The format of the Extended Channel Switch Announcement frame Action field is shown in Figure 9-1193 (Extended Channel Switch Announcement frame Action field format).

| | Category | Public Action | Channel Switch Mode | New Operating Class | New Channel Number | Channel Switch Count |
|---|---|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | 1 | 1 | 1 |
| | | Zero or one | Zero or one | Zero or more | Zero or one | |

| | Mesh Channel Switch Parameters element | New Country element | Wide Bandwidth Channel Switch element | New Transmit Power Envelope element | Max Channel Switch Time element (#7160) |
|---|---|---|---|---|---|
| Octets: | 0 or 8 | variable | variable | variable | 0 or 6 |

**Figure 9-1193—Extended Channel Switch Announcement frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The Public Action field is defined in 9.6.7.1 (Public Action field(#3729)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Channel Switch Mode, New Operating Class, New Channel Number, and Channel Switch Count fields are as described in the Extended Channel Switch Announcement element (see 9.4.2.51 (Extended Channel Switch Announcement element)).

The Mesh Channel Switch Parameters element is defined in 9.4.2.101 (Mesh Channel Switch Parameters element). This element is present when a mesh STA performs MBSS channel switching. The Mesh Channel Switch Parameters element is not included for channel switching other than for an MBSS channel switch.

The New Country element is present when an AP or mesh STA performs extended channel switching to a new Country, new Operating Class Table, or a changed set of operating classes relative to the contents of the Country element sent in the Beacon; otherwise, this element is not present. The format of the New Country element is defined to be the same as the format of the Country element (see 9.4.2.7 (Country element)), except that no Subband Triplet fields are present in the New Country element. The Country String field in the New Country element indicates the Country and Operating Class Table of the BSS after extended channel switching and Operating Triplet fields within the New Country element indicate the operating classes of the BSS after extended channel switching (see 11.38.1 (Basic VHT BSS functionality)).

This Wide Bandwidth Channel Switch element is present when extended channel switching to a channel width wider than 40 MHz, or when extended channel switching is to a channel width wider than 1 MHz and the frame carrying the element is an S1G PPDU; otherwise, this element is not present. The Wide Bandwidth Channel Switch element is defined in 9.4.2.159 (Wide Bandwidth Channel Switch element). The Wide Bandwidth Channel Switch element indicates the BSS bandwidth after extended channel switching (see 11.38.1 (Basic VHT BSS functionality) and 10.45.1 (Basic S1G BSS functionality)).

Each New Transmit Power Envelope element that is present is defined to have the same format as the Transmit Power Envelope element (see 9.4.2.160 (Transmit Power Envelope element)) and includes a distinct value of the Local Maximum Transmit Power Unit Interpretation subfield. If present, the New Transmit Power Envelope element indicates the maximum transmit powers for the BSS for the indicated bandwidths with an indicated unit interpretation after extended channel switching (see 11.38.1 (Basic VHT BSS functionality)).

(#7160)(#8094)The Max Channel Switch Time Element field, if present, cotnains a Max Channel Switch Time element as defined in 9.4.2.216 (Max Channel Switch Time element).

### 9.6.7.8 DSE Measurement Request frame format

The DSE Measurement Request frame requests a DSE measurement report. It is transmitted using the procedures defined in 11.11 (DSE procedures). The format of the DSE Measurement Request frame Action field is shown in Figure 9-1194 (DSE Measurement Request frame Action field format).

| | Category | Public Action | Requester STA Address | Responder STA Address | Operating Class | Channel Number | Measurement Start Time | Measurement Duration |
|---|---|---|---|---|---|---|---|---|
| Octets: | 1 | 1 | 6 | 6 | 1 | 1 | 8 | 2 |

**Figure 9-1194—DSE Measurement Request frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The Public Action field is defined in 9.6.7.1 (Public Action field(#3729)).

The RequesterSTAAddress field is the MAC address of the STA that requests the DSE measurement report(#6293).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The ResponderSTAAddress field is the MAC address of the responding STA that operates based on the enablement(#6293).

The Operating Class field indicates the channel set for which the measurement request applies. The Operating Class and Channel Number fields together specify the channel frequency and channel bandwidth for which the measurement request applies. Valid values for the Operating Class field are shown in Annex E.

The Measurement Start Time field is set to the timing synchronization function (TSF) at the time (± 1 TU) at which the requested DSE request measurement starts. Setting the field to 0 indicates it starts immediately.

The Measurement Duration field is set to the duration of the requested measurement, expressed in number of time units (TUs).

### 9.6.7.9 DSE Measurement Report frame format

The DSE Measurement Report frame is transmitted using the procedures defined in 11.11 (DSE procedures). The format of the DSE Measurement Report frame Action field is shown in Figure 9-1195 (DSE Measurement Report frame Action field format).

| | Category | Public Action | Requester STA Address | Responder STA Address | Length | Operating Class | Channel Number | Measurement Report Mode | Actual Measurement Start Time | Measurement Duration | Reported DSE LCI fields |
|---|---|---|---|---|---|---|---|---|---|---|---|
| Octets: | 1 | 1 | 6 | 6 | 2 | 1 | 1 | 1 | 8 | 2 | n × 26 |

**Figure 9-1195—DSE Measurement Report frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The Public Action field is defined in 9.6.7.1 (Public Action field(#3729)).

The RequesterSTAAddress field is the MAC address of the STA that requested the DSE measurement report(#6293).

The ResponderSTAAddress field is the MAC address of the responding STA that operates based on the enablement(#6293).

The Length field indicates the length of the remaining frame fields in octets, and the value is variable. The minimum value of the Length field is 13.

The Operating Class field indicates the channel set for which the measurement report applies. The Operating Class and Channel Number fields together specify the channel frequency and spacing for which the measurement request applies. Valid values for the Operating Class field are shown in Annex E.

The Measurement Report Mode field is defined in 9.4.2.20 (Measurement Report element) (see Figure 9-290 (Measurement Report Mode field format)).

The Actual Measurement Start Time field is set to the value of the measuring STA's TSF timer at the time (± 1 TU) at which the DSE measurement started.

The Measurement Duration field is set to the duration over which the requested measurement was measured, expressed in number of TUs.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The reported DSE LCI fields contain the DSE LCI received at the measuring STA. If the reported DSE LCI fields would cause the frame to exceed the maximum MAC management protocol data unit (MMPDU) size, then the reported DSE LCI fields are truncated so that the last reported DSE LCI field is complete. The DSE LCI field format is shown in Figure 9-1196 (DSE LCI field format).

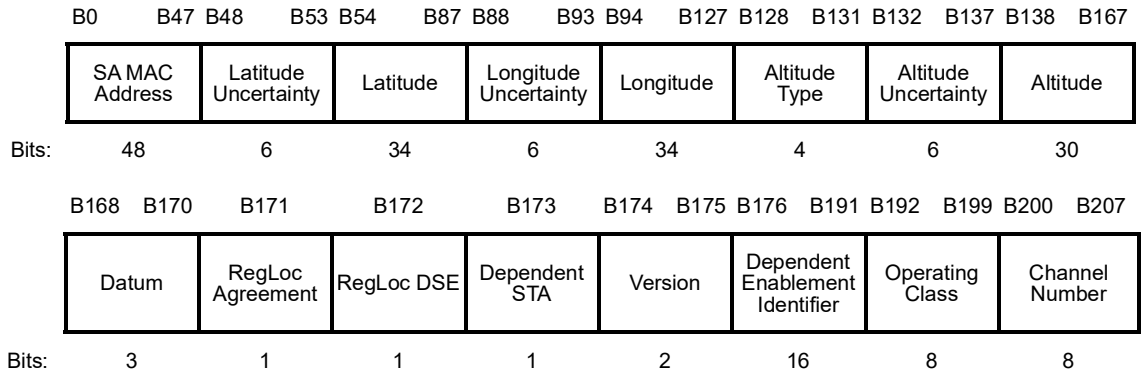

**Figure 9-1196—DSE LCI field format**

The SA MAC Address field contains the SA MAC address from the Beacon or Public Action frame containing a DSE Registered Location element being reported.

The remaining fields are as defined in the DSE Registered Location Information field (see 9.4.2.50 (DSE Registered Location element)).

### 9.6.7.10 DSE Power Constraint frame format

The DSE Power Constraint frame requests that a dependent STA constrain transmit power below the regulatory limit. It is transmitted by an enabling STA as part of enablement. The format of the DSE Power Constraint frame Action field is shown in Figure 9-1197 (DSE Power Constraint frame Action field format).

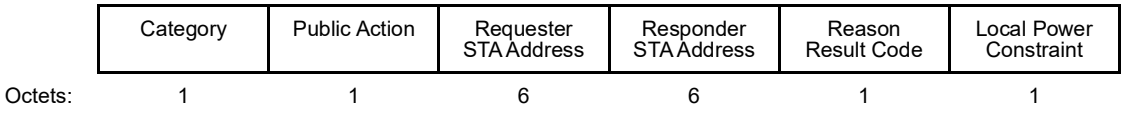

**Figure 9-1197—DSE Power Constraint frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The Public Action field is defined in 9.6.7.1 (Public Action field(#3729)).

The RequesterSTAAddress field is the MAC address of the STA that requests the DSE power constraint(#6293).

The ResponderSTAAddress field is the MAC address of the responding STA that initiates the enablement(#6293).

The Reason Result Code field is used to indicate the reason that a DSE Power Constraint frame was generated. (#8141)The reason result codes that have been allocated are shown in Table 9-476 (Reason Result Code field values).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-476—Reason Result Code field values**

| Reason Result Code field value | Name | Description |
|---|---|---|
| 0 | | Reserved |
| 1 | | Reserved |
| 2 | | Power constraint requested |
| 3 | SUCCESS | Success |
| 4 | REFUSED | Refused — no reason specified |
| 5 | INVALID_PARAMETERS | Request not successful as one or more parameters have invalid values |
| 6–255 | | Reserved |

The Local Power Constraint field is coded as an unsigned integer in units of decibels relative to 1 mW. The local maximum transmit power for a channel is thus defined as the maximum transmit power level specified for the channel in the Country element minus the local power constraint specified for the channel in the DSE Power Constraint frame.

### 9.6.7.11 Vendor Specific Public Action frame format

The Vendor Specific Public Action frame is defined for vendor-specific signaling between unassociated STAs. The format of the Action field of the Vendor Specific Public Action frame is shown in Figure 9-1198 (Vendor Specific Public Action frame Action field format).

| | Category | Public Action | Organization Identifier | Vendor Specific Content |
|---|---|---|---|---|
| Octets: | 1 | 1 | variable | variable |

**Figure 9-1198—Vendor Specific Public Action frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The Public Action field is defined in 9.6.7.1 (Public Action field(#3729)).

The Organization Identifier field contains a organization identifier assigned by the IEEE and is specified in 9.4.1.29 (Organization Identifier field). The order of the Organization Identifier field is described in 9.2.2 (Conventions). The length of the Organization Identifier field is variable, as specified in 9.4.1.29 (Organization Identifier field).

The Vendor Specific Content field contains vendor-specific field(s). The length of the vendor specific content in a Vendor Specific Public Action(#4065) frame is limited by the maximum allowed MMPDU size.

### 9.6.7.12 GAS Initial Request frame format

The GAS Initial Request frame is transmitted by a requesting STA to request information from another STA. The format of the GAS Initial Request frame Action field is shown in Table 9-477 (GAS Initial Request frame Action field format).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-477—GAS Initial Request frame Action field format**

| Order | Information |
|---|---|
| 0 | Category |
| 1 | Public Action |
| 2 | Dialog Token |
| 3 | Advertisement Protocol element |
| 4 | Query Request Length |
| 5 | Query Request |
| 6 | Multi-band (optional) |
| 7 | CAG Number (optional) |
| 8 | GAS Extension (optional) |

The Category field is defined in 9.4.1.11 (Action field).

The Public Action field is defined in 9.6.7.1 (Public Action field(#3729)).

The Dialog Token field is defined in 9.4.1.12 (Dialog Token field) and set by the requesting STA.

The Advertisement Protocol element is defined in 9.4.2.91 (Advertisement Protocol element). The Advertisement Protocol element includes exactly one advertisement protocol ID.

The Query Request Length field is defined in Figure 9-1199 (Query Request Length field). The value of the Query Request Length field is set to the total number of octets in the Query Request field.

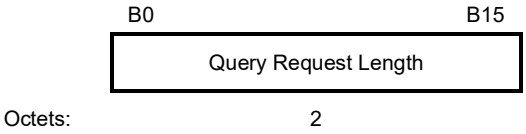

**Figure 9-1199—Query Request Length field**

The Query Request field is defined in Figure 9-1200 (Query Request field). The Query Request field is a generic container whose value is formatted in accordance with the protocol identified in the Advertisement Protocol element.

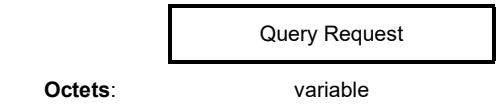

**Figure 9-1200—Query Request field**

When present in a GAS Initial Request frame, the Multi-band element indicates the frequency band, operating class, and channel number to which the GAS Initial Request frame applies.

When present in a GAS Initial Request frame, the CAG Number element includes one or more Common Advertisement Group (CAG) tuples. Each CAG tuple specifies a pair of CAG Version and CAG

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Information Type cached by the requesting STA and associated with the query request contained in the Query Request field.

The GAS Extension element indicating the STA support for GAS extension in GAS frame exchanges is optionally present if dot11GASExtensionImplemented is true.

### 9.6.7.13 GAS Initial Response frame format

The GAS Initial Response frame is transmitted in response to a GAS Initial Request frame or a Group Addressed GAS Request frame. The format of the GAS Initial Response frame Action field is shown in Table 9-478 (GAS Initial Response frame Action field format).

**Table 9-478—GAS Initial Response frame Action field format**

| Order | Information |
|---|---|
| 0 | Category |
| 1 | Public Action |
| 2 | Dialog Token |
| 3 | Status Code |
| 4 | GAS Comeback Delay |
| 5 | Advertisement Protocol element |
| 6 | Query Response Length |
| 7 | Query Response (optional) |
| 8 | Multi-band (optional) |
| 9 | GAS Extension (optional) |

The Category field is defined in 9.4.1.11 (Action field).

The Public Action field is defined in 9.6.7.1 (Public Action field(#3729)).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is copied from the corresponding GAS Initial Request frame or Group Addressed GAS Request frame.

(#3326)The Status Code field values are defined in Table 9-80 (Status codes).

The GAS Comeback Delay field specifies the delay time value in TUs. The GAS Comeback Delay field format is shown in Figure 9-1201 (GAS Comeback Delay field format). The behavior is described in 11.22.3.2 (GAS Protocol). The value 0 (M118)is returned by the STA when a Query Response is provided in this frame.

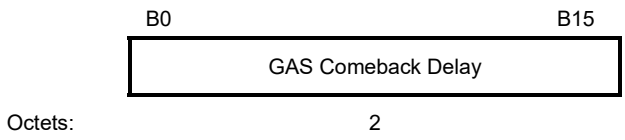

**Figure 9-1201—GAS Comeback Delay field format**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Advertisement Protocol element is defined in 9.4.2.91 (Advertisement Protocol element). The Advertisement Protocol element includes exactly one advertisement protocol ID.

The Query Response Length field is defined in Figure 9-1202 (Query Response Length field format). The Query Response Length field is set to the total number of octets in the Query Response field. If the Query Response Length field is set to 0, then there is no Query Response included in this Action frame.

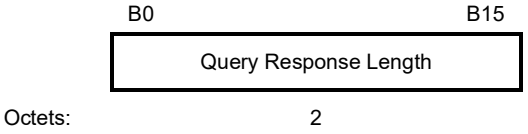

**Figure 9-1202—Query Response Length field format**

The Query Response field is defined in Figure 9-1203 (Query Response field format). The Query Response field is a generic container whose value is formatted in accordance with the protocol specified in the Advertisement Protocol element.

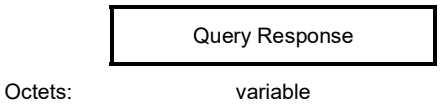

**Figure 9-1203—Query Response field format**

When present in a GAS Initial Response frame, the Multi-band element indicates the frequency band, operating class, and channel number to which the GAS Initial Response frame applies.

The GAS Extension element indicating the STA support for GAS extension in GAS frame exchanges is optionally present if dot11GASExtensionImplemented is true. It is included as a response to a GAS Initial Request frame containing a GAS Extension element.

### 9.6.7.14 GAS Comeback Request frame format

The GAS Comeback Request frame is transmitted by a requesting STA to a responding STA. The format of the GAS Comeback Request frame Action field is shown in Table 9-479 (GAS Comeback Request frame Action field format(#4092)).

**Table 9-479—GAS Comeback Request frame Action field format(#4092)**

| Order | Information |
|---|---|
| 0 | Category |
| 1 | Public Action |
| 2 | Dialog Token |
| 3 | Multi-band (optional) |
| 4 | GAS Extension (optional) |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Category field is defined in 9.4.1.11 (Action field).

The Public Action field is defined in 9.6.7.1 (Public Action field(#3729)).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is copied from the corresponding GAS Initial Request frame.

When present in a GAS Comeback Request frame, the Multi-band element indicates the frequency band, operating class, and channel number to which the GAS Comeback Request frame applies.

When present in a GAS Comeback Request frame, the GAS Extension element indicates a request to retransmit a GAS query response(#7054) fragment.

### 9.6.7.15 GAS Comeback Request Fragment frame format(#6058)

The GAS Comeback Request Fragment frame is transmitted by a requesting STA to a responding STA. The format of the GAS Comeback Request Fragment frame Action field is shown in Table 9-480 (GAS Comeback Request Fragment frame Action field format(#6058)).

**Table 9-480—GAS Comeback Request Fragment frame Action field format(#6058)**

| Order | Information |
|---|---|
| 0 | Category |
| 1 | Public Action |
| 2 | Dialog Token |
| 3 | Status Code |
| 4 | GAS Query Fragment ID |
| 5 | Query Request Length |
| 6 | Query Request |
| 7 | Multi-band (optional) |
| 8 | GAS Extension (optional) |

The Category field is defined in 9.4.1.11 (Action field).

The Public Action field is defined in 9.6.7.1 (Public Action field(#3729)).

The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is copied from the corresponding GAS Initial Request frame. The same value of the Dialog Token field is present in all fragments of a multi-fragment query request.

The Status Code field values are defined in Table 9-80 (Status codes).

The GAS Query Fragment ID field is defined in 9.4.1.31 (GAS Query Fragment ID field(#6058)). When there is more than one Query Request fragment, the requesting STA sets the GAS Query Fragment ID field to 0 for the initial fragment and increments it by 1 for each subsequent fragment in a multi-fragment query request. The More GAS Fragments field is set to 0 whenever the final fragment of a GAS query request is

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

being transmitted. A GAS Query Fragment ID field having a nonzero (#8184)GAS Fragment ID field and the More GAS Fragments field set to 1 indicates to the responding STA that another GAS Comeback Request and GAS Comeback Response frame exchange should be performed to continue the retrieval of the GAS query request.

The Query Request Length field is defined in 9.6.7.12 (GAS Initial Request frame format).

The Query Request field is defined in 9.6.7.12 (GAS Initial Request frame format).

When present in a GAS Comeback Request Fragment frame, the Multi-band element indicates the frequency band, operating class, and channel number to which the GAS Comeback Request Fragment frame applies.

### 9.6.7.16 GAS Comeback Response frame format

The GAS Comeback Response frame is transmitted by a responding STA to a requesting STA. The format of the GAS Comeback Response frame Action field is shown in Table 9-481 (GAS Comeback Response frame Action field format).

**Table 9-481—GAS Comeback Response frame Action field format**

| Order | Information |
|---|---|
| 0 | Category |
| 1 | Public Action |
| 2 | Dialog Token |
| 3 | Status Code |
| 4 | GAS Query Fragment ID(#6058) |
| 5 | GAS Comeback Delay |
| 6 | Advertisement Protocol element |
| 7 | Query Response Length |
| 8 | Query Response (optional) |
| 9 | Multi-band (optional) |
| 10(#6058) | GAS Extension (optional) |

The Category field is defined in 9.4.1.11 (Action field).

The Public Action field is defined in 9.6.7.1 (Public Action field(#3729)).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is copied from the Dialog Token field of the corresponding GAS Comeback Request or (#6058)GAS Comeback Request Fragment frame. The same value of the Dialog Token field is present in all fragments of a multi-fragment query response.

(#3326)The Status Code field values are defined in Table 9-80 (Status codes). The same status code value is present in all fragments of a multi-fragment query response.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The GAS Query Fragment ID field is defined in 9.4.1.31 (GAS Query Fragment ID field(#6058)). If the responding STA has not received a response to the query that it posted on behalf of a requesting STA, then the responding STA sets the GAS Query Fragment ID field to 0. When there is more than one query response fragment, the responding STA sets the GAS Query Fragment ID field to 0 for the initial fragment and increments it by 1 for each subsequent fragment in a multi-fragment query response. The More GAS Fragments field is set to 0 whenever the final fragment of a query response is being transmitted. A GAS Query Fragment ID field having a nonzero (#8184)GAS Fragment ID field and the More GAS Fragments field set to 1 indicates to the requesting STA that another GAS Comeback Request and GAS Comeback Response frame exchange should be performed to continue the retrieval of the query response.(#6058)

The GAS Comeback Delay field format is shown in Figure 9-1201 (GAS Comeback Delay field format). A nonzero GAS Comeback Delay field(#4356) is returned by the responding STA in this frame to indicate that the GAS query request(#7052) being carried out on behalf of the requesting STA is still in progress.

— A nonzero value indicates to the requesting STA that another GAS Comeback Request and GAS Comeback Response frame(#6058) exchange should be performed after the expiration of the GAS comeback delay(#4356) timer in order to retrieve the query response.

— This field is set to 0 for all GAS Comeback Response frames containing a query response or a fragment of a multi-fragment query response.

The Advertisement Protocol element is defined in 9.4.2.91 (Advertisement Protocol element). The Advertisement Protocol element includes exactly one advertisement protocol ID.

The Query Response Length field is defined in Figure 9-1202 (Query Response Length field format). The Query Response Length field is set to the total number of octets in the Query Response field. If the Query Response Length field is set to 0, then there is no Query Response included in this Action frame.

The Query Response field is defined in Figure 9-1203 (Query Response field format). The Query Response field is a generic container dependent on the advertisement protocol specified in the Advertisement Protocol element and the query itself. In a multi-fragment (#6058)GAS query response, the response to the (#6058)GAS query request posted on behalf of a requesting STA is fragmented such that each fragment to be transmitted fits within the MMPDU size limitation.

When present in a GAS Comeback Response frame, the Multi-band element indicates the frequency band, operating class, and channel number to which the GAS Comeback Response frame applies.

### 9.6.7.17 TDLS Discovery Response frame format

The format of the TDLS Discovery Response frame Action field is shown in Table 9-482 (TDLS Discovery Response frame Action field format). (#1751)

**Table 9-482—TDLS Discovery Response frame Action field format**

| Order | Information | Notes |
|---|---|---|
| 1 | Category | The Category field is defined in 9.4.1.11 (Action field). |
| 2 | Public Action | The Public Action field is defined in 9.6.7.1 (Public Action field(#3729)). |
| 3 | Dialog Token | The dialog token is copied from the corresponding TDLS Discovery Request frame. The dialog token is specified in 9.4.1.12 (Dialog Token field). |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-482—TDLS Discovery Response frame Action field format**

| Order | Information | Notes |
|---|---|---|
| 4 | Capability | The Capability field indicates the capabilities of the STA. The Capability field is defined in 9.4.1.4 (Capability Information field). |
| 5 | Supported Rates and BSS Membership Selectors | The Supported Rates and BSS Membership Selectors element indicates the rates supported by the STA. The Supported Rates and BSS Membership Selectors element is defined in 9.4.2.3 (Supported Rates and BSS Membership Selectors element). |
| 6 | Extended Supported Rates and BSS Membership Selectors | (#3086)The Extended Supported Rates and BSS Membership Selectors element is present if the number of supported rates and BSS membership selectors(#1470) together exceed eight; it is optional otherwise.<br>The Extended Supported Rates and BSS Membership Selectors element is defined in 9.4.2.11 (Extended Supported Rates and BSS Membership Selectors element). |
| 7 | Supported Channels | The Supported Channels element is present if the TDLS Channel Switching subfield is equal to 1.<br>The Supported Channels element is defined in 9.4.2.16 (Supported Channels element). |
| 8 | RSNE | The RSNE is present if security is required on the TDLS direct link (see 12.7.8.1 (General)); otherwise not present.(#3400)<br>The RSNE is defined in 9.4.2.23 (RSNE). |
| 9 | Extended Capabilities | The Extended Capabilities element is present if any of the fields in this element are nonzero. The Extended Capabilities element is defined in 9.4.2.25 (Extended Capabilities element). |
| 10 | Timeout Interval (TPK key lifetime) | The (#1776)TIE contains the TPK key lifetime.<br>It is present if security is required on the TDLS direct link (see 12.7.8.1 (General)).<br>The (#1776)TIE is defined in 9.4.2.47 (TIE(#1776)). |
| 11 | Supported Operating Classes | The Supported Operating Classes element is present if the TDLS Channel Switching subfield is equal to 1. |
| 12 | HT Capabilities | The HT Capabilities element is present when dot11HighThroughputOptionImplemented is true.<br>The HT Capabilities element is defined in 9.4.2.54 (HT Capabilities element). |
| 13 | 20/40 BSS Coexistence | The 20/40 BSS Coexistence element is present when dot112040BSSCoexistenceManagementSupport is true. The 20/40 BSS Coexistence element is defined in 9.4.2.58 (20/40 BSS Coexistence element). |
| 14 | Link Identifier | The Link Identifier element is defined in 9.4.2.60 (Link Identifier element). |
| 15 | Multi-band | The Multi-band element is optionally present if dot11MultibandImplemented is true. |
| 16 | VHT Capabilities | VHT Capabilities element (optional). The VHT Capabilities element is present in the 5 GHz band if dot11VHTOptionImplemented is true.(#8181) The VHT Capabilities element is defined in 9.4.2.156 (VHT Capabilities element). |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-482—TDLS Discovery Response frame Action field format**

| Order | Information | Notes |
|---|---|---|
| 18(Ed1)(11ax) | HE Capabilities | The HE Capabilities element is present if dot11HEOptionImplemented is true; otherwise, it is not present, The HE Capabilities element is defined in 9.4.2.247 (HE Capabilities element(11ax)). |
| 19(#3013) | HE 6 GHz Band Capabilities | The HE 6 GHz Band Capabilities element is present if dot11HEOptionImplemented and dot11HE6GOptionImplemented are true; otherwise, it is not present. |

### 9.6.7.18 Location Track Notification frame format

The Location Track Notification frame is transmitted to allow remote location determination to occur by another STA. The format of the Location Track Notification frame Action field is shown in Figure 9-1204 (Location Track Notification frame Action field format).

| | Category | Public Action | Location Parameters Element | Measurement Report Element (optional) |
|---|---|---|---|---|
| Octets: | 1 | 1 | variable | variable |

**Figure 9-1204—Location Track Notification frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The Public Action field is defined in 9.6.7.1 (Public Action field(#3729)).

The Location Parameters Element field contains the Location Parameters subelements, described in Table 9-253 (Optional subelement IDs for Location Parameters). Table 9-483 (Location Parameters Element field for Location Track Notification frame) defines the allowed Location Parameters subelements for a Location Parameters element that is included in the frame.

**Table 9-483—Location Parameters Element field for Location Track Notification frame**

| Allowed subelements | Subelement ID | Notes |
|---|---|---|
| Location Indication Channels | 2 | The Location Indication Channels subelement is included in the Location Track Notification frame. |
| Radio Information | 4 | The Radio subelement is included in the Location Track Notification frame. |
| Motion | 5 | The Motion subelement is included in the Location Track Notification frame if dot11MotionDetectionActivated is true. |
| Time of Departure | 7 | The Time of Departure subelement is included in the Location Track Notification frame if dot11TODActivated is true. |
| Location Indication Options | 8 | The Location Indication Options subelement is included in the Location Track Notification frame if the successful Location Configuration Request frame that configured the STA included a Location Indication Options subelement. |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Measurement Report Element field contains a Measurement Report element of type Beacon report as defined in 9.4.2.20.7 (Beacon report). The Measurement Report Element field is included in the Location Track Notification frame if the Location Parameters Element field contains a Location Indication Options subelement. The Measurement Report element Measurement Token field is set to the same value of the dialog token in the Location Configuration Request frame that configured the STA.

### 9.6.7.19 QMF Policy frame format

The QMF Policy frame is transmitted by a requesting STA to a receiving STA with the included QMF policy. It is either sent unsolicited by the requesting STA or in response to a QMF Policy Change frame from a receiving STA. The format of the Action field of the QMF Policy frame is shown in Figure 9-1205 (QMF Policy frame Action field contents).

| | Category | Public Action | Dialog Token | Status Code | QMF Policy element (optional) |
|---|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | 2 | 0 or 3-257 |

**Figure 9-1205—QMF Policy frame Action field contents**

The Category field is defined in 9.4.1.11 (Action field).

The Public Action field is defined in 9.6.7.1 (Public Action field(#3729)).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is set to the value in the corresponding QMF Policy Change frame. If the QMF Policy frame is not being transmitted in response to a QMF Policy Change frame, then the Dialog Token field is set to 0.

The Status Code field is defined in Table 9.4.1.9 (Status Code field).

The QMF Policy element is set as described in 9.4.2.118 (Quality-of-Service Management Frame Policy element). It indicates the new access categories configured for Management frame(s). This field is included if the (#7190)status code is SUCCESS and this frame is not being transmitted in response to a QMF Policy Change frame, and optionally included if the Status Code field(M118) is REQUEST_DECLINED.

### 9.6.7.20 QMF Policy Change frame format

The QMF Policy Change frame is transmitted by a requesting STA to request a change to the QMF policy it most recently received from the destination STA. The format of the Action field of the QMF Policy Change frame is shown in Figure 9-1206 (QMF Policy Change frame Action field contents).

| | Category | Public Action | Dialog Token | QMF Policy element |
|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | 3-257 |

**Figure 9-1206—QMF Policy Change frame Action field contents**

The Category field is defined in 9.4.1.11 (Action field).

The Public Action field is defined in 9.6.7.1 (Public Action field(#3729)).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is set to a nonzero value chosen by the STA sending the QMF Policy Change frame to identify the transaction.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The QMF Policy element is set as described in 9.4.2.118 (Quality-of-Service Management Frame Policy element). It indicates the access categories requested for Management frame(s), including any changes to the QMF policy it most recently received from the destination STA.

### 9.6.7.20 QLoad Request frame format

The QLoad Request frame is transmitted by an AP to request information from another AP. The format of the Action field of the QLoad Request frame is shown in Table 9-484 (QLoad Request frame Action field format).

**Table 9-484—QLoad Request frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | Public Action |
| 3 | Dialog Token |
| 4 | QLoad Report element |

The Category field is defined in 9.4.1.11 (Action field).

The Public Action field is defined in 9.6.7.1 (Public Action field(#3729)).

The Dialog Token field is defined in 9.4.1.12 (Dialog Token field) and set by the requesting STA to a nonzero value that is used for matching action responses with action requests. See 10.28.5 (Operation of the Dialog Token field).

The QLoad Report element is defined in 9.4.2.121 (QLoad Report element) and contains the QLoad report corresponding to the AP sending the request.

### 9.6.7.21 QLoad Report frame format

The QLoad Report frame is transmitted by an AP responding to a QLoad Request frame. The format of the Action field of the QLoad Report frame is shown in Table 9-485 (QLoad Report frame Action field format).

**Table 9-485—QLoad Report frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | Public Action |
| 3 | Dialog Token |
| 4 | QLoad Report element |

The Category field is defined in 9.4.1.11 (Action field).

The Public Action field is defined in 9.6.7.1 (Public Action field(#3729)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Dialog Token field is defined in 9.4.1.12 (Dialog Token field) and set by the requesting STA to a nonzero value that is used for matching action responses with action requests. See 10.28.5 (Operation of the Dialog Token field). The Dialog Token field is set to 0 when an unsolicited QLoad Report frame is sent by the AP.

The QLoad Report element is defined in 9.4.2.121 (QLoad Report element).

### 9.6.7.22 HCCA TXOP Advertisement frame

The HCCA TXOP Advertisement frame is transmitted by an AP to another AP to inform it of active and pending TXOP reservations. The format of the Action field of the HCCA TXOP Advertisement frame is shown in Figure 9-1207 (HCCA TXOP Advertisement frame Action field format).

| | Category | Public Action | Dialog Token | Number of Reported TXOP Reservations | Number of Pending TXOP Reservations | Active TXOP Reservations | Pending TXOP Reservations |
|---|---|---|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | 1 | 1 | variable | variable |

**Figure 9-1207—HCCA TXOP Advertisement frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The Public Action field is defined in 9.6.7.1 (Public Action field(#3729)).

The Dialog Token field is defined in 9.4.1.12 (Dialog Token field) and is set by the AP to a nonzero value that is used for matching action responses with action requests. See 10.28.5 (Operation of the Dialog Token field).

The Number of Reported TXOP Reservations field contains a positive integer that specifies the number of active TXOP reservations reported in this frame. Setting the field to 0 indicates that no TXOP reservations are active.

The Number of Pending Reported TXOP Reservations field contains a positive integer that specifies the number of pending TXOP reservations reported in this frame. Setting the field to 0 indicates that no TXOP reservations are in the process of being activated.

The Active TXOP Reservation field contains zero or more TXOP Reservation fields as defined in 9.4.1.41 (TXOP Reservation field). This field indicates active HCCA TXOPs that the AP has scheduled. The Start Time subfield of the TXOP Reservation field is relative to the TSF of the sending AP.

The Pending TXOP Reservation field contains zero or more TXOP Reservation fields as defined in 9.4.1.41 (TXOP Reservation field). This field indicates new HCCA TXOPs that the AP is scheduling. The Start Time subfield of the TXOP Reservation field is relative to the TSF of the sending AP.

The use of the HCCA TXOP Advertisement frame is described in 11.26.3 (HCCA TXOP negotiation).

### 9.6.7.23 HCCA TXOP Response frame

The HCCA TXOP Response frame is transmitted by an AP to another AP to respond to an HCCA TXOP Advertisement frame. The format of the Action field of the HCCA TXOP Response frame is shown in Figure 9-1208 (HCCA TXOP Response frame Action field format).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

| | Category | Public Action | Dialog Token | Status Code | Schedule Conflict | Alternate Schedule | Avoidance Request |
|---|---|---|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | 2 | 0 or 1 | 0 or 6 | 0 or 6 |

**Figure 9-1208—HCCA TXOP Response frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The Public Action field is defined in 9.6.7.1 (Public Action field(#3729)).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is set to the value of the Dialog Token field from the corresponding HCCA TXOP Advertisement frame.

The Status Code field is defined in 9.4.1.9 (Status Code field) and is set to either the value SUCCESS or TS_SCHEDULE_CONFLICT.

The Schedule Conflict field is present only when the Status Code field is not SUCCESS. The Schedule Conflict field indicates the TXOP reservation from the HCCA TXOP Advertisement frame that conflicts with an existing or in-progress schedule. Its value is between 1 and the summation of the values from the Number of Reported TXOP Reservations and Number of Pending TXOP Reservations fields of the HCCA TXOP Advertisement frame. Setting the field to 1 indicates the first TXOP reservation in the HCCA TXOP Advertisement frame, setting the field to 2 indicates the second TXOP reservation in the HCCA TXOP Advertisement frame, and so on. The value of zero is reserved.

The optional Alternate Schedule field contains a TXOP Reservation field, as defined in 9.4.1.41 (TXOP Reservation field) and is present only when the Status Code field is not SUCCESS. When the Alternate Schedule field is present, it contains an alternate to the TXOP reservation given in the corresponding HCCA TXOP Advertisement frame. The Start Time subfield of the Alternate Schedule field is relative to the TSF of the destination AP.

The optional Avoidance Request field contains a TXOP Reservation field, as defined in 9.4.1.41 (TXOP Reservation field) and is optionally present when the Status Code field is not SUCCESS. When the Avoidance Request field is present, it indicates a TXOP schedule that the AP sending the TXOP Response frame is requesting to be avoided by the AP that is the destination of the TXOP Response frame. The Start Time subfield of the Avoidance Request field is relative to the TSF of the destination AP.

The use of the HCCA TXOP Response frame is described in 11.26.3 (HCCA TXOP negotiation).

### 9.6.7.24 Public Key frame

The Public Key frame is transmitted by an AP to provide its public key to peer APs and to request the peer's public key. The format of the Public Key frame Action field is defined in Figure 9-1209 (Public Key frame Action field format).

| | Category | Public Action | Public Key Frame Usage | Finite Cyclic Group | Public Key (optional) |
|---|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | 2 | variable |

**Figure 9-1209—Public Key frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Public Action field is defined in 9.6.7.1 (Public Action field(#3729)).

The Public Key Frame Usage field is set to a number to signify the usage mode of this frame. The Request Types are shown in Table 9-486 (Public Key Frame Usage field values).

**Table 9-486—Public Key Frame Usage field values**

| Public Key Frame Usage | Value |
|---|---|
| Request | 0 |
| Response | 1 |
| NAK | 2 |
| Refused | 3 |
| Reserved | 4–255 |

The Public Key Frame Usage field is set to "Request" to indicate that a public key is being requested from a peer AP.

The Public Key Frame Usage field is set to "Response" to indicate that this frame is in response to a Public Key frame.

The Public Key Frame Usage field is set to "NAK" to indicate rejection of a received Public Key frame.

The Finite Cyclic Group field is used to indicate the cryptographic group used when generating the public key and is defined in 9.4.1.40 (Finite Cyclic Group field)), or the preferred group when the Public Key Frame Usage field is set to "NAK".

When the Public Key Frame Usage field is set to "NAK" or "Refused", the Public Key field is not included. In all other cases, the Public Key field contains the public key of the AP that is sending this Public Key frame encoded as an octet string according to 12.4.7.2.5 (Octet string to element conversion).

The use of the Public Key frame is described in 12.10 (AP PeerKey support).

### 9.6.7.25 Channel Availability Query frame format

The Channel Availability Query frame is transmitted as part of a channel query. The format of the Channel Availability Query frame Action field is shown in Figure 9-1210 (Channel Availability Query frame Action field format).

| | Category | Public Action | Requester STA Address | Responder STA Address | Reason Result Code | Length | Channel Query Info | Device Class | Device Identification Information | Device Location Information | WSM Information |
|---|---|---|---|---|---|---|---|---|---|---|---|
| Octets: | 1 | 1 | 6 | 6 | 1 | 1 | 1 | variable | variable | variable | variable |

**Figure 9-1210—Channel Availability Query frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The Public Action field is defined in 9.6.7.1 (Public Action field(#3729)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Length field indicates the length of the remaining frame fields in octets, and the value is variable.

The remaining fields are as defined in the Channel Availability Query element (see 9.4.6.2 (Channel Availability Query RLQP-element)) and White Space Map element (see 9.4.2.168 (White Space Map element)).

### 9.6.7.26 Channel Schedule Management frame format

The Channel Schedule Management frame is transmitted to exchange the channel schedule information as part of the channel schedule management procedure. The format of the Channel Schedule Management frame Action field is shown in Figure 9-1211 (Channel Schedule Management frame Action field format).

| | Category | Public Action | Requester STA Address | Responder STA Address | Length | Reason Result Code | Channel Schedule Management Mode | Device Identification Information | Channel Schedule Descriptor |
|---|---|---|---|---|---|---|---|---|---|
| Octets: | 1 | 1 | 6 | 6 | 1 | 1 | 1 | variable | variable |

**Figure 9-1211—Channel Schedule Management frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The Public Action field is defined in 9.6.7.1 (Public Action field(#3729)).

The Requester STA Address field is the MAC address of the requesting STA that initiates the Channel Schedule Management process.

The Responder STA Address field is the MAC address of the STA that responds to the STA that requested channel schedule management.

The Length field indicates the length of the remaining fields in octets, and the value is variable.

The Reason Result Code field indicates the reason for transmitting a query request for channel schedule information. It also indicates the result of a query as successful or not and the reason when the query is not successful. This field is defined in Table 9-487 (Reason Result Code field values).

**Table 9-487—Reason Result Code field values**

| Reason Result Code field values | Description |
|---|---|
| 0 | Request for channel schedule information from a RLSS. |
| 1 | Request for channel schedule information from a GDD enabling STA. |
| 2 | Success, returning full channel schedule information on the requested channels. |
| 3 | Success, returning additional timeslots from the list of the last query on the requested channels. |
| 4 | Success, returning timeslots deleted from the list of last query on the requested channels. |
| 5 | Success, returning deleted and added timeslots from the list of last query on the requested channels. |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-487—Reason Result Code field values *(continued)***

| Reason Result Code field values | Description |
|---|---|
| 6 | Success, returning no channel schedule changes from last query. |
| 7 | Request declined by the GDD enabling STA for unspecified reason. |
| 8 | Request declined by the GDD enabling STA because of no capability for providing schedule information on WLAN channels. |
| 9 | Request declined by RLSS for unspecified reason. |
| 10 | Request declined by RLSS because of no capability for providing schedule information on WLAN channels. |
| 11 | Unknown reason. |
| 12 | Continuation frame. This frame continues the fields from the previous CSM frame. |
| 13–63 | Reserved. |

The Channel Schedule Management Mode field indicates if the schedule information of the channel availability is based on TV channels or WLAN channels. If the schedule information is based on WLAN channels, the optional Operating Class field is present in the Channel Schedule Descriptor field as defined in E.1 (Country information and operating classes). This field also indicates whether the optional Channel Availability Starting Time field is present in the Channel Schedule Descriptor field. This field is defined in Table 9-488 (Channel Schedule Management Mode field values).

**Table 9-488—Channel Schedule Management Mode field values**

| Channel Schedule Management Mode value | Description |
|---|---|
| 0 | The channel schedule information is based on TV channels. The Reason Result Code field is set to either 0 or 1. |
| 1 | The channel schedule information is based on WLAN channels. The Reason Result Code field is set to either 0 or 1. |
| 2–3 | Reserved. |

The Device Identification Information field indicates the regulatory identification of the STA that is requesting the schedule information. The Device Identification Information field is present only when Reason Result Code is either 0 or 1. The field is defined in 9.4.4.2.3 (Device Identification Information).

The Channel Schedule Descriptor field indicates the channels for which the schedule information is requested, and the channel schedule information is provided in the response. The field is defined in 9.4.4.2.5 (Channel Schedule Descriptor). The Channel Schedule Descriptor field is repeated, as determined by the Length field.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 9.6.7.27 Contact Verification Signal frame format

The Contact Verification Signal frame is transmitted by a GDD enabling STA to notify whether the available channel information from the GDB has been updated. The format of the Contact Verification Signal frame Action field is shown in Figure 9-1212 (Contact Verification Signal frame Action field format).

| | Category | Public Action | Map ID |
|---|---|---|---|
| Octets: | 1 | 1 | 1 |

**Figure 9-1212—Contact Verification Signal frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The Public Action field is defined in 9.6.7.1 (Public Action field(#3729)).

The Map ID field is set to a number that is equal to the Map ID of the recently received WSM. The WSM is defined in Table 9-424 (WSM information values) in 9.4.4.2.6 (WSM information values).

### 9.6.7.28 GDD Enablement Request frame format

The format of the Action field of the GDD Enablement Request frame is shown in Figure 9-1213 (GDD Enablement Request frame Action field format).

| | Category | Public Action | Dialog Token | Device Class | Device Identification Information |
|---|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | 1 | variable |

**Figure 9-1213—GDD Enablement Request frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The Public Action field is defined in 9.6.7.1 (Public Action field(#3729)).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is a nonzero value chosen by the STA sending the GDD Enablement Request frame to identify the request/response transaction.

The Device Class field is used to indicate the characteristic of the STA requesting the GDD Enablement Request frame. The format of the Device Class field is specified in 9.4.4.2.2 (Device Class).

The Device Identification Information field is used to indicate the identification of the STA requesting the GDD Enablement Request frame. The format of the Device Identification Information field is specified in 9.4.4.2.3 (Device Identification Information).

### 9.6.7.29 GDD Enablement Response frame format

The format of the Action field of the GDD Enablement Response frame is shown in Figure 9-1214 (GDD Enablement Response frame Action field format).

The Category field is defined in 9.4.1.11 (Action field).

The Public Action field is defined in 9.6.7.1 (Public Action field(#3729)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

| | Category | Public Action | Dialog Token | Status Code | WSM Information |
|---|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | 2 | variable |

**Figure 9-1214—GDD Enablement Response frame Action field format**

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is a nonzero value of the corresponding GDD Enablement Request frame. If a GDD Enablement Response frame is being transmitted other than in response to an GDD Enablement Request frame, then the Dialog Token field is 0.

The Status Code field contains the status code in response to a GDD Enablement Request frame as defined in Table 9-80 (Status codes).

The remaining field is defined in the WSM element (see 9.4.2.168 (White Space Map element)).

### 9.6.7.30 Network Channel Control frame format

The Network Channel Control frame is transmitted by a GDD dependent STA and a GDD enabling STA as part of the procedure that allows a GDD enabling STA to control the frequency usage of a GDD dependent STA's WLAN channels. The format of the Network Channel Control frame is shown in Figure 9-1215 (Network Channel Control frame Action field format).

| | | | | | | | | a Network Channel Control triplet | | |
|---|---|---|---|---|---|---|---|---|---|---|
| | Category | Public Action | Length | Requester STA Address | Responder STA Address | Reason Result Code | Number of Network Channel Control Triplets | Operating Class | Channel Number | Maximum Transmit Power |
| Octets: | 1 | 1 | 1 | 6 | 6 | 1 | 1 | 1 | 1 | 1 |

**Figure 9-1215—Network Channel Control frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The Public Action field is defined in 9.6.7.1 (Public Action field(#3729)).

The Length field indicates the length of the remaining frame fields in octets, and the value is variable. The minimum value of the Length field is 14.

The Requester STA Address field is the MAC address of the requesting STA that initiates the network channel control process.

The Responder STA Address field is the MAC address of the STA that responds to the STA that requested network channel control.

The Reason Result Code field is used to indicate the reason that a Network Channel Control frame was generated. (#8141)The encoding of the Reason Result Code field is shown in Table 9-448 (Reason Result Code field values).

The Number of Network Channel Control Triplets field indicates the number of triplets of Operating Class, Channel Number, and Maximum Transmit Power fields.

The Operating Class field indicates the channel set for which the network channel control request applies. The Operating Class and Channel Number fields together specify the channel frequency and channel

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

bandwidth for which the network channel control applies. Values for the Operating Class field are shown in E.1 (Country information and operating classes).

In a request, the Channel Number field of the Network Channel Control frame indicates the channel that the requesting STA intends to operate on. In the response, the Channel Number field in the Network Channel Control frame indicates the channels that the responding STA permits the requesting STA to operate on. The Channel Number is defined within an Operating Class as shown in E.1 (Country information and operating classes).

The Maximum Transmit Power field gives the intended maximum transmit power in dBm for operation in the request frame and indicates the maximum allowable transmit power in dBm for operation in the response frame. The field contains EIRP per channel bandwidth and is coded as a 2s complement signed integer in units of 0.5 dBm. The field is set to 0 when a requesting STA requests a responding STA to provide a network channel control response without specifying in the request the intended maximum transmit power.

### 9.6.7.31 White Space Map Announcement frame format

The format of the Action field of the White Space Map Announcement frame is shown in Figure 9-1216 (White Space Map Announcement frame Action field format).

| | Category | Public Action | Reason Result Code | White Space Map |
|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | variable |

**Figure 9-1216—White Space Map Announcement frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The Public Action field is defined in 9.6.7.1 (Public Action field(#3729)).

Setting the Reason Result Code field to 1 indicates the Public Action frame is a continuation of the previous WSM Public Action frame, and any other value indicates this is not a continuation of the previous WSM Public Action frame.

The White Space Map field contains a White Space Map element (see 9.4.2.168 (White Space Map element)).

### 9.6.7.32 FTM(11az) Request frame format

The format of the FTMR frame(#7223) Action field is shown in Figure 9-1217 (FTM Request frame Action field format(11az)(#7065)).

| | Category | Public Action | Trigger | LCI Measurement Request (optional) | Location Civic Measurement Request (optional) | FTM Parameters (optional) |
|---|---|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | variable | variable | variable |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

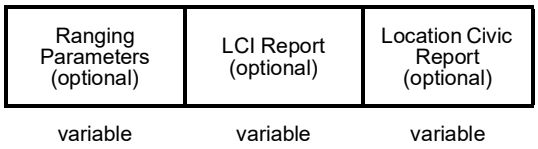

**Figure 9-1217—FTM Request frame Action field format(11az)(#7065)**

The Category field is defined in 9.4.1.11 (Action field).

The Public Action field is defined in 9.6.7.1 (Public Action field(#3729)).

(11az)When the Trigger field is set to 1, the ISTA requests that the RSTA start or continue sending FTM frames (see 11.21.6 (FTM procedure(#7065))). When the Trigger field is set to 0, indicates that the ISTA requests that the RSTA stop sending FTM frames.

(11az)When the Trigger field is set to 2, an EDMG ISTA initiates an (#8113)FTM exchange using the first path AWV; see 11.21.6.4.2.6 (DMG first path AWV for EDCA based ranging measurement exchange(11az)). (#8259)When the Trigger field is set to 3, an EDMG ISTA indicates that the following FTM burst is requested to contain LOS assessment measurements. If the FTM burst is performed over the first path AWV and is requested to contain LOS assessment measurements, the Trigger field is set to 4. Trigger field values (11az)5–255 are reserved.

The LCI Measurement Request field is optionally present. If present, it contains a Measurement Request element with Measurement Type field equal to LCI (see Table 9-136 (Measurement type definitions for measurement requests)), which indicates a request for a Measurement Report element with Measurement Type field equal to LCI (see 11.21.6.7 (LCI and Location Civic retrieval using FTM procedure)). The Enable subfield(#291) in the Measurement Request Mode field in the Measurement Request element is set to 0. The Location Subject field in the Measurement Request field of the Measurement Request element is set to Location Subject Remote (see Table 9-148 (Location Subject field definition)). The Request, Report and Duration Mandatory subfield(#291) in the Measurement Request Mode field in the Measurement Request element are reserved (see 9.4.2.19.1 (General)).

The Location Civic Measurement Request field is optionally present. If present, it contains a Measurement Request element with Measurement Type field equal to Location Civic (see Table 9-136 (Measurement type definitions for measurement requests)), which indicates a request for a Measurement Report element with Measurement Type field equal to Location Civic (see 11.21.6.7 (LCI and Location Civic retrieval using FTM procedure)). The Enable subfield(#291) in the Measurement Request Mode field in the Measurement Request element is set to 0. The Location Subject field in the Measurement Request field of the Measurement Request element is set to Location Subject Remote (see Table 9-148 (Location Subject field definition)). The Location Service Interval Units field in the Measurement Request field of the Measurement Request element is set to 0. The Request, Report and Duration Mandatory subfield(#291) in the Measurement Request Mode field within the Measurement Request element are reserved (see 9.4.2.19.1 (General)).

(11az)The FTM Parameters field is optionally present. It is present in an IFTMR frame and its retransmissions when negotiating EDCA based ranging; see 11.21.6.3.2 (Negotiation for EDCA based ranging measurement exchange).

(11az)The Ranging Parameters field is present in the IFTMR frame, and its retransmissions, when the initiator requires negotiation of parameters with the responder in order to perform non-TB ranging, or TB ranging measurement exchange, see 11.21.6.3 (FTM procedure negotiation(11az)). If present, it contains a Ranging Parameters element as defined in 9.4.2.300 (Ranging Parameters element(11az)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

(11az)The LCI Report field is optional in an IFTMR frame and is present if the frame contains a TB specific subelement with the Passive TB Ranging field set to 1. The Location Civic Report field is optional in an IFTMR frame and can be present if the frame contains a TB specific subelement with the Passive TB Ranging field set to 1. The LCI Report and Location Civic Report fields are not present in IFTMR frames without a TB specific subelement with the Passive TB Ranging field set to 1. The format of the LCI Report is defined in 9.4.2.20.1 (General) and 9.4.2.20.10 (LCI report (Location configuration information report)). The LCI Report contains the Antenna Placement And Calibration subelement if the ISTA has dot11PassiveTBRangingAoDImplemented equal to true, and does not contain the Antenna Placement And Calibration subelement if the ISTA has dot11PassiveTBRangingAoDImplemented equal to false. The format of the Location Civic Report is defined in 9.4.2.20.1 (General) and 9.4.2.20.13 (Location Civic report).

### 9.6.7.33 FTM(11az) frame format

(11az)The FTM frame is an Action frame, except when transmitted in an A-MPDU, where it is an Action No Ack frame. The FTM is used to support the FTM procedure described in 11.21.6 (FTM procedure(#7065)). The format of the (11az)FTM frame Action field is shown in Figure 9-1218 (FTM frame Action field format(11az)(#7065)).

| | TOD Error | TOA Error | LCI Report (optional) | Location Civic Report (optional) | FTM Parameters (optional) | FTM Synchronization Information (optional) | Ranging Parameters (optional) |
|---|---|---|---|---|---|---|---|
| Octets: | 2 | 2 | variable | variable | variable | variable | variable |

| | Secure HE-LTF Parameters (optional) | Channel Measurement Feedback Type (optional) | Channel Measurement Feedback (optional) | Direction Measurement Results (optional) | Multiple Best AWV ID (optional) | Multiple AOD Feedback (optional) | LOS Likelihood (optional) |
|---|---|---|---|---|---|---|---|
| Octets: | 14 | 2 | variable | 9 | variable | variable | 4 |

**Figure 9-1218—FTM frame Action field format(11az)(#7065)**

The Category field is defined in 9.4.1.11 (Action field).

The Public Action field is defined in 9.6.7.1 (Public Action field(#3729)).

The TOD Error field format is shown in Figure 9-1219 (TOD Error field format(11az)).

| | B0 B4 | B5 B14 | B15 |
|---|---|---|---|
| | Max TOD Error Exponent | Reserved | TOD Not Continuous |
| Bits: | 5 | 10 | 1 |

**Figure 9-1219—TOD Error field format(11az)**

The TOA Error field format is shown in Figure 9-1220 (TOA Error field format(11az)).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is a nonzero value chosen by the responding STA to identify the (11az)FTM frame as the first of a pair, with the second or followup(#1665) (11az)FTM frame to be sent later. The Dialog Token field is set to 0 to indicate the end of the FTM session (see 11.21.6.6 (FTM session termination(11az)) and 11.21.6.4 (Measurement exchange)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

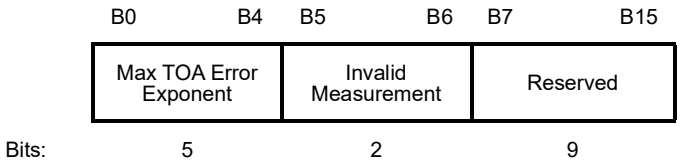

**Figure 9-1220—TOA Error field format(11az)**

The Follow Up Dialog Token field is the nonzero value of the Dialog Token field of the last transmitted (11az)FTM frame to indicate that it is the follow up (11az)FTM frame and that the TOD, TOA, Max TOD Error Exponent and Max TOA Error Exponent fields contain the values of the timestamps captured with the first (11az)FTM frame of the pair. The Follow Up Dialog Token field is 0 to indicate that the (11az)FTM frame is not a follow up to a last transmitted (11az)FTM frame. The value 0 in this field also indicates that TOD, TOA, TOD Error, and TOA Error fields are reserved. See 11.21.6 (FTM procedure(#7065)).

The TOD and TOA fields are expressed in units of picoseconds.

The maximum errors in the TOD and TOA values are represented using the function defined in Equation (9-14).

$$E_{max} = \begin{cases} \text{unknown}, & F = 0 \\ 2^{F-1}, & 1 \le F \le 30 \\ \ge 2^{30}, & F = 31 \end{cases} \quad (9\text{-}14)$$

where

$F$ is the Max Error Exponent

$E_{max}$ is the maximum TOD or TOA error, respectively, in units of picoseconds

The TOD field contains a timestamp that represents the time, with respect to a time base, at which the start of the preamble of the last transmitted (11az)FTM frame appeared at the transmit antenna connector.

The TOA field contains a timestamp that represents the time, with respect to a time base, at which the start of the preamble of the Ack frame to the last transmitted (11az)FTM frame arrived at the receive antenna connector.

NOTE 1—The values specified in the TOD and TOA fields are described in (#8109)(#8108)MLME-FINETIMINGMSMT.request MLME-FINETIMINGMSMT.confirm and MLME-FINETIMINGMSMT.indication primitives.

The Max TOD Error Exponent field contains an upper bound for the error exponent in the value specified in the TOD field.

NOTE 2—For instance, setting the Max TOD Error Exponent field to 2 indicates that the value in the TOD field has a maximum error of ± 2 ps.

The TOD Not Continuous field indicates that the TOD value is with respect to a different underlying time base than the last transmitted TOA value. It is set to 1 when a discontinuity is present. Otherwise, it is set to 0.

The Max TOA Error Exponent field contains an upper bound for the error exponent in the value specified in the TOA field.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Setting the Max TOD Error Exponent or the Max TOA Error Exponent field to 1 indicates that the upper bound on the error in the corresponding TOD or TOA value is unknown. Setting either field to 31 indicates that the upper bound on the error is greater than or equal to 1.073 741 824 ms.

(11az)The Invalid Measurement field contains an indication of an invalid TOA field. The Invalid Measurement field is set to 1 to indicate that the TOA value is invalid, and is set to 0 to indicate that the TOA value is valid; values of 2 and 3 are reserved.

The LCI Report field is optionally present. If present, it contains a Measurement Report element with Measurement Type field equal to LCI (see Table 9-163 (Measurement Type field definitions for measurement reports)), which either indicates the LCI of the transmitting STA and includes the Z and Usage Rules/Policy subelement or indicates an unknown LCI (see 11.21.6.7 (LCI and Location Civic retrieval using FTM procedure)). The Late, Incapable and Refused bits in the Measurement Report Mode field are set to 0. The (#2210)Colocated BSSID List subelement is present in the Measurement Report element with Measurement Type field equal to LCI, when there is at least one other BSS that shares the same antenna connector with the reporting BSS.

The Location Civic Report field is optionally present. If present, it contains a Measurement Report element with Measurement Type field equal to Location Civic (see Table 9-163 (Measurement Type field definitions for measurement reports)), which either indicates the Civic address of the transmitting STA or an unknown Civic address (see 11.21.6.7 (LCI and Location Civic retrieval using FTM procedure)). The Late, Incapable and Refused bits in the Measurement Report Mode field are set to 0. The (#2210)Colocated BSSID List subelement is present in the Measurement Report element with Measurement Type field equal to LCI, when there is at least one other BSS that shares the same antenna connector with the reporting BSS. When the LCI Report field contains a (#2210)Colocated BSSID List subelement, the (#2210)Colocated BSSID List subelement is not present in the Location Civic Report field.

(11az)The FTM Parameters field is optionally present. It is present in an IFTM frame and its retransmissions when negotiating EDCA based ranging; see 11.21.6.3.2 (Negotiation for EDCA based ranging measurement exchange).

The FTM Synchronization Information field is present in the initial FTM frame(#7223) and its retransmissions if any, and in the first (11az)FTM frame within each burst and its retransmissions if any; otherwise it is not present. If present, it contains an FTM Synchronization Information element with a TSF Sync Info field containing the 4 least significant octets of the TSF at the responding STA corresponding to the time the responding STA received the last (11az)FTM Request frame with the Trigger field equal to 1.

(11az)The Ranging Parameters element is optionally present. It is present in an IFTM frame and its retransmissions, when negotiating non-TB ranging; see 11.21.6.4.4 (Non-TB ranging measurement exchange(11az)) or 11.21.6.4.3 (TB ranging measurement exchange(11az)). If present, it contains a Ranging Parameters element as defined in 9.4.2.300 (Ranging Parameters element(11az)).

(11az)The Secure HE-LTF Parameters element is optionally present. It is present in an IFTM frame, if the IFTMR frame contained a Ranging Parameters element that included a Secure HE-LTF subelement. If present, it contains a Secure HE-LTF Parameters element as defined in 9.4.2.301 (Secure HE-LTF Parameters element(11az)).

(11az)The Channel Measurement Feedback Type field is present in the FTM frame if the Channel Measurement Feedback field is present. It describes the content of the Channel Measurement Feedback element contained in that field. The format of the Channel Measurement Feedback Type field is shown in Figure 9-1221 (Channel Measurement Feedback Type field format(11az)). Each of the subfields is described in Table 9-296 (FBCK-TYPE field description).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

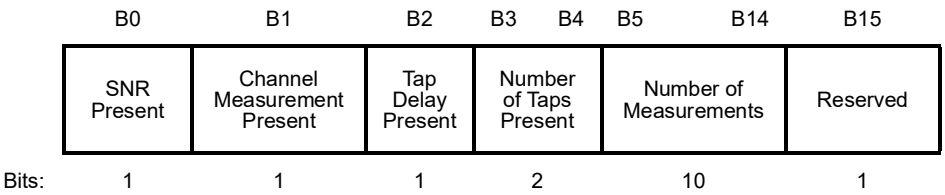

**Figure 9-1221—Channel Measurement Feedback Type field format(11az)**

(11az)The Channel Measurement Feedback element is present in the FTM frame if the frame is sent after a LOS Assessment Ack PPDU and optionally in response to an ISTA to RSTA angle of departure TRN field on an Ack frame. This field contains the Channel Measurement Feedback element (see 9.4.2.135 (Channel Measurement Feedback element)).

(11az)The Direction Measurement Results field is present in the FTM frame when the frame is sent from an RSTA to an ISTA following an FTM exchange that included ISTA to RSTA AOA measurement. This field contains the Direction Measurement Results element.

(11az)The Multiple Best AWV ID field is present in the FTM frame when the frame is sent from an ISTA as part of an AOD feedback exchange after an FTM exchange; see 11.21.6.4.2.4 (DMG AOD feedback exchange after an FTM exchange(11az)). It contains the Multiple Best AWV ID elements.

(11az)The Multiple AOD Feedback element is present in the FTM frame when the frame is sent from an RSTA to an ISTA as part of an AOD feedback exchange after an FTM exchange; see 11.21.6.4.2.4 (DMG AOD feedback exchange after an FTM exchange(11az)). It contains the Multiple AOD Feedback element.

(11az)The LOS Likelihood element (#8256)is optionally present in any FTM frame that contain TOA and TOD or Direction Measurement Results on measurements performed over DMG or EDMG PPDUs.

### 9.6.7.34 QAB Request frame format

The QAB Request frame is transmitted by an AP to another AP to schedule quiet periods that facilitate the detection of other system operating in the same band. The format of the QAB Request frame Action field is shown in Table 9-489 (QAB Request frame Action field format).

**Table 9-489—QAB Request frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | Public Action |
| 3 | Dialog Token |
| 4 | RequesterAP Address |
| 5 | ResponderAP Address |
| 6 | Quiet Period Request element |

The Category field is defined in 9.4.1.11 (Action field).

The Public Action field is defined in 9.6.7.1 (Public Action field(#3729)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is set to a nonzero value chosen by the AP.

The RequesterAP Address field is the MAC address of the AP that initiates the process. The length of this field is 6 octets.

The ResponderAP Address field is the MAC address of the responding AP. The length of this field is 6 octets. This field can be set to the broadcast address if the request is sent to multiple APs.

The Quiet Period Request element is defined in 9.4.2.148 (Quiet Period Request element).

### 9.6.7.35 QAB Response frame format

A QAB Response frame is sent in response to a QAB Request frame. The format of a QAB Response frame Action field contains the information shown in Table 9-490 (QAB Response frame Action field format).

**Table 9-490—QAB Response frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | Public Action |
| 3 | Dialog Token |
| 4 | RequesterAP Address |
| 5 | ResponderAP Address |
| 6 | Quiet Period Response element |

The Category field is defined in 9.4.1.11 (Action field).

The Public Action field is defined in 9.6.7.1 (Public Action field(#3729)).

The Dialog Token field value is copied from the corresponding received QAB Request frame.

The RequesterAP Address field is the MAC address of the AP that initiates the process. The length of this field is 6 octets.

The ResponderAP Address field is the MAC address of the responding AP. The length of this field is 6 octets.

The Quiet Period Response element is defined in 9.4.2.149 (Quiet Period Response element).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 9.6.7.36 FILS Discovery frame format

The format of the FILS Discovery frame Action field is defined in Table 9-491 (FILS Discovery frame format).

**Table 9-491—FILS Discovery frame format**

| Order | Information | Notes |
|---|---|---|
| 1 | Category | |
| 2 | Public Action | |
| 3 | FILS Discovery Information field | |
| 4 | Reduced Neighbor Report element | One or more Reduced Neighbor Report elements are optionally present if dot11FILSActivated or dot11ColocatedRNRImplemented is true; otherwise, they are not present.(11ax) |
| 5 | FILS Indication element | The FILS Indication element is optionally present if dot11FILSActivated is true; otherwise, it is not present.(11ax) |
| 6 | Roaming Consortium element | The Roaming Consortium element is optionally present if dot11FILSActivated is true; otherwise, it is not present.(11ax) |
| 7(11ax) | TIM element | The TIM element is optionally present if dot11HEOptionImplemented is true; otherwise, it is not present. |
| 8(11ax) | TWT element | The TWT element is optionally present if dot11HEOptionImplemented is true, otherwise, it is not present. If present, the Broadcast field of the TWT element is 1. |
| 9(11ax) | OPS element | The OPS element is optionally present if dot11HEOptionImplemented is true; otherwise, it is not present. |
| 10(11ax) | Transmit Power Envelope element | One Transmit Power Envelope element is optionally present for each distinct combination of values of the Maximum Transmit Power Interpretation subfield and Maximum Transmit Power Category subfield that is supported for the BSS if both of the following conditions are met:<br>— Either dot11VHTOptionImplemented or dot11ExtendedSpectrumManagementImplemented is true.<br>— Either dot11SpectrumManagementRequired or dot11RadioMeasurementActivated is true.<br><br>NOTE—In a 6 GHz HE AP, both dot11VHTOptionImplemented (see 26.17.1 (Basic HE BSS operation)) and dot11SpectrumManagementRequired (see 26.17.2.1 (General)) are true. |
| 11(11bc) | EBCS Parameters element | The EBCS Parameters element is optionally present if the transmitting STA has dot11EBCSSupport Activated set to true and a nonzero dot11EBCSTrafficStreamTable length. It is otherwise not present. |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Category field indicates the public category specified in Table 9-81 (Category values).

The Public Action field indicates the value of the FILS Discovery frame, as specified in Table 9-471 (Public Action field values) in Table 9.6.7.1 (Public Action field(#3729)).

The FILS Discovery Information field is shown in Figure 9-1222 (FILS Discovery Information field format).

| | FILS Discovery Frame Control | Timestamp | Beacon Interval | SSID/Short SSID | Length | FD Capability |
|---|---|---|---|---|---|---|
| Octets: | 2 | 8 | 2 | 1-32 | 0 or 1 | 0 or 2 |

| | Operating Class | Primary Channel | AP Configuration Sequence Number | Access Network Options | FD RSN Information | Channel Center Frequency Segment 1 | Mobility Domain |
|---|---|---|---|---|---|---|---|
| Octets: | 0 or 1 | 0 or 1 | 0 or 1 | 0 or 1 | 0 or 5 | 0 or 1 | 0 or 3 |

**Figure 9-1222—FILS Discovery Information field format**

The format of the FILS Discovery Frame Control subfield is shown in Figure 9-1223 (FILS Discovery Frame Control subfield format).

| | B0 – B4 | B5 | B6 | B7 |
|---|---|---|---|---|
| | SSID Length | Capability Presence Indicator | Short SSID Indicator | AP-CSN Presence Indicator |
| Bits: | 5 | 1 | 1 | 1 |

| | B8 | B9 | B10 | B11 | B12 | B13 | B14 B15 |
|---|---|---|---|---|---|---|---|
| | ANO Presence Indicator | Channel Center Frequency Segment 1 Presence Indicator | Primary Channel Presence Indicator | RSN Info Presence Indicator | Length Presence Indicator | MD Presence Indicator | (#4220)*Allocated to the Wi-Fi Alliance*[a] |
| Bits: | 1 | 1 | 1 | 1 | 1 | 1 | 2 |

[a] See(#6323) http://www.wi-fi.org.

**Figure 9-1223—FILS Discovery Frame Control subfield format**

The SSID Length subfield of the FILS Discovery Frame Control subfield indicates the length, in octets, of the SSID/Short SSID subfield in the FILS Discovery frame. This subfield is equal to the length of the SSID/Short SSID subfield in octets minus 1.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

NOTE 1—When the Short SSID Indicator subfield is equal to 1, the SSID Length subfield is equal to 3.

When the Capability Presence Indicator subfield is set to 1, it indicates that the FILS Discovery (FD) Capability subfield is present in the FILS Discovery frame. Setting the subfield to 0 indicates that the FD capability subfield is not present in the FILS Discovery frame.

A value of 1 in the Short SSID Indicator subfield indicates that a short SSID is contained in the SSID/Short SSID field of the FILS Discovery frame. A value of 0 indicates that an SSID is contained in the SSID/Short SSID field of the FILS Discovery frame.

A value of 1 in the AP-CSN Presence Indicator subfield indicates that the AP Configuration Sequence Number subfield is present in the FILS Discovery frame. Setting the subfield to 0 indicates that the AP-CSN subfield is not present in the FILS Discovery frame.

A value of 1 in the Access Network Options (ANO) Presence Indicator subfield indicates that the Access Network Options subfield is present in the FILS Discovery frame. Setting the subfield to 0 indicates that the ANO subfield is not present in the FILS Discovery frame.

A value of 1 in the Channel Center Frequency Segment 1 Presence Indicator subfield indicates that the Channel Center Frequency Segment 1 subfield is present in the FILS Discovery frame. Setting the subfield to 0 indicates that Channel Center Frequency Segment 1 subfield is not present.

A value of 1 in the Primary Channel Presence Indicator subfield indicates that the Primary Channel and the Operating Class subfields are present in the FILS Discovery frame. Setting the subfield to 0 indicates that the Primary Channel and the Operating Class subfields are not present in the FILS Discovery frame.

A value of 1 in the (#3248)RSN Info Presence Indicator subfield indicates that the FD RSN Information subfield is present in the FILS Discovery frame. Setting the subfield to 0 indicates that the FD RSN Information subfield is not present in the FILS Discovery frame.

A value of 1 in the Length Presence Indicator subfield indicates that the Length field is present in the FILS Discovery frame. Setting the subfield to 0 indicates that the Length field is not present in the FILS Discovery frame.

Setting the MD Presence Indicator subfield to 1 indicates that the Mobility Domain subfield is present in the FILS Discovery frame. Setting the subfield to 0 indicates that the Mobility Domain subfield is not present in the FILS Discovery frame.

The Timestamp subfield carries the value of the TSF timer at the time that the start of the data symbol containing the first bit of the Timestamp field appears at the transmit antenna connector.

The Beacon Interval subfield carries the beacon interval in TUs.

(#7151)When the Short SSID Indicator subfield is 1, the SSID/Short SSID field contains a Short SSID field (see 9.4.1.71 (Short SSID field(#7151))). Otherwise, the SSID/Short SSID field contains the SSID, whose length in octets is specified by the SSID Length subfield in the FILS Discovery Frame Control of the FILS Discovery frame(#8137).

The Length subfield indicates the length of the remaining fields in the FILS Discovery Information field in octets. Its value is variable.

NOTE 2—The Length field is used to facilitate STAs parsing the FILS Discovery frame in case of future expansions of the FILS Discovery Information field; STAs can determine the end of the FILS Discovery Information field using the value indicated in the Length field even if they do not recognize one or more subfields in the FILS Discovery Information field.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The FD Capability subfield contains the information that advertises the capabilities and operational indications of the STA transmitting the FILS Discovery frame. Its presence is indicated by the Capability Presence Indicator subfield in the FILS Discovery Frame Control subfield being equal to 1. The format of the FD Capability subfield is shown in Figure 9-1224 (FD Capability subfield format).

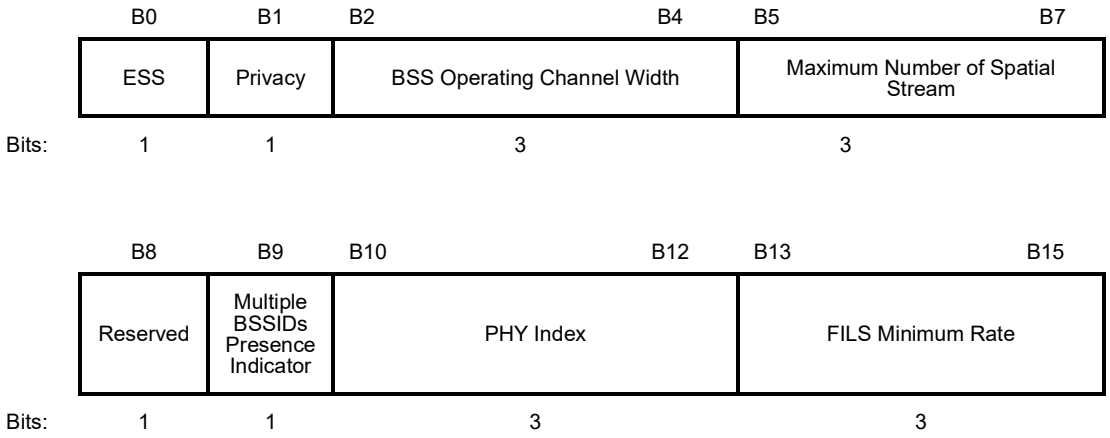

**Figure 9-1224—FD Capability subfield format**

The ESS and Privacy subfields are interpreted as specified in 9.4.1.4 (Capability Information field).

The BSS Operating Channel Width subfield indicates the BSS operating channel width as defined in Table 9-492 (BSS Operating Channel Width).

**Table 9-492—BSS Operating Channel Width**

| BSS Operating Channel Width field | HR/DSSS, OFDM, ERP, HT, VHT, HE BSS operating channel width | TVHT BSS operating channel width |
|---|---|---|
| 0 | 20 MHz or 22 MHz | TVHT_W |
| 1 | 40 MHz | TVHT_W+W |
| 2 | 80 MHz | TVHT_2W |
| 3 | 160 MHz or 80+80 MHz | TVHT_4W or TVHT_2W+2W |
| 4–7 | Reserved | Reserved |

The Maximum Number of Spatial Streams subfield indicates the number of the spatial streams supported by the AP. The Maximum Number of Spatial Streams subfield is coded per Table 9-493 (Maximum Number of Spatial Streams).

**Table 9-493—Maximum Number of Spatial Streams**

| Number of Spatial Streams subfield | Maximum Number of Spatial Streams subfield |
|---|---|
| 0 | 1 |
| 1 | 2 |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-493—Maximum Number of Spatial Streams**

| Number of Spatial Streams subfield | Maximum Number of Spatial Streams subfield |
|---|---|
| 2 | 3 |
| 3 | 4 |
| 4 | 5–8 |
| 5–7 | Reserved |

The Multiple BSSIDs Presence Indicator subfield is set to 1 to indicate that the Multiple BSSID element is present in the Beacon and Probe Response frames. It is set to 0 to indicate that the Multiple BSSID element is not present in the Beacon and Probe Response frames.

The PHY Index subfield is defined as in Table 9-494 (PHY Index subfield).

**Table 9-494—PHY Index subfield**

| PHY Index subfield | PHY |
|---|---|
| 0 | HR/DSSS (see Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification)) |
| 1 | ERP-OFDM (see Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) and Clause 18 (Extended Rate PHY (ERP) specification)) |
| 2 | HT (see Clause 19 (High Throughput (HT) PHY specification(#2297))) |
| 3 | VHT (see Clause 21 (Very high throughput (VHT) PHY specification)) or TVHT (see Clause 22 (Television very high throughput (TVHT) PHY specification)) |
| 4(11ax) | HE (see Clause 27 (High-efficiency (HE) PHY specification(11ax))) |
| 5–7 | Reserved |

The FILS Minimum Rate subfield indicates the minimum rate to be used by the AP transmitting the FILS Discovery frame and by FILS STAs in subsequent transmissions between the AP and FILS STAs. Depending on the PHY Index subfield of the received FILS Discovery frame, the minimum rate is represented as a bit rate value or as an MCS value as shown in Table 9-495 (FILS Minimum Rate). If an MCS value is provided, then the minimum rate is derived from the MCS value and the PHY Index in the FD Capability subfield.

(#1011)The Operating Class and Primary Channel subfields are present if the FILS Discovery frame is transmitted in a non-HT duplicate PPDU. Otherwise, the subfields are not present.

When present, the subfields indicate the following:

— If the operating class has a channel spacing other than 80 MHz
  - BSS bandwidth, equals the channel spacing
  - Center frequency of the channel on which the BSS operates

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-495—FILS Minimum Rate**

| FILS Minimum Rate subfield | PHY Index subfield is 0 (HR/DSSS) | PHY Index subfield is 1 (ERP-OFDM) | PHY Index subfield is 2 (HT) | PHY Index subfield is 3 (VHT or TVHT) | PHY Index subfield is 4 (HE)(11ax) |
|---|---|---|---|---|---|
| 0 | 1 Mb/s | 6 Mb/s | HT-MCS 0 | VHT-MCS 0 | HE-MCS 0 |
| 1 | 2 Mb/s | 9 Mb/s | HT-MCS 1 | VHT-MCS 1 | HE-MCS 1 |
| 2 | 5.5 Mb/s | 12 Mb/s | HT-MCS 2 | VHT-MCS 2 | HE-MCS 2 |
| 3 | 11 Mb/s | 18 Mb/s | HT-MCS 3 | VHT-MCS 3 | HE-MCS 3 |
| 4 | Reserved | 24 Mb/s | HT-MCS 4 | VHT-MCS 4 | HE-MCS 4 |
| 5–7 | Reserved | Reserved | Reserved | Reserved | Reserved |

- Center frequency of the primary channel

— If the operating class has a channel spacing of 80 MHz

- BSS bandwidth, either 80 MHz or 80+80 MHz
- Center frequency of the channel on which the BSS operates, if BSS bandwidth is 80 MHz
- Center frequency of the primary 80 MHz channel, if BSS bandwidth is 80+80 MHz
- Center frequency of the primary channel

NOTE 3—If a received FILS Discovery frame does not include the Primary Channel subfield, the primary channel is the channel on which the PPDU was received.

NOTE 4—A STA that receives a FILS Discovery frame containing an Operating Class subfield indicating a channel spacing of 80 MHz can determine the BSS bandwidth by receiving a Beacon or a Probe Response frame on the primary channel indicated in the FILS Discovery frame.

The AP Configuration Sequence Number (AP-CSN) subfield format is defined in 9.4.2.180 (AP Configuration Sequence Number (AP-CSN) element).

The Access Network Options (ANO) subfield format is defined in Figure 9-565 (Access Network Options field format) (in 9.4.2.90 (Interworking element)).

(#1012)The FD RSN Information subfield is defined in Figure 9-1225 (FD RSN Information subfield format).

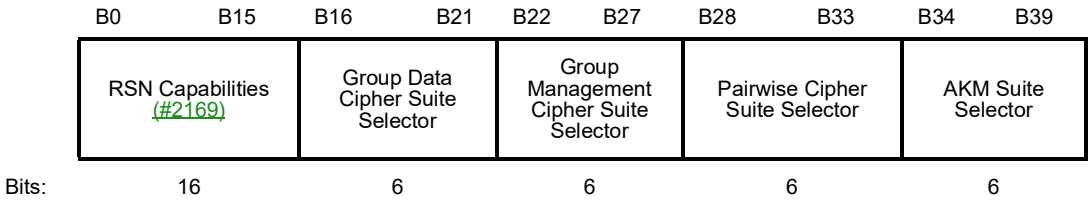

**Figure 9-1225—FD RSN Information subfield format**

The FD RSN Information subfield contains an RSN Capabilities) subfield, as specified in Figure 9-369 (RSN Capabilities field format) (in 9.4.2.23.4 (RSN capabilities)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The FD RSN Information subfield also contains three cipher suite selectors. The Group Data Cipher Suite Selector subfield contains one group data cipher suite selector. The Group Management Cipher Suite Selector subfield contains one group management cipher suite selector. The Pairwise Cipher Suite Selector subfield contains one pairwise cipher suite selector. Each of these subfields contains a code identifying a Cipher Suite Type as specified in Table 9-188 (Cipher suite selectors). The definition of the cipher suite selectors is shown in Table 9-496 (Cipher suite selector definitions).

**Table 9-496—Cipher suite selector definitions**

| Cipher suite selector | Cipher suite type |
|---|---|
| 0–13 | Cipher suite type 0 to 13 in Table 9-188 (Cipher suite selectors) |
| 14–61 | Reserved |
| 62 | Vendor Specific |
| 63 | No cipher suite selected |

The FD RSN Information subfield also contains one AKM suite selector. An AKM suite selector is a code identifying (#3266)an AKMP as specified in Table 9-190 (AKM suite selectors). The definition of the AKM suite selectors is shown in Table 9-497 (AKM suite selector definitions).

**Table 9-497—AKM suite selector definitions**

| AKM suite selector | AKMP(#3266) |
|---|---|
| 0 | Use AKM from RSN IE Beacon/Probe Response frame |
| 1 | Set (#3266)AKM 00-0F-AC: 14 of Table 9-190 (AKM suite selectors) |
| 2 | Set (#3266)AKM 00-0F-AC: 15 of Table 9-190 (AKM suite selectors) |
| 3 | Set (#3266)AKM 00-0F-AC: 14 or 00-0F-AC: 15 of Table 9-190 (AKM suite selectors) |
| 4 | Set (#3266)AKM 00-0F-AC: 17 of Table 9-190 (AKM suite selectors) |
| 5–61 | Reserved |
| 62 | Vendor Specific |
| 63 | No (#3266)AKMP selected |

The Channel Center Frequency Segment 1 subfield is set to the index of the channel center frequency of the frequency segment 1 for an 80+80 MHz VHT (11ax)or HE BSS if the FILS Discovery frame is transmitted as a non-HT duplicate PPDUs at an 80+80 MHz channel bandwidth; otherwise, the subfield is not present.

The format of the Mobility Domain subfield is shown in Figure 9-1226 (Mobility Domain subfield format).

The MDID field is defined in 9.4.2.45 (MDE(#1776)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

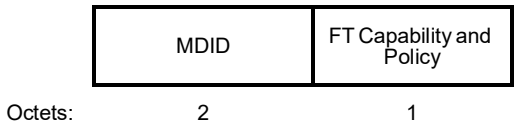

**Figure 9-1226—Mobility Domain subfield format**

The FT Capability and Policy field is defined in 9.4.2.45 (MDE(#1776)).

The Reduced Neighbor Report element is defined in 9.4.2.169 (Reduced Neighbor Report element).

The FILS Indication element is defined in 9.4.2.181 (FILS Indication element).

(#1010)The Roaming Consortium element is defined in 9.4.2.94 (Roaming Consortium element).

(11ax)The TIM element is defined in 9.4.2.5 (TIM element) and is included for operation as defined in 26.14.3 (Opportunistic power save).

(11ax)The TWT element is defined in 9.4.2.198 (TWT element) and is included with the Broadcast field set to 1 to aid an unassociated STA determine the target transmission time of Trigger frames that contain at least one User Info field that allocates RA-RUs for unassociated STAs (see 26.5.4.5 (Additional considerations for unassociated STAs) and 26.8.3.1 (General)).

(11ax)The OPS element is defined in 9.4.2.256 (OPS element(11ax)).

(11ax)The Transmit Power Envelope element is defined in 9.4.2.160 (Transmit Power Envelope element).

(11bc)The EBCS Parameters element is defined in 9.4.2.313 (EBCS Parameters element(11bc)). When included in FILS Discovery frames, the element carries the EBCS Info Frame Tx Countdown field and can include the Compressed Certificate Group ID field and the EBCS AP Group ID field.

### 9.6.7.37 DCS Measurement Request frame format

The DCS Measurement Request frame is transmitted by a DCS requesting CDMG AP or PCP to a DCS responder CDMG AP or PCP to request all of the STAs in the DCS responder AP's infrastructure BSS or PCP's PBSS to measure a specified channel or all other channels within the supported operating class (as defined in 9.4.2.52 (Supported Operating Classes element)). The format of the DCS Measurement Request frame Action field is shown in Figure 9-1227 (DCS Measurement Request frame Action field format).

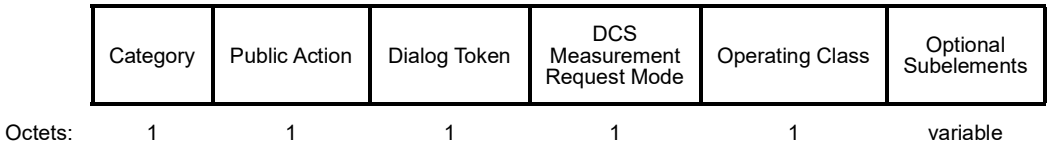

**Figure 9-1227—DCS Measurement Request frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The Public Action field is defined in 9.6.7.1 (Public Action field(#3729)).

The Dialog Token field is defined in 9.4.1.12 (Dialog Token field) and set by the requesting STA.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Measurement Request Mode field is set to 1 to indicate that the DCS requesting AP or PCP requests all STAs within the DCS responder AP's or PCP's infrastructure BSS or PBSS to measure all channels within the operating class specified in the following Operating Class field. The Measurement Request Mode field is set to 2 to indicate that the DCS requesting AP or PCP requests all STAs within the DCS responder AP's infrastructure BSS or PCP's PBSS to measure the specified channel(s) indicated within the list of optional subelements. Other values are reserved.

The Operating Class field is valid when the Measurement Request Mode field is 1. In all other cases, the Operating Class field is reserved. The Operating Class and Channel Number fields together specify the channel frequency and channel bandwidth for which the DCS procedure applies. Valid values of the Operating Class field are shown in Annex E.

The Optional Subelements field is present when the Measurement Request Mode field is 2. The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3 (Subelements). The optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 9-498 (Optional subelement IDs for DCS Measurement Request frame).

**Table 9-498—Optional subelement IDs for DCS Measurement Request frame**

| Subelement ID | Name | Extensible |
|---|---|---|
| 0 | Reserved | |
| 1 | Channel Measurement Request | Yes |
| 2–220 | Reserved | |
| 221 | Vendor Specific | Vendor defined |
| 222–255 | Reserved | |

The Channel Measurement Request subelement is used to specify the channel(s) to be measured. The format of the DCS Channel Measurement Request subelement is shown in Figure 9-1228 (DCS Channel Measurement Request subelement format).

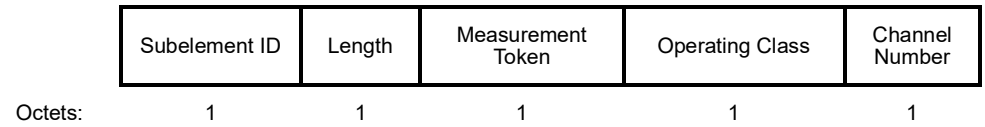

**Figure 9-1228—DCS Channel Measurement Request subelement format**

The Subelement ID field is defined in Figure 9-498 (Optional subelement IDs for DCS Measurement Request frame).

The Length field is defined in 9.4.3 (Subelements).

The Measurement Token field is set to a nonzero value that is unique among the Channel Measurement Request subelements in a particular DCS Measurement Request frame.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Operating Class and Channel Number fields together specify the channel frequency and channel bandwidth for which the DCS procedure applies. Valid values of the Operating Class field are shown in Annex E (Country elements and operating classes).

The Channel Number field is set to the channel number for which the Channel Measurement Request applies (as defined in 17.3.8.4.3 (Channelization)).

### 9.6.7.38 DCS Measurement Response frame format

The DCS Measurement Response frame is transmitted by a DCS responder AP or PCP to a DCS requesting AP or PCP to report the results of measuring one or more channels. The format of the DCS Measurement Response frame Action field is shown in Figure 9-1229 (DCS Measurement Response frame Action field format).

| | Category | Public Action | Dialog Token | DCS Measurement Report Mode | Operating Class | Optional Subelements |
|---|---|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | 1 | 1 | variable |

**Figure 9-1229—DCS Measurement Response frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The Public Action field is defined in 9.6.7.1 (Public Action field(#3729)).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is copied from the corresponding DCS Measurement Request frame.

The Measurement Report Mode field is set to 0 to indicate no clear channel to which the DCS responder AP's or PCP's BSS can move within the operating class specified in the following Operating Class field, or the DCS request has been declined by the DCS responder AP or PCP. The Measurement Report Mode field is set to 1 to indicate that all other channels within the operating class specified in the following Operating Class field are available for the DCS responder AP's or PCP's BSS. The Measurement Report Mode field is set to 2 to indicate that the clear channel for the DCS responder AP's or PCP's BSS is indicated by the Optional Subelement field in the DCS Measurement Response frame. Other values are reserved.

The Operating Class field is valid when the Measurement Report Mode field is 1. In all other cases, the Operating Class field is reserved. The Operating Class and Channel Number fields together specify the channel frequency and channel bandwidth for which the DCS procedure applies. Valid values of the Operating Class field are shown in Annex E.

The Optional Subelements field is present when the Measurement Report Mode field is 2. The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3 (Subelements). The optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 9-499 (Optional subelement IDs for DCS Measurement Response frame).

The Channel Measurement Report subelement is used to report the number of available channel to which the DCS responder AP's or PCP's BSS can move. The DCS Channel Measurement Report subelement format is as shown in Figure 9-1230 (DCS Channel Measurement Report subelement format).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-499—Optional subelement IDs for DCS Measurement Response frame**

| Subelement ID | Name | Extensible |
|---|---|---|
| 0 | Reserved | |
| 1 | Channel Measurement Report | Yes |
| 2–220 | Reserved | |
| 221 | Vendor Specific | Vendor defined |
| 222–255 | Reserved | |

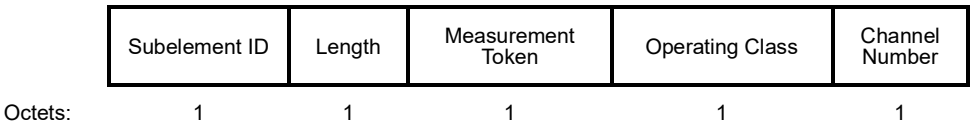

**Figure 9-1230—DCS Channel Measurement Report subelement format**

The Subelement ID field is defined in Table 9-499 (Optional subelement IDs for DCS Measurement Response frame).

The Length field is defined in 9.4.3 (Subelements).

The Measurement Token field is copied from the corresponding Channel Measurement Request subelement in the received DCS Measurement Request frame.

The Operating Class and Channel Number fields together specify the channel frequency and channel bandwidth for which the DCS procedure applies. Valid values of the Operating Class field are shown in Annex E.

The Channel Number field is set to the channel number to which the DCS responder AP's or PCP's BSS can move (as defined in 17.3.8.4.3 (Channelization)).

### 9.6.7.39 DCS Request frame format

The DCS Request frame is transmitted by a DCS requesting AP or PCP to a DCS responder AP or PCP to request the DCS responder AP's or PCP's BSS to move to an available channel indicated in the DCS Measurement Response frame. The format of the DCS Request frame Action field is shown in Figure 9-1231 (DCS Request frame Action field format).

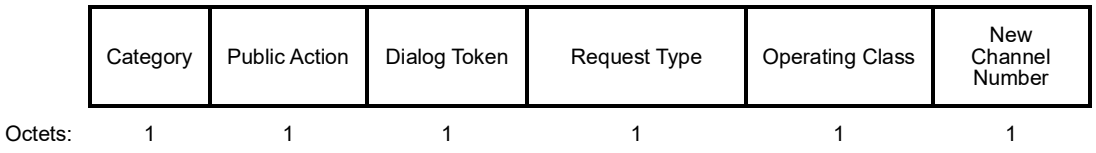

**Figure 9-1231—DCS Request frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The Public Action field is defined in 9.6.7.1 (Public Action field(#3729)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Dialog Token field value is copied from the corresponding DCS Measurement Response frame.

The Request Type field value is set to 0 to indicate that the requesting AP or PCP requests the responder AP or PCP to tear down the DCS procedure or the DCS request is refused by the responder AP or PCP; then the following Operation Class field and New Channel Number field are reserved. The Request Type field value is set to 1 to indicate that the DCS requesting AP or PCP to request the DCS responder AP's or PCP's BSS to move to an available channel indicated by the following Operating Class field and New Channel Number field. Other values are reserved.

The Operating Class and Channel Number fields together specify the channel frequency and channel bandwidth for which the DCS procedure applies. Valid values of the Operating Class field are shown in Annex E. This field is valid when the Request Type field is set to 1; otherwise, it is reserved.

The New Channel Number field is set to the channel number to which the DCS requesting AP or PCP request the DCS responder AP's or PCP's BSS to move (as defined in 17.3.8.4.3 (Channelization)). This field is valid when the Request Type field is set to 1; otherwise, it is reserved.

### 9.6.7.40 DCS Response frame format

The DCS Response frame is transmitted by a DCS responder AP or PCP to a DCS requesting AP or PCP to confirm that the DCS responder AP's or PCP's BSS is moving to the channel specified in the DCS request frame. The format of the DCS Response frame Action field is shown in Figure 9-1232 (DCS Response frame Action field format).

| | Category | Public Action | Dialog Token | Responder Type | Operating Class | New Channel Number | Channel Switch Count |
|---|---|---|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | 1 | | 1 | 1 |

**Figure 9-1232—DCS Response frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The Public Action field is defined in 9.6.7.1 (Public Action field(#3729)).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is copied from the corresponding DCS Request frame.

The Operating Class and Channel Number fields together specify the channel frequency and channel bandwidth for which the DCS procedure applies. Valid values of the Operating Class field are shown in Annex E.

The New Channel Number field is set to the channel number copied from the corresponding received DCS Request frame.

The Channel Switch Count field either is set to the number of TBTTs until the DCS responder AP or PCP sending the Channel Switch Announcement frame or element within its BSS switches to the new channel or is set to 0. It is set to 1 to indicate that the switch occurs immediately before the next TBTT. It is set to 0 to indicate that the switch occurs at any time after the frame containing the element is transmitted.

This is an unapproved IEEE Standards Draft, subject to change.

### 9.6.7.41 Extended Notification Period Request frame format

The format of the Extended Notification Period Request frame Action field is defined in Table 9-500 (Extended Notification Period Request frame Action field format).

**Table 9-500—Extended Notification Period Request frame Action field format**

| Order | Information |
|---|---|
| 0 | Category |
| 1 | Public Action |
| 2 | Dialog Token |
| 3 | NP/BHI Duration |

The Category field is defined in 9.4.1.11 (Action field).

The Public Action field is defined in 9.6.7.1 (Public Action field(#3729)).

The Dialog Token field is defined in 9.4.1.12 (Dialog Token field) and set by the requesting STA.

The NP/BHI Duration field is set to the length of the NP/BHI duration requested by the STA intending to establish its BSS on a free 1.08 GHz channel to the peer STA operating on the adjacent 1.08 GHz channel. The length of this field is 2 octets.

### 9.6.7.42 Extended Notification Period Response frame format

The format of the Extended Notification Period Response frame Action field is defined in Table 9-501 (Extended Notification Period Response frame Action field format).

**Table 9-501—Extended Notification Period Response frame Action field format**

| Order | Information |
|---|---|
| 0 | Category |
| 1 | Public Action |
| 2 | Dialog Token |
| 3 | Status Code |
| 4 | Dynamic Bandwidth Control |

The Category field is defined in 9.4.1.11 (Action field).

The Public Action field is defined in 9.6.7.1 (Public Action field(#3729)).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is copied from the corresponding Extended Notification Period Response frame.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Status Code field indicates the result of the notification period allocation request and is defined in 9.4.1.9 (Status Code field).

The Dynamic Bandwidth Control element specifies the information of the STA operating on a 1.08 GHz channel after channel splitting and is defined in 9.4.2.219 (Dynamic Bandwidth Control element). This element is present if the Status Code field indicates successful; otherwise, it is not present.

### 9.6.7.43 Extended Channel Splitting Request frame format

The format of the Extended Channel Splitting Request frame Action field is defined in Table 9-502 (Extended Channel Splitting Request frame Action field format).

**Table 9-502—Extended Channel Splitting Request frame Action field format**

| Order | Information |
|---|---|
| 0 | Category |
| 1 | Public Action |
| 2 | Dialog Token |
| 3 | NP/BHI Duration |

The Category field is defined in 9.4.1.11 (Action field).

The Public Action field is defined in 9.6.7.1 (Public Action field(#3729)).

The Dialog Token field is defined in 9.4.1.12 (Dialog Token field) and set by the requesting STA.

The NP/BHI Duration field is set to the length of the NP/BHI duration requested by the STA intending to establish its BSS on a free 1.08 GHz channel to the peer STA operating on the adjacent 1.08 GHz channel. The length of this field is 2 octets.

### 9.6.7.44 Extended Channel Splitting Response frame format

The format of the Extended Channel Splitting Response frame Action field is defined in Table 9-503 (Extended Channel Splitting Response frame Action field format).

**Table 9-503—Extended Channel Splitting Response frame Action field format**

| Order | Information |
|---|---|
| 0 | Category |
| 1 | Public Action |
| 2 | Dialog Token |
| 3 | Status Code |
| 4 | Channel Switch Announcement |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-503—Extended Channel Splitting Response frame Action field format *(continued)***

| Order | Information |
|---|---|
| 5 | Beacon Interval |
| 6 | Dynamic Bandwidth Control |

The Category field is defined in 9.4.1.11 (Action field).

The Public Action field is defined in 9.6.7.1 (Public Action field(#3729)).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is copied from the corresponding Extended Channel Splitting Response frame.

The Status Code field indicates the result of the notification period allocation request and is defined in 9.4.1.9 (Status Code field).

The Channel Switch Announcement element is defined in 9.4.2.17 (Channel Switch Announcement element). This element is present if the Status Code field indicates successful; otherwise, it is not present.

The Beacon Interval field specifies the beacon interval length on a 2.16 GHz channel set by the STA operating on one of the 1.08 GHz channel after channel splitting and is defined in 9.4.1.3 (Beacon Interval field). This field is present if the Status Code field indicates successful; otherwise, it is not present.

The Dynamic Bandwidth Control element specifies the information of the STA operating on a 1.08 GHz channel after channel splitting and is defined in 9.4.2.219 (Dynamic Bandwidth Control element). This element is present if the Status Code field indicates successful; otherwise, it is not present.

### 9.6.7.45 Group Addressed GAS Request frame format

The Group Addressed GAS Request frame is transmitted by a requesting STA to request information from another STA. The format of the Group Addressed GAS Request frame Action field is defined in Table 9-504 (Group Addressed GAS Request frame Action field format).

**Table 9-504—Group Addressed GAS Request frame Action field format**

| Order | Information |
|---|---|
| 0 | Category |
| 1 | Public Action |
| 2 | Dialog Token |
| 3 | Advertisement Protocol element |
| 4 | Query Request Length |
| 5 | Query Request |
| 6 | Multi-band (optional) |
| 7 | GAS Extension |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Category field is defined in 9.4.1.11 (Action field).

The Public Action field is defined in 9.6.7.1 (Public Action field(#3729)).

The Dialog Token field is defined in 9.4.1.12 (Dialog Token field) and set by the requesting STA.

The Advertisement Protocol element is defined in 9.4.2.91 (Advertisement Protocol element). The Advertisement Protocol element includes exactly one advertisement protocol ID.

The Query Request Length field format is provided in Figure 9-1199 (Query Request Length field). The Query Request Length field is set to the total number of octets in the Query Request field.

The Query Request field format is provided in Figure 9-1200 (Query Request field). The Query Request field is a generic container whose value is formatted in accordance with the protocol identified in the Advertisement Protocol element.

When present in a Group Addressed GAS Request frame, the Multi-band element indicates the frequency band, operating class, and channel number to which the Group Addressed GAS Request frame applies.

The GAS Extension element indicates parameters that the (#8257)STA transmitting the request is requesting the responder to use while processing this request.

### 9.6.7.46 Group Addressed GAS Response frame format

The Group Addressed GAS Response frame is transmitted in response to a GAS Initial Request frame or Group Addressed GAS Request frame. The format of the Group Addressed GAS Response frame Action field is defined in Table 9-505 (Group Addressed GAS Response frame Action field format).

**Table 9-505—Group Addressed GAS Response frame Action field format**

| Order | Information |
|---|---|
| 0 | Category |
| 1 | Public Action |
| 2 | Dialog Token |
| 3 | Status Code |
| 4 | Advertisement Protocol element |
| 5 | Query Response Length |
| 6 | Query Response |
| 7 | Multi-band (optional) |
| 8 | GAS Extension |

The Category field is defined in 9.4.1.11 (Action field).

The Public Action field is defined in 9.6.7.1 (Public Action field(#3729)).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is copied from the corresponding GAS Initial Request frame or Group Addressed GAS Request frame.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Status Code values are defined in 9.4.1.9 (Status Code field).

The Advertisement Protocol element is defined in 9.4.2.91 (Advertisement Protocol element). The Advertisement Protocol element includes exactly one advertisement protocol ID.

The Query Response Length field format is provided in Figure 9-1202 (Query Response Length field format). The value of the Query Response Length field is set to the total number of octets in the Query Response field.

The Query Response field format is provided in Figure 9-1203 (Query Response field format). The Query Response field is a generic container whose value is formatted in accordance with the protocol specified in the Advertisement Protocol element.

When present in a Group Addressed GAS Response frame, the Multi-band element indicates the frequency band, operating class, and channel number to which the GAS Initial Response frame applies.

When present in a Group Addressed GAS Response frame, the GAS Extension element indicates parameters to which STA and which Query Request of the STA the response is responding.

### 9.6.7.47 On-channel Tunnel Request frame format

The On-channel Tunnel Request frame allows nonrobust STA-STA communications of the same information that is conveyed in the robust On-channel Tunnel Request frame (see 9.6.20.7 (On-channel Tunnel Request frame format)).

The format of the robust and nonrobust On-channel Tunnel Request frame is the same and defined in 9.6.20.7 (On-channel Tunnel Request frame format). The Category field value differentiates whether an On-channel Tunnel Request frame is robust or not.

### 9.6.7.48 DMG STA Directional Transmit Activity Report frame format(11ay)

The DMG STA Directional Transmit Activity Report frame is transmitted by a DMG STA to describe the transmit activity of the STA for a given antenna pattern and over a given observation period. The information included in the frame can help a receiving STA take actions to eliminate or mitigate both the interference caused by the STA transmitting the frame, and the interference caused by the receiving STA to the transmitting STA. The format of the DMG STA Directional Transmit Activity Report frame Action field is shown in Figure 9-1233 (DMG STA Directional Transmit Activity Report frame Action field format(11ay)).

| | Category | Public Action | Timestamp | Country element | DMG STA Directional Transmit Activity Report element |
|---|---|---|---|---|---|
| Octets: | 1 | 1 | 8 | variable(M118) | variable(M118) |

**Figure 9-1233—DMG STA Directional Transmit Activity Report frame Action field format(11ay)**

The Category field is defined in 9.4.1.11 (Action field).

The Public Action field is defined in 9.6.7.1 (Public Action field(#3729)).

The Timestamp field is defined in 9.4.1.10 (Timestamp field).

The Country element is defined in 9.4.2.7 (Country element).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The DMG STA Directional Transmit Activity Report element is defined in 9.4.2.289 (DMG STA Directional Transmit Activity Report element(11ay)).

### 9.6.7.49 LMR frame format(11az)(#8216)

The LMR frame is an Action No Ack frame of category Public. The LMR frame is used to support the non-TB and TB ranging mechanisms of the FTM procedure described in 11.21.6 (Fine timing measurement (FTM) procedure). The format of the LMR Action field is shown in Figure 9-1234 (LMR frame Action field format(11az)(#8216)).

| | Category | Public Action | Dialog Token | TOD | TOA | TOD Error | TOA Error |
|---|---|---|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | 6 | 6 | 1 | 1 |

| | CFO Parameter | R2I NDP Tx Power | I2R NDP Target RSSI | Secure HE-LTF Parameters (optional) | AOA Feedback (optional) |
|---|---|---|---|---|---|
| Octets: | 2 | 1 | 1 | 14 | 9 |

**Figure 9-1234—LMR frame Action field format(11az)(#8216)**

The Category field is defined in 9.4.1.11 (Action field).

The Public Action field is defined in 9.6.7.1 (Public Action field(#3729)).

The Dialog Token field is used to link the LMR to the Measurement Sounding phase that was used for the reported measurement.

The TOD and TOA fields are expressed in units of picoseconds.

The TOD field contains a timestamp that represents the time, with respect to a time base, at which the start of the preamble of the corresponding NDP appeared at the transmit antenna connector. The corresponding NDP in an R2I LMR frame(#8216) is an R2I NDP, while in an I2R LMR frame it is an I2R NDP. In both cases the corresponding NDP refers to a measurement exchange that included a Ranging NDP Announcement frame, which carried the matching dialog token that is also included in this LMR.

The TOA field contains a timestamp that represents the time, with respect to a time base, at which the start of the preamble of the corresponding NDP arrived at the receive antenna connector. The corresponding NDP in an R2I LMR frame is an I2R NDP, while in an I2R LMR frame it is an R2I NDP. In both cases the corresponding NDP refers to a measurement exchange that included a Ranging NDP Announcement frame, which carried the matching dialog token that is also included in this LMR.

The TOD Error field format is defined in Figure 9-1235 (TOD Error field format(11az)).

The TOA Error field format is defined in Figure 9-1236 (TOA Error field format(11az)).

The maximum errors in the TOD and TOA values are represented using the function defined in Equation (9-15).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

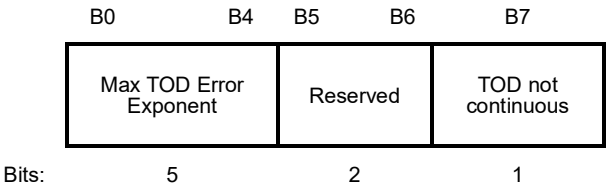

**Figure 9-1235—TOD Error field format(11az)**

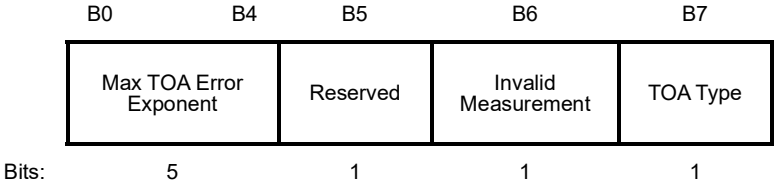

**Figure 9-1236—TOA Error field format(11az)**

$$E_{max} = \begin{cases} \text{unknown}, & F = 0 \\ 2^{F-1}, & 1 \le F \le 30 \\ \ge 2^{30}, & F = 31 \end{cases} \quad (9\text{-}15)$$

where

$F$ is the Max Error Exponent

$E_{max}$ is the maximum TOD or TOA error, respectively, in units of picoseconds

The Max TOD Error Exponent subfield contains an upper bound for the error exponent in the value specified in the TOD field.

The TOD Not Continuous subfield indicates that the TOD value is with respect to a different underlying time base than the last transmitted TOD value. It is set to 1 when a discontinuity is present. Otherwise, it is set to 0.

The Max TOA Error Exponent subfield contains an upper bound for the error exponent in the value specified in the TOA field.

A value of 0 for the Max TOD Error Exponent or the Max TOA Error Exponent subfield indicates that the upper bound on the error in the corresponding TOD or TOA value is unknown. A value of 31 indicates that the upper bound on the error is greater than or equal to 1.073741824 ms.

The Invalid Measurement subfield indicates whether the TOA field contains a valid value. It is set to 1 to indicate that the TOA value is invalid and the value 0 in this subfield indicates that the TOA value is valid.

The TOA Type subfield indicates if the TOA timestamp was calculated based on the first arrival path of the channel impulse response or the average linear phase across the subcarriers.

In the I2R LMR, the CFO Parameter field indicates the clock rate difference between the ISTA and RSTA; the format is a signed value in units of 0.01 ppm. In the R2I LMR, the value of the CFO Parameter field is reserved.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

When negotiated, the (#8066)R2I NDP Tx Power and I2R NDP Target RSSI fields are used in the in R2I LMR as part of the non-TB ranging measurement exchange, see 11.21.6.4.4 (Non-TB ranging measurement exchange(11az)), otherwise their values are reserved.

The R2I NDP Tx Power field indicates the combined average power per 20 MHz bandwidth referenced to the antenna connector, of all antennas used to transmit the preceding R2I NDP. The transmit power is reported with a resolution of 1 dB, with values in the range 0 to 60 representing –20 dBm to 40 dBm, respectively. Values above 60 are reserved.

The I2R NDP Target RSSI field indicates the preferred receive signal power, averaged over the RSTA's antenna connectors, for future I2R NDPs transmitted by the ISTA. The preferred receive signal power in units of dBm is TargetRSSI = –110 + FVal, where FVal is the value of the Target RSSI field, except that values above 90 indicate that the RSTA has no preferred receive signal power for the I2R NDPs(#8066).

The Secure HE-LTF Parameters element is present if an ISTA and RSTA have negotiated an FTM session with secure HE-LTF measurement exchange mode; see 11.21.6.3.4 (Negotiation for secure HE-LTF in the TB and non-TB ranging measurement exchange). If present, it contains a Secure HE-LTF Parameters element as defined in 9.4.2.301 (Secure HE-LTF Parameters element(11az)).

The AOA Feedback field is optionally present. If present, it contains a Direction Measurement Results element as defined in 9.4.2.302 (Direction Measurement Results element(11az)).

### 9.6.7.50 ISTA Passive TB Ranging Measurement Report frame format(11az)

The ISTA Passive TB Ranging Measurement Report frame is an Action No Ack frame of category Public. The ISTA Passive TB Ranging Measurement Report frame is used to support the passive TB ranging mechanisms of the FTM procedure described in 11.21.6 (Fine timing measurement (FTM) procedure). The format of the ISTA Passive TB Ranging Measurement Report frame is shown in Figure 9-1237 (ISTA Passive TB Ranging Measurement Report frame format(11az)).

| | Category | Public Action | ISTA Passive TB Ranging Measurement Report |
|---|---|---|---|
| Octets: | 1 | 1 | variable |

**Figure 9-1237—ISTA Passive TB Ranging Measurement Report frame format(11az)**

The Category field is defined in 9.4.1.11 (Action field).

The Public Action field is defined in 9.6.7.1 (Public Action field(#3729)).

The ISTA Passive TB Ranging Measurement Report field is defined in 9.4.2.306 (ISTA Passive TB Ranging Measurement Report element(11az)).

### 9.6.7.51 Primary RSTA Broadcast Passive TB Ranging Measurement Report frame format(11az)

The Primary RSTA Broadcast Passive TB Ranging Measurement Report frame is an Action No Ack frame of category Public. The Primary RSTA Broadcast Passive TB Ranging Measurement Report frame is used to support the passive TB ranging mechanisms of the FTM procedure described in 11.21.6 (FTM procedure(#7065)). The format of the Primary RSTA Broadcast Passive TB Ranging Measurement Report Action field is shown in Figure 9-1238 (Primary RSTA Broadcast Passive TB Ranging Measurement Report Action field format(11az)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

| Category | Public Action | Passive TB Ranging LCI Table Counter | Passive TB Ranging LCI Table Countdown Info | RSTA Passive TB Ranging Measurement Report | Passive TB Ranging LCI Table (optional) |
|---|---|---|---|---|---|
| Octets: 1 | 1 | 1 | 1 | variable | variable |

**Figure 9-1238—Primary RSTA Broadcast Passive TB Ranging Measurement Report Action field format(11az)**

The Category field is defined in 9.4.1.11 (Action field).

The Public Action field is defined in 9.6.7.1 (Public Action field(#3729)).

The Passive TB Ranging LCI Table Counter field contains a number serving as a reference to the version of the latest Passive TB Ranging LCI Table element transmitted by the RSTA transmitting the Primary RSTA Broadcast Passive TB Ranging Measurement Report frame.

The Passive TB Ranging LCI Table Countdown Info field contains two subfields as shown in Figure 9-1239 (Passive TB Ranging LCI Table Countdown Info field format(11az)).

| | B0 | B1 ... B7 |
|---|---|---|
| | New LCI Table | Passive TB Ranging LCI Table Countdown |
| Bits: | 1 | 7 |

**Figure 9-1239—Passive TB Ranging LCI Table Countdown Info field format(11az)**

The New LCI Table subfield is set to 0 if the current LCI table and LCI table to be transmitted at the end of the countdown are the same, otherwise it is set to 1.

The Passive TB Ranging LCI Table Countdown subfield is an index pointing to the next passive TB ranging availability window where the Passive LCI Table element will be contained in the Primary RSTA Broadcast Passive TB Ranging Measurement Report frame. If the Passive TB Ranging LCI Table element is contained in the current availability window, then the index has the value 0, if the Passive TB Ranging LCI Table element is contained in the next availability window the index has the value 1, if the Passive TB Ranging LCI Table element is contained in the availability window after that the index has value 2, and so on.

The RSTA Passive TB Ranging Measurement Report element is defined in 9.4.2.307 (RSTA Passive TB Ranging Measurement Report element(11az)).

The Passive TB Ranging LCI Table field is defined in 9.4.2.308 (Passive TB Ranging LCI Table element(11az)).

### 9.6.7.52 Secondary RSTA Broadcast Passive TB Ranging Measurement Report frame format(11az)

The Secondary Broadcast RSTA Passive TB Ranging Measurement Report frame is an Action No Ack frame of category Public. The Secondary RSTA Broadcast Passive TB Ranging Measurement Report frame is used to support the passive TB ranging mechanisms of the FTM procedure described in 11.21.6 (FTM procedure(#7065)). The format of the Secondary RSTA Broadcast Passive TB Ranging Measurement

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Report Action field is shown in Figure 9-1240 (Secondary RSTA Broadcast Passive TB Ranging Measurement Report Action field format(11az)).

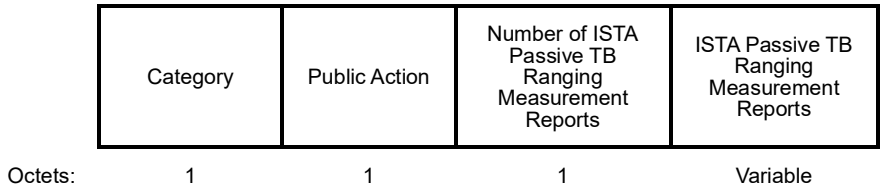

**Figure 9-1240—Secondary RSTA Broadcast Passive TB Ranging Measurement Report Action field format(11az)**

The Category field is defined in 9.4.1.11 (Action field).

The Public Action field is defined in 9.6.7.1 (Public Action field(#3729)).

The Number of ISTA Passive TB Ranging Measurement Reports field indicates the number of following ISTA Passive TB Ranging Measurement Report fields.

The ISTA Passive TB Ranging Measurement Reports field contains the number of ISTA Passive TB Ranging Measurement Reports in the ISTA Passive TB Ranging Measurement Report elements. The ISTA Passive TB Ranging Measurement Reports element is defined in 9.4.2.306 (ISTA Passive TB Ranging Measurement Report element(11az)).

### 9.6.7.53 EBCS UL frame format(11bc)

The EBCS UL frame is transmitted by an EBCS non-AP STA and carries an HLP payload intended for a destination specified within the frame. The format of the EBCS UL frame Action field is defined in Figure 9-1241 (EBCS UL frame Action field format(11bc)).

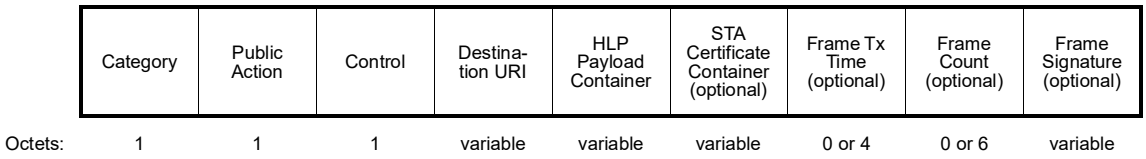

**Figure 9-1241—EBCS UL frame Action field format(11bc)**

The Category field is defined in 9.4.1.11 (Action field).

The Public Action field is defined in 9.6.7.1 (Public Action field(#3729)).

The format of Control field is shown in Figure 9-1242 (Control field format(11bc)).

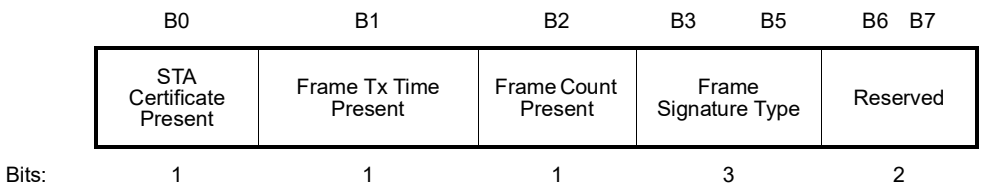

**Figure 9-1242—Control field format(11bc)**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The STA Certificate Present subfield is set to 1 when the STA Certificate Container field is carried in the frame. Otherwise, the subfield is set to 0.

The Frame Tx Time Present subfield is set to 1 when the Frame Tx Time field is carried in the frame. Otherwise, the subfield is set to 0.

The Frame Count Present subfield is set to 1 when the Frame Count field is carried in the frame. Otherwise, the subfield is set to 0.

The encoding of the Frame Signature Type subfield is shown in Table 9-506 (Encoding of Frame Signature Type subfield(11bc)).

**Table 9-506—Encoding of Frame Signature Type subfield(11bc)**

| Value | Algorithm | Frame signature length (octets) | Encoding |
|---|---|---|---|
| 0 | HLSA | — | The authentication of the HLP payload is provided by a higher layer and is included in the HLP Payload field. |
| 1 | RSASSA-PSS-2048 | 256 | See 12.15.2.5 (Signature of the EBCS UL frame) |
| 2 | RSASSA-PSS-4096 | 512 | |
| 3 | ECDSA-P256 | variable | |
| 4 | ECDSA-P521 | variable | |
| 5–7 | Reserved | | |

The format of the Destination URI field is shown in Figure 9-1243 (Destination URI field format(11bc)).

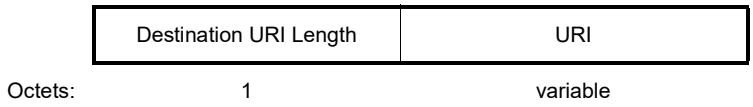

**Figure 9-1243—Destination URI field format(11bc)**

The Destination URI Length subfield indicates the length of the URI subfield in octets.

The URI subfield carries the destination URI using the format defined in IETF RFC 3986.

The format of the HLP Payload Container field is shown in Figure 9-1244 (HLP Payload Container field format(11bc)).

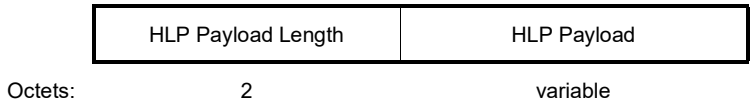

**Figure 9-1244—HLP Payload Container field format(11bc)**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The HLP Payload Length subfield indicates the length of the HLP Payload subfield in octets.

The HLP Payload subfield carries the HLP payload.

The format of the STA Certificate Container field is shown in Figure 9-1245 (STA Certificate Container field format(11bc)).

| | STA Certificate Length | STA Certificate |
|---|---|---|
| Octets: | 2 | variable |

**Figure 9-1245—STA Certificate Container field format(11bc)**

The STA Certificate Length subfield carries a nonzero value that indicates the length of the STA Certificate subfield in octets.

The STA Certificate subfield carries the X.509v3 certificate of the STA encoded according to IETF RFC 5280.

The Frame Tx Time subfield, if present, carries the time expressed as the number of seconds since 2020-01-01 00:00:00 UTC, when the frame is queued for transmission.

The Frame Count field, if present, carries a numeric value that is incremented for each EBCS UL frame transmission.

The Frame Signature field is not present if the Frame Signature Type subfield indicates HLSA. Otherwise, the Frame Signature field carries a signature of the EBCS UL frame (generated as described in 12.15.2.5 (Signature of the EBCS UL frame)). The length of the Frame Signature field is determined as defined in Table 9-506 (Encoding of Frame Signature Type subfield(11bc)). In case of ECDSA, the Signature field contains the value *r* and *s* encoded in DER-encoded ASN.1 structure (a SEQUENCE of two INTEGERS, for *r* and *s*, in that order) that includes the length.

### 9.6.7.54 EBCS Info frame format(11bc)

The format of the Action field of the EBCS Info frame is shown in Figure 9-1246 (EBCS Info frame Action field format(11bc)).

| | Category | Public Action | EBCS Info Sequence Number | EBCS Info Time-stamp | EBCS Info Control | EBCS Info Authentica-tion Algorithm | EBCS Info Interval |
|---|---|---|---|---|---|---|---|
| Octets: | 1 | 1 | 4 | 8 | 1 | 1 | 1 |

| | EBCS TIM Length | EBCS TIM | Fragment Hash Values | Certificate Length | Certificate | Content Informa-tion Number | Content Informa-tion List | Signature |
|---|---|---|---|---|---|---|---|---|
| Octets: | 0 or 1 | variable | $n \times 32$ | 0 or 2 | variable | 1 | variable | variable |

**Figure 9-1246—EBCS Info frame Action field format(11bc)**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Category field is defined in 9.4.1.11 (Action field).

The Public Action field is defined in 9.6.7.1 (Public Action field(#3729)).

The EBCS Info Sequence Number field contains the sequence number of the EBCS Info frame.

The EBCS Info Timestamp field is the elapsed time from 2020-01-01 00:00 UTC in milliseconds.

The EBCS Info Control field is shown in Figure 9-1247 (EBCS Info Control field format(11bc)).

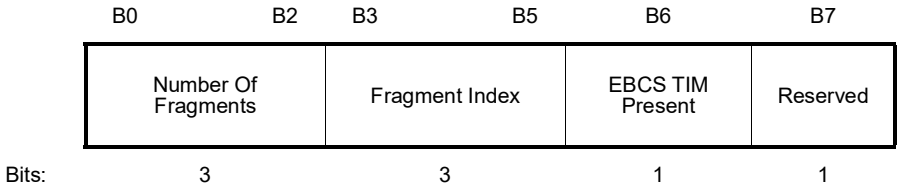

**Figure 9-1247—EBCS Info Control field format(11bc)**

The Number Of Fragments subfield indicates the number of the EBCS Info frame fragments minus 1.

The Fragment Index subfield indicates the EBCS Info frame fragment number (see 33.3.5 (EBCS Info frame fragmentation)). The first fragment is fragment 0.

The EBCS TIM Present subfield is set to 1 if the EBCS TIM Length field and the EBCS TIM field are present and is set to 0 otherwise.

The EBCS Info Authentication Algorithm field indicates the algorithm used to authenticate the EBCS Info frame. This field is defined in Table 9-507 (EBCS Info Authentication Algorithm field(11bc)).

**Table 9-507—EBCS Info Authentication Algorithm field(11bc)**

| Value | Algorithm | Certificate present |
|---|---|---|
| 0 | None | No |
| 1 | Prenegotiated | No |
| 2 | Digital signature | Yes |
| 3–255 | Reserved | - |

Details of each algorithm are described in 12.15.2.1 (Signature of an EBCS Info frame).

The EBCS Info Interval field indicates the EBCS Info frame transmission interval (from dot11EBCSInfoInterval), in units of a beacon interval.

NOTE—Even if PKFA is used, the EBCS Info frames are transmitted periodically to advertise EBCS availability.

The EBCS TIM Length field indicates the length (#7224)in octets of the EBCS TIM field.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The EBCS TIM field contains an EBCS TIM element (9.4.2.314 (EBCS TIM element(11bc))) excluding the Element ID field, the Length field and the Element ID Extension field.

The EBCS TIM Length field and the EBCS TIM field are present if dot11EBCSSupportActivated is true and one or more EBCS traffic streams have dot11EBCSTrafficStreamBufferableActivated set to true, otherwise not present.

The Fragment Hash Values field is only present if the Number Of Fragments subfield, *n*, is nonzero. It contains a sequence of *n* Fragment Hash Value subfields.

The Certificate Length field, the Certificate field and the Signature field are present if the EBCS Info Authentication Algorithm subfield indicates that a certificate is present, and are not present otherwise. The Certificate Length field indicates the length of the Certificate field in octets.

The Certificate field contains the X.509v3 certificate of the EBCS transmitter encoded according to IETF RFC 5280.

The Content Information Number field indicates the number of Content Information subfields included in the Content Information List field.

The Content Information List field contains one or more Content Information subfields. The format of each Content Information subfield is shown in Figure 9-1248 (Content Information field format(11bc)).

| | Content ID | Content Authentication Algorithm | Content Information Control | Content Address Type | Content Address Length | Content Address | Title Length | Title |
|---|---|---|---|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | 1 | 1 | variable | 1 | variable |

| | Negotiation Method | Time To Termination (optional) | Next TX Schedule (optional) | Service URL Length (optional) | Service URL (optional) | Vendor Specific Data Length (optional) | Vendor Specific Data (optional) | Content Authentication Parameters (optional) |
|---|---|---|---|---|---|---|---|---|
| Octets: | 1 | 0 or 2 | 0 or 2 | 0 or 1 | variable | 0 or 1 | variable | variable |

**Figure 9-1248—Content Information field format(11bc)**

The Content ID subfield contains the content ID.

The Content Authentication Algorithm subfield is defined in Table 9-436 (Content Authentication Algorithms(11bc)).

The Content Information Control subfield is shown in Figure 9-1249 (Content Information Control subfield format(11bc)).

The Time To Termination Present subfield indicates whether the Time To Termination field is present.

The Next Tx Schedule Present subfield indicates whether the Next Tx Schedule field is present.

The Service URL Present subfield is set to 1 if the Service URL Length subfield and the Service URL subfield are present and is set to 0 otherwise.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

| | B0 | B1 | B2 | B3 | B4 | B6 | B7 |
|---|---|---|---|---|---|---|---|
| | Time To Termination Present | Next Tx Schedule Present | Service URL Present | Vendor Specific Data Present | Bufferable Traffic | Content Transmit-ted | Reserved |
| Bits: | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

**Figure 9-1249—Content Information Control subfield format(11bc)**

The Vendor Specific Data Present subfield is set to 1 if the Vendor Specific Data Length subfield and the Vendor Specific Data subfield are present and is set to 0 otherwise.

The Bufferable Traffic subfield is set to 1 if frames for the EBCS traffic stream are bufferable at the AP. This subfield is set to 0 otherwise.

The Content Transmitted subfield is set to 1 if the content is being transmitted at the moment (no request is needed), and it is set to 0 otherwise.

The Content Address Type subfield, the Content Address subfield, the Time To Termination subfield, and the Negotiation Method subfield are defined in 9.4.5.30 (EBCS ANQP-element(11bc)).

The Title Length subfield indicates the length of the following Title subfield in octets. The Title subfield is a human readable title of the content as a UTF-8 string.The Next TX Schedule subfield indicates the number of TBTTs until the next expected broadcast of the EBCS traffic stream identified by the Content ID subfield. A value of 1 indicates that the transmission of the content identified by the Content ID subfield will begin in the beacon interval that starts at the following TBTT. A value of 0 is reserved. If the content identified by the Content ID subfield has no specific transmission starting time, the Next TX Schedule subfield is not included.

The Content Authentication Parameters subfield depends on the content authentication algorithm.

In case of PKFA, the Content Authentication Parameters subfield is present and its format is shown in Figure 9-1250 (Content Authentication Parameters subfield format for PKFA(11bc)).

| | Allowable Time Difference |
|---|---|
| Octets: | 2 |

**Figure 9-1250—Content Authentication Parameters subfield format for PKFA(11bc)**

The Allowable Time Difference subfield indicates the allowable time differencein milliseconds between the value in the EBCS Info Timestamp field and the reception time recorded by an EBCS receiver.

In case of HCFA, the Content Authentication Parameters subfield is present and its format is shown in Figure 9-1251 (Content Authentication Parameters subfield format for HCFA(11bc)).

The Allowable Time Difference subfield indicates the allowable time difference in milliseconds between the value in the EBCS Info Timestamp field and the reception time recorded by an EBCS receiver.

The HCFA Base Key subfield contains the first HCFA base key of the HCFA period that starts from this EBCS Info frame.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

| | Allowable Time Difference | HCFA Base Key | Previous Period HCFA Base Key 0 Sequence | Previous Period HCFA Base Key 0 | Previous Period HCFA Base Key 1 Sequence | Previous Period HCFA Base Key 1 | HCFA Change Interval | Number of Instant Authenti-cators (optional) | Instant Authenti-cator List (optional) |
|---|---|---|---|---|---|---|---|---|---|
| Octets: | 2 | 32 | 1 | 32 | 1 | 32 | 1 | 0 or 1 | *n* x 33 |

**Figure 9-1251—Content Authentication Parameters subfield format for HCFA(11bc)**

The Previous Period HCFA Base Key 0 Sequence subfield and the Previous Period HCFA Base Key 1 Sequence subfield indicate the key sequence number of the Previous Period HCFA Base Key 0 subfield and the Previous Period HCFA Base Key 1 subfield, respectively. The Previous Period HCFA Base Key 0 subfield and the Previous Period HCFA Base Key 1 subfield contain the HCFA base key to be disclosed for the previous HCFA period.

If the previous HCFA period does not exist, e.g., at the start of the EBCS transmission, the Previous Period HCFA Base Key 0 Sequence subfield, the Previous Period HCFA Base Key 0 subfield, the Previous Period HCFA Base Key 1 Sequence subfield, and the Previous Period HCFA Base Key 1 subfield are set to 0.

The HCFA Key Change Interval subfield indicates the EBCS HCFA key change interval in units of 10 ms (see dot11EBCSHCFAKeyChangeInterval).

The Number Of Instant Authenticators subfield and the Instant Authenticator List subfield are present if the Content Authentication Algorithm field indicates HCFA with instant authentication, and are not present otherwise.

The Number Of Instant Authenticators subfield, if present, indicates the number of Instant Authenticator subfields contained in the Instant Authenticator List subfield.

The Instant Authenticator List subfield, if present, contains one or more Instant Authenticator subfields.

The format of each Instant Authenticator subfield is shown in Figure 9-1252 (Instant Authenticator subfield format(11bc)).

| | Hash Distance | Hash Value |
|---|---|---|
| Octets: | 1 | 32 |

**Figure 9-1252—Instant Authenticator subfield format(11bc)**

The Hash Distance subfield indicates the hash distance of the instant authenticator. The Hash Value subfield contains the instant authenticator of the following EBCS Data frame of the hash distance that is indicated in the Hash Distance subfield.

In case of HLSA, the Content Authentication Parameters subfield is not present.

The Service URL Length subfield indicates the number of octets in the Service URL subfield.

The Service URL subfield indicates the URL at which information relevant to the corresponding EBCS traffic stream might be retrieved, including negotiation or registration for the service, formatted in accordance with IETF RFC 3986.

The Vendor Specific Data Length subfield indicates the number of octets in the Vendor Specific Data subfield.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Vendor Specific Data subfield is defined by application specific requirements and its contents are outside the scope of this standard.

The Signature field is the digital signature of the EBCS Info frame (see 12.15.2.1 (Signature of an EBCS Info frame)). The length of the Signature field is determined by the value of the EBCS Info Authentication Algorithm field as defined in Table 9-507 (EBCS Info Authentication Algorithm field(11bc)). In case of ECDSA, the Signature field contains the values *r* and *s* encoded in DER-encoded ASN.1 structure (a SEQUENCE of two INTEGERs, for *r* and *s*, in that order) that includes the length. In case of Prenegotiated, the length of the Signature field is negotiated beforehand between the EBCS AP and the EBCS receiver. The Signature field is not present if the Fragment Index subfield is nonzero.

### 9.6.7.55 EBCS Termination Notice frame format(11bc)

The EBCS Termination Notice frame is transmitted by a STA to announce the termination of one or more of the EBCS traffic streams transmitted by the STA. The format of the EBCS Termination Notice frame Action field is shown in Figure 9-1253 (EBCS Termination Notice frame Action Field format(11bc)).

| | Category | Public Action | EBCS Termination Info Count | EBCS Termination Information Set |
|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | variable |

**Figure 9-1253—EBCS Termination Notice frame Action Field format(11bc)**

The Category field is defined in 9.4.1.11 (Action field).

The Public Action field is defined in 9.6.7.1 (Public Action field(#3729)).

The EBCS Termination Info Count field indicates the number of EBCS Termination Info subfields contained in the EBCS Termination Information Set field.

The EBCS Termination Information Set field contains one or more EBCS Termination Info subfields.

The format of an EBCS Termination Info subfield is shown in Figure 9-1254 (EBCS Termination Info subfield format(11bc)).

| | EBCS Termination Info Length | EBCS Termination Info Control | Content ID | Title Length | Title | Time To Termination | Negotiation Method | Negotiation Address Type | Negotiation Address |
|---|---|---|---|---|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | 0 or 1 | variable | 2 | 1 | 0 or 1 | variable |

**Figure 9-1254—EBCS Termination Info subfield format(11bc)**

The EBCS Termination Info Length field indicates the length in octets of the EBCS Termination Info subfield including the EBCS Termination Info Length field.

The format of the EBCS Termination Info Control subfield is shown in Figure 9-1255 (EBCS Termination Info Control subfield format(11bc)).

A value of 1 in the Title Presence Indicator subfield indicates that a Title Length subfield and a Title subfield are present in the EBCS Termination Info subfield. A value of 0 indicates that a Title Length subfield and a Title subfield are not present in the EBCS Termination Info subfield.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

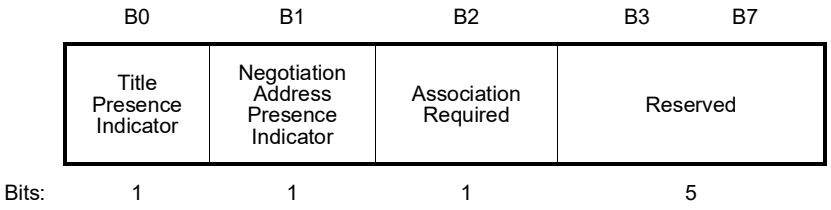

**Figure 9-1255—EBCS Termination Info Control subfield format(11bc)**

A value of 1 in the Negotiation Address Presence Indicator subfield indicates that a Negotiation Address Type subfield and a Negotiation Address subfield are present in the EBCS Termination Info subfield. The value of 0 indicates that a Negotiation Address Type subfield and a Negotiation Address subfield are not present in the EBCS Termination Info subfield.

A value of 1 in the Association Required subfield indicates that an association is required to consume the EBCS traffic stream identified by the content ID contained in the Content ID subfield. A value of 0 indicates that an association is not required to consume the EBCS traffic stream identified by the content ID contained in the Content ID subfield.

The Content ID subfield indicates the ID of the EBCS traffic stream to be terminated.

The Title Length subfield indicates the length of the Title subfield in octets.

The Title subfield indicates the title in a UTF-8 string of the EBCS traffic stream identified by the content ID contained in the Content ID subfield.

The Time To Termination subfield is defined in 9.4.1.69 (EBCS Content Response field(11bc)).

NOTE—The Time To Termination subfield indicates the termination time for the transmitter STA of the EBCS traffic stream and does not indicate the termination time of the content associated with the EBCS traffic stream.

The Negotiation Method subfield indicates the negotiation method to request an extension of the EBCS traffic stream identified by the content ID contained in the Content ID subfield. The encoding of the Negotiation Method subfield is defined in Table 9-508 (Negotiation Method subfield encoding(11bc)).

**Table 9-508—Negotiation Method subfield encoding(11bc)**

| Negotiation Method subfield value | Meaning | Notes |
|---|---|---|
| 0 | No negotiation | |
| 1 | Request through EBCS Content Request frames | EBCS traffic stream request by STAs that are associated with the broadcaster. |
| 2 | Request through EBCS Content Request ANQP-element / Request through EBCS Content Request frame | (#8258)EBCS traffic stream extensions by STAs that are not associated with the broadcaster are requested using an EBCS Content Request ANQP-element. EBCS traffic stream extensions by STAs that are associated with the broadcaster are requested using either an EBCS Content Request ANQP-element or using an EBCS Content Request frame. |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-508—Negotiation Method subfield encoding(11bc)**

| | | |
|---|---|---|
| 3 | Request through IP request | Out of band IP request. |
| 4–255 | Reserved | |

The Negotiation Address Type subfield indicates the type of the address included in the Negotiation Address subfield. The encoding of the Negotiation Address Type subfield is defined in Table 9-509 (Negotiation Address Type subfield encoding(11bc)).

The Negotiation Address subfield indicates the address to be used for negotiating for the extension of the EBCS traffic stream identified by the content ID contained in the Content ID subfield. The format and the length of the Negotiation Address subfield depends on the value contained in the Negotiation Address Type subfield.

The Negotiation Address subfield contains a MAC address if the Negotiation Address Type subfield is equal to 0.

**Table 9-509—Negotiation Address Type subfield encoding(11bc)**

| Destination Address Type value | Meaning |
|---|---|
| 0 | MAC address |
| 1 | UDP/IPv4 address |
| 2 | UDP/IPv6 address |
| 3 | UDP/hostname |
| 4–255 | Reserved |

The format of the Negotiation Address subfield when the Negotiation Address Type subfield is equal to 1 is shown in Figure 9-1256 (Negotiation Address subfield format for a Negotiation Address Type of 1(11bc)).

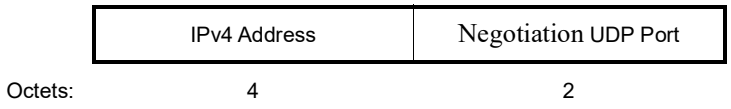

**Figure 9-1256—Negotiation Address subfield format for a Negotiation Address Type of 1(11bc)**

The IPv4 Address subfield indicates an IPv4 address used for negotiating the extension of the EBCS traffic stream.

The Negotiation UDP Port subfield indicates the UDP port associated with the IPv4 address indicated in the IPv4 Address subfield in little endian format.

The format of the Negotiation Address subfield when the Negotiation Address Type subfield is equal to 2 is shown in Figure 9-1257 (Negotiation Address subfield format for a Negotiation Address Type of 2(11bc)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Figure 9-1257—Negotiation Address subfield format for a Negotiation Address Type of 2(11bc)**

The IPv6 Address subfield indicates an IPv6 address used for negotiating the extension of the EBCS traffic stream.

The Negotiation UDP Port subfield indicates the UDP port associated with the IPv6 address indicated in the IPv6 Address subfield in little endian format.

The format of the Negotiation Address subfield when the Negotiation Address Type subfield is equal to 3 is shown in Figure 9-1258 (Negotiation Address subfield format for a Negotiation Address Type of 3(11bc)).

**Figure 9-1258—Negotiation Address subfield format for a Negotiation Address Type of 3(11bc)**

The Hostname Length subfield indicates the length of the Hostname subfield in octets.

The Hostname subfield indicates the host name for negotiating the extension of the EBCS traffic stream in a UTF-8 string.

The Negotiation UDP Port subfield indicates the UDP port associated with the host name indicated in the Hostname subfield in little endian format.

### 9.6.8 FT Action frame details

#### 9.6.8.1 FT Action field(#3729)

Four Action frame formats are defined to support fast BSS transitions over the DS, which are initiated through the currently associated AP. The FT Action frames are sent over the air between the STA and the current AP. The Action frame is used as a transport mechanism for data that are destined for the target AP. An FT Action field, in the octet immediately after the Category field, differentiates the FT Action frame formats. The FT Action field values associated with each FT Action frame format are defined in Table 9-510 (FT Action field values).

#### 9.6.8.2 FT Request frame

The FT Request frame is sent by the STA to its associated AP to initiate an over-the-DS fast BSS transition.

Figure 9-1259 (FT Request frame Action field format) shows the format of the FT Request frame Action field.

The Category field is defined in 9.4.1.11 (Action field).

The FT Action field is defined in 9.6.8.1 (FT Action field(#3729)).

The STA Address field is set to the (#4237)FTO's MAC address.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-510—FT Action field values**

| FT Action field value | Description |
|---|---|
| 0 | Reserved |
| 1 | FT Request frames |
| 2 | FT Response frames |
| 3 | FT Confirm frames |
| 4 | FT Ack frames |
| 5–255 | Reserved |

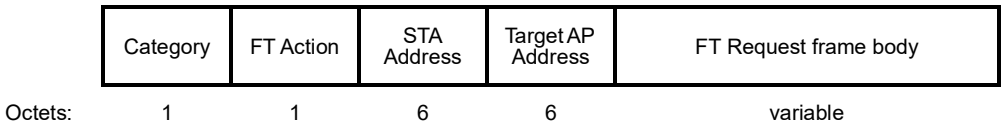

**Figure 9-1259—FT Request frame Action field format**

The Target AP Address field is set to the BSSID of the target AP's BSS.(#3522)

The FT Request frame body contains the information shown in Table 9-511 (FT Request frame body).

**Table 9-511—FT Request frame body**

| Order | Information | Notes |
|---|---|---|
| 1 | RSN | A RSNE is present if dot11RSNAActivated is true. |
| 2 | Mobility Domain | The MDE is present. |
| 3 | Fast BSS Transition | An FTE is present if dot11RSNAActivated is true. |
| (#4070)4 | RSN Extension | An RSNXE is present if any subfield of the Extended RSN Capabilities field in this element is nonzero, except the Field Length subfield; otherwise, not present. |

The usage of these elements is defined in 13.8.2 (FT authentication sequence: contents of first message).

### 9.6.8.3 FT Response frame

The FT Response frame is transmitted by the currently associated AP as a response to the STA's FT Request frame. Figure 9-1260 (FT Response frame Action field format) shows the format of the FT Response frame Action field.

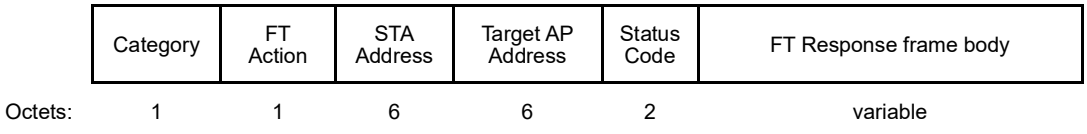

**Figure 9-1260—FT Response frame Action field format**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Category field is defined in 9.4.1.11 (Action field).

The FT Action field is defined in 9.6.8.1 (FT Action field(#3729)).

The STA Address field is set to the FTO's MAC address.

The Target AP Address field is set to the BSSID of the target AP's BSS.(#3522)

The Status Code field is a value from the options listed in 9.4.1.9 (Status Code field).

If the Status Code field is SUCCESS, then the FT Response frame body contains the information shown in Table 9-512 (FT Response frame body).

**Table 9-512—FT Response frame body**

| Order | Information | Notes |
|---|---|---|
| 1 | RSN | The RSNE is present if dot11RSNAActivated is true; otherwise not present.(#3400) |
| 2 | Mobility Domain | The MDE is present. |
| 3 | Fast BSS Transition | An FTE is present if dot11RSNAActivated is true. |

The usage of these elements is defined in 13.8.3 (FT authentication sequence: contents of second message).

### 9.6.8.4 FT Confirm frame

The FT Confirm frame in an RSN is confirmation to the target AP of receipt of the ANonce and indicates the liveness of the PTKSA. The FT Confirm frame is optionally used by the FTO to request resources. Figure 9-1261 (FT Confirm frame Action field format) shows the FT Confirm frame Action field format.

| | Category | FT Action | STA Address | Target AP Address | FT Confirm frame body |
|---|---|---|---|---|---|
| Octets: | 1 | 1 | 6 | 6 | variable |

**Figure 9-1261—FT Confirm frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The FT Action field is defined in 9.6.8.1 (FT Action field(#3729)).

The STA Address field is set to the FTO's MAC address.

The Target AP Address field is set to the BSSID of the target AP's BSS.(#3522)

The FT Confirm frame body contains the information shown in Table 9-513 (FT Confirm frame body).

The usage of these elements is defined in 13.8.4 (FT authentication sequence: contents of third message).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-513—FT Confirm frame body**

| Order | Information | Notes |
|---|---|---|
| 1 | RSN | The RSNE is present if dot11RSNAActivated is true; otherwise not present.(#3400) |
| 2 | Mobility Domain | The MDE is present. |
| 3 | Fast BSS Transition | An FTE is present if dot11RSNAActivated is true. |
| 4 | RIC | The RIC Request field is present if resources are being requested. |

### 9.6.8.5 FT Ack frame

The FT Ack frame is transmitted by the currently associated AP as a response to the STA's FT Confirm frame. Figure 9-1262 (FT Ack frame Action field format) shows the FT Ack frame Action field format.

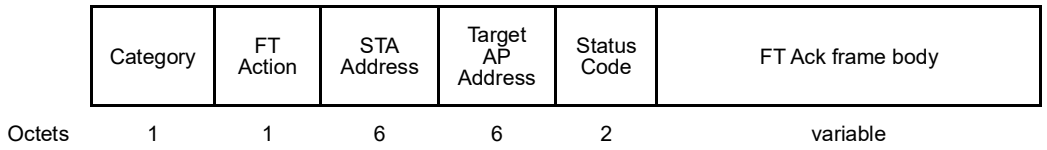

**Figure 9-1262—FT Ack frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The FT Action field is defined in 9.6.8.1 (FT Action field(#3729)).

The STA Address field is set to the FTO's MAC address.

The Target AP Address field is set to the BSSID of the target AP's BSS.(#3522)

The Status Code field is a value from the options listed in 9.4.1.9 (Status Code field).

If the Status Code field is SUCCESS, then the FT Ack frame body contains the information shown in Table 9-514 (FT Ack frame body).

**Table 9-514—FT Ack frame body**

| Order | Information | Notes |
|---|---|---|
| 1 | RSN | The RSNE is present if dot11RSNAActivated is true; otherwise not present.(#3400) |
| 2 | Mobility Domain | The MDE is present. |
| 3 | Fast BSS Transition | An FTE is present if dot11RSNAActivated is true. |
| 4 | Timeout Interval (reassociation deadline) | A TIE containing the reassociation deadline interval is present if resources were requested in the FT Confirm frame and dot11RSNAActivated is false. |
| 5 | RIC | The RIC Response field is present if resources were requested in the FT Confirm frame. |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The usage of these elements is defined in 13.8.5 (FT authentication sequence: contents of fourth message).

### 9.6.9 SA Query Action frame details

#### 9.6.9.1 SA Query Action field(#3729)

Two Action frame formats are defined for the SA Query procedure. An SA Query Action field, in the field immediately after the Category field, differentiates the formats. The Action field values associated with each frame format are defined in Table 9-515 (SA Query Action field values).

NOTE—The SA query functionality defined in this standard is used to prevent the Association Lockout problem (defined in 11.3 (STA authentication and association)).

**Table 9-515—SA Query Action field values**

| SA Query Action field value | Description |
|---|---|
| 0 | SA Query Request |
| 1 | SA Query Response |

#### 9.6.9.2 SA Query Request frame

The SA Query Request frame is used to request an SA Query Response from the receiving STA. The format of the Action field of the SA Query Request frame is shown in Figure 9-1263 (SA Query Request frame Action field format).

| | Category | SA Query Action | Transaction Identifier | OCI Element |
|---|---|---|---|---|
| Octets: | 1 | 1 | 2 | 6 |

**Figure 9-1263—SA Query Request frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The SA Query Action field is defined in 9.6.9.1 (SA Query Action field(#3729)).

The Transaction Identifier field is a (#1395)counter value set by the STA sending the SA Query Request frame to identify any outstanding request/response transaction.

The OCI Element field includes the OCI element (see 9.4.2.235 (OCI element)) and is included if dot11RSNAOperatingChannelValidationActivated is true.

#### 9.6.9.3 SA Query Response frame

The SA Query Response frame is used to respond to an SA Query Request frame from another STA. The format of the Action field of the SA Query Response frame is shown in Figure 9-1264 (SA Query Response frame Action field format).

The Category field is defined in 9.4.1.11 (Action field).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

| | Category | SA Query Action | Transaction Identifier | OCI Element |
|---|---|---|---|---|
| Octets: | 1 | 1 | 2 | 6 |

**Figure 9-1264—SA Query Response frame Action field format**

The SA Query Action field is defined in 9.6.9.1 (SA Query Action field(#3729)).

The Transaction Identifier field is set to the same value as the Transaction Identifier field in the corresponding SA Query Request frame.

The OCI Element field includes the OCI element (see 9.4.2.235 (OCI element)) and is included if dot11RSNAOperatingChannelValidationActivated is true.

### 9.6.10 Protected Dual of Public Action frame details(#3729)

The Protected Dual of Public Action frame is defined to allow robust STA-STA communications of the same information that is conveyed in (#3108)Public Action frames. A Public Action field, in the octet immediately after the Category field, differentiates the Protected Dual of Public Action frame formats. The defined Protected Dual of Public Action frames are listed in Table 9-516 (Public Action field values defined for Protected Dual of Public Action frames).

(#1631)The Action fields of Protected Dual of Public Action frames have the same format as those of the corresponding nonprotected Public Action frames.

**Table 9-516—Public Action field values defined for Protected Dual of Public Action frames**

| Public Action field value | Description | Defined in |
|---|---|---|
| 0 | Reserved | |
| 1 | Protected DSE Enablement | 9.6.7.4 (DSE Enablement frame format) |
| 2 | Protected DSE Deenablement | 9.6.7.5 (DSE Deenablement frame format) |
| 3 | Reserved | |
| 4 | Protected Extended Channel Switch Announcement | 9.6.7.7 (Extended Channel Switch Announcement frame format) |
| 5 | Protected Measurement Request | 9.6.7.8 (DSE Measurement Request frame format) |
| 6 | Protected Measurement Report | 9.6.7.9 (DSE Measurement Report frame format) |
| 7 | Reserved | |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-516—Public Action field values defined for Protected Dual of Public Action frames *(continued)***

| Public Action field value | Description | Defined in |
|---|---|---|
| 8 | Protected DSE Power Constraint | 9.6.7.10 (DSE Power Constraint frame format) |
| 9 | Protected Vendor Specific | 9.6.7.11 (Vendor Specific Public Action frame format) |
| 10 | Protected GAS Initial Request | 9.6.7.12 (GAS Initial Request frame format) |
| 11 | Protected GAS Initial Response | 9.6.7.13 (GAS Initial Response frame format) |
| 12 | Protected GAS Comeback Request | 9.6.7.14 (GAS Comeback Request frame format) |

## 9.6.11 HT Action frame details

### 9.6.11.1 HT Action field

Several Action frame formats are defined to support HT features. An HT Action field, in the octet immediately after the Category field, differentiates the HT Action frame formats. The HT Action field values associated with each frame format within the HT category are defined in Table 9-517 (HT Action field values). The frame formats are defined in 9.6.11.2 (Notify Channel Width frame format) to 9.6.11.7 (Antenna Selection Indices Feedback frame format).

**Table 9-517—HT Action field values**

| HT Action field value | Meaning | Time priority |
|---|---|---|
| 0 | Notify Channel Width | No |
| 1 | SM Power Save | No |
| (#3263)2–3(#1707) | Reserved | |
| 4 | CSI | Yes |
| 5 | Noncompressed Beamforming | Yes |
| 6 | Compressed Beamforming | Yes |
| 7 | ASEL Indices Feedback | Yes |
| 8–255(#1707) | Reserved | |

### 9.6.11.2 Notify Channel Width frame format

A STA sends the Notify Channel Width frame to another STA if it wants to change the channel width of frames that the other STA sends to it. See definition in 11.15.2 (Basic 20/40 MHz BSS functionality).

The format of the Notify Channel Width frame Action field is defined in Table 9-518 (Notify Channel Width frame Action field format).

**Table 9-518—Notify Channel Width frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | HT Action |
| 3 | Channel Width (see 9.4.1.21 (Channel Width field)) |

This frame can be sent by both non-AP STA and AP.

The Category field is defined in 9.4.1.11 (Action field).

The HT Action field is defined in 9.6.11.1 (HT Action field).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 9.6.11.3 SM Power Save frame format

The SM Power Save frame is of category HT. The SM Power Save frame is used to manage SM power-saving state transitions as defined in 11.2.6 (SM power save).

The Action field of the SM Power Save frame is defined in Table 9-519 (SM Power Save frame Action field format).

**Table 9-519—SM Power Save frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | HT Action |
| 3 | SM Power Control (see 9.4.1.23 (SM Power Control field)) |

The Category field is defined in 9.4.1.11 (Action field).

The HT Action field is defined in 9.6.11.1 (HT Action field).(#3263)

### 9.6.11.4 CSI frame format

The CSI frame is an Action or an Action No Ack frame of category HT. The format of its Action field is defined in Table 9-520 (CSI frame Action field format).

**Table 9-520—CSI frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | HT Action |
| 3 | MIMO Control (see 9.4.1.24 (MIMO Control field)) |
| 4 | CSI Report (see 9.4.1.25 (CSI Report field)) |

The Category field is defined in 9.4.1.11 (Action field).

The HT Action field is defined in 9.6.11.1 (HT Action field).

In a CSI frame, the fields of the MIMO Control field (see 9.4.1.24 (MIMO Control field)) are used as described in Table 9-85 (Subfields of the MIMO Control field). The Codebook Information subfield is reserved in this frame.

### 9.6.11.5 Noncompressed Beamforming frame format

The Noncompressed Beamforming frame is an Action or an Action No Ack frame of category HT. The format of its Action field is defined in Table 9-521 (Noncompressed Beamforming frame Action field format).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-521—Noncompressed Beamforming frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | HT Action |
| 3 | MIMO Control (see 9.4.1.24 (MIMO Control field)) |
| 4 | Noncompressed Beamforming Report (see 9.4.1.26 (Noncompressed Beamforming Report field)) |

The Category field is defined in 9.4.1.11 (Action field).

The HT Action field is defined in 9.6.11.1 (HT Action field).

In a Noncompressed Beamforming frame, the fields of the MIMO Control field (see 9.4.1.24 (MIMO Control field)) are used as described in Table 9-85 (Subfields of the MIMO Control field). The Codebook Information subfield is reserved in this frame.

### 9.6.11.6 Compressed Beamforming frame format

The Compressed Beamforming frame is an Action or an Action No Ack frame of category HT. The format of its Action field is defined in Table 9-522 (Compressed Beamforming frame Action field format).

**Table 9-522—Compressed Beamforming frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | HT Action |
| 3 | MIMO Control (see 9.4.1.24 (MIMO Control field)) |
| 4 | Compressed Beamforming Report (see 9.4.1.27 (Compressed Beamforming Report field)) |

The Category field is defined in 9.4.1.11 (Action field).

The HT Action field is defined in 9.6.11.1 (HT Action field).

In a Compressed Beamforming frame, the fields of the MIMO Control field (see 9.4.1.24 (MIMO Control field)) are used as described in Table 9-85 (Subfields of the MIMO Control field). The Coefficient Size subfield is reserved in this frame.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 9.6.11.7 Antenna Selection Indices Feedback frame format

The Antenna Selection Indices Feedback frame is an Action or Action No Ack frame of category HT. The format of its Action field is defined in Table 9-523 (Antenna Selection Indices Feedback frame Action field format).

**Table 9-523—Antenna Selection Indices Feedback frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | HT Action |
| 3 | Antenna Selection Indices (see 9.4.1.28 (Antenna Selection Indices field)) |

The Category field is defined in 9.4.1.11 (Action field).

The HT Action field is defined in 9.6.11.1 (HT Action field).

## 9.6.12 TDLS Action field formats

### 9.6.12.1 TDLS Action field(#3729)

Several Action field formats are defined to support TDLS. A TDLS Action field, in the octet immediately after the Category field, differentiates the TDLS Action field formats. The TDLS Action field values associated with each Action field format within the TDLS category are defined in Table 9-524 (TDLS Action field values).

**Table 9-524—TDLS Action field values**

| Action field value | Meaning |
|---|---|
| 0 | TDLS Setup Request |
| 1 | TDLS Setup Response |
| 2 | TDLS Setup Confirm |
| 3 | TDLS Teardown |
| 4 | TDLS Peer Traffic Indication |
| 5 | TDLS Channel Switch Request |
| 6 | TDLS Channel Switch Response |
| 7 | TDLS Peer PSM Request |
| 8 | TDLS Peer PSM Response |
| 9 | TDLS Peer Traffic Response |
| 10 | TDLS Discovery Request |
| 11–255 | Reserved |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

References to one of the TDLS Action field values as a frame, e.g., "TDLS Setup Request frame," denote a Data frame carrying a TDLS Action field and any Vendor Specific elements tunneled as described in 11.20.2 (TDLS payload).(#1680)

NOTE—There is no TDLS Discovery Response TDLS Action field; the TDLS Discovery Response frame is not a Data frame but a Public Action frame.(#1546)

### 9.6.12.2 TDLS Setup Request Action field format

The Action field of a TDLS Setup Request Action field contains the information shown in Table 9-525 (Information for TDLS Setup Request Action field).

**Table 9-525—Information for TDLS Setup Request Action field**

| Order | Information | Notes |
|---|---|---|
| 1 | Category | The Category field is defined in 9.4.1.11 (Action field). |
| 2 | TDLS Action | The TDLS Action field is defined in 9.6.12.1 (TDLS Action field(#3729)). |
| 3 | Dialog Token | The Dialog Token field contains a unique nonzero value for the conversation between the STAs involved in this request. The dialog token is specified in 9.4.1.12 (Dialog Token field). |
| 4 | Capability | The Capability field indicates the capabilities of the STA. The Capability field is defined in 9.4.1.4 (Capability Information field). |
| 5 | Supported Rates and BSS Membership Selectors | The Supported Rates and BSS Membership Selectors element indicates the rates that are supported by the STA. The Supported Rates and BSS Membership Selectors element is defined in 9.4.2.3 (Supported Rates and BSS Membership Selectors element). |
| 6 | Country | The Country element is present when dot11MultiDomainCapabilityActivated is true or dot11SpectrumManagementRequired is true. The Country element is defined in 9.4.2.7 (Country element). |
| 7 | Extended Supported Rates and BSS Membership Selectors | (#3086)The Extended Supported Rates and BSS Membership Selectors element is present if the number of supported rates and BSS membership selectors(#1470) together exceed eight; it is optional otherwise. The Extended Supported Rates and BSS Membership Selectors element is defined in 9.4.2.11 (Extended Supported Rates and BSS Membership Selectors element). |
| 8 | Supported Channels | The Supported Channels element is present if the TDLS Channel Switching subfield is equal to 1.<br>The Supported Channels element is defined in 9.4.2.16 (Supported Channels element). |
| 9 | RSNE | The RSNE is present if security is required on the TDLS direct link (see 12.7.8.1 (General)); otherwise not present. (#3400)The RSNE is defined in 9.4.2.23 (RSNE). |
| 10 | Extended Capabilities | The Extended Capabilities element is present if any of the fields in this element are nonzero. The Extended Capabilities element is defined in 9.4.2.25 (Extended Capabilities element). |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-525—Information for TDLS Setup Request Action field *(continued)***

| Order | Information | Notes |
|---|---|---|
| 11 | QoS Capability | The QoS Capability element is present when dot11QosOptionImplemented is true and not present otherwise. The QoS Capability element is defined in 9.4.2.33 (QoS Capability element). |
| 12 | FTE | The FTE is present if security is required on the TDLS direct link (see 12.7.8.1 (General)). The FTE is defined in 9.4.2.46 (FTE(#1776)). |
| 13 | Timeout Interval (TPK key lifetime) | The (#1776)TIE contains the TPK key lifetime and is present if security is required on the TDLS direct link (see 12.7.8.1 (General)).<br>The (#1776)TIE is defined in 9.4.2.47 (TIE(#1776)). |
| 14 | Supported Operating Classes | The Supported Operating Classes element is present if the TDLS Channel Switching subfield is equal to 1. |
| 15 | HT Capabilities | The HT Capabilities element is defined in 9.4.2.54 (HT Capabilities element).<br>The HT Capabilities element is present when dot11HighThroughputOptionImplemented is true. |
| 16 | 20/40 BSS Coexistence | The 20/40 BSS Coexistence element is defined in 9.4.2.58 (20/40 BSS Coexistence element).<br>The 20/40 BSS Coexistence element is optionally present. |
| 17 | Link Identifier | The Link Identifier element is specified in 9.4.2.60 (Link Identifier element). |
| 18 | Multi-band | The Multi-band element is optionally present if dot11MultibandImplemented is true. |
| 19 | AID | The AID element containing the AID of the STA sending the frame is present if dot11VHTOptionImplemented, dot11HEOptionImplemented, or dot11S1GOptionImplemented is true.(11ax) |
| 20 | VHT Capabilities | The VHT Capabilities element is present in the 5 GHz band if dot11VHTOptionImplemented is true.(#8181) |
| 21 | S1G Capabilities | S1G Capabilities element is optionally present if dot11S1GOptionImplemented is true. |
| 22 | EL Operation | EL Operation element is present if dot11S1GELOperationActivated is true. |
| 23(11ax) | HE Capabilities | The HE Capabilities element is present if dot11HEOptionImplemented is true; otherwise, it is not present. The HE Capabilities element is defined in 9.4.2.247 (HE Capabilities element(11ax)). |
| 24(11ax) | TWT | The TWT element is optionally present if dot11TWTOptionActivated is true; otherwise, it is not present.<br>The Trigger subfield and the Negotiation Type subfield of the TWT element are set to 0. |
| 25(11ax) | HE 6 GHz Band Capabilities | The HE 6 GHz Band Capabilities element is present if dot11HEOptionImplemented and dot11HE6GOptionImplemented are true; otherwise, it is not present. |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The TDLS Setup Request Action field is encapsulated in a Data frame and transmitted to the recipient STA through the AP to request the setup of a TDLS direct link. See 11.20 (Tunneled direct link setup(#1356)).

### 9.6.12.3 TDLS Setup Response Action field format

The Action field of a TDLS Setup Response Action field contains the information shown in Table 9-526 (Information for TDLS Setup Response Action field).

**Table 9-526—Information for TDLS Setup Response Action field**

| Order | Information | Notes |
|---|---|---|
| 1 | Category | The Category field is defined in 9.4.1.11 (Action field). |
| 2 | TDLS Action | The TDLS Action field is defined in 9.6.12.1 (TDLS Action field(#3729)). |
| 3 | Status Code | The Status Code is defined in 9.4.1.9 (Status Code field). |
| 4 | Dialog Token | The dialog token is copied from the corresponding TDLS Setup Request. The dialog token is specified in 9.4.1.12 (Dialog Token field). |
| 5 | Capability | The Capability field indicates the capabilities of the STA and is present when the (#7190)status code is SUCCESS and is not present otherwise. The Capability field is defined in 9.4.1.4 (Capability Information field). |
| 6 | Supported Rates and BSS Membership Selectors | The Supported Rates and BSS Membership Selectors element indicates the rates that are supported by the STA and is present when the (#7190)status code is SUCCESS and is not present otherwise.The Supported Rates and BSS Membership Selectors element is defined in 9.4.2.3 (Supported Rates and BSS Membership Selectors element). |
| 7 | Country | The Country element is present when Status Code is SUCCESS and either dot11MultiDomainCapabilityActivated is true or dot11SpectrumManagementRequired is true and is not present otherwise.<br>The Country element is defined in 9.4.2.7 (Country element). |
| 8 | Extended Supported Rates and BSS Membership Selectors | The Extended Supported Rates and BSS Membership Selectors element is present when there are more than 8 supported rates and Status Code is SUCCESS. It is optionally present when there are less than 8 supported rates and Status Code is SUCCESS. Otherwise it is not present. The Extended Supported Rates and BSS Membership Selectors element is defined in 9.4.2.11 (Extended Supported Rates and BSS Membership Selectors element). |
| 9 | Supported Channels | The Supported Channels element is defined in 9.4.2.16 (Supported Channels element). It is present if the TDLS Channel Switching subfield is equal to 1 and the (#7190)status code is SUCCESS, and not present otherwise. |
| 10 | RSNE | The RSNE is present if security is required on the TDLS direct link (see 12.7.8.1 (General)) and the (#7190)status code is SUCCESS, and not present otherwise. The RSNE is defined in 9.4.2.23 (RSNE). |
| 11 | Extended Capabilities | The Extended Capabilities element is present if any of the fields in this element are nonzero and the (#7190)status code is SUCCESS, and not present otherwise. The Extended Capabilities element is defined in 9.4.2.25 (Extended Capabilities element). |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-526—Information for TDLS Setup Response Action field *(continued)***

| Order | Information | Notes |
|---|---|---|
| 12 | QoS Capability | The QoS Capability element is present when dot11QosOptionImplemented is true and the (#7190)status code is SUCCESS and not present otherwise. The QoS Capability element is defined in 9.4.2.33 (QoS Capability element). |
| 13 | FTE | The FTE is present if security is required on the TDLS direct link (see 12.7.8.1 (General)) and the (#7190)status code is SUCCESS, and not present otherwise.<br>The FTE is defined in 9.4.2.46 (FTE(#1776)). |
| 14 | Timeout Interval (TPK key lifetime) | The (#1776)TIE, containing the TPK key lifetime, is present if security is required on the TDLS direct link (see 12.7.8.1 (General)) and the (#7190)status code is SUCCESS, and not present otherwise.<br>The (#1776)TIE is defined in 9.4.2.47 (TIE(#1776)). |
| 15 | Supported Operating Classes | The Supported Operating Classes element is present if the TDLS Channel Switching subfield is equal to 1 and the (#7190)status code is SUCCESS and not present otherwise. |
| 16 | HT Capabilities | The HT Capabilities element is present if dot11HighThroughputOptionImplemented is true and the (#7190)status code is SUCCESS and is not present otherwise.<br>The HT Capabilities element is defined in 9.4.2.54 (HT Capabilities element). |
| 17 | 20/40 BSS Coexistence | The 20/40 BSS Coexistence element is optionally present if the (#7190)status code is SUCCESS and not present otherwise.<br>The 20/40 BSS Coexistence element is defined in 9.4.2.58 (20/40 BSS Coexistence element). |
| 18 | Link Identifier | The Link Identifier element is present if the (#7190)status code is SUCCESS and not present otherwise.<br>The Link Identifier is specified in 9.4.2.60 (Link Identifier element). |
| 19 | Multi-band | The Multi-band element is optionally present if dot11MultibandImplemented is true and the (#7190)status code is SUCCESS and not present otherwise. |
| 20 | AID | The AID element containing the AID of the STA sending the frame is present if dot11VHTOptionImplemented, (11ax)dot11HEOptionImplemented, or dot11S1GOptionImplemented is true and the (#7190)status code is SUCCESS and not present otherwise. |
| 21 | VHT Capabilities | The VHT Capabilities element is present in the 5 GHz band if dot11VHTOptionImplemented is true(#8181) and the (#7190)status code is SUCCESS and not present otherwise. |
| 22 | Operating Mode Notification | The Operating Mode Notification element is optionally present if the TDLS Setup Request frame contained an Extended Capabilities element with the Operating Mode Notification field is equal to 1. |
| 23 | S1G Capabilities | S1G Capabilities element is optionally present if dot11S1GOptionImplemented is true. |
| 24 | EL Operation | EL Operation element is present if dot11S1GELOperationActivated is true. |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-526—Information for TDLS Setup Response Action field *(continued)***

| Order | Information | Notes |
|---|---|---|
| 25(11ax) | HE Capabilities | The HE Capabilities element is present if dot11HEOptionImplemented is true and the (#7190)status code is SUCCESS; otherwise, it is not present. The HE Capabilities element is defined in 9.4.2.247 (HE Capabilities element(11ax)). |
| 26(11ax) | TWT | The TWT element is present if dot11TWTOptionActivated is true and the TWT element is present in the TDLS Setup Request frame that elicited this TDLS Setup Response frame. The TWT element is optionally present if dot11TWTOptionActivated is true and the TWT Requester Support field or the TWT Responder Support field is equal to 1 in the HE Capabilities in the TDLS Setup Request frame that elicited this TDLS Setup Response frame. Otherwise, the TWT element is not present.<br><br>The Trigger subfield and the Negotiation Type subfield of the TWT element are set to 0. |
| 27(11ax) | HE 6 GHz Band Capabilities | The HE 6 GHz Band Capabilities element is present if dot11HEOptionImplemented and dot11HE6GOptionImplemented are true; otherwise, it is not present. |

The TDLS Setup Response Action field is encapsulated in a Data frame and transmitted to the TDLS initiator STA through the AP in response to a TDLS Setup Request Action field. See 11.20 (Tunneled direct link setup(#1356)).

### 9.6.12.4 TDLS Setup Confirm Action field format

The Action field of a TDLS Setup Confirm Action field contains the information shown in Table 9-527 (Information for TDLS Setup Confirm Action field).

**Table 9-527—Information for TDLS Setup Confirm Action field**

| Order | Information | Notes |
|---|---|---|
| 1 | Category | The Category field is defined in 9.4.1.11 (Action field). |
| 2 | TDLS Action | The TDLS Action field is defined in 9.6.12.1 (TDLS Action field(#3729)). |
| 3 | Status Code | The Status Code is defined in 9.4.1.9 (Status Code field). |
| 4 | Dialog Token | The dialog token is copied from the corresponding TDLS Setup Response. The dialog token is specified in 9.4.1.12 (Dialog Token field). |
| 5 | RSNE | The RSNE is present if security is required on the TDLS direct link (see 12.7.8.1 (General)) and the (#7190)status code is SUCCESS, and not present otherwise. The RSNE is defined in 9.4.2.23 (RSNE). |
| 6 | EDCA Parameter Set | The EDCA parameter set is present if QoS is supported on the TLDS direct link (see 12.7.8.1 (General)) . The EDCA Parameter Set element is specified in 9.4.2.27 (EDCA Parameter Set element). It is present for Status Code SUCCESS. |

This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-527—Information for TDLS Setup Confirm Action field *(continued)***

| Order | Information | Notes |
|---|---|---|
| 7 | FTE | The FTE is defined in 9.4.2.46 (FTE(#1776)).<br>The FTE is present if security is required on the TDLS direct link (see 12.7.8.1 (General)) and the (#7190)status code is SUCCESS, and not present otherwise. |
| 8 | Timeout Interval (TPK key lifetime(#7162)) | The (#1776)TIE is defined in 9.4.2.47 (TIE(#1776)).<br>The (#1776)TIE, containing the TPK key lifetime(#7162), is present if security is required on the (#2152)TDLS direct link and the (#7190)status code is SUCCESS, and not present otherwise. |
| 9 | HT Operation | The HT Operation element is present if dot11HighThroughputOptionImplemented is true, the TDLS Setup Response frame contained an HT Capabilities element, the (#7190)status code is SUCCESS.<br>The HT Operation element is defined in 9.4.2.55 (HT Operation element). |
| 10 | Link Identifier | The Link Identifier is specified in 9.4.2.60 (Link Identifier element). It is present if the (#7190)status code is SUCCESS. |
| 11 | VHT Operation | VHT Operation element (optional). The VHT Operation element is present if dot11VHTOptionImplemented is true, the TDLS Setup Response frame contained a VHT Capabilities element, the status code is SUCCESS, and the TDLS direct link is not established in the 2.4 GHz band. The VHT Operation element is defined in 9.4.2.157 (VHT Operation element). |
| 12 | Operating Mode Notification | The Operating Mode Notification element is optionally present if the TDLS Setup Request frame contained an Extended Capabilities element with the Operating Mode Notification field is equal to 1. |
| 13 | S1G Operation | The S1G Operation element is present if dot11S1GOptionImplemented is true and the status code is 0 (Successful). The S1G Operation element is defined in 9.4.2.211 (S1G Operation element). |
| 14(11ax) | HE Operation | The HE Operation element is present when dot11HEOptionImplemented is true, the TDLS Setup Response frame contains an HE Capabilities element, and the (#7190)status code is SUCCESS; otherwise, it is not present.<br>The HE Operation element is defined in 9.4.2.248 (HE Operation element(11ax)). |

The TDLS Setup Confirm Action field is encapsulated in a Data frame and transmitted to the TDLS responder STA through the AP in response to a TDLS Setup Response Action field. See 11.20 (Tunneled direct link setup(#1356)).

#### 9.6.12.5 TDLS Teardown Action field format

The Action field of a TDLS Teardown Action field contains the information shown in Table 9-528 (Information for TDLS Teardown Action field).

**Table 9-528—Information for TDLS Teardown Action field**

| Order | Information | Notes |
|---|---|---|
| 1 | Category | The Category field is defined in 9.4.1.11 (Action field). |
| 2 | TDLS Action | The TDLS Action field is defined in 9.6.12.1 (TDLS Action field(#3729)). |
| 3 | Reason Code | The Reason Code is defined in 9.4.1.7 (Reason Code field). |
| 4 | FTE | The FTE is present if a TPK handshake was successful for this session.<br>The FTE is defined in 9.4.2.46 (FTE(#1776)). |
| 5 | Link Identifier | The Link Identifier is specified in 9.4.2.60 (Link Identifier element). |

The TDLS Teardown Action field is encapsulated in a Data frame and transmitted to the TDLS peer STA directly or through the AP to tear down a TDLS direct link. See 11.20 (Tunneled direct link setup(#1356)).

#### 9.6.12.6 TDLS Peer Traffic Indication Action field format

The Action field of a TDLS Peer Traffic Indication Action field contains the information shown in Table 9-529 (Information for TDLS Peer Traffic Indication Action field).

**Table 9-529—Information for TDLS Peer Traffic Indication Action field**

| Order | Information | Notes |
|---|---|---|
| 1 | Category | The Category field is defined in 9.4.1.11 (Action field). |
| 2 | TDLS Action | The TDLS Action field is defined in 9.6.12.1 (TDLS Action field(#3729)). |
| 3 | Dialog Token | The dialog token is specified in 9.4.1.12 (Dialog Token field). |
| 4 | Link Identifier | The Link Identifier is specified in 9.4.2.60 (Link Identifier element). |
| 5 | PTI Control | The PTI Control element is optionally present. It is defined in 9.4.2.63 (PTI Control element). |
| 6 | TPU Buffer Status | The TPU Buffer Status element is defined in 9.4.2.64 (TPU Buffer Status element). |

The TDLS Peer Traffic Indication Action field indicates the state of the power save buffer at the STA supporting TPU that is buffering data for a TDLS peer STA in power save mode.

The TPU Buffer Status element indicates the status of the AC buffers at the TPU buffer STA.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The PTI Control element is optionally included in the TDLS Peer Traffic Indication Action field (see 11.2.3.12 (TDLS peer U-APSD (TPU))) to identify the latest MPDU transmitted to the TPU sleep STA that is the destination of the TDLS Peer Traffic Indication Action field.

The TDLS Peer Traffic Indication Action field is encapsulated in a Data frame and transmitted to the TDLS peer STA through the AP. See 11.2.3.12 (TDLS peer U-APSD (TPU)).

### 9.6.12.7 TDLS Channel Switch Request Action field format

The Action field of the TDLS Channel Switch Request Action field contains the information shown in Table 9-530 (Information for TDLS Channel Switch Request Action field).

**Table 9-530—Information for TDLS Channel Switch Request Action field**

| Order | Information | Notes |
|---|---|---|
| 1 | Category | The Category field is defined in 9.4.1.11 (Action field). |
| 2 | TDLS Action | The TDLS Action field is defined in 9.6.12.1 (TDLS Action field(#3729)). |
| 3 | Target Channel | 1-octet field that specifies the channel number of the target channel. See 9.4.1.33 (Target Channel field(#3249)). |
| 4 | Operating Class | 1-octet field that specifies the operating class for the target channel. The Operating Channel field is defined in 9.4.1.34 (Operating Class field(#3249)). |
| 5 | Secondary Channel Offset | The secondary channel offset is present if a switch to a (#2152)40 MHz TDLS direct link is indicated and is absent otherwise. See 9.4.2.18 (Secondary Channel Offset element). |
| 6 | Link Identifier | The Link Identifier element is specified in 9.4.2.60 (Link Identifier element). |
| 7 | Channel Switch Timing | The Channel Switch Timing element is specified in 9.4.2.62 (Channel Switch Timing element). |
| 8 | Wide Bandwidth Channel Switch | Wide Bandwidth Channel Switch element (optional). The Wide Bandwidth Channel Switch element is included when a switch to an 80 MHz, 160 MHz, or 80+80 MHz (#2152)TDLS direct link is indicated. See 9.4.2.159 (Wide Bandwidth Channel Switch element). |
| 9 | Country | Country element (optional). The Country element is included to change operating classes when a switch to a (#2152)TDLS direct link is indicated. The Country element indicates the same country as the BSS and includes zero Subband Triplet fields. |
| 10 | Transmit Power Envelope | Transmit Power Envelope element (zero or more). Each Transmit Power Envelope element that is present includes a distinct value of the Local Maximum Transmit Power Unit Interpretation subfield. If present, the New Transmit Power Envelope element indicates the maximum transmit powers for the (#2152)TDLS direct link for the indicated bandwidths with an indicated unit interpretation after a switch to a (#2152)TDLS direct link (see 11.20.6.5.1 (General)). |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The TDLS Channel Switch Request Action field is encapsulated in a Data frame and transmitted directly to the TDLS peer STA to request for the TDLS direct link to be switched to another channel. See 11.20 (Tunneled direct link setup(#1356)).

### 9.6.12.8 TDLS Channel Switch Response Action field format

The Action field of the TDLS Channel Switch Response Action field contains the information shown in Table 9-531 (Information for TDLS Channel Switch Response Action field).

**Table 9-531—Information for TDLS Channel Switch Response Action field**

| Order | Information | Notes |
|---|---|---|
| 1 | Category | The Category field is defined in 9.4.1.11 (Action field). |
| 2 | TDLS Action | The TDLS Action field is defined in 9.6.12.1 (TDLS Action field(#3729)). |
| 3 | Status Code | The Status Code is defined in 9.4.1.9 (Status Code field). |
| 5 | Link Identifier | The Link Identifier element is specified in 9.4.2.60 (Link Identifier element). It is present if the (#7190)status code is SUCCESS. |
| 6 | Channel Switch Timing | The Channel Switch Timing element is specified in 9.4.2.62 (Channel Switch Timing element). |

The TDLS Channel Switch Response Action field is encapsulated in a Data frame and transmitted directly to the TDLS peer STA in response to a TDLS Channel Switch Request Action field. See 11.20 (Tunneled direct link setup(#1356)).

### 9.6.12.9 TDLS Peer PSM Request Action field format

The TDLS Peer PSM Request Action field contains the information shown in Table 9-532 (Information for TDLS Peer PSM Request Action field).

**Table 9-532—Information for TDLS Peer PSM Request Action field**

| Order | Information | Notes |
|---|---|---|
| 1 | Category | The Category field is defined in 9.4.1.11 (Action field). |
| 2 | TDLS Action | The TDLS Action field is defined in 9.6.12.1 (TDLS Action field(#3729)). |
| 3 | Dialog Token | The Dialog Token field contains a value that is unique among TDLS Peer PSM Request Action fields for which a corresponding TDLS Peer PSM Response Action field has not been received. The dialog token is specified in 9.4.1.12 (Dialog Token field). |
| 4 | Link Identifier | The Link Identifier element is specified in 9.4.2.60 (Link Identifier element). |
| 5 | Wakeup Schedule | The Wakeup Schedule element is specified in 9.4.2.61 (Wakeup Schedule element). |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The TDLS Peer PSM Request Action field is encapsulated in a Data frame and transmitted to the TDLS peer STA, directly or through the AP, to set up or change a periodic wakeup schedule on the TDLS direct link. See 11.2.3.11 (TDLS peer power save mode).

### 9.6.12.10 TDLS Peer PSM Response Action field format

The TDLS Peer PSM Response Action field contains the information shown in Table 9-533 (Information for TDLS Peer PSM Response Action field).

**Table 9-533—Information for TDLS Peer PSM Response Action field**

| Order | Information | Notes |
|---|---|---|
| 1 | Category | The Category field is defined in 9.4.1.11 (Action field). |
| 2 | TDLS Action | The TDLS Action field is defined in 9.6.12.1 (TDLS Action field(#3729)). |
| 3 | Dialog Token | The dialog token is set to the value contained in the corresponding TDLS Peer PSM Request Action field. The dialog token is specified in 9.4.1.12 (Dialog Token field). |
| 4 | Status Code | The Status Code is specified in 9.4.1.9 (Status Code field). |
| 5 | Link Identifier | The Link Identifier element is specified in 9.4.2.60 (Link Identifier element). It is present if the (#7190)status code is SUCCESS. |
| 6 | Wakeup Schedule | The Wakeup Schedule element is present is present if the status code is set to TDLS_REJECTED_ALTERNATIVE_PROVIDED and is not present otherwise. The Wakeup Schedule element is specified in 9.4.2.61 (Wakeup Schedule element). |

The TDLS Peer PSM Response Action field is encapsulated in a Data frame and transmitted to the TDLS peer STA directly in response to a TDLS Peer PSM Request Action field. See 11.2.3.11 (TDLS peer power save mode).

### 9.6.12.11 TDLS Peer Traffic Response Action field format

The Action field of a TDLS Peer Traffic Response Action field contains the information shown in Table 9-534 (Information for TDLS Peer Traffic Response Action field).

**Table 9-534—Information for TDLS Peer Traffic Response Action field**

| Order | Information | Notes |
|---|---|---|
| 1 | Category | The Category field is defined in 9.4.1.11 (Action field). |
| 2 | TDLS Action | The TDLS Action field is defined in 9.6.12.1 (TDLS Action field(#3729)). |
| 3 | Dialog Token | The dialog token is specified in 9.4.1.12 (Dialog Token field). |
| 4 | Link Identifier | The Link Identifier element is specified in 9.4.2.60 (Link Identifier element). |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The TDLS Peer Traffic Response Action field indicates the receipt of the corresponding TDLS Peer Traffic Indication Action field.

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is set to the nonzero value of the corresponding TDLS Peer Traffic Indication Action field.

The Link Identifier field is set to identify the TDLS direct link in relation to which the TDLS Peer Traffic Response Action field is transmitted.

The TDLS Peer Traffic Response Action field is encapsulated in a Data frame and transmitted to the TDLS peer STA directly. See 11.2.3.12 (TDLS peer U-APSD (TPU)).

#### 9.6.12.12 TDLS Discovery Request Action field format

The TDLS Discovery Request Action field contains the information shown in Table 9-535 (Information for TDLS Discovery Request Action field).

**Table 9-535—Information for TDLS Discovery Request Action field**

| Order | Information | Notes |
|---|---|---|
| 1 | Category | The Category field is defined in 9.4.1.11 (Action field). |
| 2 | TDLS Action | The TDLS Action field is defined in 9.6.12.1 (TDLS Action field(#3729)). |
| 3 | Dialog Token | The Dialog Token field can be used to match TDLS Discovery Response frames to the corresponding TDLS Discovery Request frame. The dialog token is specified in 9.4.1.12 (Dialog Token field). |
| 4 | Link Identifier | The Link Identifier element is specified in 9.4.2.60 (Link Identifier element). |
| 5 | Multi-band | The Multi-band element is optionally present if dot11MultibandImplemented is true. |

The TDLS Discovery Request Action field is encapsulated in a Data frame and transmitted to a TDLS peer STA through the AP, to request TDLS STAs in the same BSS to respond with a TDLS Discovery Response frame. See 11.20 (Tunneled direct link setup(#1356)).

### 9.6.13 WNM Action frame details(#3729)

#### 9.6.13.1 WNM Action field(#3729)

Several Action frame formats are defined for wireless network management (WNM) purposes. A WNM Action field, in the field immediately after the Category field, differentiates the formats. The WNM Action field values associated with each frame format are defined in Table 9-536 (WNM Action field values).

#### 9.6.13.2 Event Request frame format

The Event Request frame is transmitted to request another STA to report one or more events. The format of the Event Request frame Action field is shown in Figure 9-1265 (Event Request frame Action field format).

The Category field is defined in 9.4.1.11 (Action field).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-536—WNM Action field values**

| WNM Action field value | Description |
|---|---|
| 0 | Event Request |
| 1 | Event Report |
| 2 | Diagnostic Request |
| 3 | Diagnostic Report |
| 4 | Location Configuration Request |
| 5 | Location Configuration Response |
| 6 | BSS Transition Management Query |
| 7 | BSS Transition Management Request |
| 8 | BSS Transition Management Response |
| 9 | FMS Request |
| 10 | FMS Response |
| 11 | (#2210)Colocated Interference Request |
| 12 | (#2210)Colocated Interference Report |
| 13 | TFS Request |
| 14 | TFS Response |
| 15 | TFS Notify |
| 16 | WNM Sleep Mode Request |
| 17 | WNM Sleep Mode Response |
| 18 | TIM Broadcast Request |
| 19 | TIM Broadcast Response |
| 20 | QoS Traffic Capability Update |
| 21 | Channel Usage Request |
| 22 | Channel Usage Response |
| 23 | DMS Request |
| 24 | DMS Response |
| 25 | Timing Measurement Request |
| 26 | WNM Notification Request |
| 27 | WNM Notification Response |
| 28–255 | Reserved |

The WNM Action field is defined in 9.6.13.1 (WNM Action field(#3729)).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is a nonzero value chosen by the STA sending the event request to identify the request/report transaction.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

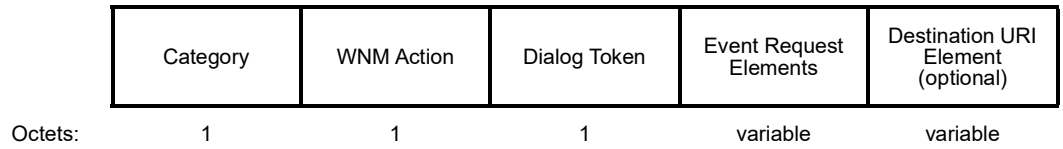

**Figure 9-1265—Event Request frame Action field format**

The Event Request Elements field contains one or more of the Event Request elements described in 9.4.2.65 (Event Request element).

The Destination URI element field contains zero or one Destination URI elements described in 9.4.2.88 (Destination URI element).

### 9.6.13.3 Event Report frame format

The Event Report frame is transmitted in response to an Event Request frame, or autonomously. The format of the Event Report frame Action field is shown in Figure 9-1266 (Event Report frame Action field format).

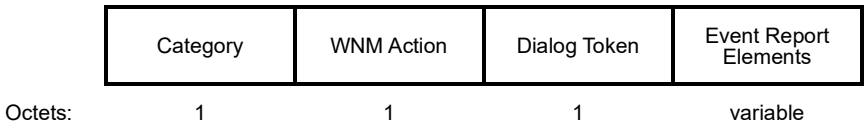

**Figure 9-1266—Event Report frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The WNM Action field is defined in 9.6.13.1 (WNM Action field(#3729)).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is the nonzero value of the corresponding Event Request frame. If the Event Report frame is being transmitted other than in response to an Event Request frame, then the dialog token is 0.

The Event Report Elements field contains one or more of the Event Report elements described in 9.4.2.66 (Event Report element).

### 9.6.13.4 Diagnostic Request frame format

The Diagnostic Request frame is transmitted requesting the receiving STA to execute a diagnostic test. The format of the Diagnostic Request frame Action field is shown in Figure 9-1267 (Diagnostic Request frame Action field format).

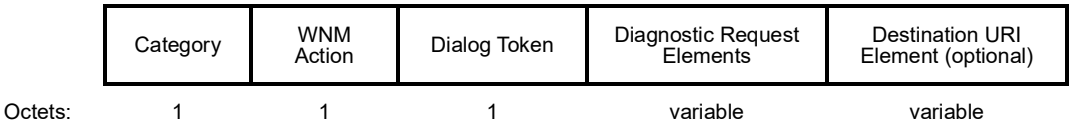

**Figure 9-1267—Diagnostic Request frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The WNM Action field is defined in 9.6.13.1 (WNM Action field(#3729)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is a nonzero value chosen by the STA sending the Diagnostic Request frame to identify the request/report transaction.

The Diagnostic Request Elements field contains one or more of the Diagnostic Request elements described in 9.4.2.67 (Diagnostic Request element). The number and length of the Diagnostic Request elements in a Diagnostic Request frame is limited by the maximum MMPDU size (see 9.3.3.1 (Format of (PV0) Management frames)).

The Destination URI element field contains zero or one Destination URI elements described in 9.4.2.88 (Destination URI element).

### 9.6.13.5 Diagnostic Report frame format

The Diagnostic Report frame is transmitted by a STA in response to a Diagnostic Request frame. The format of the Diagnostic Report frame Action field is shown in Figure 9-1268 (Diagnostic Report frame Action field format).

| | Category | WNM Action | Dialog Token | Diagnostic Report Elements |
|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | variable |

**Figure 9-1268—Diagnostic Report frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The WNM Action field is defined in 9.6.13.1 (WNM Action field(#3729)).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is the nonzero value in any corresponding Diagnostic Request frame.

The Diagnostic Report Elements field contains one or more of the Diagnostic Report elements described in 9.4.2.68 (Diagnostic Report element). The number and length of the Diagnostic Report elements in a Diagnostic Report frame is limited by the maximum MMPDU size (see 9.3.3.1 (Format of (PV0) Management frames)).

### 9.6.13.6 Location Configuration Request frame format

The Location Configuration Request frame is transmitted to configure another STA to send a Location Track Notification frame on a set of channels periodically for the purposes of determining location of the STA. The format of the Location Configuration Request frame Action field is shown in Figure 9-1269 (Location Configuration Request frame Action field format).

| | Category | WNM Action | Dialog Token | Location Parameters Element |
|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | variable |

**Figure 9-1269—Location Configuration Request frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The WNM Action field is defined in 9.6.13.1 (WNM Action field(#3729)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is a nonzero value that is unique among the Location Configuration Request frames sent to each destination MAC address for which a corresponding Location Configuration Response frame has not been received.

The Location Parameters Element field contains the location parameters subelements, described in 9.4.2.69 (Location Parameters element). Table 9-537 (Location Parameters Element field for Location Configuration Request frame) defines the allowed Location Parameters subelements for a Location Parameters element that is included in the Location Configuration Request frame.

**Table 9-537—Location Parameters Element field for Location Configuration Request frame**

| Allowed subelements | Subelement ID | Notes |
|---|---|---|
| Location Indication Parameters | 1 | The Location Indication Parameters subelement is included in the Location Configuration Request frame. |
| Location Indication Channels | 2 | The Location Indication Channels subelement is included in the Location Configuration Request frame. |
| Location Indication Broadcast Data Rate | 6 | The Location Indication Broadcast Data Rate subelement is included in the Location Configuration Request frame. |
| Location Indication Options | 8 | The Location Indication Options subelement is optionally included in the Location Configuration Request frame. |
| Vendor Specific Information | 221 | Zero or more Vendor Specific subelements are included in the Location Configuration Request frame. |

### 9.6.13.7 Location Configuration Response frame format

The Location Configuration Response frame is transmitted in response to a Location Configuration Request frame. The format of the Location Configuration Response frame Action field is shown in Figure 9-1270 (Location Configuration Response frame Action field format).

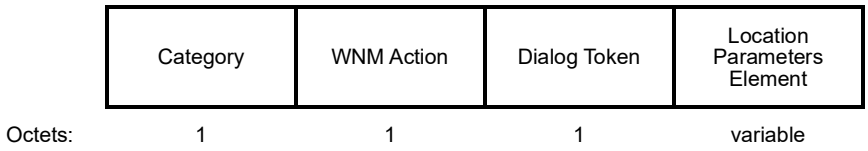

**Figure 9-1270—Location Configuration Response frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The WNM Action field is defined in 9.6.13.1 (WNM Action field(#3729)).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is the nonzero value received in the Location Configuration Request frame to identify the request/response transaction.

The Location Parameters Element field contains the location parameters subelements, described in 9.4.2.69 (Location Parameters element). Table 9-538 (Location Parameters Element field for Location Configuration Response frame) defines the allowed Location Parameters subelements for a Location Parameters element that is included in the Location Configuration Response frame.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-538—Location Parameters Element field for Location Configuration Response frame**

| Allowed subelements | Subelement ID | Notes |
|---|---|---|
| Location Indication Parameters | 1 | The Location Indication Parameters subelement is optionally included in the Location Configuration Response frame. |
| Location Indication Channels | 2 | The Location Indication Channels subelement is optionally included in the Location Configuration Response frame. |
| Location Indication Broadcast Data Rate | 6 | The Location Indication Broadcast Data Rate subelement is optionally included in the Location Configuration Response frame. |
| Location Indication Options | 8 | The Location Indication Options subelement is optionally included in the Location Configuration Response frame. |
| Location Status | 3 | The Location Status subelement is included in the Location Configuration Response frame. If all configuration of the subelements contained in a Location Configuration Request frame was successful, then a single Location Status subelement is included in the Location Configuration Response frame. For each subelement contained in the Location Configuration Request frame that is not successful a Location Status subelement is included in the Location Configuration Response frame that indicates the subelement ID and the unsuccessful status code for that subelement ID. |
| Vendor Specific Information | 221 | Zero or more Vendor Specific subelements are included in the Location Configuration Response frame. |

### 9.6.13.8 BSS Transition Management Query frame format

The BSS Transition Management Query frame is transmitted to request or provide information on BSS transition candidate APs. The format of the BSS Transition Management Query frame Action field is shown in Figure 9-1271 (BSS Transition Management Query frame Action field format).

| | Category | WNM Action | Dialog Token | BSS Transition Query Reason | BSS Transition Candidate List Entries (Optional) |
|---|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | 1 | variable |

**Figure 9-1271—BSS Transition Management Query frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The WNM Action field is defined in 9.6.13.1 (WNM Action field(#3729)).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is a nonzero value chosen by the STA sending the BSS Transition Management Query frame to identify the query/request/response transaction.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The BSS Transition Query Reason field contains the reason code for a BSS transition management query as defined in Table 9-238 (Transition and Transition Query reasons).

The BSS Transition Candidate List Entries field contains zero or more Neighbor Report elements, as described in 9.4.2.35 (Neighbor Report element). The Neighbor Report elements are collected by the STA as part of its scanning procedures and provided to the AP as described in 11.21.7.2 (BSS transition management query). The length of the BSS Transition Candidate List Entries field in a BSS Transition Management Query frame is limited by the maximum MMPDU size (see 9.3.3.1 (Format of (PV0) Management frames)).

### 9.6.13.9 BSS Transition Management Request frame format

The BSS Transition Management Request frame is transmitted by an AP in response to a BSS Transition Management Query frame, or autonomously. The format of the BSS Transition Management Request frame Action field is shown in Figure 9-1272 (BSS Transition Management Request frame Action field format(#554)).

| | Category | WNM Action | Dialog Token | Request Mode | Disassociation Timer |
|---|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | 1 | 2 |

| | Validity Interval | BSS Termination Duration (optional) | Session Information URL (optional) | BSS Transition Candidate List Entries (optional) |
|---|---|---|---|---|
| Octets: | 1 | 0 or 12 | variable | variable |

**Figure 9-1272—BSS Transition Management Request frame Action field format(#554)**

The Category field is defined in 9.4.1.11 (Action field).

The WNM Action field is defined in 9.6.13.1 (WNM Action field(#3729)).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is the nonzero value received in the BSS Transition Management Query frame if the BSS Transition Management Request frame is being transmitted in response to a BSS Transition Management Query frame. If the BSS Transition Management Request frame is being transmitted other than in response to a BSS Transition Management Query frame, then the Dialog Token field is a nonzero value chosen by the AP sending the BSS Transition Management Request frame to identify the request/response transaction.

The (#554)Request Mode field is defined in Figure 9-1273 (Request Mode field format(#130)).

| | B0 | B1 | B2 | B3 | B4 | B5 | B7 |
|---|---|---|---|---|---|---|---|
| | Preferred Candidate List Included | Abridged | Disassociation Imminent | BSS Termination Included | ESS Disassociation Imminent | Reserved | |
| Bits: | 1 | 1 | 1 | 1 | 1 | 3 | |

**Figure 9-1273—Request Mode field format(#130)**

— The Preferred Candidate List Included (bit 0) field indicates whether the BSS transition candidate list included in this frame is a preferred candidate list or a list of known BSS transition candidates. The Preferred Candidate List Included bit set to 0 indicates that the receiving STA can ignore the

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

BSS Transition Candidate List Entries field (see 11.21.7.3 (BSS transition management request)). The Preferred Candidate List Included bit set to 1 indicates that the sender expects the receiving STA to process this frame.

— The Abridged (bit 1) field indicates to the recipient of the frame the intended treatment of all BSSIDs not listed in the BSS Transition Candidate List Entries field. The AP sets the Abridged bit in the Request Mode field to 1 when a preference value of 0 is assigned to all BSSIDs that do NOT appear in the BSS Transition Candidate List. The AP sets the Abridged bit in the Request Mode field to 0 when the AP has no recommendation for or against any BSSID not present in the BSS Transition Candidate List Entries field.

— The Disassociation Imminent (bit 2) field indicates whether the STA will be disassociated from the current AP. The value 1 in the Disassociation Imminent bit in the Request Mode field indicates that the STA is to be disassociated from the current AP, while the value 0 indicates that disassociation from the AP is not imminent.

— The BSS Termination Included (bit 3) field indicates that the BSS Termination Duration field is included, the BSS is shutting down and the STA will be disassociated. The AP sets the BSS Termination Included bit in the (#554)Request Mode field to 1 to indicate that the BSS is shutting down. The BSS Termination Included bit is 0 if no BSS Termination Duration information is included in the BSS Transition Management Request frame.

— The ESS Disassociation Imminent (bit 4) field indicates that the Session Information URL field is included, and that the STA will be disassociated from the ESS. The value 1 in the ESS Disassociation Imminent bit in the Request Mode field indicates that the STA is to be disassociated from the ESS, while the value 0 indicates that disassociation from the ESS is not imminent. When the ESS Disassociation Imminent bit value is 1, a Session Information URL field is included in the BSS Transition Management Request frame.

The Disassociation Timer indicates the time after which the AP issues a Disassociation frame to this STA. The Disassociation Timer field contains the number of (#2227)target beacon transmission times (TBTTs) until the AP sends a Disassociation frame to this STA. Setting the field to 0 indicates that the AP has not determined when it will send a Disassociation frame to this STA. If the Disassociation Imminent field is 0, the Disassociation Timer field is reserved. The format of the Disassociation Timer field is shown in Figure 9-1274 (Disassociation Timer field format).

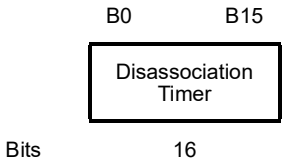

**Figure 9-1274—Disassociation Timer field format**

The Validity Interval field is the number of (#2228)target beacon transmission times (TBTTs) until the BSS transition candidate list is no longer valid. A value of 0 is reserved.

The BSS Termination Duration field contains the BSS Termination Duration subelement (see 9.4.2.35 (Neighbor Report element)) for the current BSS and is present only when the BSS Termination Included field is 1 in the (#554)Request Mode field.

The format of the optional Session Information URL field is shown in Figure 9-1275 (Session Information URL field format). This field is present when the ESS Disassociation Imminent field is 1.

The URL Length field is (#7224)the length in octets of the URL field. The URL Length field is 0 when the URL field is not present.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

| URL Length | URL (optional) |
|---|---|
| 1 | variable |

Octets:

**Figure 9-1275—Session Information URL field format**

The URL field is a variable length field formatted in accordance with IETF RFC 3986.

The BSS Transition Candidate List Entries field contains zero or more Neighbor Report elements described in 9.4.2.35 (Neighbor Report element). If the STA has no information in response to the BSS Transition Management Query frame or in an unsolicited BSS Transition Management Request frame, the Neighbor Report elements are omitted and the Preferred Candidate List Included bit is 0. The length of the BSS Transition Candidate List Entries in a BSS Transition Management Request frame is limited by the maximum MMPDU size (see 9.3.3.1 (Format of (PV0) Management frames)).

### 9.6.13.10 BSS Transition Management Response frame format

The BSS Transition Management Response frame is optionally transmitted by a STA in response to a BSS Transition Management Request frame. The format of the BSS Transition Management Response frame Action field is shown in Figure 9-1276 (BSS Transition Management Response frame Action field format).

| Category | WNM Action | Dialog Token | BTM Status Code | BSS Termination Delay | Target BSSID (Optional) | BSS Transition Candidate List Entries (Optional) |
|---|---|---|---|---|---|---|
| 1 | 1 | 1 | 1 | 1 | 0 or 6 | variable |

Octets:

**Figure 9-1276—BSS Transition Management Response frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The WNM Action field is defined in 9.6.13.1 (WNM Action field(#3729)).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is the value in the corresponding BSS Transition Management Request frame. The BSS Transition Management Response frame is transmitted in response to a BSS Transition Management Request frame.

The BTM Status Code field contains the status code in response to a BSS Transition Management Request frame as defined in Table 9-539 (BTM status code definitions). If the STA will transition to another BSS, then the status code is 0 (i.e., Accept). If the STA intends to retain the association with the current BSS, the status code is one of the “Reject” status codes.

The BSS Termination Delay field is the number of minutes that the responding STA requests the BSS to delay termination. This field is reserved if the BTM Status Code field is not 5.(#3326)

The Target BSSID field is the BSSID of the BSS that the non-AP STA transitions to. This field is present (#3326)if the BTM Status Code field is 0, and not present otherwise.

The BSS Transition Candidate List Entries field contains zero or more Neighbor Report elements described in 9.4.2.35 (Neighbor Report element). The Neighbor Report elements are collected by the STA as part of its scanning procedures and provided to the AP as described in 11.21.7.4 (BSS transition management response). The length of the BSS Transition Candidate List Entries field in a BSS Transition Management

This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-539—BTM status code definitions**

| Status code | Status code description |
|---|---|
| 0 | Accept |
| 1 | Reject—Unspecified reject reason. |
| 2 | Reject—Insufficient Beacon or Probe Response frames received from all candidates. |
| 3 | Reject—Insufficient available capacity from all candidates. |
| 4 | Reject—BSS termination undesired. |
| 5 | Reject—BSS termination delay requested. |
| 6 | Reject—STA BSS Transition Candidate List provided. |
| 7 | Reject—No suitable BSS transition candidates. |
| 8 | Reject—Leaving ESS. |
| 9–255 | Reserved |

Response frame is limited by the maximum MMPDU size (see 9.3.3.1 (Format of (PV0) Management frames)).

### 9.6.13.11 FMS Request frame format

The FMS Request frame is sent by a non-AP STA to the AP to request the specified FMS and to propose delivery intervals for a set of group addressed streams. The FMS Request frame is also sent by a non-AP STA to request a modification to an existing FMS(#238). The format of the Action field of the FMS Request frame is shown in Figure 9-1277 (FMS Request frame Action field format).

| | Category | WNM Action | Dialog Token | FMS Request Element |
|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | variable |

**Figure 9-1277—FMS Request frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The WNM Action field is defined in 9.6.13.1 (WNM Action field(#3729)).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is a nonzero value that is unique among the FMS Request frame sent to each destination MAC address for which a corresponding FMS Report frame has not been received.

The FMS Request Element field indicates the group addressed traffic streams that are requested by the non-AP STA. The FMS Request Element field contains one FMS Request element described in 9.4.2.74 (FMS Request element).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 9.6.13.12 FMS Response frame format

The FMS Response frame is sent by an AP in response to an FMS Request frame, or sent by the AP to the STA to instruct the non-AP STA to change the delivery interval or data rate. The format of the Action field of the FMS Response frame is shown in Figure 9-1278 (FMS Response frame Action field format).

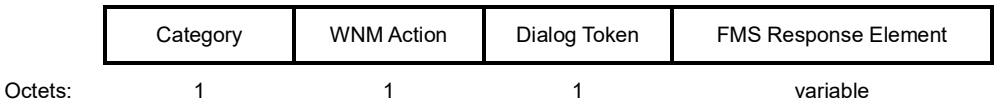

**Figure 9-1278—FMS Response frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The WNM Action field is defined in 9.6.13.1 (WNM Action field(#3729)).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is the nonzero value received in the FMS Request frame to identify the request/response transaction. If an FMS Response frame is being transmitted other than in response to an FMS Request frame, then the Dialog Token field is 0.

The FMS Response Element indicates the group addressed traffic streams that the AP supports and the corresponding delivery intervals. The FMS Response Element field contains one FMS Response elements, described in 9.4.2.75 (FMS Response element).

### 9.6.13.13 (#2210)Colocated Interference Request frame format

The (#2210)Colocated Interference Request frame is transmitted to request (#2210)colocated interference reports, sent using (#2210)Colocated Interference Report frames. The format of the (#2210)Colocated Interference Request frame Action field is shown in Figure 9-1279 ((#2210)Colocated Interference Request frame Action field format).

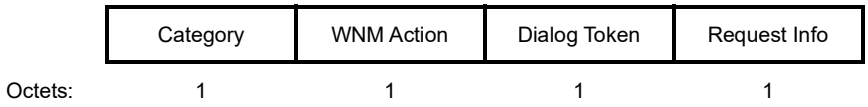

**Figure 9-1279—(#2210)Colocated Interference Request frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The WNM Action field is defined in 9.6.13.1 (WNM Action field(#3729)).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is any nonzero value to identify the request/response transaction.

The Request Info field is shown in Figure 9-1280 (Request Info field format).

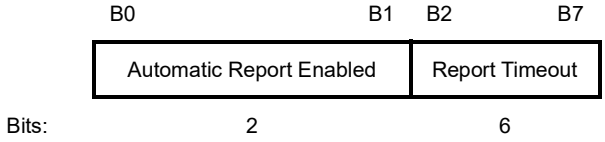

**Figure 9-1280—Request Info field format**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Automatic Report Enabled subfield contains an unsigned integer value.

The Automatic Report Enabled subfield set to 0 indicates that the requesting STA cancels the previous requests so that the receiving STA stops sending (#2210)colocated interference reports.

The Automatic Report Enabled subfield set to 1 indicates that the requesting STA requests the receiving STA to send a (#2210)colocated interference report when the STA knows of a change in the (#2210)colocated interference, subject to meeting the Report Timeout requirement.

The Automatic Report Enabled subfield set to 2 indicates that the requesting STA requests the receiving STA to send a (#2210)colocated interference report periodically using the period included in the Report Period field in the (#2210)Colocated Interference Report element; see 9.4.2.83 ((#2210)Colocated Interference Report element).

The Automatic Report Enabled subfield set to 3 indicates that the requesting STA requests the receiving STA to send (#2210)colocated interference reports periodically using the period included in the Report Period field in the (#2210)Colocated Interference Report element; see 9.4.2.83 ((#2210)Colocated Interference Report element), or send a (#2210)colocated interference report when the STA knows of a change in the (#2210)colocated interference, subject to meeting the Report Timeout requirement.

The Report Timeout field contains a value in units of 200 TUs and indicates the minimum duration between two consecutive (#2210)Colocated Interference Report frames from the reporting STA. When the Automatic Report Enabled subfield is 0, the Report Timeout field is reserved.

### 9.6.13.14 (#2210)Colocated Interference Report frame format

The (#2210)Colocated Interference Report frame is transmitted in response to a(#375) (#2210)Colocated Interference Request frame. The format of the (#2210)Colocated Interference Report frame Action field is shown in Figure 9-1281 ((#2210)Colocated Interference Report frame Action field format).

| | Category | WNM Action | Dialog Token | (#2210) Colocated Interference Report Elements |
|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | variable |

**Figure 9-1281—(#2210)Colocated Interference Report frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The WNM Action field is defined in 9.6.13.1 (WNM Action field(#3729)).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is the nonzero value received in the corresponding (#2210)Colocated Interference Request frame to identify the request/response transaction.

The (#2210)Colocated Interference Report Elements field contains one or more (#2210)Colocated Interference Report elements to indicate the characteristics of the reported (#2210)colocated interferences, as defined in 9.4.2.83 ((#2210)Colocated Interference Report element).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 9.6.13.15 TFS Request frame format

The TFS Request frame is sent by a non-AP STA to the AP to request the specified traffic filtering. The format of the TFS Request frame Action field is defined in Figure 9-1282 (TFS Request frame Action field format).

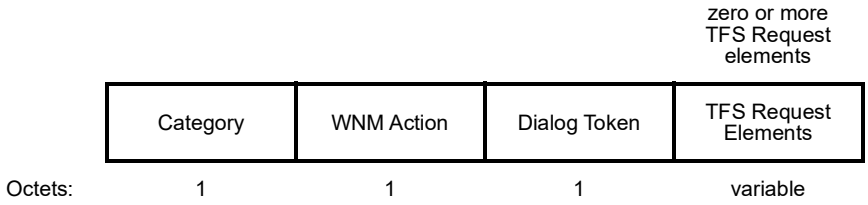

**Figure 9-1282—TFS Request frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The WNM Action field is defined in 9.6.13.1 (WNM Action field(#3729)).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is a value chosen by the STA sending the TFS Request frame to identify the request/response transaction.

The TFS Request Elements field contains one or more TFS Request elements to specify one or more traffic filter sets that are requested by the non-AP STA, as defined in 9.4.2.78 (TFS Request element), or zero TFS Request elements to cancel all of the existing traffic filter sets (see 11.21.12.2 (TFS non-AP STA operation)).

### 9.6.13.16 TFS Response frame format

The TFS Response frame is sent by an AP in response to a TFS Request frame. The format of the TFS Response frame Action field is defined in Figure 9-1283 (TFS Response frame Action field format).

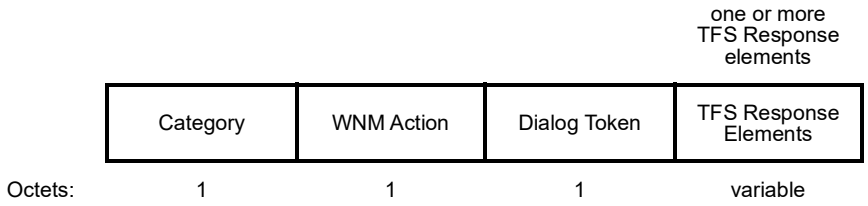

**Figure 9-1283—TFS Response frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The WNM Action field is defined in 9.6.13.1 (WNM Action field(#3729)).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is the value in the corresponding TFS Request frame.

The TFS Response Elements field contains one or more TFS Response elements to indicate the status of the filtering parameters that the AP is requested to support, as defined in 9.4.2.79 (TFS Response element). The number of TFS Response elements in a TFS Response frame is the same as the number of the TFS Request elements in the TFS Request frame with the same dialog token, where the TFS Response elements appear in

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

the same order as the corresponding TFS Request elements in the TFS Request frame with the same dialog token.

### 9.6.13.17 TFS Notify frame format

The TFS Notify frame is sent by an AP to a STA when a frame matching a traffic filter is encountered. The format of the TFS Notify frame Action field is defined in Figure 9-1284 (TFS Notify frame Action field format).

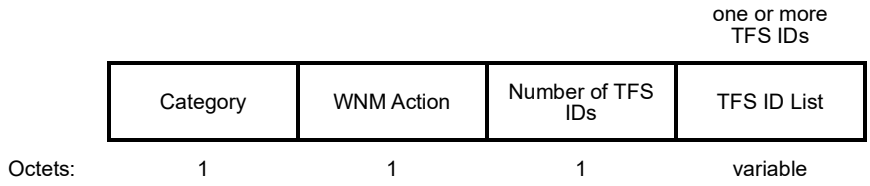

**Figure 9-1284—TFS Notify frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The WNM Action field is defined in 9.6.13.1 (WNM Action field(#3729)).

The Number of TFS IDs field indicates the number of 1-octet TFS IDs present in the TFS ID List field.

The TFS ID field indicates the traffic filter set containing the matched TCLAS element.

### 9.6.13.18 TFS Notify Response frame format

A TFS Notify Response frame is transmitted by a non-AP STA to an AP to request the AP to resume generation of the TFS Notify frame when a frame matches any traffic filter set identified by the TFS ID(s) included in the TFS Notify Response frame. The format of the TFS Notify Response frame Action field is shown in Figure 9-1285 (TFS Notify Response frame Action field format).

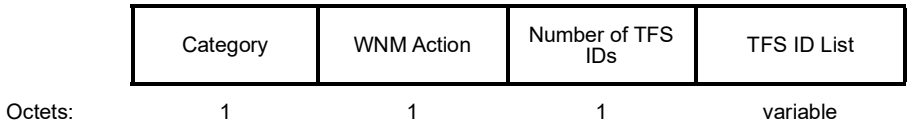

**Figure 9-1285—TFS Notify Response frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The WNM Action field is defined in 9.6.13.1 (WNM Action field(#3729)).

The Number of TFS IDs field indicates the number of 1-octet TFS IDs present in the TFS ID List field.

The TFS ID List field indicates the identifiers of the traffic filter sets.

### 9.6.13.19 WNM Sleep Mode Request frame format

The WNM Sleep Mode Request frame is sent by a non-AP STA to the AP to enter the WNM sleep mode. The format of the WNM Sleep Mode Request frame Action field is defined in Figure 9-1286 (WNM Sleep Mode Request frame Action field format(#7025)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

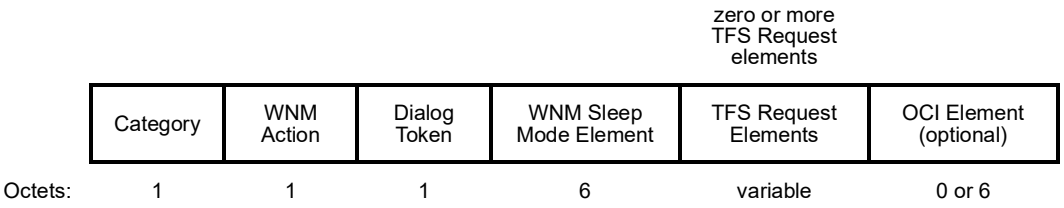

**Figure 9-1286—WNM Sleep Mode Request frame Action field format(#7025)**

The Category field is defined in 9.4.1.11 (Action field).

The WNM Action field is defined in 9.6.13.1 (WNM Action field(#3729)).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is a nonzero value chosen by the non-AP STA sending the WNM Sleep Mode Request frame to identify the request/response transaction.

The WNM Sleep Mode Element field contains a WNM Sleep Mode element that is requested by a non-AP STA, as described in 9.4.2.80 (WNM Sleep Mode element).

The TFS Request Elements field contains (#7025)zero or more TFS Request elements to specify the traffic filters that are requested by a non-AP STA, as defined in 9.4.2.78 (TFS Request element).

The OCI Element field is optionally present, and contains an OCI element as defined in 9.4.2.235 (OCI element).

### 9.6.13.20 WNM Sleep Mode Response frame format

The WNM Sleep Mode Response frame is sent by an AP in response to a WNM Sleep Mode Request frame or is sent without solicitation by an AP to a non-AP STA upon the AP's deletion of all traffic filter sets established according to the traffic filtering agreement between the AP and the non-AP STA. The format of the WNM Sleep Mode Response frame Action field is defined in Figure 9-1287 (WNM Sleep Mode Response frame Action field format(#7025)).

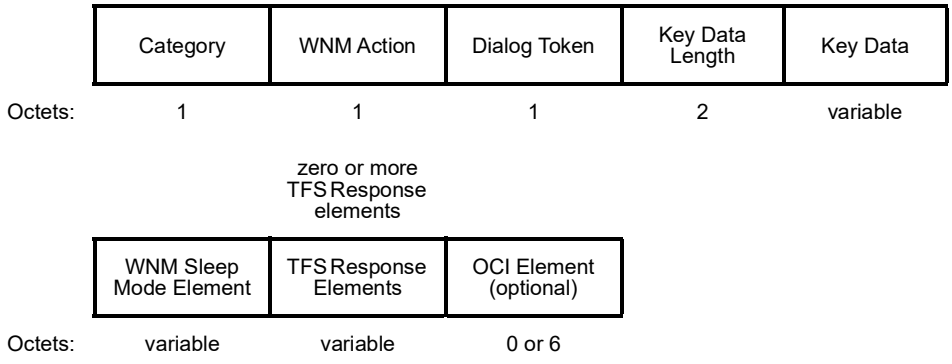

**Figure 9-1287—WNM Sleep Mode Response frame Action field format(#7025)**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Category field is defined in 9.4.1.11 (Action field).

The WNM Action field is defined in 9.6.13.1 (WNM Action field(#3729)).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field).(Ed1) When the WNM Sleep Mode Response frame is transmitted as a response to a WNM Sleep Mode Request frame, the Dialog Token field is the value in the corresponding WNM Sleep Mode Request frame. When the WNM Sleep Mode Response frame is transmitted as an unsolicited response, the Dialog Token field is set to 0.

The Key Data Length field is the length (#7224)in octets of the Key Data field. If (#1722)management frame protection was not negotiated for the current association(#7049), this field is 0.

The Key Data field contains zero or more subelements that provide the current GTK, IGTK and BIGTK to the STA. The format of these subelements is shown in Figure 9-1288 (WNM Sleep Mode GTK subelement format), Figure 9-1289 (WNM Sleep Mode IGTK subelement format), and Figure 9-1290 (WNM Sleep Mode BIGTK subelement format).(#155) The subelement IDs for these subelements are defined in Table 9-540 (Optional subelement IDs for WNM Sleep Mode parameters). When management frame protection was not negotiated for the current association(#7049), the Key Data field is not present.

**Table 9-540—Optional subelement IDs for WNM Sleep Mode parameters**

| Value | Contents of subelement |
|---|---|
| 0 | GTK |
| 1 | IGTK |
| 2 | BIGTK |
| 3–255 | Reserved |

The GTK subelement contains the GTK as shown in Figure 9-1288 (WNM Sleep Mode GTK subelement format).

| | Subelement ID | Length | Key Info | Key Length | RSC | Key |
|---|---|---|---|---|---|---|
| Octets: | 1 | 1 | 2 | 1 | 8 | 5 to 32 |

**Figure 9-1288—WNM Sleep Mode GTK subelement format**

The Length field is defined in 9.4.3 (Subelements).

The Key Info field is defined in Figure 9-440 (GTK subelement's Key Info subfield format).

The Key Length field is the length of the Key field in octets.

The RSC field contains the current (#1406)RSC for the GTK being installed(#1928). If the RSC is less than 8 octets in length, it is stored in the first octets and the remaining octets are set to 0. The least significant octet of the RSC is in the first octet of the RSC field. The RSC for TKIP is the TKIP sequence counter (TSC); for CCMP and GCMP it is the packet number (PN); see Table 12-9 (RSC field(#1406)).

The Key field is the GTK being distributed.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The IGTK subelement contains the IGTK as shown in Figure 9-1289 (WNM Sleep Mode IGTK subelement format).

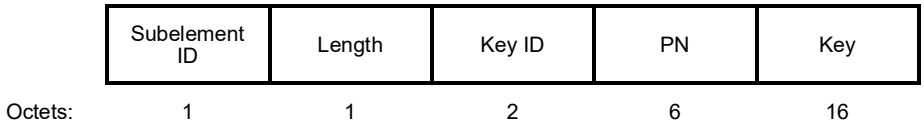

**Figure 9-1289—WNM Sleep Mode IGTK subelement format**

The Length field is defined in 9.4.3 (Subelements).

(#3493)The Key ID field contains the IGTK key ID.

The PN field contains the current RSC (#1406)for the IGTK being installed(#1928). The RSC for an IGTK is the IGTK packet number (IPN).

The Key field is the IGTK being distributed.

The BIGTK subelement contains the BIGTK as shown in Figure 9-1290 (WNM Sleep Mode BIGTK subelement format).

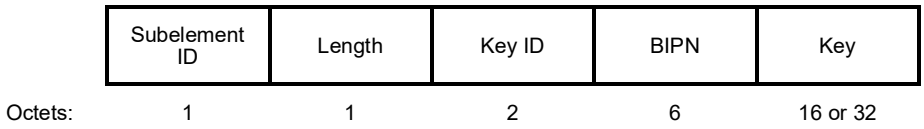

**Figure 9-1290—WNM Sleep Mode BIGTK subelement format**

The Subelement ID field is defined in 9.6.13.20 (WNM Sleep Mode Response frame format).

The Length field is defined in 9.4.3 (Subelements).

(#3493)The Key ID field contains the BIGTK key ID.

The BIPN field contains the current RSC for the BIGTK being installed.(#1928) The RSC for a BIGTK is the BIGTK packet number (BIPN).

The Key field is the BIGTK being distributed.

NOTE 1—There might be multiple GTK, multiple IGTK, and multiple BIGTK subelements if (#1273)GTK rekeying is in progress(#3392) when the non-AP STA wakes up from WNM sleep mode.

NOTE 2—Management frame protection is used to provide confidentiality, replay, and integrity protection for GTK/IGTK/BIGTK update in WNM Sleep Mode Response frames.

The WNM Sleep Mode Element field contains a WNM Sleep Mode element, as described in 9.4.2.80 (WNM Sleep Mode element).

The TFS Response Elements field contains (#7025)zero or more TFS Response elements to specify the traffic filters, as defined in 9.4.2.79 (TFS Response element).

The OCI Element field is optionally present, and contains an OCI element as defined in 9.4.2.235 (OCI element).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 9.6.13.21 TIM Broadcast Request frame format

The format of the TIM Broadcast Request frame Action field is shown in Figure 9-1291 (TIM Broadcast Request frame Action fieldformat).

| | Category | WNM Action | Dialog Token | TIM Broadcast Request Element |
|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | 3 |

**Figure 9-1291—TIM Broadcast Request frame Action fieldformat**

The Category field is defined in 9.4.1.11 (Action field).

The WNM Action field is defined in 9.6.13.1 (WNM Action field(#3729)).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is a nonzero value chosen by the STA sending the TIM Broadcast Request frame to identify the request/response transaction.

The TIM Broadcast Request Element field contains a TIM Broadcast Request Element as specified in 9.4.2.81 (TIM Broadcast Request element).

### 9.6.13.22 TIM Broadcast Response frame format

The format of the TIM Broadcast Response frame Action field is shown in Figure 9-1292 (TIM Broadcast Response frame Action field format).

| | Category | WNM Action | Dialog Token | TIM Broadcast Response Element |
|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | 3 or 12 |

**Figure 9-1292—TIM Broadcast Response frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The WNM Action field is defined in 9.6.13.1 (WNM Action field(#3729)).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is the nonzero value of the corresponding TIM Broadcast Request frame. If the TIM Broadcast Response frame is being transmitted other than in response to a TIM Broadcast Request frame, then the dialog token is 0.

The TIM Broadcast Response Element field contains a TIM Broadcast Response Element as specified in 9.4.2.82 (TIM Broadcast Response element).

### 9.6.13.23 QoS Traffic Capability Update frame format

The QoS Traffic Capability Update frame is sent by a non-AP STA to the AP to update QoS Traffic Capability information. The format of the Action field of the QoS Traffic Capability Update frame is shown in Figure 9-1293 (QoS Traffic Capability Update frame Action field format).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

| | Category | WNM Action | QoS Traffic Capability Flags |
|---|---|---|---|
| Octets: | 1 | 1 | 1 |

**Figure 9-1293—QoS Traffic Capability Update frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The WNM Action field is defined in 9.6.13.1 (WNM Action field(#3729)).

The QoS Traffic Capability Flags field is defined in Table 9-541 (Definition of the QoS Traffic Capability Flags field(#403)). The QoS Traffic Capability Flags field comprises 1 octet, with the bits 4–6 serving as (#403)QoS traffic capability flags. Each of the bits 4–6 serves as a flag for one of the three user priorities, UP 4–6. The field is 1 to indicate the expectation of generating traffic belonging to the corresponding user priority (UP). The field is 0 to indicate that such expectation does not exist. The use of the QoS Traffic Capability Update frame is described in 11.21.10 (QoS Traffic capability procedure).

**Table 9-541—Definition of the QoS Traffic Capability Flags field(#403)**

| Bit | Description |
|---|---|
| 0–3 | Reserved |
| 4 | UP 4 Traffic |
| 5 | UP 5 Traffic |
| 6 | UP 6 Traffic |
| 7 | Reserved |

### 9.6.13.24 Channel Usage Request frame format

The Channel Usage Request frame is sent by a non-AP STA to the AP to request the specified (#3311)channel usage information. The format of the Channel Usage Request frame Action field is defined in Figure 9-1294 (Channel Usage Request frame Action field format(#6016)).

| | Category | WNM Action | Dialog Token | Channel Usage Elements | Supported Operating Classes Element | TWT Elements (optional) (#1024) | Timeout Interval Element (optional)( #3155) |
|---|---|---|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | variable | variable | variable | 0 or 7 |

| | HT Capabilities Element (optional) | VHT Capabilities Element (optional) | HE Capabilities Element (optional) | HE 6 GHz Band Capabilities Element (optional) |
|---|---|---|---|---|
| Octets: | variable | variable | variable | variable |

**Figure 9-1294—Channel Usage Request frame Action field format(#6016)**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Category field is defined in 9.4.1.11 (Action field).

The WNM Action field is defined in 9.6.13.1 (WNM Action field(#3729)).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is a nonzero value chosen by the non-AP STA sending the Channel Usage Request frame to identify the request/response transaction.

The Channel Usage Elements field includes one or more Channel Usage elements described in 9.4.2.84 (Channel Usage element) to identify the request channel usage.(#3310) If the Usage Mode field in a Channel Usage element indicates Channel-usage-aidable BSS channel switch request or Capability notification, no other Channel Usage element is included in the Channel Usage Request frame.(#6016)

The Supported Operating Classes Element field contains a Supported Operating Classes element to indicate the supported operating classes for the requested network type, consistent with the Country element advertised by the AP. The Supported Operating Classes is described in 9.4.2.52 (Supported Operating Classes element). This field is not present if the Usage Mode field in the Channel Usage element is Capability notification.(#6016)

(#1024)The TWT Elements field includes zero or more TWT elements each containing only one individual TWT parameter set (see Figure 9-790 (Individual TWT Parameter Set field format(11ax))). (#3146)When included in a Channel Usage Request frame, the TWT Elements field contains only one TWT element, except if used for the establishment of a peer-to-peer TWT agreement with a range of TWT parameter values (see 10.46.9 (TWT parameter ranges(11ax))). In this case, an additional TWT element is present. The subfields of the Individual TWT Parameter Set field are set as described in 11.21.15 (Channel usage procedures).

(#3155)The Timeout Interval Element field is present when the TWT Elements field contains at least one TWT element; if present it contains a TIE. Otherwise, the Timeout Interval Element field is not present in this frame. The subfields of the TIE are set as described in 11.21.15 (Channel usage procedures).

(#6016)The HT Capabilities Element field, if present, contains an HT Capabilities element. It specifies the HT capabilities of the STA in the operating class and channel specified in the Channel Entry field of the Channel Usage element. It is optionally present when the Usage Mode field in the Channel Usage element indicates Channel-usage-aidable BSS channel switch request or Capability notification; not present otherwise.

(#6016)The VHT Capabilities Element field, if present, contains a VHT Capabilities element. It specifies the VHT capabilities of the STA for the operating class and channel specified in the Channel Entry field of the Channel Usage element. It is optionally present when the Usage Mode field in the Channel Usage element indicates Channel-usage-aidable BSS channel switch request or Capability notification; not present otherwise.

(#6016)The HE Capabilities Element field, if present, contains an HE Capabilities element. It specifies the HE capabilities of the STA for the operating class and channel specified in the Channel Entry field of the Channel Usage element. It is optionally present when the Usage Mode field in the Channel Usage element indicates Channel-usage-aidable BSS channel switch request or Capability notification; not present otherwise.

(#6016)The HE 6 GHz Band Capabilities Element field, if present, contains an HE 6 GHz Band Capabilities element. It specifies the HE capabilities of the STA for the operating class and channel in the 6 GHz band that is specified in the Channel Entry field of the Channel Usage element. It is optionally present when the Usage Mode field in the Channel Usage element indicates Channel-usage-aidable BSS channel switch request or Capability notification; not present otherwise.

### 9.6.13.25 Channel Usage Response frame format

The Channel Usage Response frame is sent by an AP in response to a Channel Usage Request frame, or autonomously. The format of the Channel Usage Response frame Action field is shown in Figure 9-1295 (Channel Usage Response frame Action field format).

| | Category | WNM Action | Dialog Token | Channel Usage Elements | Country String | Power Constraint Element (optional) | EDCA Parameter Set Element (optional) | Transmit Power Envelope Element (optional) (#7001) | TWT Elements (optional) (#1024) | Timeout Interval Element (optional) (#1024) |
|---|---|---|---|---|---|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | variable | 3 | 0 or 3 | 0 or 20 | variable | variable | 0 or 7 |

**Figure 9-1295—Channel Usage Response frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The WNM Action field is defined in 9.6.13.1 (WNM Action field(#3729)).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is the nonzero value received in the Channel Usage Request frame if the Channel Usage Response frame is being transmitted in response to a Channel Usage Request frame. The Dialog Token field is 0 if the Channel Usage Response frame is being transmitted other than in response to a Channel Usage Request frame.

The Channel Usage Element field includes zero or more Channel Usage elements described in 9.4.2.84 (Channel Usage element).

The Country String field is the value contained in the dot11CountryString attribute.

The Power Constraint Element field includes zero or one Power Constraint elements described in 9.4.2.12 (Power Constraint element). The use of the Power Constraint element included in the Power Constraint Element field is described in 11.21.15 (Channel usage procedures).

The EDCA Parameter Set Element field includes zero or one EDCA Parameter Set elements described in 9.4.2.27 (EDCA Parameter Set element). The use of the EDCA Parameter Set element included in the EDCA Parameter Set Element field is described in 11.21.15 (Channel usage procedures).

The Transmit Power Envelope Element field includes zero or one Transmit Power Envelope element described in 9.4.2.160 (Transmit Power Envelope element). The use of the Transmit Power Envelope element included in the Transmit Power Envelope Element field is described in 11.21.15 (Channel usage procedures).(#7001)

(#1024)The TWT Elements field includes zero or more TWT elements each containing only one individual TWT parameter set (see Figure 9-790 (Individual TWT Parameter Set field format(11ax))). (#3146)When included in a Channel Usage Request frame, the TWT Elements field contains only one TWT element, except if used for the establishment of a peer-to-peer TWT agreement with a range of TWT parameter values (see 10.46.9 (TWT parameter ranges(11ax))). In this case, an additional TWT element is present. The subfields of the Individual TWT Parameter Set field are set as described in 11.21.15 (Channel usage procedures).

(#1024)The Timeout Interval Element field is present when the TWT Elements field contains at least one TWT element; if present it contains a TIE(#3390). Otherwise, the Timeout Interval Element field is not

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

present in this frame. The subfields of the TIE(#3390) are set as described in 11.21.15 (Channel usage procedures).

### 9.6.13.26 DMS Request frame format

The DMS Request frame is sent by a non-AP STA to the AP to define information about a DMS request to the AP. The format of the DMS Request frame Action field is defined in Figure 9-1296 (DMS Request frame Action field format).

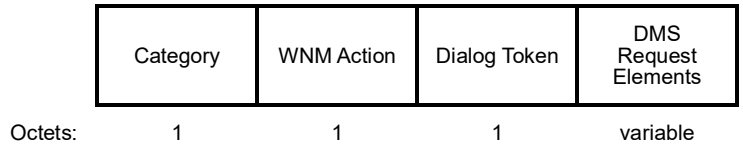

**Figure 9-1296—DMS Request frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The WNM Action field is defined in 9.6.13.1 (WNM Action field(#3729)).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is a nonzero value chosen by the non-AP STA sending the DMS Request frame to identify the request/response transaction.

The DMS Request Elements field contains one or more DMS Request elements as specified in 9.4.2.86 (DMS Request element).

### 9.6.13.27 DMS Response frame format

The DMS Response frame is sent by an AP or a mesh STA in response to a DMS Request frame, or autonomously to terminate a requested DMS stream, or to advertise the current parameters for one or more GCR streams. The format of the DMS Response frame Action field is shown in Figure 9-1297 (DMS Response frame Action field format).

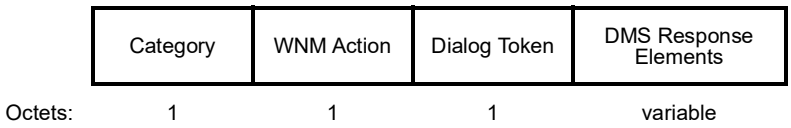

**Figure 9-1297—DMS Response frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The WNM Action field is defined in 9.6.13.1 (WNM Action field(#3729)).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is the nonzero value received in the DMS Request frame if the DMS Response frame is being transmitted in response to a DMS Request frame. The Dialog Token field is 0 if the DMS Response frame is being transmitted autonomously, and not in response to a DMS Request frame.

The DMS Response Elements field contains one or more DMS Response elements as specified in 9.4.2.87 (DMS Response element).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 9.6.13.28 Timing Measurement Request frame format

The format of the Timing Measurement Request frame Action field is shown in Figure 9-1298 (Timing Measurement Request frame Action field format).

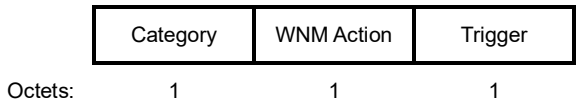

**Figure 9-1298—Timing Measurement Request frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The WNM Action field is defined in 9.6.13.1 (WNM Action field(#3729)).

The Trigger field set to the value 1 indicates that the sending STA requests a timing measurement procedure at the receiving STA as defined in 11.21.5 (Timing measurement procedure). The Trigger field set to the value 0 indicates that the sending STA requests that the receiving STA stop sending Timing Measurement frames. Trigger field values 2–255 are reserved.

### 9.6.13.29 WNM Notification Request frame format

The format of the WNM Notification Request frame Action field is shown in Figure 9-1299 (WNM Notification Request frame Action field format).

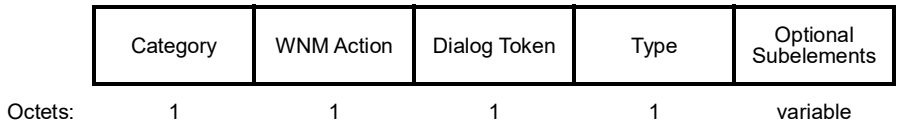

**Figure 9-1299—WNM Notification Request frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The WNM Action field is defined in 9.6.13.1 (WNM Action field(#3729)).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is set to a nonzero value chosen by the STA sending the WNM notification request to identify the request/response transaction.

The Type field indicates the type of WNM notification, as defined in Table 9-542 (WNM notification type).

(#524)The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3 (Subelements).

The Subelement ID field values for the defined subelements are shown in Table 9-543 (Optional subelement IDs for WNM Notification Request).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-542—WNM notification type**

| Value | Description |
|---|---|
| 0 | Firmware Update Notification |
| 1 | Reserved |
| 2 | Beacon Protection Failure |
| 3–220 | Reserved |
| 221 | Vendor Specific |
| 222–255 | Reserved |

**Table 9-543—Optional subelement IDs for WNM Notification Request**

| Subelement ID | Name | Extensible |
|---|---|---|
| 0 | AP Descriptor | No |
| 1 | Firmware Version—Current | No |
| 2 | Firmware Version—New | No |
| 3–220 | Reserved | |
| 221 | Vendor Specific | Vendor defined |
| 222–255 | Reserved | |

When the Type field is 0, the AP Descriptor, Firmware Version—Current, and Firmware Version—New optional subelements are included in the WNM Notification Request frame. The AP descriptor field format is defined in Figure 9-498 (AP Descriptor subelement format). The Firmware Version—Current subelement contains the current firmware version, in the Firmware Version subelement format defined in Figure 9-504 (Firmware Version subelement format). The Firmware Version—New subelement contains the new firmware version, in the Firmware Version subelement format defined in Figure 9-504 (Firmware Version subelement format).

When the Type field is 2, the AP Descriptor, Firmware Version—Current, and Firmware Version—New optional subelements are not included in the WNM Notification Request frame.

### 9.6.13.30 WNM Notification Response frame format

The format of the WNM Notification Response frame Action field is shown in Figure 9-1300 (WNM Notification Response frame Action field format).

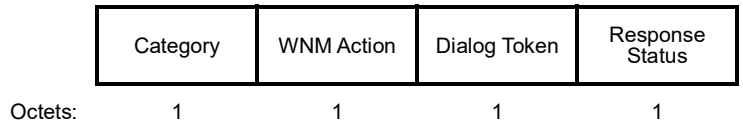

**Figure 9-1300—WNM Notification Response frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The WNM Action field is defined in 9.6.13.1 (WNM Action field(#3729)).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is set to the nonzero value of the corresponding WNM Notification Request frame.

The Response Status field indicates the Response Status value, as defined in Table 9-544 (WNM Notification Response Status).

**Table 9-544—WNM Notification Response Status**

| Value | Description |
|---|---|
| 0 | Notification Acknowledged |
| 1–255 | Reserved |

### 9.6.14 Unprotected WNM Action frame details(#3729)

#### 9.6.14.1 Unprotected WNM Action field(#3729)

Unprotected WNM Action frames are not encapsulated using mechanisms defined for robust Management frames. An Unprotected WNM Action field, in the field immediately after the Category field, differentiates the formats. The Unprotected WNM Action field values associated with each frame format is defined in Table 9-545 (Unprotected WNM Action field values).

**Table 9-545—Unprotected WNM Action field values**

| Action field value | Description |
|---|---|
| 0 | TIM |
| 1 | Timing Measurement |
| 2–255 | Reserved |

#### 9.6.14.2 TIM frame format

The format of the TIM frame Action field is shown in Figure 9-1301 (TIM frame Action field format).

| | Category | Unprotected WNM Action | Check Beacon | Timestamp | TIM Element |
|---|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | 8 | 4–256 |

**Figure 9-1301—TIM frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The Unprotected WNM Action field is defined in 9.6.14.1 (Unprotected WNM Action field(#3729)).

The Check Beacon field is defined as an unsigned integer initialized to 0, that increments when a critical update to the Beacon frame has occurred; see 11.2.3.14 (TIM Broadcast).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Timestamp field is defined in 9.4.1.10 (Timestamp field). The field contains a TSF timestamp when the TIM Broadcast Response frame contained a Status field set to "Accept, timestamp present in TIM frames" or "Overridden, timestamp present in TIM frames." The field is reserved otherwise.

The TIM Element field contains a TIM element as specified in 9.4.2.5 (TIM element). The bit corresponding to buffered group addressed frames is reserved for all BSSIDs.

### 9.6.14.3 Timing Measurement frame format

The Timing Measurement frame is used to support the timing measurement procedure described in 11.21.5 (Timing measurement procedure). The format of the Timing Measurement frame Action field is shown in Figure 9-1302 (Timing Measurement frame Action field format).

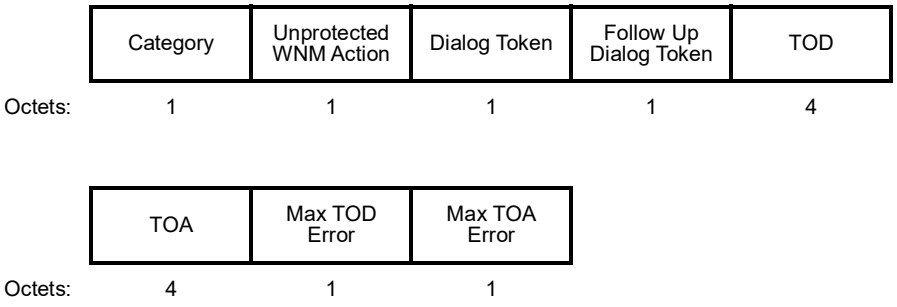

**Figure 9-1302—Timing Measurement frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The Unprotected WNM Action field is defined in 9.6.14.1 (Unprotected WNM Action field(#3729)).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is a nonzero value chosen by the sending STA to identify the Timing Measurement frame as the first of a pair, with the second or followup(#1665) Timing Measurement frame to be sent later. The Dialog Token field is set to 0 to indicate that the Timing Measurement frame will not be followed by a subsequent followup(#1665) Timing Measurement frame.

The Follow Up Dialog Token field is the nonzero value of the Dialog Token field of the previously transmitted Timing Measurement frame to indicate that it is the follow up Timing Measurement frame and that the TOD, TOA, Max TOD Error and Max TOA Error fields contain the values of the timestamps captured with the first Timing Measurement frame of the pair. The Follow Up Dialog Token field is 0 to indicate that the Timing Measurement frame is not a follow up to a previously transmitted Timing Measurement frame. The value 0 in this field also indicates that the TOD, TOA, Max TOD Error, and Max TOA Error fields are reserved. See 11.21.5 (Timing measurement procedure).

The TOD, TOA, Max TOD Error, and Max TOA Error fields are expressed in units of 10 ns.

The TOD field contains a timestamp that represents the time at which the start of the preamble of the previously transmitted Timing Measurement frame appeared at the transmit antenna connector.

The TOA field contains a timestamp that represents the time at which the start of the preamble of the Ack frame to the previously transmitted Timing Measurement frame arrived at the receive antenna connector.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

NOTE—The values specified in the TOD and TOA fields are described in (#8109)(#8108)MLME-TIMINGMSMT.request MLME-TIMINGMSMT.confirm and MLME-TIMINGMSMT.indication primitives.(#1114-Ed1)

The Max TOD Error field contains an upper bound for the error in the value specified in the TOD field. For instance, a 2 in the Max TOD Error field indicates that the TOD field has a maximum error of ± 20 ns.

The Max TOA Error field contains an upper bound for the error in the value specified in the TOA field. For instance, a 2 in the Max TOA Error field indicates that the TOA field has a maximum error of ± 20 ns.

Setting the Max TOD Error or the Max TOA Error field to 0 indicates that the upper bound on the error in the corresponding TOD or TOA value is unknown. Setting either field to 255 indicates that the upper bound on the error is greater than or equal to 2.55 μs.

### 9.6.15 Self-protected Action frame details

#### 9.6.15.1 Self-protected Action field(#3729)(#125)

The Self-protected Action frame is defined to allow robust STA-STA communications of the Action frames that are not robust (see 9.4.1.11 (Action field)). The protocols that use these Action frames are responsible for deciding whether to protect these frames and supporting protection mechanisms for these frames as needed.

Self-protected Action frames have a different nature than Public Action frames and robust Action frames. Robust Action frames assume the existence of a completely established security association. Self-protected Action frames typically exist to manage the creation and deletion of security associations, regardless of whether they are completely established.

Public Action frames are defined as public for all STAs, including those that are not in the BSS and MBSS. Self-protected Action frames, however, are used for relationship creation and maintenance between two specific STAs. Their public nature is incidental.

(#125)The Mesh Peering Open frame, the Mesh Peering Confirm frame, and the Mesh Peering Close frame are referred to as *mesh peering Management frames*.

A Self-protected Action field, in the field immediately after the Category field, differentiates the formats. The defined Self-protected Action frames are listed in Table 9-546 (Self-protected Action field values).

**Table 9-546—Self-protected Action field values**

| Self-protected Action field value | Description |
|---|---|
| 0 | Reserved |
| 1 | Mesh Peering Open |
| 2 | Mesh Peering Confirm |
| 3 | Mesh Peering Close |
| 4 | Mesh Group Key Inform |
| 5 | Mesh Group Key Acknowledge |
| 6–255 | Reserved |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

NOTE—A Self-protected Action frame is not necessarily protected. When it is, the MIC element and the Authenticated Mesh Peering Exchange element are present after the Action field (see 9.3.3.13 (Action frame format)).(#125)(#1637)

### 9.6.15.2 Mesh Peering Open frame format

#### 9.6.15.2.1 Mesh Peering Open frame self protection

Protection of this frame is provided when authenticated mesh peering exchange (AMPE) is enabled. AMPE provides integrity protection of Mesh Peering Open frames.

When the Mesh Peering Open frame is used by the mesh peering management (MPM) protocol, integrity protection on the frame is not enabled.

#### 9.6.15.2.2 Mesh Peering Open frame details

The Mesh Peering Open frame is used to open a mesh peering using the procedures defined in 14.4.6 (Mesh peering open) and in 14.6.5 (Mesh peering Management frames for AMPE). (#125)It is also used for HCCA TXOP negotiation between APs (see 11.26.3 (HCCA TXOP negotiation)). The format of the Mesh Peering Open frame Action field is shown in Table 9-547 (Mesh Peering Open frame Action field format).

**Table 9-547—Mesh Peering Open frame Action field format**

| Order | Information | Notes |
|---|---|---|
| 1 | Category | The Category field is defined in 9.4.1.11 (Action field).(#125) |
| 2 | Self-protected Action | The Self-protected Action field is defined in 9.6.15.1 (Self-protected Action field(#3729)(#125)).(#125) |
| 3 | Capability | The Capability field is defined in 9.4.1.4 (Capability Information field).(#125) |
| 4 | Supported Rates and BSS Membership Selectors | The Supported Rates and BSS Membership Selectors element is defined in 9.4.2.3 (Supported Rates and BSS Membership Selectors element).(#125) |
| 5 | Extended Supported Rates and BSS Membership Selectors | (#3086)The Extended Supported Rates and BSS Membership Selectors element is present if the number of supported rates and BSS membership selectors(#1470) together exceed eight; it is optional otherwise. |
| 6 | Power Capability | The Power Capability element is present if dot11SpectrumManagementRequired is true. |
| 7 | Supported Channels | The Supported Channels element is present if dot11SpectrumManagementRequired is true and dot11ExtendedChannelSwitchActivated is false.<br>The Supported Channels element is optionally present, otherwise.(#3510) |
| 8 | RSN | The RSNE is present if dot11MeshSecurityActivated, dot11ProtectedQLoadReportActivated, or dot11ProtectedTXOPNegotiationActivated is true; otherwise not present. |
| 9 | Mesh ID | The Mesh ID element is defined in 9.4.2.97 (Mesh ID element) and is present when dot11MeshActivated is true; otherwise it is not present.(#125) |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-547—Mesh Peering Open frame Action field format *(continued)***

| Order | Information | Notes |
|---|---|---|
| 10 | Mesh Configuration | The Mesh Configuration element is defined in 9.4.2.96 (Mesh Configuration element) and is present when dot11MeshActivated is true; otherwise it is not present.(#125) |
| 11 | Mesh Peering Management | The Mesh Peering Management element is (#125)defined in 9.4.2.100 (Mesh Peering Management element). |
| 12 | ERP Information | The ERP element is present if ERP mesh STA detects non-ERP STAs in its vicinity and is optionally present otherwise. |
| 13 | Supported Operating Classes | The Supported Operating Classes element is present if dot11ExtendedChannelSwitchActivated is true, or for a mesh STA if dot11OperatingClassesImplemented is true and the STA is capable of operation in more than one operating class. |
| 14 | HT Capabilities | The HT Capabilities element is present when dot11HighThroughputOptionImplemented is true. |
| 15 | HT Operation | The HT Operation element is included when dot11HighThroughputOptionImplemented is true. |
| 16 | 20/40 BSS Coexistence element | The 20/40 BSS Coexistence element is optionally present when dot112040BSSCoexistenceManagementSupport is true. |
| 17 | Extended Capabilities element | The Extended Capabilities element is present if any of the fields in this element are nonzero. |
| 18 | Interworking | The Interworking element is present if dot11InterworkingServiceActivated is true. |
| 19 | VHT Capabilities | The VHT Capabilities element is present in the 5 GHz band if dot11VHTOptionImplemented is true.(#8181) |
| 20 | VHT Operation | The VHT Operation element is present when dot11VHTOptionImplemented is true. |
| 21 | Operating Mode Notification | The Operating Mode Notification element is optionally present if dot11OperatingModeNotificationImplemented is true. |
| 22(11ax) | HE Capabilities | The HE Capabilities element is present when dot11HEOptionImplemented is true; otherwise, it is not present. |
| 23(11ax) | HE Operation | The HE Operation element is present when dot11HEOptionImplemented is true; otherwise, it is not present. |
| 24(#125) | OCI | The OCI element is present when dot11RSNAOperatingChannelValidationActivated is true; otherwise, it is not present. |

### 9.6.15.3 Mesh Peering Confirm frame format

#### 9.6.15.3.1 Mesh Peering Confirm frame self protection

Protection of this frame is provided when authenticated mesh peering exchange (AMPE) is enabled. AMPE provides integrity protection of Mesh Peering Confirm frames.

When the Mesh Peering Confirm frame is used by the mesh peering management (MPM) protocol, integrity protection on the frame is not enabled.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

#### 9.6.15.3.2 Mesh Peering Confirm frame details

The Mesh Peering Confirm frame is used to confirm a mesh peering using the procedures defined in 14.4.7 (Mesh peering confirm) and 14.6.5 (Mesh peering Management frames for AMPE). (#125)It is also used for HCCA TXOP negotiation between APs (see 11.26.3 (HCCA TXOP negotiation)). The format of the Mesh Peering Confirm frame Action field is shown in Table 9-548 (Mesh Peering Confirm frame Action field format).

**Table 9-548—Mesh Peering Confirm frame Action field format**

| Order | Information | Notes |
|---|---|---|
| 1 | Category | The Category field is defined in 9.4.1.11 (Action field).(#125) |
| 2 | Self-protected Action | The Self-protected Action field is defined in 9.6.15.1 (Self-protected Action field(#3729)(#125)).(#125) |
| 3 | Capability | The Capability field is defined in 9.4.1.4 (Capability Information field).(#125) |
| 4 | AID | The AID field is defined in 9.4.1.8 (AID field).(#125) |
| 5 | Supported Rates and BSS Membership Selectors | The Supported Rates and BSS Membership Selectors element is defined in 9.4.2.3 (Supported Rates and BSS Membership Selectors element).(#125) |
| 6 | Extended Supported Rates and BSS Membership Selectors | (#3086)The Extended Supported Rates and BSS Membership Selectors element is present if the number of supported rates and BSS membership selectors(#1470) together exceed eight; it is optional otherwise. |
| 7 | RSN | The RSNE is present when dot11MeshSecurityActivated, dot11ProtectedQLoadReportActivated, or dot11ProtectedTXOPNegotiationActivated is true; otherwise not present.(#1621) |
| 8 | Mesh ID | The Mesh ID element is defined in 9.4.2.97 (Mesh ID element) and is present when dot11MeshActivated is true; otherwise it is not present.(#125) |
| 9 | Mesh Configuration | The Mesh Configuration element is defined in 9.4.2.96 (Mesh Configuration element) and is present when dot11MeshActivated is true; otherwise it is not present.(#125) |
| 10 | Mesh Peering Management | The Mesh Peering Management element is (#125)defined in 9.4.2.100 (Mesh Peering Management element). |
| 11 | HT Capabilities | The HT Capabilities element is present when dot11HighThroughputOptionImplemented is true. |
| 12 | HT Operation | The HT Operation element is included when dot11HighThroughputOptionImplemented is true. |
| 13 | 20/40 BSS Coexistence element | The 20/40 BSS Coexistence element is optionally present when dot112040BSSCoexistenceManagementSupport is true. |
| 14 | Extended Capabilities element | The Extended Capabilities element is present if any of the fields in this element are nonzero. |
| 15 | VHT Capabilities | The VHT Capabilities element is present in the 5 GHz band if dot11VHTOptionImplemented is true.(#8181) |
| 16 | VHT Operation | The VHT Operation element is present when dot11VHTOptionImplemented is true. |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-548—Mesh Peering Confirm frame Action field format *(continued)***

| Order | Information | Notes |
|---|---|---|
| 17 | Operating Mode Notification | The Operating Mode Notification element is optionally present if dot11OperatingModeNotificationImplemented is true. |
| 18(11ax) | HE Capabilities | The HE Capabilities element is present when dot11HEOptionImplemented is true; otherwise, it is not present. |
| 19(11ax) | HE Operation | The HE Operation element is present when dot11HEOptionImplemented is true; otherwise, it is not present. |
| 20(#125) | OCI | The OCI element is present when dot11RSNAOperatingChannelValidationActivated is true; otherwise, it is not present. |

### 9.6.15.4 Mesh Peering Close frame format

#### 9.6.15.4.1 Mesh Peering Close frame self protection

Protection of this frame is provided when authenticated mesh peering exchange (AMPE) is enabled. AMPE provides integrity protection of Mesh Peering Close frames.

When the Mesh Peering Close frame is used by the mesh peering management (MPM) protocol, integrity protection on the frame is not enabled.

#### 9.6.15.4.2 Mesh Peering Close frame details

The Mesh Peering Close frame is used to close a mesh peering using the procedures defined in 14.4.8 (Mesh peering close) and in 14.6.5 (Mesh peering Management frames for AMPE). (#125)It is also used for HCCA TXOP negotiation between APs (see 11.26.3 (HCCA TXOP negotiation)). The format of the Mesh Peering Close frame Action field is shown in Table 9-549 (Mesh Peering Close frame Action field format).

**Table 9-549—Mesh Peering Close frame Action field format**

| Order | Information | Notes |
|---|---|---|
| 1 | Category | The Category field is defined in 9.4.1.11 (Action field).(#125) |
| 2 | Self-protected Action | The Self-protected Action field is defined in 9.6.15.1 (Self-protected Action field(#3729)(#125)).(#125) |
| 3 | Mesh ID | The Mesh ID element is defined in 9.4.2.97 (Mesh ID element) and is present when dot11MeshActivated is true; otherwise it is not present.(#125) |
| 4 | Mesh Peering Management | The Mesh Peering Management element is (#125)defined in 9.4.2.100 (Mesh Peering Management element). |

#### 9.6.15.5 Mesh Group Key Inform frame format

##### 9.6.15.5.1 Mesh Group Key Inform frame self protection

The protection of the frames is provided by the mesh group key handshake protocol (see 14.7 (Mesh group key handshake)) that uses Mesh Group Key Inform frames.

##### 9.6.15.5.2 Mesh Group Key Inform frame details

The Mesh Group Key Inform frame is used to update a mesh GTK (MGTK) with a peer (#125)(see 14.7.2 (Protection on mesh group key handshake frames)). The format of the Mesh Group Key Inform frame Action field is shown in Table 9-550 (Mesh Group Key Inform frame Action field format).

**Table 9-550—Mesh Group Key Inform frame Action field format**

| Order | Information | Notes |
|---|---|---|
| 1 | Category | The Category field is defined in 9.4.1.11 (Action field).(#125) |
| 2 | Self-protected Action | The Self-protected Action field is defined in 9.6.15.1 (Self-protected Action field(#3729)(#125)).(#125) |

#### 9.6.15.6 Mesh Group Key Acknowledge frame format

##### 9.6.15.6.1 Mesh Group Key Acknowledge frame self protection

The protection of the frames is provided by the mesh group key handshake protocol (see 14.7 (Mesh group key handshake)) that uses Mesh Group Key Acknowledge frames.

##### 9.6.15.6.2 Mesh Group Key Acknowledge frame details

The Mesh Group Key Acknowledge frame is used to acknowledge receipt and processing of a Mesh Group Key Inform frame (#125)(see 14.7.2 (Protection on mesh group key handshake frames)). The format of the Mesh Group Key Acknowledge frame Action field is shown in Table 9-551 (Mesh Group Key Acknowledge frame Action field format).

**Table 9-551—Mesh Group Key Acknowledge frame Action field format**

| Order | Information | Notes |
|---|---|---|
| 1 | Category | The Category field is defined in 9.4.1.11 (Action field).(#125) |
| 2 | Self-protected Action | The Self-protected Action field is defined in 9.6.15.1 (Self-protected Action field(#3729)(#125)).(#125) |

### 9.6.16 Mesh Action frame details

#### 9.6.16.1 Mesh Action field(#3729)

Several Mesh Action frame formats are defined for mesh BSS operation. A Mesh Action field, in the field immediately after the Category field, differentiates the formats. The Mesh Action field values associated with each frame format are defined in Table 9-552 (Mesh Action field values).

**Table 9-552—Mesh Action field values**

| Mesh Action field value | Description |
|---|---|
| 0 | Mesh Link Metric Report |
| 1 | HWMP Mesh Path Selection |
| 2 | Gate Announcement |
| 3 | Congestion Control Notification |
| 4 | MCCA Setup Request |
| 5 | MCCA Setup Reply |
| 6 | MCCA Advertisement Request |
| 7 | MCCA Advertisement |
| 8 | MCCA Teardown |
| 9 | TBTT Adjustment Request |
| 10 | TBTT Adjustment Response |
| 11–255 | Reserved |

#### 9.6.16.2 Mesh Link Metric Report frame format

The Mesh Link Metric Report frame is transmitted by a mesh STA to a neighbor peer mesh STA to report metric information on the link between the two mesh STAs. It is also transmitted by a mesh STA to a neighbor peer mesh STA to request metric information on the link between the two mesh STAs from the recipient. This frame is transmitted using an individually addressed frame. The format of the Mesh Link Metric Report frame Action field is shown in Table 9-553 (Mesh Link Metric Report frame Action field format).

**Table 9-553—Mesh Link Metric Report frame Action field format**

| Order | Information | Notes |
|---|---|---|
| 1 | Category | |
| 2 | Mesh Action | |
| 3 | Mesh Link Metric Report element | |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Category field is defined in 9.4.1.11 (Action field).

The Mesh Action field is defined in 9.6.16.1 (Mesh Action field(#3729)).

The Mesh Link Metric Report element is set as described in 9.4.2.98 (Mesh Link Metric Report element).

### 9.6.16.3 HWMP Mesh Path Selection frame format

The HWMP Mesh Path Selection frame is transmitted by a mesh STA to establish, update or delete paths to other mesh STAs using the HWMP defined in 14.11 (Hybrid wireless mesh protocol (HWMP)). This frame is transmitted in an individually or group addressed frame depending on the contained elements and as defined in 14.11.7 (Addressing of HWMP Mesh Path Selection frame). The format of the HWMP Mesh Path Selection frame Action field is shown in Table 9-554 (HWMP Mesh Path Selection frame Action field format).

The HWMP Mesh Path Selection frame contains one or more of the elements indicated in Table 9-554 (HWMP Mesh Path Selection frame Action field format). Usage of the HWMP Mesh Path Selection frame is described in 14.11.7 (Addressing of HWMP Mesh Path Selection frame).

**Table 9-554—HWMP Mesh Path Selection frame Action field format**

| Order | Information | Notes |
|---|---|---|
| 1 | Category | |
| 2 | Mesh Action | |
| 3 | PREQ element | A PREQ element is optionally present |
| 4 | PREP element | A PREP element is optionally present |
| 5 | PERR element | A PERR element is optionally present |
| 6 | RANN element | A RANN element is optionally present |

The Category field is defined in 9.4.1.11 (Action field).

The Mesh Action field is defined in 9.6.16.1 (Mesh Action field(#3729)).

The PREQ element is set as described in 9.4.2.111 (PREQ element). It is present in an HWMP Mesh Path Selection frame as described in 14.11.9 (Path request (PREQ) mechanism).

The PREP element is set as described in 9.4.2.112 (PREP element).

The PERR element is set as described in 9.4.2.113 (PERR element).

The RANN element is set as described in 9.4.2.110 (RANN element).

### 9.6.16.4 Gate Announcement frame format

The Gate Announcement frame is transmitted by a mesh gate to announce its presence in the MBSS. This frame is transmitted using group addresses. The format of the Gate Announcement frame Action field is shown in Table 9-555 (Gate Announcement frame Action field format).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-555—Gate Announcement frame Action field format**

| Order | Information | Notes |
|---|---|---|
| 1 | Category | |
| 2 | Mesh Action | |
| 3 | GANN element | |

The Category field is defined in 9.4.1.11 (Action field).

The Mesh Action field is defined in 9.6.16.1 (Mesh Action field(#3729)).

The GANN element is set as described in 9.4.2.109 (GANN element).

### 9.6.16.5 Congestion Control Notification frame format

A mesh STA uses the Congestion Control Notification frame to indicate its congestion status to its neighbor peer mesh STA(s). This frame is transmitted using individual addresses or group addresses. The format of the Congestion Control Notification frame Action field is shown in Table 9-556 (Congestion Control Notification frame Action field format).

**Table 9-556—Congestion Control Notification frame Action field format**

| Order | Information | Notes |
|---|---|---|
| 1 | Category | |
| 2 | Mesh Action | |
| 3 | Congestion Notification element | One or more Congestion Notification elements (9.4.2.99 (Congestion Notification element)) are present. Repeated *N* times (*N* is the number of Congestion Notification elements contained in the frame). |

The Category field is defined in 9.4.1.11 (Action field).

The Mesh Action field is defined in 9.6.16.1 (Mesh Action field(#3729)).

The Congestion Notification element is set as described in 9.4.2.99 (Congestion Notification element).

### 9.6.16.6 MCCA Setup Request frame format

The MCCA Setup Request frame is used to set up an MCCAOP reservation. A mesh STA (with dot11MCCAActivated equal to true) transmits the MCCA Setup Request frame to one or more neighbor mesh STAs (with dot11MCCAActivated equal to true too). This frame is transmitted using individual addresses or group addresses. The format of the MCCA Setup Request frame Action field is shown in Table 9-557 (MCCA Setup Request frame Action field format).

The Category field is defined in 9.4.1.11 (Action field).

The Mesh Action field is defined in 9.6.16.1 (Mesh Action field(#3729)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-557—MCCA Setup Request frame Action field format**

| Order | Information | Notes |
|---|---|---|
| 1 | Category | |
| 2 | Mesh Action | |
| 3 | MCCAOP Setup Request element | |

The MCCAOP Setup Request element is described in 9.4.2.104 (MCCAOP Setup Request element).

### 9.6.16.7 MCCA Setup Reply frame format

The MCCA Setup Reply frame is used to reply to an MCCA Setup Request frame. It is transmitted by a mesh STA with dot11MCCAActivated equal to true to a neighbor peer mesh STA with dot11MCCAActivated equal to true. This frame is transmitted using individual addresses. The format of the MCCA Setup Reply frame Action field is shown in Table 9-558 (MCCA Setup Reply frame Action field format).

**Table 9-558—MCCA Setup Reply frame Action field format**

| Order | Information | Notes |
|---|---|---|
| 1 | Category | |
| 2 | Mesh Action | |
| 3 | MCCAOP Setup Reply element | |

The Category field is defined in 9.4.1.11 (Action field).

The Mesh Action field is defined in 9.6.16.1 (Mesh Action field(#3729)).

The MCCAOP Setup Reply element is described in 9.4.2.105 (MCCAOP Setup Reply element).

### 9.6.16.8 MCCA Advertisement Request frame format

The MCCA Advertisement Request frame is transmitted by a mesh STA with dot11MCCAActivated equal to true to a neighbor peer mesh STA with dot11MCCAActivated equal to true in order to request MCCAOP advertisements from the neighbor peer mesh STA. This frame is transmitted using individual addresses. The format of the MCCA Advertisement Request frame Action field is shown in Table 9-559 (MCCA Advertisement Request frame Action field format).

The Category field is defined in 9.4.1.11 (Action field).

The Mesh Action field is defined in 9.6.16.1 (Mesh Action field(#3729)).

The MCCAOP Advertisement Overview element is described in 9.4.2.106 (MCCAOP Advertisement Overview element).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-559—MCCA Advertisement Request frame Action field format**

| Order | Information | Notes |
|---|---|---|
| 1 | Category | |
| 2 | Mesh Action | |
| 3 | MCCAOP Advertisement Overview element | An MCCAOP Advertisement Overview element is optionally present. |

### 9.6.16.9 MCCA Advertisement frame format

The MCCA Advertisement frame is transmitted by a mesh STA with dot11MCCAActivated equal to true to one or more neighbor peer mesh STAs with dot11MCCAActivated equal to true. This frame is transmitted using group addresses or individual addresses. The format of the MCCA Advertisement frame Action field is shown in Table 9-560 (MCCA Advertisement frame Action field format).

**Table 9-560—MCCA Advertisement frame Action field format**

| Order | Information | Notes |
|---|---|---|
| 1 | Category | |
| 2 | Mesh Action | |
| 3 | MCCAOP Advertisement Overview element | An MCCAOP Advertisement Overview element is optionally present. |
| 4 | MCCAOP Advertisement elements | If an MCCAOP Advertisement Overview element is present, zero or more MCCAOP Advertisement elements are present. If an MCCAOP Advertisement Overview element is not present, one or more MCCAOP Advertisement elements are present. |

The Category field is defined in 9.4.1.11 (Action field).

The Mesh Action field is defined in 9.6.16.1 (Mesh Action field(#3729)).

The MCCAOP Advertisement Overview element is described in 9.4.2.106 (MCCAOP Advertisement Overview element).

The MCCAOP Advertisement element is described in 9.4.2.107 (MCCAOP Advertisement element).

### 9.6.16.10 MCCA Teardown frame format

The MCCA Teardown frame is transmitted by a mesh STA with dot11MCCAActivated equal to true to one or more neighbor peer mesh STAs with dot11MCCAActivated equal to true. This frame is transmitted using group addresses or individual addresses. The format of the MCCA Teardown frame Action field is shown in Table 9-561 (MCCA Teardown frame Action field format).

The Category field is defined in 9.4.1.11 (Action field).

The Mesh Action field is defined in 9.6.16.1 (Mesh Action field(#3729)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-561—MCCA Teardown frame Action field format**

| Order | Information | Notes |
|---|---|---|
| 1 | Category | |
| 2 | Mesh Action | |
| 3 | MCCAOP Teardown element | |

The MCCAOP Teardown element is described in 9.4.2.108 (MCCAOP Teardown element).

### 9.6.16.11 TBTT Adjustment Request frame format

The TBTT Adjustment Request frame is used to request a particular neighbor peer mesh STA to adjust its TBTT. This frame is transmitted using individual addresses. The format of the TBTT Adjustment Request frame Action field is shown in Table 9-562 (TBTT Adjustment Request frame Action field format).

**Table 9-562—TBTT Adjustment Request frame Action field format**

| Order | Information | Notes |
|---|---|---|
| 1 | Category | |
| 2 | Mesh Action | |
| 3 | Beacon Timing element | Repeated *N_Info* times (*N_Info* is a number of beacon timing information tuples as described in 14.14.4.2.5 (Transmitter's procedure)). |

The Category field is defined in 9.4.1.11 (Action field).

The Mesh Action field is defined in 9.6.16.1 (Mesh Action field(#3729)).

The Beacon Timing element is set as described in 9.4.2.103 (Beacon Timing element). When not all beacon timing information is included in a Beacon Timing element due to the maximum element size limit, multiple Beacon Timing elements are present. The elements are present in the order of Beacon Timing Element Number field value in the Report Control field of the Beacon Timing element.

### 9.6.16.12 TBTT Adjustment Response frame format

The TBTT Adjustment Response frame is used to respond to a TBTT adjustment request. This frame is transmitted using individual addresses. The format of the TBTT Adjustment Response frame Action field is shown in Table 9-563 (TBTT Adjustment Response frame Action field format).

**Table 9-563—TBTT Adjustment Response frame Action field format**

| Order | Information | Notes |
|---|---|---|
| 1 | Category | |
| 2 | Mesh Action | |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-563—TBTT Adjustment Response frame Action field format *(continued)***

| Order | Information | Notes |
|---|---|---|
| 3 | Status Code | |
| 4 | Beacon Timing element (optional) | Repeated *N_Info* times (*N_Info* is a number of beacon timing information tuples as described in 14.14.4.2.5 (Transmitter's procedure)). |

The Category field is defined in 9.4.1.11 (Action field).

The Mesh Action field is defined in 9.6.16.1 (Mesh Action field(#3729)).

The Status Code field is set as described in 14.14.4.4.2 (Requested TBTT adjustment).

The Beacon Timing element is set as defined in 9.4.2.103 (Beacon Timing element). It is present only if the (#7190)status code is set to CANNOT_FIND_ALTERNATIVE_TBTT (i.e., when the request is not successful due to the neighbor constraint). When not all beacon timing information is included in a Beacon Timing element due to the maximum element size limit, multiple Beacon Timing elements are present. The elements are present in the order of Beacon Timing Element Number field value in the Report Control field of the Beacon Timing element.

### 9.6.17 Multihop Action frame details

#### 9.6.17.1 Multihop Action field(#3729)

Several Multihop Action frame formats are defined for mesh BSS operation. A Multihop Action field, in the field immediately after the Category field, differentiates the formats. The Multihop Action field values associated with each frame format are defined in Table 9-564 (Multihop Action field values). The Mesh Control field is present immediately after the Multihop Action field in all Multihop Action frames.

**Table 9-564—Multihop Action field values**

| Multihop Action field value | Description |
|---|---|
| 0 | Proxy Update |
| 1 | Proxy Update Confirmation |
| 2–255 | Reserved |

#### 9.6.17.2 Proxy Update frame format

The Proxy Update frame is used to inform the recipient about new, updated, or deleted proxy information. This frame is transmitted using individual addresses. The format of the Proxy Update frame Action field is shown in Table 9-565 (Proxy Update frame Action field format).

The Category field is defined in 9.4.1.11 (Action field).

The Multihop Action field is defined in 9.6.17.1 (Multihop Action field(#3729)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-565—Proxy Update frame Action field format**

| Order | Information | Notes |
|---|---|---|
| 1 | Category | |
| 2 | Multihop Action | |
| 3 | Mesh Control | |
| 4 | PXU element | Repeated *N* times (*N* is the number of PXU elements contained in the frame). |

The Mesh Control field is set as defined in 9.2.4.8.3 (Mesh Control field).

The PXU element is described in 9.4.2.114 (PXU element). The Proxy Update frame allows the inclusion of multiple PXU elements.

### 9.6.17.3 Proxy Update Confirmation frame format

The Proxy Update Confirmation frame is transmitted by a mesh STA in response to a Proxy Update frame. This frame is used to inform that the corresponding PXU element has been properly received and is transmitted using individual addresses. The format of the Proxy Update Confirmation frame Action field is shown in Table 9-566 (Proxy Update Confirmation frame Action field format).

**Table 9-566—Proxy Update Confirmation frame Action field format**

| Order | Information | Notes |
|---|---|---|
| 1 | Category | |
| 2 | Multihop Action | |
| 3 | Mesh Control | |
| 4 | PXUC element | Repeated *N* times (*N* is the number of PXUC elements contained in the frame). |

The Category field is defined in 9.4.1.11 (Action field).

The Multihop Action field is defined in 9.6.17.1 (Multihop Action field(#3729)).

The Mesh Control field is set as defined in 9.2.4.8.3 (Mesh Control field).

The PXUC element is described in 9.4.2.115 (PXUC element). The Proxy Update Confirmation frame allows the inclusion of one or more PXUC elements.

## 9.6.18 Robust AV Streaming Action frame details

### 9.6.18.1 Robust AV Streaming Action field(#3729)

Several Action frame formats are defined to support robust AV streaming. The Robust Action field values associated with each frame format within the robust AV streaming category are defined in Table 9-567

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

(Robust AV streaming Robust Action field values). The frame formats are defined in 9.6.18.2 (SCS Request frame format) to 9.6.18.7 (MSCS Response frame format).

**Table 9-567—Robust AV streaming Robust Action field values**

| Robust Action field value | Meaning |
|---|---|
| 0 | SCS Request |
| 1 | SCS Response |
| 2 | Group Membership Request |
| 3 | Group Membership Response |
| 4 | MSCS Request |
| 5 | MSCS Response |
| 6–255 | Reserved |

### 9.6.18.2 SCS Request frame format

SCS Request frames are used to request the creation, modification, or deletion of a stream classification using the procedures defined in 11.25.2 (SCS procedures).

The Action field of the SCS Request frame contains the information shown in Figure 9-1303 (SCS Request frame Action field format).

| | Category | Robust Action | Dialog Token | SCS Descriptor List |
|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | variable |

**Figure 9-1303—SCS Request frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The Robust Action field is defined in 9.6.18.1 (Robust AV Streaming Action field(#3729)).

The Dialog Token field is defined in 9.4.1.12 (Dialog Token field) and set by the requesting STA to a nonzero value that is used for matching action responses with action requests. See 10.28.5 (Operation of the Dialog Token field).

The SCS Descriptor List field contains one or more SCS Descriptor elements, as defined in 9.4.2.120 (SCS Descriptor element).

### 9.6.18.3 SCS Response frame format

The SCS Response frame is sent in response to an SCS Request frame using the procedures defined in 11.25.2 (SCS procedures). The Action field of an SCS Response frame contains the information shown in Figure 9-1304 (SCS Response frame Action field format).

The Category field is defined in 9.4.1.11 (Action field).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

| | Category | Robust Action | Dialog Token | Count(#49) | SCS Status List |
|---|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | 1 | variable |

**Figure 9-1304—SCS Response frame Action field format**

The Robust Action field is defined in 9.6.18.1 (Robust AV Streaming Action field(#3729)).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is set to the nonzero value of the corresponding SCS Request frame. If the SCS Report frame is being transmitted for a reason other than in response to an SCS Request frame, then the Dialog Token field is set to 0.

(#49)The Count field is set to the value of the number of SCS Status duples in the SCS Status List field.

The SCS Status List field contains one or more SCS Status duples. The format of the SCS Status duple is defined in Figure 9-1305 (SCS Status duple format).

| | SCSID | Status |
|---|---|---|
| Octets: | 1 | 2 |

**Figure 9-1305—SCS Status duple format**

The SCSID field identifies an SCS stream.(#586)

The Status field indicates the status of the SCS stream(#586), as (#3326)defined in Table 9-80 (Status codes).

### 9.6.18.4 Group Membership Request frame format

The Group Membership Request frame is sent to a STA to request the contents of its dot11GroupAddressesTable. The Action field of a Group Membership Request frame contains the information shown in Figure 9-1306 (Group Membership Request frame Action field format).

| | Category | Robust Action | Dialog Token |
|---|---|---|---|
| Octets: | 1 | 1 | 1 |

**Figure 9-1306—Group Membership Request frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The Robust Action field is defined in 9.6.18.1 (Robust AV Streaming Action field(#3729)).

The Dialog Token field is defined in 9.4.1.12 (Dialog Token field) and set by the requesting STA to a nonzero value that is used for matching action responses with action requests. See 10.28.5 (Operation of the Dialog Token field).

Usage of the Group Membership Request frame is described in 11.21.16.3.2 (GCR group membership procedures).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 9.6.18.5 Group Membership Response frame format

The Group Membership Response frame is sent in response to a Group Membership Request frame or upon a change in the dot11GroupAddressesTable object, using the procedures defined in 11.21.16.3.2 (GCR group membership procedures). The Action field of a Group Membership Response frame contains the information shown in Figure 9-1307 (Group Membership Response frame Action field format(#261)).

| | Category | Robust Action | Dialog Token | Address Count | Group Address List |
|---|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | 1 | *n* × 6 |

**Figure 9-1307—Group Membership Response frame Action field format(#261)**

The Category field is defined in 9.4.1.11 (Action field).

The Robust Action field is defined in 9.6.18.1 (Robust AV Streaming Action field(#3729)).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is set to the nonzero value of the corresponding Group Membership Request frame. If the Group Membership Report frame is being transmitted for a reason other than in response to a Group Membership Request frame, the Dialog Token field is set to 0.

The Address Count field specifies the number of MAC addresses that are in the Group Address List field.

The Group Address List field contains zero or more MAC addresses to indicate the set of (#1653)group addresses for which the STA receives frames.(#261)

### 9.6.18.6 MSCS Request frame format

MSCS Request frames are used to request the creation, modification, or deletion of mirrored stream classification using the procedures defined in 11.25.3 (MSCS procedures).

The Action field of the MSCS Request frame contains the information shown in Figure 9-1308 (MSCS Request frame Action field format).

| | Category | Robust Action | Dialog Token | MSCS Descriptor element |
|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | variable |

**Figure 9-1308—MSCS Request frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The Robust Action field is defined in 9.6.18.1 (Robust AV Streaming Action field(#3729)).

The Dialog Token field is defined in 9.4.1.12 (Dialog Token field) and set by the requesting STA to a nonzero value that is used for matching action responses with action requests. See 10.28.5 (Operation of the Dialog Token field).

The MSCS Descriptor element is defined in 9.4.2.242 (MSCS Descriptor element).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 9.6.18.7 MSCS Response frame format

The MSCS Response frame is sent in response to an MSCS Request frame using the procedures defined in 11.25.3 (MSCS procedures). The Action field of an MSCS Response frame contains the information shown in Figure 9-1309 (MSCS Response frame Action field format).

| | Category | Robust Action | Dialog Token | Status | MSCS Descriptor element (optional) |
|---|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | 2 | variable |

**Figure 9-1309—MSCS Response frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The Robust Action field is defined in 9.6.18.1 (Robust AV Streaming Action field(#3729))

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is set to the nonzero value of the corresponding MSCS Request frame. If the MSCS Report frame is being transmitted for a reason other than in response to an MSCS Request frame, then the Dialog Token field is set to 0.

The Status field indicates the status of the request, as (#3326)defined in Table 9-80 (Status codes).

The MSCS Descriptor element is defined in 9.4.2.242 (MSCS Descriptor element). When the Status field is SUCCESS the element is not present; otherwise it is optionally present as described in 11.25.3 (MSCS procedures).

## 9.6.19 DMG Action frame details

### 9.6.19.1 DMG Action field

Several Action frame formats are defined to support DMG features. A DMG Action field, in the octet immediately after the Category field, differentiates the DMG Action frame formats. The DMG Action field values associated with each frame format within the DMG category are defined in Table 9-568 (DMG Action field values).

**Table 9-568—DMG Action field values**

| DMG Action field value | Meaning |
|---|---|
| 0 | Power Save Configuration Request |
| 1 | Power Save Configuration Response |
| 2 | Information Request |
| 3 | Information Response |
| 4 | Handover Request |
| 5 | Handover Response |
| 6 | Reserved |
| 7 | Reserved |
| 8 | Relay Search Request |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-568—DMG Action field values *(continued)***

| DMG Action field value | Meaning |
|---|---|
| 9 | Relay Search Response |
| 10 | Multi-Relay Channel Measurement Request |
| 11 | Multi-Relay Channel Measurement Report |
| 12 | RLS Request |
| 13 | RLS Response |
| 14 | RLS Announcement |
| 15 | RLS Teardown |
| 16 | Relay Ack Request |
| 17 | Relay Ack Response |
| 18 | TPA Request |
| 19 | TPA Response |
| 20 | TPA Report |
| 21 | ROC Request |
| 22 | ROC Response |
| 23(11ay) | Protected Announce |

### 9.6.19.2 Power Save Configuration Request frame format

The format of the Power Save Configuration Request (PSC-REQ) frame Action field is shown in Table 9-569 (Power Save Configuration Request frame Action field format).

**Table 9-569—Power Save Configuration Request frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | DMG Action |
| 3 | Dialog Token |
| 4 | DMG Power Management |
| 5 | DMG Wakeup Schedule element (optional) |
| 6(11ay) | QoS Triggered Unscheduled element (optional) |

The Category field is defined in 9.4.1.11 (Action field).

The DMG Action field is defined in 9.6.19.1 (DMG Action field).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is set to a value chosen by the STA sending the frame to uniquely identify the transaction.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The length of the DMG Power Management (DPM) field is 1 octet. Setting the DPM field to 0 indicates a transition from power save mode to active mode. Setting the DPM field to 1 indicates a transition from active mode to power save mode. All other values are reserved.

The DMG Wakeup Schedule element is defined in 9.4.2.129 (DMG Wakeup Schedule element) (11.2.7.2 (Non-AP and non-PCP STA power management mode)).

(11ay)The QoS Triggered Unscheduled element is defined in 9.4.2.277 (QoS-TU element(#1776)(11ay)).

### 9.6.19.3 Power Save Configuration Response frame format

The format of the Power Save Configuration Response (PSC-RSP) frame Action field is shown in Table 9-570 (Power Save Configuration Response frame Action field format).

**Table 9-570—Power Save Configuration Response frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | DMG Action |
| 3 | Dialog Token |
| 4 | Status Code |
| 5 | DMG Wakeup Schedule element (optional) |
| 6 | Antenna Sector ID Pattern element (optional) |
| 7(11ay) | QoS Triggered Unscheduled element (optional) |

The Category field is defined in 9.4.1.11 (Action field).

The DMG Action field is defined in 9.6.19.1 (DMG Action field).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is set to the value of the Dialog Token field in the corresponding PSC-REQ frame.

The Status Code field is defined in 9.4.1.9 (Status Code field).

The DMG Wakeup Schedule element is defined in 9.4.2.129 (DMG Wakeup Schedule element).

The Antenna Sector ID Pattern element is defined in 9.4.2.155 (Antenna Sector ID Pattern element).

(11ay)The QoS Triggered Unscheduled element is defined in 9.4.2.277 (QoS-TU element(#1776)(11ay)).

### 9.6.19.4 Information Request frame format

The format of an Information Request frame Action field is shown in Table 9-571 (Information Request frame Action field format).

The Category field is defined in 9.4.1.11 (Action field).

The DMG Action field is defined in 9.6.19.1 (DMG Action field).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-571—Information Request frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | DMG Action |
| 3 | Subject Address |
| 4 | Request element |
| 5 | Zero or more DMG Capabilities elements |
| 6 | Zero or more provided elements |
| 7 | Zero or more Extended Request elements |
| 8 | Zero or more Vendor Specific Request elements |

The Subject Address field contains the MAC address of the STA whose information is being requested. If this frame is sent to the PCP and the Subject Address field is the broadcast address, then the STA is requesting information regarding all associated STAs.

The Request element field is described in 9.4.2.8 (Request element).

The DMG Capabilities element carries information about the transmitter STA and other STAs known to the transmitter STA. The format of this element is defined in 9.4.2.126 (DMG Capabilities element).

Each provided element is an element as specified in 9.4.2 (Elements), that the transmitter of this frame is providing to the destination of the frame.

The Extended Request element is described in 9.4.2.9 (Extended Request element).

The Vendor Specific Request element is described in 9.4.2.217 (Vendor Specific Request element).

### 9.6.19.5 Information Response frame format

The format of an Information Response frame Action field is shown in Table 9-572 (Information Response frame Action field format).

This frame is individually addressed to a STA in response to an Information Request frame or it is sent unsolicited and individually addressed to a STA or broadcast to all STAs in the PBSS/infrastructure BSS. If this frame is sent as a broadcast, then this frame is an Action No Ack frame.

**Table 9-572—Information Response frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | DMG Action |
| 3 | Subject Address |
| 4 | One or more DMG Capabilities elements |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-572—Information Response frame Action field format**

| | |
|---|---|
| 5 | Zero or more requested elements |
| 6 | Zero or more provided elements |

The Category field is defined in 9.4.1.11 (Action field).

The DMG Action field is defined in 9.6.19.1 (DMG Action field).

The Subject Address field contains the MAC address of the STA whose information is being provided. If this field is set to the broadcast address, then the STA is providing information regarding all associated STAs.

The DMG Capabilities element carries information about the transmitter STA and other STAs known to the transmitter STA. The DMG Capabilities element is described in 9.4.2.126 (DMG Capabilities element).

The requested elements are those returned in response to an Information Request frame, as described in 11.28.1 (Information Request and Response).

The provided elements are elements, as described in 9.4.2 (Elements), that the transmitter of this frame provides to the destination of the frame, either in addition to the requested elements, or in an unsolicited Information Response frame.

### 9.6.19.6 Handover Request frame format

The format of the Handover Request frame Action field is shown in Table 9-573 (Handover Request frame Action field format).

**Table 9-573—Handover Request frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | DMG Action |
| 3 | Handover Reason |
| 4 | Handover Remaining BI |

The Category field is defined in 9.4.1.11 (Action field).

The DMG Action field is defined in 9.6.19.1 (DMG Action field).

The Handover Reason field is 1 octet in length and indicates the reason that the current PCP intends to do the PCP handover. The Handover Reason field is set to 0 to indicate the PCP is leaving the PBSS, it is set to 1 to indicate low power in the PCP, is set to 2 to indicate that a more qualified PCP handover capable STA is available, and is set to 3 to indicate that the PCP handover capable STA wishes to become a PCP. The other values are reserved.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Handover Remaining BI field is 1 octet in length and indicates the number of beacon intervals, excluding the beacon interval in which this frame is transmitted, remaining until the handover takes effect.

### 9.6.19.7 Handover Response frame format

The format of the Handover Response frame Action field is shown in Table 9-574 (Handover Response frame Action field format).

**Table 9-574—Handover Response frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | DMG Action |
| 3 | Handover Result |
| 4 | Handover Reject Reason |

The Category field is defined in 9.4.1.11 (Action field).

The DMG Action field is defined in 9.6.19.1 (DMG Action field).

The Handover Result field is 1 octet in length and indicates whether the STA accepted the handover request. Setting this field to 0 indicates that the STA accepts the handover request. Setting this field to 1 indicates that the STA does not accept the handover request.

If the Handover Result field is set to 0, the Handover Reject Reason field is reserved and set to 0. If the Handover Result field is set to 1, the Handover Reject Reason field indicates the reason the STA rejected the handover request and can be one of the following: 0 for low power, 1 for handover in progress with another STA, 2 for invalid value for Handover Remaining BI field, and 3 for unspecified reason. The length of Handover Reject Reason field is 1 octet.

### 9.6.19.8 Relay Search Request frame format

The Relay Search Request frame is transmitted by a non-AP and non-PCP STA to the AP or PCP to request a list of RDSs in the BSS. The format of the Relay Search Request frame Action field is shown in Table 9-575 (Relay Search Request frame Action field format).

**Table 9-575—Relay Search Request frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | DMG Action |
| 3 | Dialog Token |
| 4 | Destination REDS AID |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Category field is defined in 9.4.1.11 (Action field).

The DMG Action field is defined in 9.6.19.1 (DMG Action field).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is set to a nonzero value chosen by the STA sending the Relay Search Request frame to identify the request/response transaction.

The Destination REDS AID field is set to the AID of the target destination REDS. The structure of the field is defined in 9.4.1.8 (AID field).

### 9.6.19.9 Relay Search Response frame format

The Relay Search Response frame is sent by an AP or PCP in response to a Relay Search Request frame. The format of a Relay Search Response frame Action field is shown in Table 9-576 (Relay Search Response frame Action field format).

**Table 9-576—Relay Search Response frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | DMG Action |
| 3 | Dialog Token |
| 4 | Status Code |
| 5 | Number of Relay Capable STAs |
| 6 | Zero or more Relay Capable STA Info fields |

The Category field is defined in 9.4.1.11 (Action field).

The DMG Action field is defined in 9.6.19.1 (DMG Action field).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is set to the value in the corresponding Relay Search Request frame that generated this response.

The Status Code field is defined in 9.4.1.9 (Status Code field).

The Number of Relay Capable STAs field is 1 octet in length and indicates the number of STAs in the BSS that are relay capable. This field is set to 0 if the (#7190)status code does not indicate success.

The Relay Capable STA Info field is defined in 9.4.1.42 (Relay Capable STA Info field). This information is included only if the status code indicates successful. The number of Relay Capable STA Info fields that appear in the frame is indicated by the value of the Number of Relay Capable STAs field.

### 9.6.19.10 Multi-relay Channel Measurement Request frame format

The Multi-Relay Channel Measurement Request frame is transmitted by a STA initiating relay operation to the recipient STA in order to obtain Channel Measurements between the recipient STA and the other STA participating in the relay operation. The format of the Multi-Relay Channel Measurement Request frame

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Action field is shown in Table 9-577 (Multi-relay Channel Measurement Request frame Action field format).

**Table 9-577—Multi-relay Channel Measurement Request frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | DMG Action |
| 3 | Dialog Token |

The Category field is defined in 9.4.1.11 (Action field).

The DMG Action field is defined in 9.6.19.1 (DMG Action field).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is set to a nonzero value chosen by the STA sending the Multi-Relay Channel Measurement Request frame to identify the request/report transaction.

### 9.6.19.11 Multi-relay Channel Measurement Report frame format

The Multi-Relay Channel Measurement Report frame is sent in response to a Multi-Relay Channel Measurement Request. The format of the Multi-Relay Channel Measurement Report frame Action field is shown in Table 9-578 (Multi-relay Channel Measurement Report frame Action field format).

**Table 9-578—Multi-relay Channel Measurement Report frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | DMG Action |
| 3 | Dialog Token |
| 4 | Number of Channel Measurement Info |
| 5 | One or more Channel Measurement Info fields |

The Category field is defined in 9.4.1.11 (Action field).

The DMG Action field is defined in 9.6.19.1 (DMG Action field).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is set to the value in any corresponding Multi-Relay Channel Measurement Request frame. If the Multi-Relay Channel Measurement Report frame is not being transmitted in response to a Multi-Relay Channel Measurement Request frame, then the dialog token is set to 0.

The Number of Channel Measurement Info field is 1 octet in length and indicates the number of Channel Measurements Info fields included in the frame.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The format of the Channel Measurement Info field is defined in Figure 9-1310 (Channel Measurement Info field format). The number of Channel Measurement Info fields included in the frame is indicated by the Number of Channel Measurement Info field. More than one Multiple Channel Measurement Info field is included if the reporting STA measures the channel for multiple RDSs.

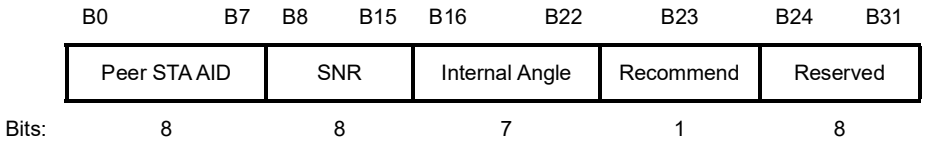

**Figure 9-1310—Channel Measurement Info field format**

The Peer STA AID subfield contains the AID of the STA toward which the reporting STA measures link.

The SNR subfield indicates the SNR measured in the link toward the STA corresponding to Peer STA AID. This subfield is encoded as 8-bit 2s complement value of 4x(SNR-19), where SNR is measured in dB. This covers from –13 dB to 50.75 dB in 0.25 dB steps.

The Internal Angle subfield indicates the angle between directions toward the other STAs involved in the relay operation. This covers from 0° to 180° in 2° steps. This subfield uses the degree of the direction from the sector that the feedbacks indicates has highest quality during TXSS if SLS phase of BF is performed and RXSS is not included.

The Recommend subfield indicates whether the responding STA recommends relay operation based on the channel measurement with the Peer STA. This subfield is set to 1 when the relay operation is recommended and otherwise is set to 0.

### 9.6.19.12 RLS Request frame format

The RLS Request frame is used to set up a relay link. The format of the RLS Request frame Action field is shown in Table 9-579 (RLS Request frame Action field format).

**Table 9-579—RLS Request frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | DMG Action |
| 3 | Dialog Token |
| 4 | Destination AID |
| 5 | Relay AID |
| 6 | Source AID |
| 7 | Destination Capability Information |
| 8 | Relay Capability Information |
| 9 | Source Capability Information |
| 10 | Relay Transfer Parameter Set |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Category field is defined in 9.4.1.11 (Action field).

The DMG Action field is defined in 9.6.19.1 (DMG Action field).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is set to a nonzero value chosen by the STA sending the RLS Request frame to identify the request/response transaction.

The Destination AID field value is the AID of the target destination formatted per 9.4.1.8 (AID field).

The Relay AID field value is the AID of the selected RDS formatted per 9.4.1.8 (AID field).

The Source AID field value is the AID of the initiating STA formatted per 9.4.1.8 (AID field).

The Destination Capability Information field indicates the Relay Capability Information field within the Relay Capabilities element of the target destination REDS as defined in 9.4.2.146 (Relay Capabilities element).

The Relay Capability Information field indicates the Relay Capability Information field within the Relay Capabilities element of the selected RDS as defined in 9.4.2.146 (Relay Capabilities element).

The Source Capability Information field indicates the Relay Capability Information field within the Relay Capabilities element of the originator of the request as defined in 9.4.2.146 (Relay Capabilities element).

The Relay Transfer Parameter Set element is defined in 9.4.2.147 (Relay Transfer Parameter Set element).

### 9.6.19.13 RLS Response frame format

The RLS Response frame is sent in response to an RLS Request frame. The format of an RLS Response frame Action field is shown in Table 9-580 (RLS Response frame Action field format).

**Table 9-580—RLS Response frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | DMG Action |
| 3 | Dialog Token |
| 4 | Destination Status Code |
| 5 | Relay Status Code (optional) |

The Category field is defined in 9.4.1.11 (Action field).

The DMG Action field is defined in 9.6.19.1 (DMG Action field).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is set to the value in any corresponding RLS Request frame.

The Destination Status Code field is included when the destination REDS transmits an RLS Response frame as a result of RLS Request. It is defined in 9.4.1.9 (Status Code field).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Relay Status Code field is included when the relay REDS transmits an RLS Response frame as a result of RLS Request. It is defined in 9.4.1.9 (Status Code field).

### 9.6.19.14 RLS Announcement frame format

The RLS Announcement frame is sent to announce the successful RLS. The format of an RLS Announcement frame Action field is shown in Table 9-581 (RLS Announcement frame Action field format).

**Table 9-581—RLS Announcement frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | DMG Action |
| 3 | Status Code |
| 4 | Destination AID |
| 5 | Relay AID |
| 6 | Source AID |

The Category field is defined in 9.4.1.11 (Action field).

The DMG Action field is defined in 9.6.19.1 (DMG Action field).

The Status Code field is defined in 9.4.1.9 (Status Code field).

The Destination AID field value is the AID of the target destination formatted per 9.4.1.8 (AID field).

The Relay AID field value is the AID of the RDS formatted per 9.4.1.8 (AID field).

The Source AID field value is the AID of the initiating STA formatted per 9.4.1.8 (AID field).

### 9.6.19.15 RLS Teardown frame format

The RLS Teardown frame is sent to terminate a relay operation. The format of the RLS Teardown frame Action field is shown in Table 9-582 (RLS Teardown frame Action field format).

**Table 9-582—RLS Teardown frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | DMG Action |
| 3 | Destination AID |
| 4 | Relay AID |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-582—RLS Teardown frame Action field format**

| | |
|---|---|
| 5 | Source AID |
| 6 | Reason Code |

The Category field is defined in 9.4.1.11 (Action field).

The DMG Action field is defined in 9.6.19.1 (DMG Action field).

The Destination AID field value is the AID of the destination REDS formatted per 9.4.1.8 (AID field).

The Relay AID field value is the AID of the RDS formatted per 9.4.1.8 (AID field).

The Source AID field value is the AID of the source REDS formatted per 9.4.1.8 (AID field).

The Reason Code field is defined in 9.4.1.7 (Reason Code field).

### 9.6.19.16 Relay Ack Request frame format

The Relay Ack Request frame is sent by a source REDS to an RDS participating in a relay operation in order to determine whether all frames forwarded through the RDS were received by the destination REDS also participating in the relay operation. This frame is used only when the RDS is operated in HD-DF mode and relay operation is link switching. The format of the Relay Ack Request frame Action field is shown in Table 9-583 (Relay Ack Request frame Action field format).

**Table 9-583—Relay Ack Request frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | DMG Action |
| 3 | BAR Control |
| 4 | (#4200)Block Ack Starting Sequence Control |

The Category field is defined in 9.4.1.11 (Action field).

The DMG Action field is defined in 9.6.19.1 (DMG Action field).

The BAR Control and (#4200)Block Ack Starting Sequence Control fields are defined in 9.3.1.7 (BlockAckReq frame format).

### 9.6.19.17 Relay Ack Response frame format

The Relay Ack Response frame is sent by an RDS to a source REDS participating in a relay operation in order to report the frames received by the destination REDS also participating in the relay operation. This frame is used only when the RDS is operated in HD-DF mode and relay operation is link switching. The format of the Relay Ack Response frame Action field is shown in Table 9-584 (Relay Ack Response frame Action field format).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-584—Relay Ack Response frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | DMG Action |
| 3 | BA Control |
| 4 | (#4200)Block Ack Starting Sequence Control |
| 5 | BlockAck Bitmap |

The Category field is defined in 9.4.1.11 (Action field).

The DMG Action field is defined in 9.6.19.1 (DMG Action field).

(#6322)The BA Control, (#4200)Block Ack Starting Sequence Control, and BlockAck Bitmap fields are defined in 9.3.1.8 (BlockAck frame format).(#7201)

The BlockAck Bitmap field is defined in 9.3.1.8 (BlockAck frame format).

### 9.6.19.18 TPA Request frame format

The TPA Request frame is sent by a destination REDS participating in operation based on link cooperation to both the RDS and source REDS that belong to the same group as the destination REDS in order for them to send back their own TPA Response frames at the separately predefined times. Also, a source REDS sends a TPA Request frame to the RDS that is selected by the source REDS in order for the RDS to feedback its own TPA Response frame at the predefined time.

The format of the TPA Request frame Action field is shown in Table 9-585 (TPA Request frame Action field format).

**Table 9-585—TPA Request frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | DMG Action |
| 3 | Dialog Token |
| 4 | Timing Offset |
| 5 | Sampling Frequency Offset |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Category field is defined in 9.4.1.11 (Action field).

The DMG Action field is defined in 9.6.19.1 (DMG Action field).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is set to a nonzero value chosen by the STA sending the TPA Request frame to identify the request/response transaction.

The Timing Offset field is 2 octets in length and indicates the amount of time, in nanoseconds, that the STA identified in the RA of the frame is required to change the timing offset of its transmissions so that they arrive at the expected time at the transmitting STA.

The Sampling Frequency Offset field is 2 octets in length and indicates the amount by which to change the sampling frequency offset of the burst transmission so that bursts arrive at the destination DMG STA with no sampling frequency offset. The unit is 0.01 ppm.

### 9.6.19.19 TPA Response frame format

The TPA Response frame is sent by an RDS or a source REDS participating in relay operation in response to a TPA Request frame from a destination REDS or a source REDS. The RDS or the source REDS that receives a TPA Request frame responds to the destination REDS or the source REDS, as appropriate, with a TPA Response frame at a predetermined time from the end of the TPA Request frame (see 11.34 (DMG relay procedures)). The format of the TPA Response frame Action field is shown in Table 9-586 (TPA Response frame Action field format).

**Table 9-586—TPA Response frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | DMG Action |
| 3 | Dialog Token |

The Category field is defined in 9.4.1.11 (Action field).

The DMG Action field is defined in 9.6.19.1 (DMG Action field).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is set to the value of the Dialog Token field of the TPA Request frame that generated this response.

### 9.6.19.20 TPA Report frame format

The TPA Report frame is sent to announce whether a TPA procedure is successful. The format of the TPA Report frame Action field is shown in Table 9-587 (TPA Report frame Action field format).

**Table 9-587—TPA Report frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-587—TPA Report frame Action field format**

| | |
|---|---|
| 2 | DMG Action |
| 3 | Status Code(#3326) |

The Category field is defined in 9.4.1.11 (Action field).

The DMG Action field is defined in 9.6.19.1 (DMG Action field).

The Status Code field indicates the result of the current TPA procedure and is defined in 9.4.1.9 (Status Code field).

### 9.6.19.21 ROC Request frame format

The ROC Request frame is sent by the source REDS participating in a relay operation in order to request a change in the current relay operation type. The format of the ROC Request frame Action field is shown in Table 9-588 (ROC Request frame Action field format).

**Table 9-588—ROC Request frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | DMG Action |
| 3 | Dialog Token |
| 4 | Relay Operation Type |

The Category field is defined in 9.4.1.11 (Action field).

The DMG Action field is defined in 9.6.19.1 (DMG Action field).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is set to a nonzero value chosen by the STA sending the ROC Request frame to identify the request/response transaction.

The format of the Relay Operation Type field is defined in Figure 9-1311 (Relay Operation Type field format).

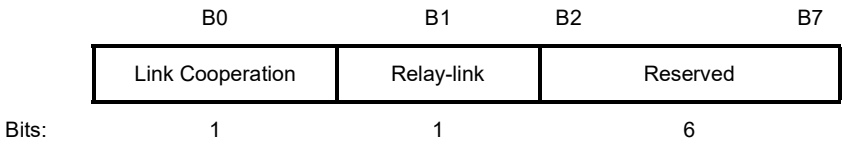

**Figure 9-1311—Relay Operation Type field format**

The Link Cooperation subfield is set to 0 to request the operation to be changed to link switching and is set to 1 to request the operation to be changed to link cooperation.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Relay-link subfield is set to 0 to indicate that the link switching operation starts at the direct link between the source REDS and destination REDS and set to 1 to indicate that the link switching operation starts with the RDS. If the Link Cooperation subfield is set to 1, the Relay-link subfield is reserved.

#### 9.6.19.22 ROC Response frame format

The ROC Response frame is sent by the RDS or the destination DMG STA participating in a relay operation in response to a ROC Request frame from the source DMG STA. The format of the ROC Response frame Action field is shown in Table 9-589 (ROC Response frame Action field format).

**Table 9-589—ROC Response frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | DMG Action |
| 3 | Dialog Token |
| 4 | Status Code |

The Category field is defined in 9.4.1.11 (Action field).

The DMG Action field is defined in 9.6.19.1 (DMG Action field).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is set to the value received in the corresponding ROC Request frame that generated this response.

The Status Code field is defined in 9.4.1.9 (Status Code field).

#### 9.6.19.23 Protected Announce frame format(11ay)

The Protected Announce frame allows robust STA-STA communications of the same information that is conveyed in the nonrobust Announce frame (see 9.6.21.2 (Announce frame format)).

The format of the robust Protected Announce and nonrobust Announce frame is the same and defined in 9.6.21.2 (Announce frame format). The Category field value differentiates whether the frame is robust or not.

### 9.6.20 FST Action frame details

#### 9.6.20.1 FST Action field

The FST Action field values are defined in Table 9-590 (FST Action field values).

**Table 9-590—FST Action field values**

| FST Action field value | Meaning |
|---|---|
| 0 | FST Setup Request |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-590—FST Action field values**

| | |
|---|---|
| 1 | FST Setup Response |
| 2 | FST Teardown |
| 3 | FST Ack Request |
| 4 | FST Ack Response |
| 5 | On-channel Tunnel Request |

### 9.6.20.2 FST Setup Request frame format

The FST Setup Request frame allows an initiating STA to announce to a peer STA whether the initiating STA intends to enable FST for the session between the initiating STA and the peer STA (11.31 (Multi-band operation)). The format of the FST Setup Request frame Action field is shown in Table 9-591 (FST Setup Request frame Action field format).

**Table 9-591—FST Setup Request frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | FST Action |
| 3 | Dialog Token |
| 4 | LLT |
| 5 | Session Transition |
| 6 | Multi-band (optional) |
| 7 | DMG Wakeup Schedule (optional) |
| 8 | Awake Window (optional) |
| 9 | Switching Stream (optional) |
| 10 | Zero or more additional elements are present, as defined in 11.31.1 (General). Each of these elements is not present more than once in the frame. |

The Category field is defined in 9.4.1.11 (Action field).

The FST Action field is defined in 9.6.20.1 (FST Action field).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is set to a nonzero value chosen by the STA.

The Link loss timeout (LLT) field is 32 bits and indicates the compressed maximum duration counted from the last time an MPDU was received by the initiating STA from the peer STA until the initiating STA decides to initiate FST. The use of this field is described in 11.31 (Multi-band operation).

The Session Transition field contains the Session Transition element as defined in 9.4.2.144 (Session Transition element).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Multi-band field contains the Multi-Band element as defined in 9.4.2.137 (Multi-band element). The regulatory information contained in the Multi-band element is applicable to all of the fields and elements contained in the frame.

The DMG Wakeup Schedule element is defined in 9.4.2.129 (DMG Wakeup Schedule element).

The Awake Window element is defined in 9.4.2.136 (Awake Window element).

The Switching Stream element is defined in 9.4.2.143 (Switching Stream element).

### 9.6.20.3 FST Setup Response frame format

The FST Setup Response frame is transmitted in response to an FST Setup Request frame. The format of the frame Action field is shown in Table 9-592 (FST Setup Response frame Action field format).

**Table 9-592—FST Setup Response frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | FST Action |
| 3 | Dialog Token |
| 4 | Status Code |
| 5 | Session Transition |
| 6 | Multi-band (optional) |
| 7 | DMG Wakeup Schedule (optional) |
| 8 | Awake Window (optional) |
| 9 | Switching Stream (optional) |
| 10 | (#1776)TIE (optional) |
| 11 | Zero or more additional elements are present, as defined in 11.31.1 (General). Each of these elements is not present more than once in the frame. |

The Category field is defined in 9.4.1.11 (Action field).

The FST Action field is defined in 9.6.20.1 (FST Action field).

The Dialog Token field value is copied from the corresponding received FST Setup Request frame.

The Status Code field is defined in 9.4.1.9 (Status Code field).

The Session Transition field contains the Session Transition element as defined in 9.4.2.144 (Session Transition element).

The Multi-band element is defined in 9.4.2.137 (Multi-band element).

The DMG Wakeup Schedule element is defined in 9.4.2.129 (DMG Wakeup Schedule element).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Awake Window element is defined in 9.4.2.136 (Awake Window element)

The Switching Stream element is defined in 9.4.2.143 (Switching Stream element).

The (#1776)TIE is defined in 9.4.2.47 (TIE(#1776)).

### 9.6.20.4 FST Teardown frame format

The FST Teardown frame is transmitted to delete an established FST session between STAs. The format of the frame Action field is shown in Table 9-593 (FST Teardown frame Action field format).

**Table 9-593—FST Teardown frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | FST Action |
| 3 | FSTS ID |

The Category field is defined in 9.4.1.11 (Action field).

The FST Action field is defined in 9.6.20.1 (FST Action field).

The FSTS ID field contains the identification of the FST session established between the STAs identified by the TA and RA fields of this frame. The format of the FSTS ID field is as specified 9.4.2.144 (Session Transition element).

### 9.6.20.5 FST Ack Request frame format

The FST Ack Request frame is transmitted in the frequency band an FST session is transferred to and confirms the FST. The format of the frame Action field is shown in Table 9-594 (FST Ack Request frame Action field format).

**Table 9-594—FST Ack Request frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | FST Action |
| 3 | Dialog Token |
| 4 | FSTS ID |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Category field is defined in 9.4.1.11 (Action field).

The FST Action field is defined in 9.6.20.1 (FST Action field).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is set to a nonzero value chosen by the STA sending the FST Ack request to identify the request/report transaction.

The FSTS ID field contains the identification of the FST session established between the STAs identified by the TA and RA fields of this frame. The format of the FSTS ID field is as specified in 9.4.2.144 (Session Transition element).

### 9.6.20.6 FST Ack Response frame format

The FST Ack Response frame is transmitted in response to an FST Ack Request frame. The format of the frame Action field is shown in Table 9-595 (FST Ack Response frame Action field format).

**Table 9-595—FST Ack Response frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | FST Action |
| 3 | Dialog Token |
| 4 | FSTS ID |

The Category field is defined in 9.4.1.11 (Action field).

The FST Action field is defined in 9.6.20.1 (FST Action field).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is set to the value in any corresponding FST Ack Request frame. If the FST Ack Response frame is not being transmitted in response to an FST Ack Request frame, then the dialog token is set to 0.

The FSTS ID field contains the identification of the FST session established between the STAs identified in the TA and RA fields of this frame. The format of the FSTS ID field is as specified in 9.4.2.144 (Session Transition element).

### 9.6.20.7 On-channel Tunnel Request frame format

The On-channel Tunnel Request frame allows a STA of a multi-band device to encapsulate an MMPDU for transmission to an MLME of a peer STA within the same multi-band device (11.31 (Multi-band operation)), which can be used to perform multi-band association and multi-band authentication.

The format of the On-channel Tunnel Request frame Action field is shown in Table 9-596 (On-channel Tunnel Request frame Action field format).

The Category field is defined in 9.4.1.11 (Action field).

The FST Action field is defined in 9.6.20.1 (FST Action field).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-596—On-channel Tunnel Request frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | FST Action |
| 3 | OCT MMPDU Descriptor |
| 4 | Multi-band |
| 5 | OCT Source |

The OCT MMPDU Descriptor field is defined in Figure 9-1312 (Definition of the OCT MMPDU Descriptor field).

| | MMPDU Length | MMPDU Frame Control | MMPDU Frame Body |
|---|---|---|---|
| Octets: | 2 | 2 | variable(#213) |

**Figure 9-1312—Definition of the OCT MMPDU Descriptor field**

The MMPDU Length subfield contains the length in octets of the MMPDU Frame Body subfield.

The MMPDU Frame Control subfield carries the content of the Frame Control field of an MMPDU that would be constructed if the MMPDU for the corresponding management frame type were transmitted over the air.

The MMPDU Frame Body subfield carries the content of the Frame Body field of an MPDU carrying the MMPDU that would be constructed if the MMPDU for the corresponding management frame type were transmitted unencrypted over the air (i.e., all of the octets after the MAC header and up to, but not including, the FCS).

The Multi-band field contains the Multi-band element (see 9.4.2.137 (Multi-band element)) of the peer MLME to which the OCT MMPDU is destined to. The values of the Band ID, Channel Number and BSSID fields contained in this element are used to deliver the OCT MMPDU to the correct MLME within the peer STA.

The OCT Source field contains an OCT Source element that identifies the MLME that is the source of an OCT MMPDU.

### 9.6.21 Unprotected DMG Action frame details

#### 9.6.21.1 Unprotected DMG Action field

Unprotected DMG Action frames are not encapsulated using mechanisms defined for robust Management frames. An Unprotected DMG Action field, in the field immediately after the Category field, differentiates the formats. The Action field values associated with each frame format are defined in Table 9-597 (Unprotected DMG Action field values).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-597—Unprotected DMG Action field values**

| Unprotected DMG Action field value | Meaning |
|---|---|
| 0 | Announce |
| 1 | BRP |
| 2(11ay) | MIMO BF Setup |
| 3(11ay) | MIMO BF Poll |
| 4(11ay) | MIMO BF Feedback |
| 5(11ay) | MIMO BF Selection |

### 9.6.21.2 Announce frame format

The Announce frame is an Action or an Action No Ack frame of category Unprotected DMG. The format of an Announce frame Action field is shown in Table 9-598 (Announce frame Action field format).

Announce frames can be transmitted during the ATI of a beacon interval and can perform functions including of a DMG Beacon frame, but since this frame does not have to be transmitted as a sector sweep to a STA, it can provide much more spectrally efficient access than using a DMG Beacon frame.

**Table 9-598—Announce frame Action field format**

| Order | Information | Notes |
|---|---|---|
| 1 | Category | The Category field is defined in 9.4.1.11 (Action field). |
| 2 | Unprotected DMG Action or DMG Action(11ay-Ed1) | The Unprotected DMG Action field is defined in 9.6.21.1 (Unprotected DMG Action field) and is sent when the Announce frame is transmitted unprotected.(11ay)<br>The DMG Action field is defined in(#4199) 9.6.19.1 (DMG Action field) and is sent when the Announce frame is transmitted protected. (11ay) |
| 3 | Timestamp | The Timestamp field is defined in 9.4.1.10 (Timestamp field). |
| 4 | Beacon Interval | The Beacon Interval field is defined in 9.4.1.3 (Beacon Interval field) and specifies the duration of the beacon interval of the BSS. |
| 5 | SSID | The SSID element is defined in 9.4.2.2 (SSID element). The SSID element is optionally present. If present, the SSID element specifies the SSID of the BSS. |
| 6 | Extended Schedule | The Extended Schedule element is defined in 9.4.2.130 (Extended Schedule element). The Extended Schedule element is optionally present. If present, the Extended Schedule element specifies the schedule of the BSS. |
| 7 | DMG Capabilities | The DMG Capabilities element is defined in 9.4.2.126 (DMG Capabilities element). The DMG Capabilities element is optionally present. If present, the DMG Capabilities element specifies capabilities of the transmitting STA. |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-598—Announce frame Action field format *(continued)***

| Order | Information | Notes |
|---|---|---|
| 8 | RSN | The RSNE is defined in 9.4.2.23 (RSNE). The RSNE is optionally present. If present, the RSNE indicates that security is required in the BSS. |
| 9 | Multiple BSSID | (#488)One or more Multiple BSSID elements are present if the AP is a member of a multiple BSSID set (see 11.10.14 (Multiple BSSID set)) with two or more members and any of the following conditions are true:<br>• dot11MultiBSSIDImplemented is true<br>• dot11MultiBSSIDImplemented is false and dot11RMMeasurementPilotActivated is between 2 and 7<br>• dot11InterworkingServiceActivated is true and at least one dot11GASAdvertisementID exists<br>Otherwise not present. |
| 10 | DMG Operation | The DMG Operation element is defined in 9.4.2.126.7 (TDD Capability Information field(11ay)). The DMG Operation element is optionally present. If present, the DMG Operation element specifies the operational parameters of the BSS. |
| 11 | Next DMG ATI | The Next DMG ATI element is defined in 9.4.2.134 (Next DMG ATI element). The Next DMG ATI element is optionally present. If present, the Next DMG ATI element specifies the start time of the next ATI at a subsequent beacon interval. |
| 12 | Multi-band | The Multi-band element is defined in 9.4.2.137 (Multi-band element). The Multi-band element is optionally present. |
| 13 | Awake Window | The Awake Window element is defined in 9.4.2.136 (Awake Window element). The Awake Window element is optionally present. |
| 14 | DMG BSS Parameter Change | The DMG BSS Parameter Change element is defined in 9.4.2.125 (DMG BSS Parameter Change element). The DMG BSS Parameter Change element is optionally present. |
| 15 | BeamLink Maintenance | The BeamLink Maintenance element is defined in 9.4.2.150 (BeamLink Maintenance element). The BeamLink Maintenance element is optionally present. |
| 16 | Multiple MAC Sublayers | The Multiple MAC Sublayers element is defined in 9.4.2.151 (MMS element(#1776)). The Multiple MAC Sublayers element is optionally present. |
| 17 | ECAPC Policy | The ECAPC Policy element is defined in 9.4.2.153 (ECAPC Policy element). The ECAPC Policy element is optionally present. |
| 18 | Cluster Report | The Cluster Report element is defined in 9.4.2.145 (Cluster Report element). The Cluster Report element is optionally present. |
| 19 | Next PCP List | The Next PCP List element is defined in 9.4.2.139 (Next PCP List element). The Next PCP List element is optionally present. |
| 20 | PCP Handover | The PCP Handover element is defined in 9.4.2.140 (PCP Handover element). The PCP Handover element is optionally present. |
| 21 | STA Availability | The STA Availability element is defined in 9.8 (MAC frame format for PV1 frames).(#1358) The STA Availability element is optionally present. |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-598—Announce frame Action field format *(continued)***

| Order | Information | Notes |
|---|---|---|
| 22 | UPSIM | The UPSIM element is defined in 9.4.2.165 (UPSIM element). The UPSIM element is optionally present. |
| 23 | Extended Channel Switch Announcement | The Extended Channel Switch Announcement element is defined in 9.4.2.51 (Extended Channel Switch Announcement element). The Extended Channel Switch Announcement element is optionally present if dot11ExtendedChannelSwitchActivated is true. |
| 24 | Cluster Probe | The Cluster Probe element is defined in 9.4.2.222 (Cluster Probe element). The Cluster Probe element is optionally present. |
| 25 | Extended Cluster Report | The Extended Cluster Report element is defined in 9.4.2.223 (Extended Cluster Report element). The Extended Cluster Report element is optionally present. |
| 26 | Cluster Switch Announcement | The Cluster Switch Announcement element is defined in 9.4.2.224 (Cluster Switch Announcement element). The Cluster Switch Announcement element is optionally present. |
| 27 | CDMG Extended Schedule | The Extended Schedule element is optionally present if dot11OpportunisticTransmissionsImplemented is true; otherwise not present. |
| 28 | Service Hash | The Service Hash element is optionally present if dot11UnsolicitedPADActivated is true; otherwise not present. |
| 29 | Service Hint | The Service Hint element is optionally present if dot11UnsolicitedPADActivated is true; otherwise not present. |
| 30(11ay) | TDD Slot Structure | This element is optionally present if dot11TDDOptionImplemented is true; otherwise, not present. If present, the element specifies the TDD slot timing. |
| 31(11ay) | TDD Slot Schedule | This element is optionally present if dot11TDDOptionImplemented is true; otherwise, not present. If present, the element specifies the type of the TDD slot and the access permission. |
| 32(11ay) | TDD Route | This element is optionally present if dot11TDDOptionImplemented is true; otherwise, not present. If present, the element specifies the TDD beamforming results and sector switch configuration. |
| 33(11ay) | DMG Link Margin | This element is optionally present. If present, the element specifies the parameters needed for link maintenance. |
| 34(11ay) | TDD Bandwidth Request | This element is optionally present if dot11TDDOptionImplemented is true; otherwise, not present. If present, the element specifies the parameters needed for bandwidth reservation during TDD SPs. |
| 35(11ay) | TDD Synchronization | This element is optionally present if dot11TDDOptionImplemented is true; otherwise, not present. If present, the element specifies the information needed for clock synchronization during TDD SPs. |
| 36(11ay) | EDMG Capabilities | This element is optionally present if dot11EDMGOptionImplemented is true. |
| 37(11ay) | EDMG Operation | This element is optionally present if dot11EDMGOptionImplemented is true. |
| 38(11ay) | EDMG Extended Schedule | This element is optionally present if dot11EDMGOptionImplemented is true. |

This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-598—Announce frame Action field format *(continued)***

| Order | Information | Notes |
|---|---|---|
| 39(11ay) | EDMG Group ID Set | This element is optionally present if dot11EDMGOptionImplemented is true. |
| 40(11ay) | EDMG Training Field Schedule | This element is optionally present if dot11EDMGOptionImplemented is true. |
| 41(11ay) | Time Advertisement | Optionally present if dot11UTCTSFOffsetActivated is true |
| 42(#4137) | BSS Load | The BSS Load element is present if dot11QBSSLoadImplemented is true. |

### 9.6.21.3 BRP frame format

The BRP frame is an Action No Ack frame. The BRP frame Action field format is one of two variants depending upon the value of the EDMG-SHORT-BRP subfield within the BRP Request field. If the value of the EDMG-SHORT-BRP subfield is 1, the format of the BRP frame Action field is shown in Table 9-600 (BRP frame Action field format when the EDMG-SHORT-BRP subfield is 1(11ay)). In all other cases, the format of a BRP frame Action field is shown in Table 9-599 (BRP frame Action field format).

**Table 9-599—BRP frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | Unprotected DMG Action |
| 3 | Dialog Token |
| 4 | BRP Request field |
| 5 | DMG Beam Refinement element |
| 6 | Zero or more Channel Measurement Feedback elements |
| 7 | Enhanced Beam Tracking element |
| 8 | SSW Report element |
| 9(11ay) | EDMG Partial Sector Level Sweep element (optional) |
| 10(11ay) | EDMG BRP Request element (optional) |
| 11(11ay) | Zero or more EDMG Channel Measurement Feedback elements |

**Table 9-600—BRP frame Action field format when the EDMG-SHORT-BRP subfield is 1(11ay)**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | Unprotected DMG Action |
| 3 | Dialog Token |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-600—BRP frame Action field format when the EDMG-SHORT-BRP subfield is 1(11ay)**

| Order | Information |
|---|---|
| 4 | BRP Request field |
| 5 | EDMG BRP field |
| 6 | Short BRP Feedback field (optional) |

The Category field is defined in 9.4.1.11 (Action field).

The Unprotected DMG Action field is defined in 9.6.21.1 (Unprotected DMG Action field).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is set to a value chosen by the STA sending the frame to uniquely identify the transaction.

The BRP Request field is defined in 9.5.4 (BRP Request field).

The DMG Beam Refinement element is defined in 9.4.2.128 (DMG Beam Refinement element).

The Channel Measurement Feedback element is defined in 9.4.2.135 (Channel Measurement Feedback element).

The BRP frame contains more than one Channel Measurement Feedback element if the measurement information exceeds 255 octets. The content of each Channel Measurement Feedback element that follows the first one in a single BRP frame is a continuation of the content in the previous element. The Channel Measurement, Tap Delay, and Sector ID Order subfields can be split between several elements. Each Channel Measurement Feedback element that is not the last Channel Measurement Feedback element in the frame is 257 octets long. Channel measurement information for a single channel measurement is always contained within a single BRP frame.

NOTE—The length of a BRP frame can limit the choice of channel measurement parameters such as the number of measurements and the number of taps.

The EDMG Partial Sector Level Sweep element is defined in 9.4.2.271.

(11ay)The EDMG BRP Request element is defined in 9.4.2.269 (EDMG BRP Request element(11ay)). If this element is present in the frame, the value of a field within this element overrides the value of the field with the same name in the BRP Request field contained in the frame.

(11ay)The EDMG Channel Measurement Feedback element is defined in 9.4.2.267 (EDMG Channel Measurement Feedback element(11ay)). If an EDMG Channel Measurement Feedback element appears in the frame, then at least one Channel Measurement Feedback element is also included in the frame.

(11ay)The EDMG BRP field is defined in 9.5.7 (EDMG BRP field(11ay)).

(11ay)The Short BRP Feedback field is defined in 9.5.8 (Short BRP Feedback field(11ay)).

(11ay)The Enhanced Beam Tracking element is defined in 9.4.2.225 (Enhanced Beam Tracking element).

(11ay)The SSW Report element is defined in 9.4.2.221 (SSW Report element).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 9.6.21.4 MIMO BF Setup frame format(11ay)

The MIMO BF Setup frame is an Action No Ack frame. The format of a MIMO BF Setup frame Action field is shown in Table 9-601 (MIMO BF Setup frame Action field format(11ay)).

**Table 9-601—MIMO BF Setup frame Action field format(11ay)**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | Unprotected DMG Action |
| 3 | Dialog Token |
| 4 | MIMO Setup Control element |

The Category field is defined in 9.4.1.11 (Action field).

The Unprotected DMG Action field is defined in 9.6.21.1 (Unprotected DMG Action field).

The Dialog Token field is set to a value chosen by the STA sending the frame to uniquely identify the transaction.

The MIMO Setup Control element is defined in 9.4.2.272 (MIMO Setup Control element(11ay)).

### 9.6.21.5 MIMO BF Poll frame format(11ay)

The MIMO BF Poll frame is an Action No Ack frame. The format of a MIMO BF Poll frame Action field is shown in Table 9-602 (MIMO BF Poll frame Action field format(11ay)).

**Table 9-602—MIMO BF Poll frame Action field format(11ay)**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | Unprotected DMG Action |
| 3 | Dialog Token |
| 4 | MIMO Poll Control element |

The Category field is defined in 9.4.1.11 (Action field).

The Unprotected DMG Action field is defined in 9.6.21.1 (Unprotected DMG Action field).

The Dialog Token field is set to a value chosen by the STA sending the frame to uniquely identify the transaction.

The MIMO Poll Control element is defined in 9.4.2.273 (MIMO Poll Control element(11ay)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 9.6.21.6 MIMO BF Feedback frame format(11ay)

The MIMO BF Feedback frame is an Action No Ack frame. The format of a MIMO BF Feedback frame Action field is shown in Table 9-603 (MIMO BF Feedback frame Action field format(11ay)).

**Table 9-603—MIMO BF Feedback frame Action field format(11ay)**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | Unprotected DMG Action |
| 3 | Dialog Token |
| 4 | MIMO Feedback Control element |
| 5 | Zero or more Channel Measurement Feedback elements |
| 6 | Zero or more EDMG Channel Measurement Feedback elements |
| 7 | Zero or more Digital BF Feedback elements |

The Category field is defined in 9.4.1.11 (Action field).

The Unprotected DMG Action field is defined in 9.6.21.1 (Unprotected DMG Action field).

The Dialog Token field is set to a value chosen by the STA sending the frame to uniquely identify the transaction.

The MIMO Feedback Control element is defined in 9.4.2.274 (MIMO Feedback Control element(11ay)).

The Channel Measurement Feedback element is defined in 9.4.2.135 (Channel Measurement Feedback element).

The EDMG Channel Measurement Feedback element is defined in 9.4.2.267 (EDMG Channel Measurement Feedback element(11ay)).

The Digital BF Feedback element is defined in 9.4.2.283 (Digital BF Feedback element(11ay)).

The MIMO BF Feedback frame contains more than one Channel Measurement Feedback element if the measurement information exceeds 255 octets. The content of each Channel Measurement Feedback element that follows the first one in a single MIMO BF Feedback frame is a continuation of the content in the previous element. The SNR, Channel Measurement, Additional SNR and Additional Channel Measurement subfields can be split between several elements. Each Channel Measurement Feedback element that is not the last Channel Measurement Feedback element in the frame is 257 octets long. Channel measurement information for a single channel measurement is always contained within a single MIMO BF Feedback frame.

The MIMO BF Feedback frame contains more than one EDMG Channel Measurement Feedback element if the measurement information exceeds 254 octets. The content of each EDMG Channel Measurement Feedback element that follows the first one in a single MIMO BF Feedback frame is a continuation of the content in the previous element. The EDMG Sector ID Order, BRP CDOWN, Tap Delay, Additional EDMG Sector ID Order, Additional BRP CDOWN and Additional Tap Delay fields can be split between several elements. Each EDMG Channel Measurement Feedback element that is not the last EDMG Channel

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Measurement Feedback element in the frame is 257 octets long. Channel measurement information for a single channel measurement is always contained within a single MIMO BF Feedback frame.

NOTE—The length of a MIMO BF Feedback frame can limit the choice of channel measurement parameters such as the number of measurements and the number of taps.

### 9.6.21.7 MIMO BF Selection frame format(11ay)

The MIMO BF Selection frame is an Action No Ack frame. The format of a MIMO BF Selection frame Action field is shown in Table 9-604 (MIMO BF Selection frame Action field format(11ay)).

**Table 9-604—MIMO BF Selection frame Action field format(11ay)**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | Unprotected DMG Action |
| 3 | Dialog Token |
| 4 | MIMO Selection Control element |
| 5 | EDMG Group ID Set element (optional) |

The Category field is defined in 9.4.1.11 (Action field).

The Unprotected DMG Action field is defined in 9.6.21.1 (Unprotected DMG Action field).

The Dialog Token field is set to a value chosen by the STA sending the frame to uniquely identify the transaction.

The MIMO Selection Control element is defined in 9.4.2.275 (MIMO Selection Control element(11ay)).

The EDMG Group ID Set element is defined in 9.4.2.268 (EDMG Group ID Set element(11ay)). The element contains the updated list of MU groups following completion of the MU MIMO beamforming training.

## 9.6.22 VHT Action frame details

### 9.6.22.1 VHT Action field

Several Action frame formats are defined to support VHT functionality and S1G functionality. A VHT Action field, in the octet immediately after the Category field, differentiates the VHT Action frame formats. The VHT Action field values associated with each frame format within the VHT category are defined in Table 9-605 (VHT Action field values).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-605—VHT Action field values**

| Value | Meaning | Time priority |
|---|---|---|
| 0 | VHT Compressed Beamforming | Yes |
| 1 | Group ID Management | No |
| 2 | Operating Mode Notification | No |
| 3–255 | Reserved | |

### 9.6.22.2 VHT Compressed Beamforming frame format

The VHT Compressed Beamforming frame is an Action No Ack frame of category VHT. The Action field of a VHT Compressed Beamforming frame contains the information shown in Table 9-606 (VHT Compressed Beamforming frame Action field format).

**Table 9-606—VHT Compressed Beamforming frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | VHT Action |
| 3 | VHT MIMO Control (see 9.4.1.46 (VHT MIMO Control field)) |
| 4 | VHT Compressed Beamforming Report (see 9.4.1.47 (VHT Compressed Beamforming Report field)) |
| 5 | MU Exclusive Beamforming Report (see 9.4.1.49 (MU Exclusive Beamforming Report field)) |

The Category field is defined in 9.4.1.11 (Action field).

The VHT Action field is defined in 9.6.22.1 (VHT Action field).

The VHT MIMO Control field is always present in the frame. The presence and contents of the VHT Compressed Beamforming Report field and the MU Exclusive Beamforming Report field are dependent on the values of the Feedback Type, Remaining Feedback Segments, and First Feedback Segment subfields of the VHT MIMO Control field (see 9.4.1.46 (VHT MIMO Control field), 9.4.1.47 (VHT Compressed Beamforming Report field), 9.4.1.49 (MU Exclusive Beamforming Report field), and 10.35.5 (VHT sounding protocol)).

No Vendor Specific elements are present in a VHT Compressed Beamforming frame.

When carried in an S1G PPDU, a VHT Compressed Beamforming frame is referred to as an S1G Compressed Beamforming frame, and a VHT MIMO Control field is referred to as an S1G MIMO Control field.

When carried in an S1G PPDU, a VHT NDP Announcement frame is referred to as an S1G NDP Announcement frame.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 9.6.22.3 Group ID Management frame format

The Group ID Management frame is transmitted by the AP to assign or change the user position of a STA for one or more group IDs. The Action field of a Group ID Management frame contains the information shown in Table 9-607 (Group ID Management frame Action field format).

**Table 9-607—Group ID Management frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | VHT Action |
| 3 | Membership Status Array (see 9.4.1.52 (Membership Status Array field))(#4383) |
| 4 | User Position Array (see 9.4.1.53 (User Position Array field)) |

The Category field is defined in 9.4.1.11 (Action field).

The VHT Action field is defined in 9.6.22.1 (VHT Action field).

### 9.6.22.4 Operating Mode Notification frame format

The Operating Mode Notification frame is used to notify STAs that the transmitting STA is changing one or more of its operating channel width, the maximum number of spatial streams it can receive, and its LDPC receive preference.

The Action field of the Operating Mode Notification frame contains the information shown in Table 9-608 (Operating Mode Notification frame Action field format).

**Table 9-608—Operating Mode Notification frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | VHT Action |
| 3 | Operating Mode (see 9.4.1.51 (Operating Mode field)) |

The Category field is defined in 9.4.1.11 (Action field).

The VHT Action field is defined in 9.6.22.1 (VHT Action field).

## 9.6.23 FILS Action frame details

### 9.6.23.1 FILS Action field(#3729)

The FILS Action frame is used for FILS operation after the non-AP STA has associated with the AP. The defined FILS Action frames are listed in Table 9-609 (FILS Action field(#4199) values).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-609—FILS Action field(#4199) values**

| Action field value | Description |
|---|---|
| 0 | FILS Container(#4199) |
| 1–255 | Reserved |

### 9.6.23.2 FILS Container frame

The FILS Container frame is used to exchange FILS IP Address Assignment elements (see 9.4.2.183 (FILS IP Address Assignment element)). The format of the Action field of the FILS Container frame is shown in Figure 9-1313 (FILS Container frame Action field format).

| | Category | FILS Action | FILS IP Address Assignment Elements |
|---|---|---|---|
| Octets: | 1 | 1 | variable |

**Figure 9-1313—FILS Container frame Action field format**

The Category field is set to the value for FILS defined in Table 9-81 (Category values).

The FILS Action field is defined in 9.6.23.1 (FILS Action field(#3729)).(#4199)

The FILS IP Address Assignment Elements field contains one or more FILS IP Address Assignment elements as defined in 9.4.2.183 (FILS IP Address Assignment element).

### 9.6.24 Unprotected S1G Action frame details

### 9.6.24.1 Unprotected S1G Action field

(11ax)An Unprotected S1G Action field, in the octet immediately after the Category field, differentiates the Unprotected S1G Action frame formats. The Unprotected S1G Action field values associated with each frame format within the Unprotected S1G category are defined in Table 9-610 (Unprotected S1G Action field values(#1707)).

**Table 9-610—Unprotected S1G Action field values(#1707)**

| Value | Meaning |
|---|---|
| 0 | AID Switch Request |
| 1 | AID Switch Response |
| 2 | Sync Control |
| 3 | STA Information Announcement |
| 4 | EDCA Parameter Set |
| 5 | EL Operation |
| 6 | TWT Setup |
| 7 | TWT Teardown |

**Table 9-610—Unprotected S1G Action field values(#1707)**

| Value | Meaning |
|---|---|
| 8 | Sectorized Group ID List |
| 9 | Sector ID Feedback |
| 10 | Reserved |
| 11 | TWT Information |
| 12–255 | Reserved |

### 9.6.24.2 AID Switch Request frame format

A STA that is changing its device characteristic as defined in 9.4.2.192 (AID Request element) uses the AID Switch Request frame to request the frame's recipient to change its AID or to request a group AID from an AP. The Action field of the AID Switch Request frame contains the information shown in Table 9-611 (AID Switch Request frame Action field format).

**Table 9-611—AID Switch Request frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | Unprotected S1G Action |
| 3 | Dialog Token |
| 4 | AID Request (see 9.4.2.192 (AID Request element)) |

The Category field is defined in 9.4.1.11 (Action field).

The Unprotected S1G Action field is defined in 9.6.24.1 (Unprotected S1G Action field).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is a value chosen by the non-AP STA sending the AID Switch Request frame to identify the request/response transaction.

The AID Request field contains an AID Request element as specified in 9.4.2.192 (AID Request element).

### 9.6.24.3 AID Switch Response frame format

The AID Switch Response frame is sent by an AP in response to an AID Switch Request frame, or sent by an AP to a non-AP STA to instruct the STA to change its AID or wakeup interval and it is sent by an AP to assign a group AID to a requesting STA. The Action field of the AID Switch Response frame contains the information shown in Table 9-612 (AID Switch Response frame Action field format).

The Category field is defined in 9.4.1.11 (Action field).

The Unprotected S1G Action field is defined in 9.6.24.1 (Unprotected S1G Action field).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-612—AID Switch Response frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | Unprotected S1G Action |
| 3 | Dialog Token |
| 4 | AID Response (see 9.4.2.193 (AID Response element)) |

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is the value in the corresponding AID Switch Request frame. If the AID Switch Response frame is not being transmitted in response to an AID Switch Request frame, then the Dialog token is set to 0.

The AID Response field contains an AID Response element as specified in 9.4.2.193 (AID Response element).

### 9.6.24.4 Sync Control frame format

The Sync Control frame is transmitted by a non-AP STA to a UL-Sync capable AP to enable or disable sync frame transmission for uplink traffic (see 10.48 (Sync frame operation)). The Action field of a Sync Control frame contains the information shown in Table 9-613 (Sync Control frame Action field format).

**Table 9-613—Sync Control frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | Unprotected S1G Action |
| 3 | Sync Control (see 9.4.1.56 (Sync Control field)) |

The Category field is defined in 9.4.1.11 (Action field).

The Unprotected S1G Action field is defined in 9.6.24.1 (Unprotected S1G Action field).

The Sync Control field is defined in 9.4.1.56 (Sync Control field).

### 9.6.24.5 STA Information Announcement frame format

The STA Information Announcement frame is either used by a non-AP STA to inform the peer STAs of the updated AID when a STA's AID is changed or used by a relay STA to inform the AP of a newly associated STA's AID or the updated AID when a STA's AID is changed. The Action field of the STA Information Announcement frame contains the information shown in Table 9-614 (STA Information Announcement frame Action field format).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-614—STA Information Announcement frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | Unprotected S1G Action |
| 3 | AID Announcement (9.4.2.207 (AID Announcement element)) |

The Category field is defined in 9.4.1.11 (Action field).

The Unprotected S1G Action field is defined in 9.6.24.1 (Unprotected S1G Action field).

The AID Announcement field contains an AID Announcement element as specified in 9.4.2.207 (AID Announcement element).

### 9.6.24.6 EDCA Parameter Set frame format

The EDCA Parameter Set frame is used to update the EDCA Parameter Set at the recipient STA, as defined in 10.2.3.2 (HCF contention based channel access (EDCA))). The Action field of the EDCA Parameter Set frame contains the information shown in Table 9-615 (EDCA Parameter Set frame Action field format).

**Table 9-615—EDCA Parameter Set frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | Unprotected S1G Action |
| 3 | EDCA Parameter Set (9.4.2.27 (EDCA Parameter Set element)) |

The Category field is defined in 9.4.1.11 (Action field).

The Unprotected S1G Action field is defined in 9.6.24.1 (Unprotected S1G Action field).

The EDCA Parameter Set field contains an EDCA Parameter Set element as specified in 9.4.2.27 (EDCA Parameter Set element).

### 9.6.24.7 EL Operation frame format

The EL Operation frame is used to carry the EL Operation element (9.4.2.209 (EL Operation element)). The Action field of the EL Operation frame contains the information shown in Table 9-616 (EL Operation Action field format)

The Category field is defined in 9.4.1.11 (Action field).

The Unprotected S1G Action field is defined in 9.6.24.1 (Unprotected S1G Action field).

The EL Operation field contains an EL Operation element as specified in 9.4.2.209 (EL Operation element).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-616—EL Operation Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | Unprotected S1G Action |
| 3 | EL Operation (9.4.2.209 (EL Operation element)) |

### 9.6.24.8 TWT Setup frame format

The TWT Setup frame is sent by a STA to request the setup of a TWT SP and it is sent by a responding STA to indicate the status of a requested TWT SP. The Action field of the TWT Setup frame contains the information shown in Table 9-617 (TWT Setup frame Action field format).

**Table 9-617—TWT Setup frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | Unprotected S1G Action |
| 3 | Dialog Token |
| 4 | (11ax)One or two TWT (9.4.2.198 (TWT element)) |

The Category field is defined in 9.4.1.11 (Action field).

The Unprotected S1G Action field is defined in 9.6.24.1 (Unprotected S1G Action field).

(#417)(Ed1)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). In a TWT Setup frame with a TWT Request field that is set to 1, the Dialog Token field is set to a nonzero value chosen by the transmitting STA to identify the request/response transaction. In a TWT Setup frame with a TWT Request field set to 0 that is sent in response to a TWT Setup frame with a TWT Request field that is equal to 1, the Dialog Token field is set to the value copied from the corresponding received TWT Setup frame with a TWT Request field equal to 1. In a TWT Setup frame with a TWT Request field set to 0 that is not sent in response to a TWT Setup frame with a TWT Request field equal to 1, the Dialog Token field is set to 0.(11ax)

(11ax)A TWT Setup frame contains only one TWT element, except if used for the establishment of a TWT agreement with a range of TWT parameter values (see 10.47.9 (TWT parameter ranges)). In this case, an additional TWT element is present.

### 9.6.24.9 TWT Teardown frame format

The TWT Teardown frame is sent by a STA to request the teardown of a TWT agreement and is transmitted by either STA of an existing TWT agreement. The Action field of the TWT Teardown frame contains the information shown in Table 9-618 (TWT Teardown frame Action field format).

The Category field is defined in 9.4.1.11 (Action field).

The Unprotected S1G Action field is defined in 9.6.24.1 (Unprotected S1G Action field).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-618—TWT Teardown frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | Unprotected S1G Action |
| 3 | TWT Flow |

(11ax)The format of the TWT Flow field if the Negotiation Type subfield is 0 or 1 is defined in Figure 9-1314 (TWT Flow field format if the Negotiation Type subfield is 0 or 1(11ax)). The format of the TWT Flow field if the Negotiation Type field is 2 is defined in Figure 9-1315 (TWT Flow field format if the Negotiation Type subfield is 2(11ax)). The format of the TWT Flow field if the Negotiation Type subfield is 3 is defined in Figure 9-1316 (TWT Flow field format if the Negotiation Type subfield is 3(11ax)).

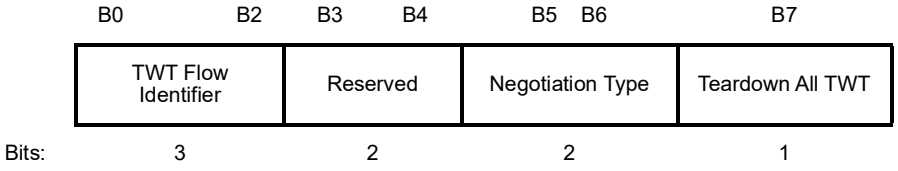

**Figure 9-1314—TWT Flow field format if the Negotiation Type subfield is 0 or 1(11ax)**

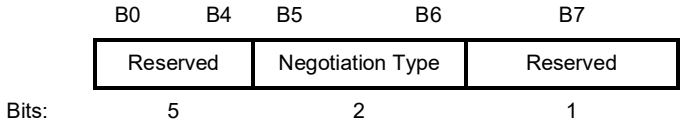

**Figure 9-1315—TWT Flow field format if the Negotiation Type subfield is 2(11ax)**

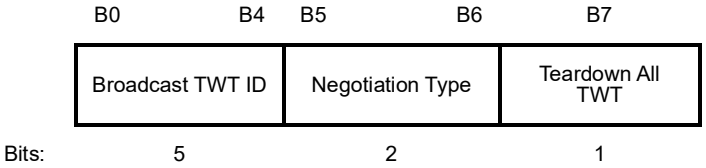

**Figure 9-1316—TWT Flow field format if the Negotiation Type subfield is 3(11ax)**

(11ax)The TWT Flow Identifier/Broadcast TWT ID field contains the TWT Flow Identifier when the Negotiation Type subfield is 0 or 1 and contains the Broadcast TWT ID field when the Negotiation Type subfield is 3. The TWT Flow Identifier field and the Broadcast TWT ID field are ~~is~~ defined in 9.4.2.198 (TWT element) and are reserved if the Teardown All TWT field is 1.

(11ax)The TWT Flow Identifier field in a TWT Teardown frame is set to the value of the TWT Flow Identifier field of the TWT element in the frame that successfully concluded the setup of the TWT that is the subject of the teardown request. The Broadcast TWT ID field of a TWT Teardown frame is set to the value of the Broadcast TWT identifier of the broadcast TWT schedule that is subject of the teardown request.

(11ax)The Negotiation Type subfield indicates the type of negotiation that is subject to the teardown request and is set as defined in Table 9-346 (Interpretation of Negotiation Type subfield and of Target Wake Time, TWT Wake Interval Mantissa, and TWT Wake Interval Exponent subfields(11ax)). An S1G STA sets the

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Negotiation Type subfield to 0. The Negotiation Type subfield is reserved if the Teardown All TWT field is 1.

(11ax)The Teardown All TWT field is set to 1 by an HE STA to indicate that the TWT Teardown frame tears down all TWTs as defined in 26.8 (TWT operation). Otherwise, it is set to 0.

### 9.6.24.10 Sectorized Group ID List frame format

The Sectorized Group ID List frame is an Action or Action No Ack frame of category Unprotected S1G Action. The frame is used to allocate/change sectorized group IDs to a STA. The format of its Action field is defined in Table 9-619 (Sectorized Group ID List frame Action field format).

**Table 9-619—Sectorized Group ID List frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | Unprotected S1G Action |
| 3 | Sectorized Group ID List (9.4.2.210 (Sectorized Group ID List element)) |

The Category field is defined in 9.4.1.11 (Action field).

The Unprotected S1G Action field is defined in 9.6.24.1 (Unprotected S1G Action field).

The Sectorized Group ID List field contains a Sectorized Group ID List as specified in 9.4.2.210 (Sectorized Group ID List element).

### 9.6.24.11 Sector ID Feedback frame format

The Sector ID Feedback frame is an Action or Action No Ack frame of category Unprotected S1G. The format of its Action field is defined in Table 9-620 (Sector ID Feedback frame Action field format).

**Table 9-620—Sector ID Feedback frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | Unprotected S1G Action |
| 3 | Sector ID Index |

The Category field is defined in 9.4.1.11 (Action field).

The Unprotected S1G Action field is defined in 9.6.24.1 (Unprotected S1G Action field).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Sector ID index field is shown in Figure 9-1317 (Sector ID Index format).

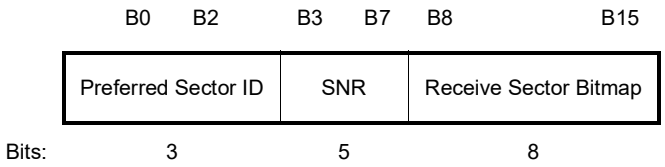

**Figure 9-1317—Sector ID Index format**

The Preferred Sector ID field indicates the sector selected by the STA. The method in which a STA selects the Sector ID is out of the scope of this standard.

The SNR field indicates the received SNR at the preferred Sector, 0 to 30 represents SNR values from –3 to 27 dB, respectively. If the SNR value is less than –3 dB, set to 0. If the SNR value is greater than 27 dB, set to 30. 31 indicates no feedback.

The Receive Sector Bitmap field indicates a bit map. A bit position equal to 0 within the bit map indicates that the STA does not receive the AP signal in the corresponding Sector ID. A bit position equal to 1 within the bit map indicates that the STA does receive the AP signal in the corresponding Sector ID. The position of the bit map (0 to 7) corresponding to the sector ID (see Figure 9-1318 (Receive Sector Bitmap format)).

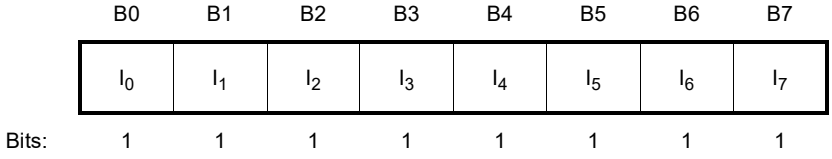

**Figure 9-1318—Receive Sector Bitmap format**

### 9.6.24.12 TWT Information frame format

The TWT Information frame is sent by a STA to request or deliver information about a TWT(11ax) and is transmitted by either STA of an existing TWT agreement (11ax)or is transmitted by a STA to a peer STA that has indicated support of its reception. The Action field of the TWT Information frame contains the information shown in Table 9-621 (TWT Information frame Action field format).

**Table 9-621—TWT Information frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | Unprotected S1G Action |
| 3 | TWT Information (9.4.1.58 (TWT Information field)) |

The Category field is defined in 9.4.1.11 (Action field).

The Unprotected S1G Action field is defined in 9.6.24.1 (Unprotected S1G Action field).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 9.6.25 S1G Action frame details

#### 9.6.25.1 S1G Action field

The S1G Action field values are specified in Table 9-622 (S1G Action field values).

**Table 9-622—S1G Action field values**

| S1G Action field value | Description |
|---|---|
| 0 | Reachable Address Update |
| 1 | Relay Activation Request |
| 2 | Relay Activation Response |
| 3 | Header Compression(#1275) |
| 4 | Protected TWT Setup |
| 5 | Protected TWT Teardown |
| 6 | Protected TWT Information |
| 7(#1276) | Protected AID Switch Request |
| 8(#1276) | Protected AID Switch Response |
| 9(#1276) | Protected Sync Control |
| 10(#1276) | Protected STA Information Announcement |
| 11(#1276) | Protected EDCA Parameter Set |
| 12(#1276) | Protected EL Operation |
| 13(#1276) | Protected Sectorized Group ID List |
| 14(#1276) | Protected Sector ID Feedback |
| (#1276)15–255 | Reserved |

#### 9.6.25.2 Reachable Address Update frame format

The Reachable Address Update frame is used to update the addresses that can be reached through a relay STA. The format of the Reachable Address Update frame Action field is shown in Table 9-623 (Reachable Address Update frame Action field format).

**Table 9-623—Reachable Address Update frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | S1G Action |
| 3 | Reachable Address |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Category field is defined in 9.4.1.11 (Action field).

The S1G Action field is defined in 9.6.25.1 (S1G Action field).

The Reachable Address element (as specified by 9.4.2.204 (Reachable Address element)) contains the addresses whose reachability through the S1G relay STA is being updated.

### 9.6.25.3 Relay Activation Request frame format

The Relay Activation Request frame is used by the STA or AP to Request start or terminate a relay function. The format of the Relay Activation Request frame Action field is shown in Table 9-624 (Relay Activation Request frame Action field format).

**Table 9-624—Relay Activation Request frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | S1G Action |
| 3 | Relay Activation |

The Category field is defined in 9.4.1.11 (Action field).

The S1G Action field is defined in 9.6.25.1 (S1G Action field).

The Relay Activation Mode subfield of the S1G Relay Activation element (as specified by 9.4.2.205 (S1G Relay Activation element)) included in the Relay Activation Request frame is set to 1.

### 9.6.25.4 Relay Activation Response frame format

The Relay Activation Response frame is used by the STA or AP to confirm or reject the start or the termination of the relay function. The format of the Relay Activation Response frame Action field is shown in Table 9-625 (Relay Activation Response frame Action field format).

**Table 9-625—Relay Activation Response frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | S1G Action |
| 3 | Relay Activation |

The Category field is defined in 9.4.1.11 (Action field).

The S1G Action field is defined in 9.6.25.1 (S1G Action field).

The Relay Activation Mode subfield of the S1G Relay Activation element (as specified by 9.4.2.205 (S1G Relay Activation element)) included in the Relay Activation Response frame is set to 0.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 9.6.25.5 Header Compression frame format

The Header Compression frame is used to update information at the recipient STA, as defined in 10.57 (Generation of PV1 MPDUs and header compression procedure). The Header Compression frame Action field contains the information shown in Table 9-626 (Header Compression frame Action field format).

**Table 9-626—Header Compression frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | S1G Action |
| 3 | Dialog Token |
| 4 | Header Compression (see 9.4.2.212 (Header Compression element)) |

The Category field is defined in 9.4.1.11 (Action field).

The S1G Action field is defined in 9.6.25.1 (S1G Action field).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is is a value chosen by the STA sending the Header Compression frame to identify the request/response transaction.

The Header Compression field contains a Header Compression element as specified in 9.4.2.212 (Header Compression element).

### 9.6.25.6 Protected TWT Setup frame format

The Protected TWT Setup frame allows robust STA-STA communication of the same information that is conveyed in the TWT Setup frame that is not robust (see 9.6.24.1 (Unprotected S1G Action field)).

The Action field of the Protected TWT Setup frame has the same format as the Action field of the unprotected TWT Setup frame (see 9.6.24.8 (TWT Setup frame format)), except that the Order 2 item is the S1G Action field, which is defined in 9.6.25.1 (S1G Action field), instead of the Unprotected S1G Action field.

### 9.6.25.7 Protected TWT Teardown frame format

The Protected TWT Teardown frame allows robust STA-STA communication of the same information that is conveyed in the TWT Teardown frame that is not robust (see 9.6.24.1 (Unprotected S1G Action field)).

The Action field of the Protected TWT Teardown frame has the same format as the Action field of the unprotected TWT Teardown frame (see 9.6.24.9 (TWT Teardown frame format)), except that the Order 2 item is the S1G Action field, which is defined in 9.6.25.1 (S1G Action field), instead of the Unprotected S1G Action field.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

#### 9.6.25.8 Protected TWT Information frame format

The Protected TWT Information frame allows robust STA-STA communication of the same information that is conveyed in the TWT Information frame that is not robust (see 9.6.24.1 (Unprotected S1G Action field)).

The Action field of the Protected TWT Information frame has the same format as the Action field of the unprotected TWT Information frame (see 9.6.24.12 (TWT Information frame format)), except that the Order 2 item is the S1G Action field, which is defined in 9.6.25.1 (S1G Action field), instead of the Unprotected S1G Action field.

#### 9.6.25.9 Protected AID Switch Request frame format(#1276)

The Protected AID Switch Request frame allows robust STA-STA communication of the same information that is conveyed in the AID Switch Request frame that is not robust (see 9.6.24.1 (Unprotected S1G Action field)).

The Action field of the Protected AID Switch Request frame has the same format as the Action field of the unprotected AID Switch Request frame (see 9.6.24.2 (AID Switch Request frame format)), except that the Order 2 item is the S1G Action field, which is defined in 9.6.25.1 (S1G Action field), instead of the Unprotected S1G Action field.

#### 9.6.25.10 Protected AID Switch Response frame format(#1276)

The Protected AID Switch Response frame is an Action frame of category S1G and is defined to allow robust STA-STA communication of the same information that is conveyed in the AID Switch Response frame that is not robust (see 9.6.24.1 (Unprotected S1G Action field)).

The Action field of the Protected AID Switch Response frame has the same format as the Action field of the unprotected AID Switch Response frame (see 9.6.24.3 (AID Switch Response frame format)), except that the Order 2 item is the S1G Action field, which is defined in 9.6.25.1 (S1G Action field), instead of the Unprotected S1G Action field.

#### 9.6.25.11 Protected Sync Control frame format(#1276)

The Protected Sync Control frame is an Action frame of category S1G and is defined to allow robust STA-STA communication of the same information that is conveyed in the Sync Control frame that is not robust (see 9.6.24.1 (Unprotected S1G Action field)).

The Action field of the Protected Sync Control frame has the same format as the Action field of the unprotected Sync Control frame (see 9.6.24.4 (Sync Control frame format)), except that the Order 2 item is the S1G Action field, which is defined in 9.6.25.1 (S1G Action field), instead of the Unprotected S1G Action field.

#### 9.6.25.12 Protected STA Information Announcement frame format(#1276)

The Protected STA Information Announcement frame is an Action frame of category S1G and is defined to allow robust STA-STA communication of the same information that is conveyed in the STA Information Announcement frame that is not robust (see 9.6.24.1 (Unprotected S1G Action field)).

The Action field of the Protected STA Information Announcement frame has the same format as the Action field of the unprotected STA Information Announcement frame (see 9.6.24.5 (STA Information Announcement frame format)), except that the Order 2 item is the S1G Action field, which is defined in 9.6.25.1 (S1G Action field), instead of the Unprotected S1G Action field.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

#### 9.6.25.13 Protected EDCA Parameter Set frame format(#1276)

The Protected EDCA Parameter Set frame is an Action frame of category S1G and is defined to allow robust STA-STA communication of the same information that is conveyed in the EDCA Parameter Set frame that is not robust (see 9.6.24.1 (Unprotected S1G Action field)).

The Action field of the Protected EDCA Parameter Set frame has the same format as the Action field of the unprotected EDCA Parameter Set frame (see 9.6.24.6 (EDCA Parameter Set frame format)), except that the Order 2 item is the S1G Action field, which is defined in 9.6.25.1 (S1G Action field), instead of the Unprotected S1G Action field.

#### 9.6.25.14 Protected EL Operation frame format(#1276)

The Protected EL Operation frame is an Action frame of category S1G and is defined to allow robust STA-STA communication of the same information that is conveyed in the EL Operation frame that is not robust (see 9.6.24.1 (Unprotected S1G Action field)).

The Action field of the Protected EL Operation frame has the same format as the Action field of the unprotected EL Operation frame (see 9.6.24.7 (EL Operation frame format)), except that the Order 2 item is the S1G Action field, which is defined in 9.6.25.1 (S1G Action field), instead of the Unprotected S1G Action field.

#### 9.6.25.15 Protected Sectorized Group ID List frame format(#1276)

The Protected Sectorized Group ID List frame is an Action frame of category S1G and is defined to allow robust STA-STA communication of the same information that is conveyed in the Sectorized Group ID List frame that is not robust (see 9.6.24.1 (Unprotected S1G Action field)).

The Action field of the Protected Sectorized Group ID List frame has the same format as the Action field of the unprotected Sectorized Group ID List frame (see 9.6.24.10 (Sectorized Group ID List frame format)), except that the Order 2 item is the S1G Action field, which is defined in 9.6.25.1 (S1G Action field), instead of the Unprotected S1G Action field.

#### 9.6.25.16 Protected Sector ID Feedback frame format(#1276)

The Protected Sector ID Feedback frame is an Action frame of category S1G and is defined to allow robust STA-STA communication of the same information that is conveyed in the Sector ID Feedback frame that is not robust (see 9.6.24.1 (Unprotected S1G Action field)).

The Action field of the Protected Sector ID Feedback frame has the same format as the Action field of the unprotected Sector ID Feedback frame (see 9.6.24.11 (Sector ID Feedback frame format)), except that the Order 2 item is the S1G Action field, which is defined in 9.6.25.1 (S1G Action field), instead of the Unprotected S1G Action field.

### 9.6.26 Flow Control Action frame details

#### 9.6.26.1 Flow Control Action field

The Flow Control Action field values are specified in Table 9-627 (Flow Control Action field format).

#### 9.6.26.2 Flow Suspension frame format

The Flow Suspension frame is an Action or an Action No Ack frame of category Flow Control Action used by a STA to suspend incoming transmissions for an amount of time indicated in the Suspend Duration field.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-627—Flow Control Action field format**

| Flow Control Action field value | Description | Time priority |
|---|---|---|
| 0 | Flow suspension | Yes when transmitted as an Action no Ack frame |
| 1 | Flow resumption | Yes when transmitted as an Action no Ack frame |
| 2–255 | Reserved | |

The format of the Flow Suspension frame Action field is shown in Table 9-628 (Flow Suspension frame Action field format).

**Table 9-628—Flow Suspension frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | Flow Control Action |
| 3 | Suspend Duration |

The Category field is defined in 9.4.1.11 (Action field).

The Flow Control Action field is defined in 9.6.26.1 (Flow Control Action field).

The Suspend Duration field is 2 octets and denotes the amount of time, in microseconds, during which the intended recipient STAs are not allowed to transmit Data frames to the STA identified by the TA field of the Flow Suspension frame.

### 9.6.26.3 Flow Resumption frame format

The Flow Resumption frame is an Action or an Action No Ack frame of category Flow Control Action used by the STA identified by the TA field of the frame to cancel any outstanding flow suspension time the STA had previously invoked through the transmission of a Flow Suspension, BAT, TACK, STACK, or NDP Ack frame as described in 10.60 (S1G flow control). The format of the Flow Resumption frame Action field is shown in Table 9-629 (Flow Resumption frame Action field format).

**Table 9-629—Flow Resumption frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | Flow Control Action |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Category field is defined in 9.4.1.11 (Action field).

The Flow Control Action field is defined in 9.6.26.1 (Flow Control Action field).

### 9.6.27 Control Response MCS Negotiation Action frame details(#3175)

#### 9.6.27.1 Control Response MCS Negotiation Action field

The Control Response MCS Negotiation Action field values are specified in Table 9-630 (Control Response MCS Negotiation Action field values).

**Table 9-630—Control Response MCS Negotiation Action field values**

| MCS Negotiation Action field value | Description |
|---|---|
| 0 | Control Response MCS Negotiation Request |
| 1 | Control Response MCS Negotiation Response |
| 2–255 | Reserved |

#### 9.6.27.2 Control Response MCS Negotiation Request frame format

The Control Response MCS Negotiation Request frame is used by a STA to negotiate with its peer STA the requested MCS for transmitting control response frame as defined in 10.6.6.5.3 (Control response frame MCS computation). The format of the Action field of the Control Response MCS Negotiation Request frame is shown Table 9-631 (Control Response Negotiation Request frame Action field format).

**Table 9-631—Control Response Negotiation Request frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | Control Response MCS Negotiation Action |
| 3 | MCS Difference |

The Category field is defined in 9.4.1.11 (Action field).

The Control Response MCS Negotiation Action field is defined in 9.6.27.1 (Control Response MCS Negotiation Action field).

The MCS Difference field is 1 octet and is set to an unsigned value that represents the MCS difference between the index of the primary MCS and the index of the MCS that is preferred for use by the STA to transmit control response frame as described in 10.6.6.5.6 (Control response MCS negotiation).

#### 9.6.27.3 Control Response MCS Negotiation Response frame format

The Control Response MCS Negotiation Response frame is used to indicate a response to a Control Response MCS Negotiation Request frame, which is either Accept or Reject, and the MCS Difference

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

proposed by the Requesting STA. The format of the Action field of the Control Response MCS Negotiation Response frame is shown in Table 9-632 (Control Response MCS Negotiation Response frame Action field format).

**Table 9-632—Control Response MCS Negotiation Response frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | Control Response MCS Negotiation Action |
| 3 | Command |

The Category field is defined in 9.4.1.11 (Action field).

The Control Response MCS Negotiation Action field is defined in 9.6.27.1 (Control Response MCS Negotiation Action field).

The Command field is 1 octet and is set to a value from the Table 9-633 (Command values) to represent accepting or rejecting the proposed MCS Difference by the Control Response MCS Negotiation Request frame as described in 10.6.6.5.6 (Control response MCS negotiation).

**Table 9-633—Command values**

| Values | Description |
|---|---|
| 0 | Reject |
| 1 | Accept |
| 2–255 | Reserved |

### 9.6.28 CDMG Action frame details

#### 9.6.28.1 CDMG Action field

Several Action frame formats are defined to support CDMG features. A CDMG Action field, in the octet immediately after the Category field, differentiates the CDMG Action frame formats. The CDMG Action field values associated with each frame format within the CDMG category are defined in Table 9-634 (CDMG Action field values).

**Table 9-634—CDMG Action field values**

| CDMG Action field value | Meaning |
|---|---|
| 0 | Notification Period Request frame |
| 1 | Notification Period Response frame |
| 2 | Channel Splitting Request frame |
| 3 | Channel Splitting Response frame |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-634—CDMG Action field values *(continued)***

| CDMG Action field value | Meaning |
|---|---|
| 4 | CDMG Allocation Request frame |
| 5 | CDMG Allocation Response frame |

### 9.6.28.2 Notification Period Request frame format

The format of the Notification Period Request frame Action field is shown in Figure 9-1319 (Notification Period Request frame Action field format).

| | Category | CDMG Action | Dialog Token | NP/BHI Duration |
|---|---|---|---|---|
| Octets: | 1 | 1 | 1 | 2 |

**Figure 9-1319—Notification Period Request frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The CDMG Action field is defined in 9.6.28.1 (CDMG Action field).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is defined in 9.4.1.12 (Dialog Token field) and set by the requesting STA.

The NP/BHI Duration field is set to the length of the NP/BHI duration requested by the STA intending to establish its BSS on a free 1.08 GHz channel to the peer STA operating on the adjacent 1.08 GHz channel.

### 9.6.28.3 Notification Period Response frame format

The format of the Notification Period Response frame Action field is shown in Table 9-635 (Notification Period Response frame Action field format).

**Table 9-635—Notification Period Response frame Action field format**

| Order | Information |
|---|---|
| 0 | Category |
| 1 | CDMG Action |
| 2 | Dialog Token |
| 3 | Status Code |
| 4 | Dynamic Bandwidth Control |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Category field is defined in 9.4.1.11 (Action field).

The CDMG Action field is defined in 9.6.28.1 (CDMG Action field).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is copied from the corresponding Notification Period Request frame.

The Status Code field indicates the result of the notification period allocation request and is defined in 9.4.1.9 (Status Code field).

The Dynamic Bandwidth Control element is defined in 9.4.2.219 (Dynamic Bandwidth Control element). This element is present if the Status Code field indicates successful; otherwise, it is not present.

### 9.6.28.4 Channel Splitting Request frame format

The format of the Channel Splitting Request frame Action field is shown in Figure 9-1320 (Channel Splitting Request frame Action field format).

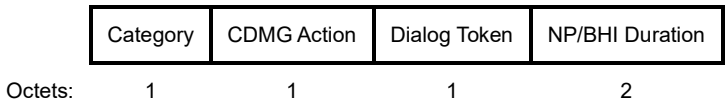

**Figure 9-1320—Channel Splitting Request frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The CDMG Action field is defined in 9.6.28.1 (CDMG Action field).

The Dialog Token field is defined in 9.4.1.12 (Dialog Token field) and set by the requesting STA.

The NP/BHI Duration field is set to the length of the NP/BHI duration requested by the STA intending to establish its BSS on a free 1.08 GHz channel to the peer STA operating on the adjacent 1.08 GHz channel.

### 9.6.28.5 Channel Splitting Response frame format

The format of the Channel Splitting Response frame Action field is shown in Table 9-636 (Channel Splitting Response frame Action field format).

**Table 9-636—Channel Splitting Response frame Action field format**

| Order | Information |
|---|---|
| 0 | Category |
| 1 | CDMG Action |
| 2 | Dialog Token |
| 3 | Status Code |
| 4 | Channel Switch Announcement |
| 5 | Beacon Interval |
| 6 | Dynamic Bandwidth Control |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Category field is defined in 9.4.1.11 (Action field).

The CDMG Action field is defined in 9.6.28.1 (CDMG Action field).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is copied from the corresponding Channel Splitting Request frame.

The Status Code field indicates the result of the channel splitting request and is defined in 9.4.1.11 (Action field).

The Channel Switch Announcement element is defined in 9.4.2.17 (Channel Switch Announcement element). This element is present if the Status Code field indicates successful; otherwise, it is not present.

The Beacon Interval field specifies the beacon interval length on a 2.16 GHz channel set by the STA operating on one of the 1.08 GHz channel after channel splitting and is defined in 9.4.1.3 (Beacon Interval field). This element is present if the Status Code field indicates successful; otherwise, it is not present.

The Dynamic Bandwidth Control element specifies the information of the STA operating on a 1.08 GHz channel after channel splitting and is defined in 9.4.2.219 (Dynamic Bandwidth Control element). This element is present if the Status Code field indicates successful; otherwise, it is not present.

### 9.6.28.6 CDMG Allocation Request frame format

The format of the CDMG Allocation Request frame Action field is shown in Figure 9-1321 (CDMG Allocation Request frame Action field format).

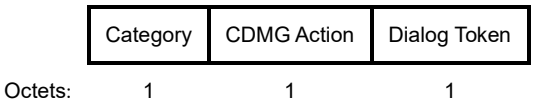

**Figure 9-1321—CDMG Allocation Request frame Action field format**

The Category field is defined in 9.4.1.11 (Action field).

The CDMG Action field is defined in 9.6.28.1 (CDMG Action field).

The Dialog Token field is defined in 9.4.1.12 (Dialog Token field) and set by the requesting STA.

### 9.6.28.7 CDMG Allocation Response frame format

The format of the CDMG Allocation Response frame Action field is shown in Table 9-637 (CDMG Allocation Response frame Action field format).

**Table 9-637—CDMG Allocation Response frame Action field format**

| Order | Information |
|---|---|
| 0 | Category |
| 1 | CDMG Action |
| 2 | Dialog Token |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-637—CDMG Allocation Response frame Action field format *(continued)***

| Order | Information |
|---|---|
| 3 | Status Code |
| 4 | Extended Schedule |

The Category field is defined in 9.4.1.11 (Action field).

The CDMG Action field is defined in 9.6.29.1 (CMMG Action field).

(#417)The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). It is copied from the corresponding CDMG Allocation Request frame.

The Status Code field indicates the result of the Allocation request and is defined in 9.4.1.9 (Status Code field).

The Extended Schedule element indicates all the available time that can be allocated to the DMG STAs on a 2.16 GHz channel by the STA operating on the adjacent 1.08 GHz channel of the STA sending this response and is defined in 9.4.2.130 (Extended Schedule element). This element is present if the Status Code field indicates successful; otherwise, it is not present.

### 9.6.29 CMMG Action frame details

#### 9.6.29.1 CMMG Action field

Several Action frame formats are defined to support CMMG functionality. A CMMG Action field, in the octet immediately after the Category field, differentiates the CMMG Action frame formats. The CMMG Action field values associated with each frame format within the CMMG category are defined in Table 9-638 (CMMG Action field values).

**Table 9-638—CMMG Action field values**

| Value | Meaning | Time priority |
|---|---|---|
| 0 | CMMG CSI | Yes |
| 1 | CMMG Compressed Beamforming | Yes |
| 2 | CMMG Operating Mode Notification | Yes |
| 3–255 | Reserved | |

#### 9.6.29.2 CMMG Compressed Beamforming frame format

The CMMG Compressed Beamforming frame is an Action or an Action No Ack frame of category CMMG. The format of its Action field is defined in Table 9-639 (CMMG Compressed Beamforming frame Action field format).

The Category field is defined in 9.4.1.11 (Action field).

The CMMG Action field is defined in 9.6.29.1 (CMMG Action field).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-639—CMMG Compressed Beamforming frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | CMMG Action |
| 3 | CMMG MIMO Control (see 9.4.1.59 (CMMG MIMO Control field)) |
| 4 | CMMG Compressed Beamforming Report (see 9.4.1.60 (CMMG Compressed Beamforming Report field)) |

The CMMG MIMO Control field (see 9.4.1.59 (CMMG MIMO Control field)) are used as described in Table 9-115 (Subfields of the CMMG MIMO Control field).

The CMMG Compressed Beamforming Report field is defined in 9.4.1.60 (CMMG Compressed Beamforming Report field).

### 9.6.29.3 CMMG Operating Mode Notification frame format

The CMMG Operating Mode Notification frame is used to notify STAs that the transmitting STA is changing its operating channel width, the maximum number of spatial streams it can receive, or both.

In the context of CMMG STAs, references to an Operating Mode Notification frame or element should be understood as referring to a CMMG Operating Mode Notification frame or element, respectively.

The Action field of the CMMG Operating Mode Notification frame contains the information shown in Table 9-640 (CMMG Operating Mode Notification frame Action field format).

**Table 9-640—CMMG Operating Mode Notification frame Action field format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | CMMG Action |
| 3 | CMMG Operating Mode (see 9.4.1.61 (CMMG Operating Mode field)) |

The Category field is defined in 9.4.1.11 (Action field).

The CMMG Action field is defined in 9.6.29.1 (CMMG Action field).

The CMMG Operating Mode field is defined in 9.4.1.61 (CMMG Operating Mode field).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 9.6.30 GLK Action frame details

#### 9.6.30.1 GLK Action field

A GLK Action field, in the octet immediately after the Category field, differentiates the GLK Action frame formats. The GLK Action field values associated with each frame format within the GLK category are defined in Table 9-641 (GLK Action field values(#1707)).

**Table 9-641—GLK Action field values(#1707)**

| Value | Meaning |
|---|---|
| 0 | GLK Groupcast Mode Change Notification |
| 1–255 | Reserved |

#### 9.6.30.2 GLK Groupcast Mode Change Notification

The GLK Groupcast Mode Change Notification frame is used to indicate a change to the GLK groupcast transmission policy. See Table 9-642 (GLK Groupcast Mode Change Notification frame format).

**Table 9-642—GLK Groupcast Mode Change Notification frame format**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | GLK Action |
| 3 | GLK-GCR Parameter Set |

The Category field is defined in 9.4.1.11 (Action field). The GLK Action field is defined in 9.6.30.1 (GLK Action field). The GLK-GCR Parameter Set element is defined in 9.4.2.233 (GLK-GCR Parameter Set element).

### 9.6.31 HE Action frame details(11ax)

#### 9.6.31.1 HE Action field

An HE Action field, in the octet immediately after the Category field, differentiates the HE Action frame formats. The HE Action field values associated with each frame format within the HE category are defined in Table 9-643 (HE Action field values(#3764)(11ax)).

**Table 9-643—HE Action field values(#3764)(11ax)**

| Value | Meaning | Time priority |
|---|---|---|
| 0 | HE Compressed Beamforming/CQI | Yes |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-643—HE Action field values(#3764)(11ax) *(continued)***

| | | |
|---|---|---|
| 1 | Quiet Time Period | No |
| 2 | OPS | No |
| 3–255 | Reserved | |

### 9.6.31.2 HE Compressed Beamforming/CQI frame format

The HE Compressed Beamforming/CQI frame is an Action No Ack frame of category HE. The Action field of an HE Compressed Beamforming/CQI frame contains the information shown in Table 9-644 (HE Compressed Beamforming/CQI frame Action field format(11ax)).

**Table 9-644—HE Compressed Beamforming/CQI frame Action field format(11ax)**

| Order | Information | Notes |
|---|---|---|
| 1 | Category | |
| 2 | HE Action | |
| 3 | HE MIMO Control (see 9.4.1.62 (HE MIMO Control field(11ax))) | |
| 4 | HE Sounding Feedback Segment (see 9.4.1.67 (HE Sounding Feedback Segment field(#6006)))(#6006) | Optional |

The Category field is defined in Table 9-81 (Category values).

The HE Action field is defined in 9.6.31.1 (HE Action field).(#4199)(#6006)

A Vendor Specific element is not present in the HE Compressed Beamforming/CQI frame.

### 9.6.31.3 Quiet Time Period action frame format

The Quiet Time Period action frame is an Action No Ack frame of category HE. The Action field of a Quiet Time Period contains the information shown in Table 9-645 (Quiet Time Period frame body(11ax)).

**Table 9-645—Quiet Time Period frame body(11ax)**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | HE Action |
| 3 | Quiet Time Period element (see 9.4.2.254 (Quiet Time Period element(11ax))) |

The Category field is defined in Table 9-81 (Category values).

The HE Action field is defined in 9.6.31.1 (HE Action field).(#4199)

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Quiet Time Period element is defined in 9.4.2.254 (Quiet Time Period element(11ax)).

#### 9.6.31.4 OPS frame format

The OPS frame is an Action No Ack frame of category HE. The Action field of an OPS frame contains the information shown in Table 9-646 (OPS frame Action field format(11ax)).

**Table 9-646—OPS frame Action field format(11ax)**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | HE Action |
| 3 | TIM element (see 9.4.2.5 (TIM element)) |
| 4 | OPS element (see 9.4.2.256 (OPS element(11ax))) |

The Category field is defined in Table 9-81 (Category values).

The HE Action field is defined in 9.6.31.1 (HE Action field).(#4199)

### 9.6.32 Protected HE Action frame details(11ax)

#### 9.6.32.1 Protected HE Action field

A Protected HE Action field, in the octet immediately after the Category field, differentiates the Protected HE Action frame formats. The Protected HE Action field values associated with each frame format within the (#2217)Protected HE category are defined in Table 9-647 (Protected HE Action field values(11ax)).

**Table 9-647—Protected HE Action field values(11ax)**

| Value | Meaning |
|---|---|
| 0 | HE BSS Color Change Announcement |
| 1 | MU EDCA Reset |
| 2–255 (#3764) | Reserved |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 9.6.32.2 HE BSS Color Change Announcement frame format

The HE BSS Color Change Announcement frame is an Action or Action No Ack frame of category Protected HE. The Action field of an HE BSS Color Change Announcement frame contains the information shown in Table 9-648 (HE BSS Color Change Announcement frame Action field format(11ax)).

**Table 9-648—HE BSS Color Change Announcement frame Action field format(11ax)**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | Protected HE Action |
| 3 | BSS Color Change Announcement element (see 9.4.2.253 (BSS Color Change Announcement element(11ax))) |

NOTE—An HE AP might send an HE BSS Color Change Announcement frame as an Action frame to a STA that appears to have missed a color change announcement and is transmitting with the old color.

The Category field is defined in Table 9-81 (Category values).

The Protected HE Action field is defined in 9.6.32.1 (Protected HE Action field).(#4199)

### 9.6.32.3 MU EDCA Reset frame format

The MU EDCA Reset frame is an Action frame of category Protected HE. The Action field of an MU EDCA Reset frame contains the information shown in Table 9-649 (MU EDCA Reset frame Action field format(11ax)).

**Table 9-649—MU EDCA Reset frame Action field format(11ax)**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | Protected HE Action |
| 3 | MU EDCA Control |

The Category field is defined in Table 9-81 (Category values).

The Protected HE Action field is defined in 9.6.32.1 (Protected HE Action field).(#4199)

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The MU EDCA Control field is defined in Figure 9-1322 (MU EDCA Control field format(11ax)).

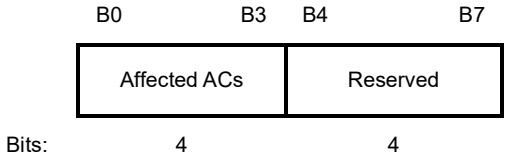

**Figure 9-1322—MU EDCA Control field format(11ax)**

The Affected ACs subfield contains a bitmap that indicates the ACs for which the MUEDCATimer[AC] as defined in 26.2.7 (EDCA operation using MU EDCA parameters) are reset to 0 upon receipt of the MU EDCA Reset frame for affected STAs. Each bit in the bitmap corresponds to one AC with B0 mapped to AC_BK, B1 mapped to AC_BE, B2 mapped to AC_VI and B3 mapped to AC_VO. A value of 1 in the bit position corresponding to a given AC indicates that the MUEDCATimer[AC] for that AC is reset to 0; otherwise, the value of the bit is 0.

### 9.6.33 WUR Action frame details(#3175)(11ba)

#### 9.6.33.1 WUR Action field

Several Action frame formats are defined to support WUR functionalities. A WUR Action field, in the octet field immediately after the Category field, differentiates the formats. The WUR Action field values associated with each frame format are defined in Table 9-650 (WUR Action field values(11ba)).

**Table 9-650—WUR Action field values(11ba)**

| Value | Meaning |
|---|---|
| 0 | WUR Mode Setup |
| 1 | WUR Mode Teardown |
| 2 | WUR Wake-up Indication |
| 3–255 | Reserved |

#### 9.6.33.2 WUR Mode Setup frame format

The WUR Mode Setup frame is an Action frame of category WUR. The Action field of a WUR Mode Setup frame contains the information shown in Table 9-651 (WUR Mode Setup frame Action field format(11ba)).

**Table 9-651—WUR Mode Setup frame Action field format(11ba)**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | WUR Action |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-651—WUR Mode Setup frame Action field format(11ba)**

| Order | Information |
|---|---|
| 3 | Dialog Token |
| 4 | WUR Mode element (see 9.4.2.292 (WUR Mode element(11ba))) |
| 5 | WUR Operation element (optional) (see 9.4.2.291 (WUR Operation element(11ba))) |
| 6 | WUR PN Update (optional) (see 9.4.2.294 (WUR PN Update element(11ba))) |

The Category field is defined in Table 9-81 (Category values).

The WUR Action field is defined in 9.6.33.1 (WUR Action field).(#4199)

The Dialog Token field is defined in 9.4.1.12 (Dialog Token field).

In a WUR Mode Setup frame with the Action Type field of the WUR Mode element equal to "Enter WUR Mode Suspend Request" or "Enter WUR Mode Request", the Dialog Token field is set to a nonzero value chosen by the transmitting STA to identify the request/response transaction.

In a WUR Mode Setup frame with the Action Type field of the WUR Mode element equal to "Enter WUR Mode Suspend Response" or "Enter WUR Mode Response", the Dialog Token field is set to the value copied from the corresponding received WUR Mode Setup frame with the Action Type field of the carrying WUR Mode element equal to "Enter WUR Mode Suspend Request" or "Enter WUR Mode Request"

In a WUR Mode Setup frame with the Action Type field of the WUR Mode element equal to "Enter WUR Mode Suspend" or "Enter WUR Mode", the Dialog Token field is set to 0.

The WUR Mode element field contains a WUR Mode element as defined in 9.4.2.292 (WUR Mode element(11ba)).

The WUR Operation element field contains a WUR Operation element as defined in 9.4.2.291 (WUR Operation element(11ba)).

The WUR PN Update field contains one or more WUR PN Update elements as defined in 9.4.2.294 (WUR PN Update element(11ba)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 9.6.33.3 WUR Mode Teardown frame format

The WUR Mode Teardown frame is an Action frame of category WUR. The Action field of a WUR Mode Teardown frame contains the information shown in Table 9-652 (WUR Mode Teardown frame Action field format(11ba)).

**Table 9-652—WUR Mode Teardown frame Action field format(11ba)**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | WUR Action |

The Category field is defined in Table 9-81 (Category values).

The WUR Action field is defined in 9.6.33.1 (WUR Action field).(#4199)

### 9.6.33.4 WUR Wake-up Indication frame format

The WUR Wake-up Indication frame is an Action frame of category WUR. The Action field of a WUR Wake-up Indication frame contains the information shown in Table 9-653 (WUR Wake-up Indication frame Action field format(11ba)).

**Table 9-653—WUR Wake-up Indication frame Action field format(11ba)**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | WUR Action |
| 3 | WUR Wake-up Indication |

The Category field is defined in Table 9-81 (Category values).

The WUR Action field is defined in 9.6.33.1 (WUR Action field).(#4199)

The WUR Wake-up Indication field is 8 bits in size and contains an unsigned integer.

The WUR Wake-up Indication field is defined in Table 9-654 (WUR Wake-up Indication field values (11ba)).

**Table 9-654—WUR Wake-up Indication field values (11ba)**

| Value | Description |
|---|---|

### 9.6.34 Protected Fine Timing Action frame details(11az)(#8155)

#### 9.6.34.1 Protected Fine Timing Action field

The Protected Fine Timing Action field, in the octet immediately after the Category field(#8217), differentiates between various Protected Fine Timing frames as shown in the Table 9-655 (Protected Fine Timing Action field values(11az)).

**Table 9-655—Protected Fine Timing Action field values(11az)**

| Value | Meaning |
|---|---|
| 0 | Reserved. |
| 1 | Protected FTMR frame. The format of frame after the Action field is identical to the format of the FTM Request frame; see 9.6.7.32 (FTM(11az) Request frame format). It is carried in an Action frame.(#8215) |
| 2 | Protected FTM frame. The format of the frame after the Action field is identical to the format of the FTM frame; see 9.6.7.33 (FTM(11az) frame format). It is carried in an Action frame.(#8215) |
| 3 | Protected LMR frame. The format of the frame after the Action field is identical to the format of the (#8216)LMR frame(#8215); see 9.6.7.49 (LMR frame format(11az)(#8216)). It is carried in an Action No Ack frame.(#8215) |
| 4–255 | Reserved. |

### 9.6.35 EBCS Action frame details(11bc)

#### 9.6.35.1 EBCS Action field

Two Action frame formats are defined to support EBCS functionalities. The EBCS Action field, in the octet field immediately after the Category field, differentiates the formats. The EBCS Action field values associated with each frame format are defined in Table 9-656 (EBCS Action field values(11bc)).

**Table 9-656—EBCS Action field values(11bc)**

| Value | Meaning |
|---|---|
| 0 | EBCS content request |
| 1 | EBCS content response |
| 2–255 | Reserved |

#### 9.6.35.2 EBCS Content Request frame format

The EBCS Content Request frame is an Action frame of category EBCS. The EBCS Content Request frame is transmitted by a STA to its associated EBCS AP to request one or more EBCS traffic streams. The Action field of an EBCS Content Request frame contains the information shown in Table 9-657 (EBCS Content Request frame Action field format(11bc)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-657—EBCS Content Request frame Action field format(11bc)**

| Order | Information |
|---|---|
| 1 | Category |
| 2 | EBCS Action |
| 3 | Dialog Token |
| 4 | EBCS Content Request |

The Category field is defined in Table 9-81 (Category values).

The EBCS Action field is set to 0 to indicate an EBCS content request as defined in Table 9-656 (EBCS Action field values(11bc)).

The Dialog Token field is defined in 9.4.1.12 (Dialog Token field).

In an EBCS Content Request frame, the Dialog Token field is set to a nonzero value chosen by the transmitting STA to identify the request/response transaction.

The EBCS Content Request field is defined in 9.4.1.68 (EBCS Content Request field(11bc)).

### 9.6.35.3 EBCS Content Response frame format

The EBCS Content Response frame is an Action frame of category EBCS. The EBCS Content Response frame is transmitted by an EBCS AP to an associated EBCS non-AP STA in response to an EBCS Content Request frame received from the EBCS STA. The Action field of an EBCS Content Response frame contains the information shown in Table 9-658 (EBCS Content Response frame Action field format(11bc)).

**Table 9-658—EBCS Content Response frame Action field format(11bc)**

| Field | Information |
|---|---|
| 1 | Category |
| 2 | EBCS Action |
| 3 | Dialog Token |
| 4 | EBCS Content Response |

The Category field is defined in Table 9-81 (Category values).

The EBCS Action field is set to 1 to indicate an EBCS content response as defined in Table 9-656 (EBCS Action field values(11bc)).

The Dialog Token field is defined in 9.4.1.12 (Dialog Token field). The Dialog Token field is set to the value contained in the Dialog Token field in the corresponding received EBCS Content Request frame.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The EBCS Content Response field is defined in 9.4.1.69 (EBCS Content Response field(11bc)).

## 9.7 Aggregate MPDU (A-MPDU)

### 9.7.1 A-MPDU format

An A-MPDU consists of a sequence of one or more A-MPDU subframes and a variable amount of EOF padding as shown in Figure 9-1323 (A-MPDU format).

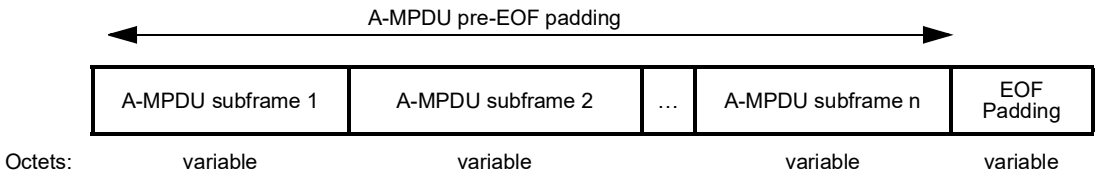

**Figure 9-1323—A-MPDU format**

The structure of the A-MPDU subframe is shown in Figure 9-1325 (A-MPDU subframe format). Each A-MPDU subframe consists of an MPDU delimiter optionally followed by an MPDU. Each nonfinal A-MPDU subframe in an A-MPDU has padding octets appended to make the subframe a multiple of 4 octets in length. The content of these octets is unspecified.

In an HT, DMG or NGV PPDU(11bd), the final A-MPDU subframe is not padded. In a VHT, (11ay)EDMG, or S1G PPDU, padding is added as described below.

The EOF Padding field is shown in Figure 9-1324 (EOF Padding field format). This is present only in a VHT, (11ay)EDMG, S1G, or HE PPDU.(11ax)

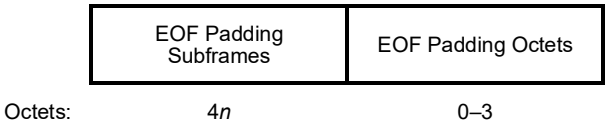

**Figure 9-1324—EOF Padding field format**

The EOF Padding Subframes subfield contains zero or more EOF padding subframes. An EOF padding subframe is an A-MPDU subframe with 0 in the MPDU Length field and 1 in the EOF/Tag(#4367) field.

In a VHT, EDMG,(11ay) S1G, or HE PPDU(11ax), the following padding is present, as determined by the rules in 10.12.6 (A-MPDU padding for VHT, HE(11ax) or S1G PPDU):

— 0–3 octets in the Padding subfield of the final A-MPDU subframe (see Figure 9-1325 (A-MPDU subframe format)) before any EOF padding subframes. The content of these octets is unspecified.
— Zero or more EOF padding subframes in the EOF Padding Subframes subfield.
— 0–3 octets in the EOF Padding Octets subfield. The content of these octets is unspecified.

An A-MPDU pre-EOF padding refers to the contents of the A-MPDU up to, but not including, the EOF Padding field.

NOTE 1—A-MPDU pre-EOF padding includes any A-MPDU subframes with 0 in the MPDU Length field and 0 in the EOF/Tag field inserted in order to meet the minimum MPDU start spacing requirement.(11ax)

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The maximum length of an A-MPDU in an HT PPDU is 65 535 octets. The maximum length of an A-MPDU in a DMG PPDU is 262 143 octets. The maximum length of an A-MPDU pre-EOF padding in a VHT PPDU is 1 048 575 octets. (11ax)The maximum length of an A-MPDU pre-EOF padding in an HE PPDU is 6 500 631 octets. (11ay)(#4367)The maximum length of an A-MPDU in an EDMG PPDU is 4 194 303 octets. The length of an A-MPDU addressed to a particular STA can be further constrained as described in 10.12.2 (A-MPDU length limit rules).

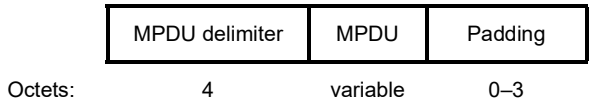

**Figure 9-1325—A-MPDU subframe format**

(11ay)The structure of the MPDU delimiter is defined in Figure 9-1326 (MPDU delimiter(11ay)(#4367)).

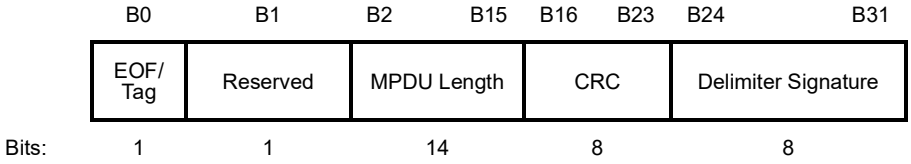

**Figure 9-1326—MPDU delimiter(11ay)(#4367)**

(11ay)The fields of the MPDU delimiter are defined in Table 9-659 (MPDU delimiter fields(11ay)).

**Table 9-659—MPDU delimiter fields(11ay)**

| Field | Size (bits) | Description |
|---|---|---|
| EOF/Tag(11ax) | 1 | End of frame indication if the MPDU Length field is 0. Set to 1 in an A-MPDU subframe that has 0 in the MPDU Length field and that is used to pad the A-MPDU in a VHT or HE PPDU as described in 10.12.6 (A-MPDU padding for VHT, HE(11ax) or S1G PPDU). Set to 1 in the MPDU delimiter of an S-MPDU as described in 10.12.7 (Setting the EOF/Tag(11ax) field of the MPDU delimiter).(11ax)<br><br>(11ax)Tagged/untagged indication if the MPDU Length field is nonzero. Set to 1 in an MPDU delimiter preceding a QoS Data frame or Management frame soliciting an Ack frame or Per AID TID Info field with the Ack Type field set to 1 in a Multi-STA BlockAck frame in a response that is contained in an ack-enabled multi-TID A-MPDU as described in 26.6.3.4 (Ack-enabled multi-TID A-MPDU operation)and ack-enabled single-TID A-MPDU as described in 26.6.3.2 (Ack-enabled single-TID A-MPDU operation). Set to 0 otherwise.<br><br>(11ay)In a DMG PPDU, this field is reserved. In an EDMG PPDU, it is set to 1 in EOF padding subframes and set to 0 otherwise (see 10.12.7 (Setting the EOF/Tag(11ax) field of the MPDU delimiter)). |
| Reserved | 1 | |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-659—MPDU delimiter fields(11ay)**

| | | |
|---|---|---|
| MPDU Length | 14 | Length of the MPDU in octets. Set to 0 if no MPDU is present. An A-MPDU subframe with 0 in the MPDU Length field is used as defined in 10.12.3 (Minimum MPDU start spacing rules) to meet the minimum MPDU start spacing requirement and also to pad the A-MPDU to fill the available octets in a VHT (11ax)or HE PPDU as defined in 10.12.6 (A-MPDU padding for VHT, HE(11ax) or S1G PPDU). |
| CRC | 8 | 8-bit CRC of the preceding 16 bits.(#346) |
| Delimiter Signature | 8 | Pattern that can be used to detect an MPDU delimiter when scanning for an MPDU delimiter.<br>The unique pattern is 0x4E, which is the ASCII value of the character "N".(11ax) |

The format of the MPDU Length field when transmitted by a non-DMG STA is shown in Figure 9-1327 (MPDU Length field format (non-DMG)). The MPDU Length Low subfield contains the 12 low order bits of the MPDU length. In a VHT or HE PPDU(11ax), the MPDU Length High subfield contains the two high order bits of the MPDU length. In an HT PPDU, the MPDU Length High subfield is reserved.

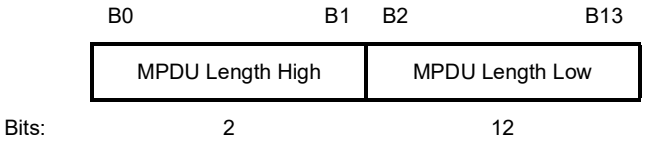

**Figure 9-1327—MPDU Length field format (non-DMG)**

(11ay)The format of the MPDU Length field when transmitted by a DMG STA is shown in Figure 9-1328 (MPDU Length field format (DMG)(11ay)). The MPDU Length Low subfield contains the 13 low order bits of the MPDU length. The MPDU Length High subfield contains one high order bit of the MPDU length.

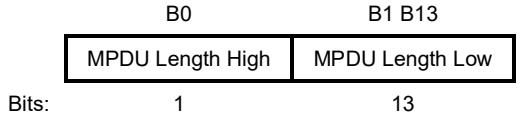

**Figure 9-1328—MPDU Length field format (DMG)(11ay)**

The MPDU length value is derived from the MPDU Length field subfields as follows:(11ax)(11ay)

$$L_{MPDU} = \begin{cases} L_{low} + L_{high} \times 4096, & \text{for a VHT and HE PPDU} \\ L_{low}, & \text{for an HT PPDU} \\ L_{low} + L_{high} \times 8192, & \text{for a DMG and EDMG PPDU} \end{cases} \quad (9\text{-}16)$$

where

$L_{low}$ is the value of the MPDU Length Low subfield

$L_{high}$ is the value of the MPDU Length High subfield

$L$ is the value of the MPDU Length field

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

NOTE 2—The format of the MPDU Length field maintains a common encoding structure for HE, VHT, and HT PPDUs(11ax). For HT PPDUs, only the MPDU Length Low subfield is used, while for VHT and HE(11ax) PPDUs, both subfields are used.

### 9.7.2 MPDU delimiter CRC field

The purpose of the MPDU delimiter is to locate the MPDUs within the A-MPDU so that the structure of the A-MPDU can usually be recovered when one or more MPDU delimiters are received with errors. See O.2 (A-MPDU deaggregation) for a description of a deaggregation algorithm.

(#346)The MPDU delimiter CRC field (#4162)is a CRC value used as a check sequence to protect the fields that precede it in the MPDU delimiter. The CRC field is the 1s complement of the remainder generated by the modulo 2 division of the protected bits by the polynomial $x^8 + x^2 + x^1 + 1$, where the shift-register state is preset to all 1s.

NOTE—The order of transmission of bits within the CRC field is defined in 9.2.2 (Conventions).

Figure 9-1329 (MPDU delimiter CRC calculation) illustrates the CRC calculation for the MPDU delimiter.

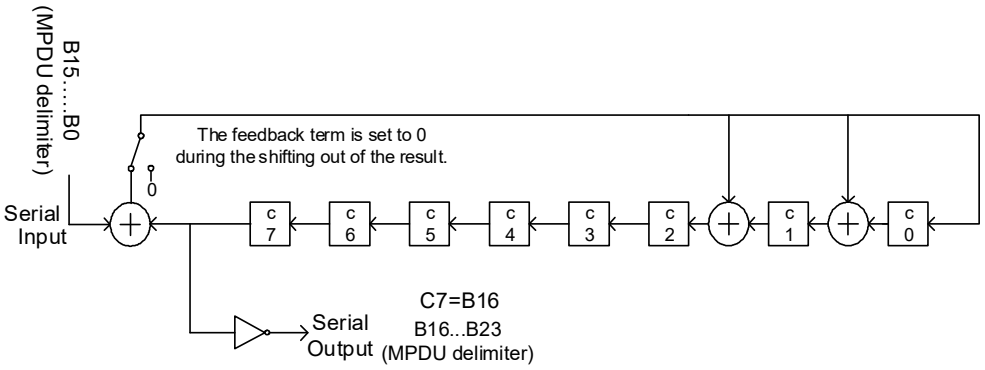

**Figure 9-1329—MPDU delimiter CRC calculation**

### 9.7.3 A-MPDU contents

In a non-DMG PPDU, an A-MPDU is a sequence of A-MPDU subframes carried in a single PPDU with one of the following combinations of RXVECTOR or TXVECTOR parameter values:

- The FORMAT parameter set to VHT
- The FORMAT parameter set to HT_MF or HT_GF and the AGGREGATION parameter set to 1
- The FORMAT parameter set to S1G, S1G_DUP_1M, or S1G_DUP_2M and the AGGREGATION parameter set to 1.
- The FORMAT parameter set to HE_SU, HE_MU, HE_TB, or HE_ER_SU.(11ax)
- The FORMAT parameter set to NGV.(11bd)

(11ax)An A-MPDU carried in an HE SU PPDU, HE ER SU PPDU, HE TB PPDU, or HE MU PPDU can include MPDUs with different values of the TID field as described in 26.6.3 (Multi-TID A-MPDU and ack-enabled single-TID A-MPDU).

In a DMG PPDU, an A-MPDU is a sequence of A-MPDU subframes(#152) carried in a single PPDU with the TXVECTOR/RXVECTOR AGGREGATION parameter set to 1.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

All of the MPDUs within an A-MPDU are addressed to the same RA. (11ax)All of the MPDUs within an A-MPDU have the same TA. All QoS Data frames within an A-MPDU that have a TID for which an HT-immediate block ack agreement exists have the same value for the Ack Policy Indicator subfield of the QoS Control field.

All protected MPDUs within an A-MPDU have the same (#3493)key ID.

The Duration/ID fields in the MAC headers of all MPDUs in an A-MPDU carry the same value. The Duration/ID fields in the MAC headers of the MPDUs in the A-MPDUs carried in a VHT MU PPDU and an HE MU PPDU carry the same value.(11ax)

NOTE 1—The reference point for the Duration/ID field is the end of the PPDU carrying the MPDU. Setting the Duration/ID field to the same value in the case of A-MPDU aggregation means that each MPDU consistently specifies the same NAV setting.

An A-MPDU is transmitted in one of the contexts specified in Table 9-660 (A-MPDU contexts) as defined by the description in the Definition of context column.(11ax)The content of an A-MPDU depends on the context in which it is transmitted as defined in the tables below. Ordering of MPDUs within an A-MPDU is not constrained, except where noted in these tables. See 10.12.1 (A-MPDU contents).

NOTE 2—If the number qualifier for a frame subtype does not exist, zero or more frames of the frame subtype can be aggregated in the A-MPDU.(11ax)

A VHT MU PPDU, S1G MU PPDU, and HE MU PPDU do not carry more than one A-MPDU that contains one or more MPDUs soliciting an immediate response if the immediate response is carried in a PPDU that is not an HE TB PPDU. An HE MU PPDU can carry more than one A-MPDU each of which contains one or more MPDUs soliciting an immediate response if the immediate response is carried in an HE TB PPDU.(11ax)

NOTE 3—The TIDs present in a data enabled A-MPDU context are also constrained by the channel access rules (for a TXOP holder; see 10.23.2 (HCF contention based channel access (EDCA)) and 10.23.3 (HCF controlled channel access (HCCA))), (11ax)the TXOP responder rules (see 26.6 (A-MPDU operation in an HE PPDU), and 26.5.2 (UL MU operation)) and the RD response rules (for an RD responder, see 10.29.4 (Rules for RD responder)). This is not shown in these tables.

NOTE 4—If a STA supports A-MSDUs of 7935 octets (indicated by the Maximum A-MSDU Length field in the HT Capabilities element), A-MSDUs transmitted by that TA within an A-MPDU carried in a PPDU with FORMAT HT_MF or HT_GF or within an MPDU carried in a non-HT PPDU are constrained so that the length of the QoS Data frame carrying the A-MSDU is no more than 4095 octets. The 4095-octet MPDU length limit does not apply to A-MPDUs carried in VHT or DMG PPDUs. The use of A-MSDU within A-MPDU might be further constrained as described in 9.4.1.13 (Block Ack Parameter Set field) through the operation of the A-MSDU Supported field.

NOTE 5—If a STA transmits an A-MPDU in a TDD slot, the contents of the A-MPDU follows the TDD slot category as defined in 10.38.6.2.2 (SP with TDD channel access(11ay)).(11ay)

NOTE 6— Limits on using BRP frames in A-MPDU are defined in 10.41.6.4.1 (General).(11ay)

(11ay)An A-MPDU carried in an EDMG PPDU can include MPDUs with different values for the TID field as described in 10.70 (EDMG A-MPDU with multiple TIDs(11ay)).

This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-661—A-MPDU contents in the non-HE(11ax) data enabled immediate response context *(continued)***

| MPDU Description | Conditions | |
|---|---|---|
| Data frames sent under an HT-immediate block ack agreement | QoS Data frames with the same TID, which corresponds to an HT-immediate block ack agreement. See NOTE 1.(11ay)<br><br>QoS Data frames with different TIDs, which corresponds to multiple HT-immediate block ack agreements. See NOTE 2(11ay) | Of these, at most one of the following is present in a non-DMG BSS:<br>— One or more QoS Data frames with Implicit BAR ack policy<br>— A BlockAckReq frame<br><br>Of these, at most one of the following is present in a DMG BSS:<br>— One or more QoS Data frames with Implicit BAR ack policy<br>— QoS Null frame with the No Ack ack policy<br>— A BlockAckReq frame with an optional QoS Null frame with No Ack ack policy<br>(11ay)Of these, any of the following is present in an EDMG BSS:<br>— One or more QoS Data frames with different TIDs and at the most one Action frame.<br>— One or more QoS Null frames with No Ack ack policy.<br>— One of BlockAckReq or Multi-TID BlockAckReq frame, but not both in the same A-MPDU. |
| QoS Null frames with the No Ack ack policy | In a DMG BSS, QoS Null frames with the No Ack ack policy. | |
| Immediate BlockAckReq | At most one BlockAckReq frame with a TID that corresponds to an HT-immediate block ack agreement or an unsolicited block ack extension agreement. It is not present if any QoS Data frames for that TID are present.(11ay)<br><br>(11ay)Multi-TID BlockAckReq frame with TIDs that correspond to an HT-immediate block ack agreement. It is not present if any QoS Data frames for those TIDs are present.<br><br>This is the last MPDU in the A-MPDU. | |
| Management frame requires Ack or Action Ack frames(11ay) | At most one Action Ack in case of an EDMG STA supporting (#4251)EDMG Multi-TID BlockAck.(11ay) | |
| Block Ack Schedule(11ay) | In an EDMG BSS, one or more copies of the Block Ack Schedule frame is present when transmitted within an EDMG MU PPDU. (11ay) | |
| Data without a block ack agreement(11ay) | QoS Data frames with a TID that does not have an established block ack agreement. These one per TID MPDUs with the Ack Policy field equal to Scheduled Ack are conveyed in an EDMG MU-MIMO PPDU. (11ay) | |
| NOTE 1—These MPDUs all have the same ack policy, which is Implicit BAR, Block Ack, or Scheduled Ack.(11ay)<br>NOTE 2—The agreement can be established using an ADDBA exchange or under an unsolicited block ack extension. (11ay) | | |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-662—A-MPDU contents in the data enabled no immediate response context**

| MPDU Description | Conditions |
|---|---|
| Data without a block ack agreement | QoS Data frames with a TID that does not correspond to a block ack agreement. These have No Ack ack policy and the A-MSDU Present subfield equal to 0. |
| Action No Ack | Action No Ack frames. |
| (11ax)Trigger | If sent by an HE AP, Trigger frames where the Trigger Type field indicates Basic Trigger frame, BSRP Trigger frame, or BQRP Trigger frame.<br><br>The Trigger frames are the first MPDUs of the A-MPDU, unless the A-MPDU also carries an Ack or BlockAck frame in which case the Trigger frames are included immediately after the Ack or BlockAck frame.<br><br>See NOTE 1 and NOTE 2. |
| (11ax)QoS Null frame with No Ack ack policy | If sent to an HE STA, QoS Null frames with No Ack ack policy. |
| NOTE 1—Only an HE AP is allowed to include a Trigger frame in the A-MPDU. The presence of more than one copy of a Trigger frame in an A-MPDU might increase the probability of the successful reception of the Trigger frame. The content of all Trigger frames in the A-MPDU is the same.(11ax)<br><br>NOTE 2—The BSRP and BQRP Trigger frames can be aggregated with other MPDUs in the A-MPDU if the receiver has indicated the support of receiving these trigger types in the BSRP BQRP A-MPDU Aggregation field in the HE Capabilities element.(11ax) | |

**Table 9-665—A-MPDU contents in the HE non-ack-enabled single-TID immediate response context(11ax)**

| MPDU | Conditions | |
|---|---|---|
| Data frames sent under an HT-immediate block ack agreement | One or more QoS Data frames with the same TID, which corresponds to an HT-immediate block ack agreement<br><br>See NOTE 1. | One of the following is present:<br>— One or more untagged MPDUs, each of which is a QoS Data frame with Implicit BAR, HETP Ack, or Block Ack ack policy and belonging to a block ack agreement, zero or more untagged MPDUs, each of which is a Basic Trigger, BSRP Trigger, or BQRP Trigger frame.<br>— One untagged MPDU that is BlockAckReq frame, zero or more untagged MPDUs each of which is a QoS Null frame with No Ack ack policy.<br>— One or more untagged MPDUs each of which is a Basic Trigger, MU-BAR Trigger, BQRP Trigger, or BSRP Trigger frame. The MU-BAR Trigger frame solicits block acknowledgment for one TID. |
| Compressed BlockAckReq | At most one BlockAckReq frame with a TID that corresponds to an HT-immediate block ack agreement.<br><br>This frame is the last MPDU in the A-MPDU.<br><br>BlockAckReq is not present if any QoS Data frames are present. | |
| Trigger | Trigger frames where the Trigger Type field is Basic Trigger, MU-BAR Trigger, BQRP Trigger or BSRP Trigger.<br><br>MU BAR Trigger frame is not present if any QoS Data frames are present.<br><br>The Trigger frames are the first MPDUs of the A-MPDU, unless the A-MPDU also carries an Ack or BlockAck frame in which case the Trigger frames are included immediately after the Ack or BlockAck frame.<br><br>See NOTE 2 and NOTE 3. | |

NOTE 1—MPDUs from the same TID all have the same ack policy, which is Implicit BAR, HETP Ack or Block Ack.

NOTE 2—Only an HE AP is allowed to include a Trigger frame in the A-MPDU. The presence of more than one copy of a Trigger frame in an A-MPDU might increase the probability of the reception of the Trigger frame. The content of all Trigger frames in the A-MPDU is the same.

NOTE 3–The BSRP and BQRP Trigger frames can be aggregated with other MPDUs in the A-MPDU if the receiver has indicated the support of receiving these trigger types in the BSRP BQRP A-MPDU Aggregation field in the HE Capabilities element.

## 9.8 MAC frame format for PV1 frames

### 9.8.1 Basic components

Each PV1 frame consists of the following basic components:

a) A PV1 MAC header, which comprises frame control, address, optional sequence control information;

b) A variable-length frame body, which contains information specific to the frame type;

c) An FCS, which contains a 32-bit CRC based on ITU-T Recommendation V.42 [B63] (see 9.2.4.9 (FCS field)).

**Table 9-666—A-MPDU contents in the HE ack-enabled single-TID immediate response context(11ax)**

| MPDU | Conditions | |
|---|---|---|
| Ack | If the preceding PPDU contains an MPDU that requires an Ack frame response, a single Ack frame at the start of the A MPDU. | At most one untagged MPDU that is an Ack, Compressed BlockAck, or Multi-STA BlockAck frame is present |
| HT-immediate BlockAck | If the preceding PPDU contains an implicit or explicit block ack request for a TID for which an HT-immediate block ack agreement exists, at most one Compressed BlockAck frame for this TID at the start of the A-MPDU.<br><br>If the preceding PPDU contains explicit block ack requests for multiple TIDs or a multi-TID A-MPDU, at most one Multi-STA BlockAck frame at the start of the A-MPDU. | |
| Action No Ack | Untagged MPDUs that are Action No Ack frames. | |
| Data frames not sent under an HT-immediate block ack agreement | At most one Data frame with a TID that does not correspond to an HT-immediate block ack agreement and Normal Ack or HETP Ack ack policy. | One of the following:<br>— A tagged MPDU that is a QoS Data frame with Normal Ack or HETP Ack ack policy<br>— A tagged MPDU that is a Management frame that solicits an immediate response<br><br>And at least one untagged MPDU that is a QoS Null frame with No Ack ack policy, Basic Trigger frame, BSRP Trigger frame, or BQRP Trigger frame. |
| Data frames sent under an HT-immediate block ack agreement | At most one QoS Data frame with a TID that corresponds to an HT-immediate block ack agreement | |
| QoS Null frame with No Ack ack policy | QoS Null frames with No Ack ack policy. | |
| Management frame | At most one Management frame that solicits an acknowledgment. | |
| Trigger | Basic Trigger, BQRP Trigger or BSRP Trigger frames.<br><br>The Trigger frames are the first MPDUs of the A-MPDU, unless the A-MPDU also carries an Ack or BlockAck frame in which case the Trigger frames are included immediately after the Ack or BlockAck frame.<br><br>See NOTE 1 and NOTE 2. | |

NOTE 1—Only an HE AP is allowed to include a Trigger frame in the A-MPDU. The presence of more than one copy of a Trigger frame in an A-MPDU might increase the probability of the reception of the Trigger frame. The content of all Trigger frames in the A-MPDU is the same.

NOTE 2—The BSRP Trigger and BQRP Trigger frames can be aggregated with other MPDUs in the A-MPDU if the receiver has indicated the support of receiving these Trigger frame types in the BSRP BQRP A-MPDU Aggregation field in the HE Capabilities element.

NOTE 3—The single Management frame that solicits the acknowledgment in ack-enabled single-TID A-MPDU is treated as single-TID frame, e.g., soliciting Ack of TID 15 in multi-STA BlockAck frame.

### 9.8.2 General PV1 frame format

Figure 9-1330 (PV1 frame format(#1633)) depicts the general PV1 MAC frame format. The first three fields (Frame Control, A1 and A2) and the last field FCS are always present in PV1 frames. The Sequence Control, A3, A4 and Frame body fields are optionally present. Each field is defined in 9.8.3 (PV1 frame fields).

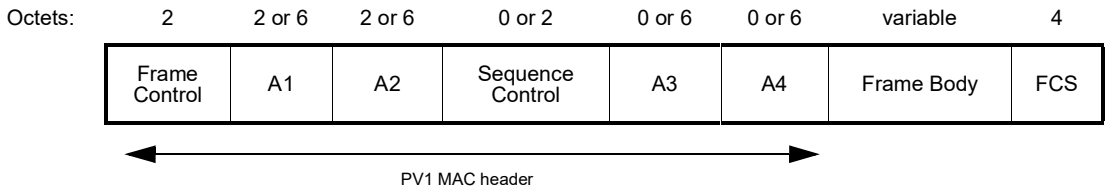

**Figure 9-1330—PV1 frame format(#1633)**

NOTE—In Figure 9-1330 (PV1 frame format(#1633)), the total number of octets in the A1 and A2 fields is either 8 or 12.

The Frame Body field is of variable size, constrained as defined in 9.2.4.8.1 (General).

### 9.8.3 PV1 frame fields

#### 9.8.3.1 Frame Control field

The Frame Control field of the PV1 MAC header for PV1 frames except the PV1 Probe Response(#3384) frame, PV1 Resource Allocation frame, and PV1 Control frames, is defined in Figure 9-1331 (Frame Control field format for some PV1 frames(#1744)).

The Frame Control field of the PV1 MAC header for the PV1 Probe Response frame, PV1 Resource Allocation frame and PV1 Control frames is defined in 9.8.5.3 (PV1 Probe Response frame format), 9.8.5.4 (Resource Allocation frame format), and 9.8.4 (PV1 Control frames), respectively.

The Protocol Version subfield is defined in 9.2.4.1.2 (Protocol Version subfield). For PV1 frames the Protocol Version subfield is 1.

The Type subfield identifies the type of the frame, as defined in Table 9-669 (PV1 frame types).

(#3384)The PTID/Subtype subfield, depending on the type of the PV1 frame, indicates:

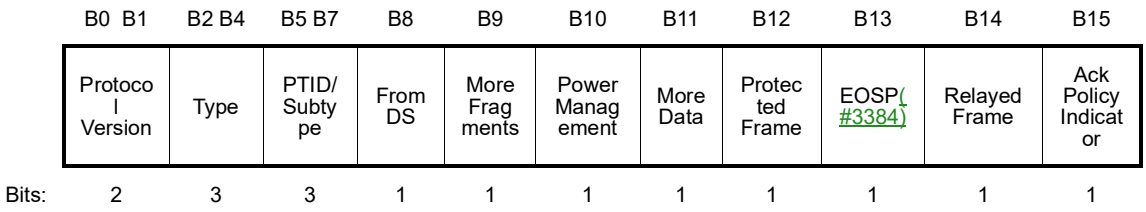

**Figure 9-1331—Frame Control field format for some PV1 frames(#1744)**

**Table 9-669—PV1 frame types**

| Type Value | Type | Description |
|---|---|---|
| 0 | QoS Data | Either the A1 field or the A2 field is (#4169)a SID (defined in 9.8.3.2 (Address fields)), as determined by the From DS subfield in the Frame Control field (see Table 9-670 (From DS subfield values in type 0 or 1 PV1 frames(#278)(#3384))), and the other field contains a MAC address.(#3384) |
| 1 | Management | For PV1 Probe Response frames: both A1 and A2 fields contain MAC addresses.<br>Otherwise: either the A1 field or the A2 field is (#4169)a SID (defined in 9.8.3.2 (Address fields)), as determined by the From DS subfield in the Frame Control field (see Table 9-670 (From DS subfield values in type 0 or 1 PV1 frames(#278)(#3384))), and the other field contains a MAC address.(#3384) |
| 2 | Control | The A1 field is (#4169)a SID(#7172) and the A2 field is either (#4169)a SID(#7172) or contains a MAC address, depending on the PV1 Control frame subtype (see 9.8.4 (PV1 Control frames)).(#6213) |
| 3 | QoS Data | Both A1 and A2 fields contain MAC addresses. |
| 4–6 | Reserved | |
| 7 | Reserved for extension | |

— The 3 LSBs of the TID as defined in 9.2.4.5.2 (TID subfield) for PV1 QoS Data frames (Type (#427)subfield equal to 0 and 3) transmitted by a QoS STA.

— The (#427)subtype for PV1 Control frames (Type subfield equal to 2) as described in 9.8.4 (PV1 Control frames).

— The (#427)subtype for PV1 Management frames (Type subfield equal to 1) as described in 9.8.5 (PV1 Management frames).

The From DS subfield (#3384)defines the addressing of PV1 frames with values of the Type field less than 2, as defined in Table 9-670 (From DS subfield values in type 0 or 1 PV1 frames(#278)(#3384)).

The More Fragments subfield is described in 9.2.4.1.5 (More Fragments subfield).

The Power Management subfield is described in 9.2.4.1.7 (Power Management subfield).

The EOSP subfield is described in 9.2.4.5.3 (EOSP (end of service period) subfield).

The Protected Frame subfield is described in 9.2.4.1.9 (Protected Frame subfield).

The More Data subfield is described in 9.2.4.1.8 (More Data subfield).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-670—From DS subfield values in type 0 or 1 PV1 frames(#278)(#3384)**

| From DS subfield | Meaning | Use |
|---|---|---|
| 0 | A1 contains the MAC address of the receiver<br>A2 is (#4169)a SID, which contains the AID of the transmitter<br>— A2 contains the MAC address of the transmitter for PV1 QoS Data frames with Type subfield equal to 3<br>A3 (if present) contains the MAC address of the destination<br>A4 (if present) contains the MAC address of the source | For frames transmitted by a non-AP STA to an AP<br><br>For frames transmitted from a non-AP STA to non-AP STA (direct link) |
| 1 | A1 is (#4169)a SID, which contains the AID of the receiver<br>— A1 contains the MAC address of the receiver for PV1 QoS Data frames with Type subfield equal to 3<br>A2 is the MAC address of the transmitter<br>A3 (if present) contains the MAC address of the destination<br>A4 (if present) contains the MAC address of the source | AP to non-AP STA |

The Relayed Frame subfield indicates that the current TXOP is shared with the relay STA using the TXOP sharing procedures for relays described in 10.53.5 (Procedures of TXOP sharing for S1G relay operation).

The Ack Policy Indicator subfield identifies the ack policy that is followed upon the delivery of the MPDU, as defined in Table 9-671 (Ack Policy Indicator subfield in the Frame Control field for PV1 frames).

**Table 9-671—Ack Policy Indicator subfield in the Frame Control field for PV1 frames**

| Ack policy | Ack Policy Indicator subfield | Other conditions | Meaning |
|---|---|---|---|
| Normal Ack | 0 | MPDU is a non-A-MPDU frame | Where the frame contains a fragment and both the originator and the addressed recipient support fragment BA:<br>The addressed recipient returns an NDP BlockAck or BAT frame after a SIFS, according to the procedures defined in 10.3.2.12 (Fragment BA procedure) and 10.46.2 (TWT acknowledgment procedure).<br><br>Otherwise:<br>The addressed recipient returns an Ack, TACK or STACK frame after a short interframe space (SIFS)(#320), according to the procedures defined in 10.3.2.11 (Acknowledgment procedure) and 10.46.2 (TWT acknowledgment procedure). |
| Implicit BAR | 0 | MPDU is not a non-A-MPDU frame | The addressed recipient returns a BlockAck or BAT frame, either individually or as part of an A-MPDU starting a SIFS after the PPDU carrying the frame, according to the procedures defined in 10.3.2.11 (Acknowledgment procedure) and 10.46.2 (TWT acknowledgment procedure). |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-671—Ack Policy Indicator subfield in the Frame Control field for PV1 frames**

| | | | |
|---|---|---|---|
| No Ack | 1 | MPDU is a non-A-MPDU frame | The addressed recipient takes no action upon receipt of the frame. More details are provided in 10.26 (No Acknowledgment (No Ack)). This ack policy is used in all individually addressed frames in which the sender does not require acknowledgment. It is also used in all group addressed frames. It is not used for PV1 Data frames with a TID for which a block ack agreement exists. |
| Block Ack | 1 | MPDU is not a non-A-MPDU frame | The addressed recipient takes no action upon the receipt of the frame except for recording the state. The recipient can expect a BlockAckReq frame in the future to which it responds using the procedure described in 10.25 (Block acknowledgment (block ack)). |

### 9.8.3.2 Address fields

There are up to four address fields in the PV1 MAC frame format. These fields are used to indicate the recipient of the frame (A1), the transmitter of the frame (A2), and optionally the MAC address of the source and/or the MAC address of the destination of the frame (A3 and/or A4).

The recipient of the frame (A1) or the transmitter of the frame (A2) can be identified by the AID subfield located in the Short ID (SID) field depending on the value of the From DS subfield of the Frame Control field as described in 9.8.3.1 (Frame Control field). A group of receiving non-AP STAs of the frame can be identified by the AID subfield with a group AID value, as described in 10.54 (Group AID), located in the Short ID (SID) field. The length of the SID field (#8141)is shown in Figure 9-1332 (SID field format).

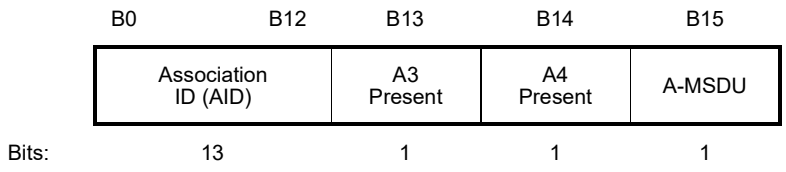

**Figure 9-1332—SID field format**

The AID subfield contains an AID as specified in Table 9-670 (From DS subfield values in type 0 or 1 PV1 frames(#278)(#3384)) in PV1 frames of Type 0, 1, and 2.

The A3 Present subfield is 1 if the A3 is present in the PV1 MAC header, otherwise it is 0.

The A4 Present subfield is 1 if the A4 is present in the PV1 MAC header, otherwise it is 0.

The A-MSDU subfield is 1 if the MPDU contains a Dynamic A-MSDU as described in 9.3.2.2.5 (Dynamic A-MSDU format).

NOTE—PV1 frames without (#4169)a SID field do not contain A3 and A4 fields and do not carry A-MSDUs.

The A3 field is present if A3 is not equal to the address identified by A1 and an A3 is not stored at the receiver, or when A3 is not equal to an A3 stored at the receiver (as described in 10.57 (Generation of PV1 MPDUs and header compression procedure)). When the A3 field is not present, A3 is either stored at the recipient of the frame or, if an A3 is not stored at the recipient of the frame then A3 is equal to the address identified by A1.

The A4 field is present if A4 is not equal to the address identified by A2 and an A4 is not stored at the receiver, or when A4 is not equal to an A4 stored at the receiver (as described in 10.57 (Generation of PV1

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

MPDUs and header compression procedure)). When the A4 field is not present, A4 is either stored at the recipient of the frame or, if an A4 is not stored at the recipient of the frame then A4 is equal to the address identified by A2.

#### 9.8.3.3 Sequence Control field

The Sequence Control field is present in all PV1 Data frames and PV1 Management frames other than PV1 Probe Response frames, and is described in 9.2.4.4 (Sequence Control field).(#1892)

#### 9.8.3.4 Frame Body field

The Frame Body field is a variable-length field and is described in 9.2.4.7 (Control subfield variants of an A-Control subfield(11ax)).

#### 9.8.3.5 Overhead for encryption

The overhead for encryption is described in Clause 12 (Security).

#### 9.8.3.6 FCS field

The FCS field is described in 9.2.4.9 (FCS field).

### 9.8.4 PV1 Control frames

#### 9.8.4.1 General

The subfields within the Frame Control field of PV1 Control frames are set as shown in Figure 9-1333 (Frame Control field subfield values within PV1 Control frames(#3463)).

| | B0 B1 | B2 B4 | B5 B7 | B8 B10 | B11 | B12 | B13 | B14 | B15 |
|---|---|---|---|---|---|---|---|---|---|
| | Protocol Version | Type (Control) | PTID/ Subtype | Bandwidth Indication | Dynamic Indication | Power Management | More Data | Flow Control | Next TWT Info Present |
| Bits: | 2 | 3 | 3 | 3 | 1 | 1 | 1 | 1 | 1 |

**Figure 9-1333—Frame Control field subfield values within PV1 Control frames(#3463)**

Table 9-672 (PV1 Control frame subtypes) defines the different PV1 Control frame subtypes.

**Table 9-672—PV1 Control frame subtypes**

| PTID/Subtype value b2 b1 b0(#1743) | Subtype description |
|---|---|
| 000 | STACK |
| 001 | BAT |
| 010–111 | Reserved |

The Bandwidth Indication subfield and the Dynamic Indication subfield are described in 9.2.4.1.11 (Bandwidth Indication and Dynamic Indication subfields).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Next TWT Info Present subfield is set to 1 if the Next TWT Info field is present in PV1 Control frames. Otherwise, it is set to 0.

The More Data subfield is described in 9.2.4.1.8 (More Data subfield).

The Flow Control subfield is used for flow suspension signaling as described in 10.60 (S1G flow control).

### 9.8.4.2 STACK frame format

The frame format of the short TWT acknowledgment (STACK) frame is defined in Figure 9-1334 (STACK frame format). The A1 field is (#4169)a SID field that contains the AID of the intended recipient of the frame in the AID subfield when the intended recipient is not an AP and the value 0 when the intended recipient is an AP. A3 Present, A4 Present, and A-MSDU subfields (B13, B14, and B15) of the SID field are reserved.

The A2 field is (#4169)a SID field that contains the bit sequence Scrambler Initialization[0:6] || FCS[23:31] obtained from the scrambler initialization value in the (#3409)SERVICE field (as defined in 23.3.9.2 (SERVICE field)), prior to descrambling, and the FCS field of the PSDU that carries the soliciting frame. The scrambler initialization value is obtained from the RXVECTOR parameter SCRAMBLER_OR_CRC.

| | Frame Control | A1 | A2 | Tetrapartial Timestamp/ Next TWT Info/ Suspend Duration | FCS |
|---|---|---|---|---|---|
| Octets: | 2 | 2 | 2 | 4 | 4 |

**Figure 9-1334—STACK frame format**

If the Next TWT Info Present subfield in the Frame Control field is equal to 0, the Tetrapartial Timestamp/Next TWT Info/Suspend Duration field contains the value of the 4 least significant octets of the STA's TSF timer at the time that the start of the data symbol containing the first bit of the Tetrapartial Timestamp field appears at the transmit antenna connector.

If the Next TWT Info Present subfield in the Frame Control field is equal to 1 and the Flow Control subfield of the Frame Control field is equal to 0, then the Tetrapartial Timestamp/Next TWT Info/Suspend Duration field contains the value of the 4 least significant octets of the TSF timer for the next TWT logically ANDed with the value 0xFFFFFFF8 and then added to the value of the TWT flow identifier that corresponds to that next TWT value.

NOTE—The Next TWT Info/Suspension Duration field carries only a portion of the target TSF time, and changes in the most significant octets of the corresponding target TSF time are not communicated to the receiving STA. Hence, the receiving STA must consider and account for a rollover of the corresponding most significant octets of the target TSF time that might happen at the receiving STA.(#7083)

If the Next TWT Info Present subfield in the Frame Control field is equal to 1 and the Flow Control subfield of the Frame Control field is equal to 0 and the 29 MSBs of the Next TWT Info subfield is equal to all 0s, the transmitter does not currently have a next TWT value available for transmission for the TWT indicated by the TWT flow identifier corresponding to the value of the 3 LSBs of the Next TWT Info field.

If the Next TWT Info Present subfield in the Frame Control field is equal to 1 and the Flow Control subfield of the Frame Control field is equal to 1, then the Tetrapartial Timestamp/Next TWT Info/Suspend Duration field contains a flow suspension duration, in microseconds, during which the intended recipient TWT STAs are not allowed to transmit Data frames to the STA identified by the RA field of the frame that elicited the STACK frame.

This is an unapproved IEEE Standards Draft, subject to change.

### 9.8.4.3 BAT frame format

The frame format of the Block Acknowledgment TWT (BAT) frame is defined in Figure 9-1335 (BAT frame format):

| | Frame Control | A1 | A2 | Beacon Sequence | Pentapartial Timestamp | Next TWT Info /Suspend Duration | Starting Sequence Control | BAT Bitmap | FCS |
|---|---|---|---|---|---|---|---|---|---|
| Octets: | 2 | 2 | 6 | 1 | 5 | 6 | 2 | 4 | 4 |

**Figure 9-1335—BAT frame format**

The A1 field is (#4169)a SID(#7172) that contains the AID of the intended recipient of the frame in the AID subfield when the intended recipient is not an AP and the value 0 when the intended recipient is an AP. A3 Present, A4 Present, and A-MSDU subfields (B13, B14, and B15) of the SID field are reserved.

The A2 field contains the MAC address of the transmitter sending the frame.

The Beacon Sequence field contains the value of the Change Sequence field from the most recently transmitted Beacon frame.

The Pentapartial Timestamp field contains the value of the 5 least significant octets of the STA's TSF timer at the time that the start of the data symbol containing the first bit of the Pentapartial Timestamp field appears at the transmit antenna connector.

If the Next TWT Info Present subfield in the Frame Control field is equal to 1 and the Flow Control subfield of the Frame Control field is equal to 0, then the Next TWT Info/Suspend Duration field contains a next TWT value for the intended recipient of the frame corresponding to the value of the 6 least significant octets of the TSF timer for the next TWT logically ANDed with the value 0xFFFFFFFFFFF8 and then added to the value of the TWT flow identifier that corresponds to that next TWT value.

If the Next TWT Info Present subfield in the Frame Control field is equal to 1 and the Flow Control subfield of the Frame Control field is equal to 0 and the 45 MSBs of the Next TWT Info/Suspend Duration subfield is equal to all 0s, the transmitter does not currently have a next TWT value available for transmission for the TWT indicated by the TWT flow identifier corresponding to the value of the 3 LSBs of the Next TWT Info/Suspend Duration field.

If the Next TWT Info Present subfield in the Frame Control field is equal to 1 and the Flow Control subfield of the Frame Control field is equal to 1, then the Next TWT Info/Suspend Duration field contains a flow suspension duration, in microseconds, during which the intended recipient TWT STAs are not allowed to transmit Data frames to the STA identified by the A2 field of the BAT frame.

If the Next TWT Info Present subfield in the Frame Control field is equal to 0, then the Next TWT Info/Suspend Duration field is reserved.

The Starting Sequence Control field contains the sequence number of the first MSDU and the TID for which this BAT frame is sent and is defined in Figure 9-1336 (Starting Sequence Control field format):

The BAT Bitmap field is used to indicate the received status of up to 32 MSDUs and A-MSDUs. Each bit that is equal to 1 in the BAT Bitmap field acknowledges the reception of a single MSDU or A-MSDU in sequentially increasing sequence number order, with the first bit of the BAT Bitmap field corresponding to the MSDU or A-MSDU with the sequence number that matches the value of the Starting Sequence Number subfield of the BAT frame.

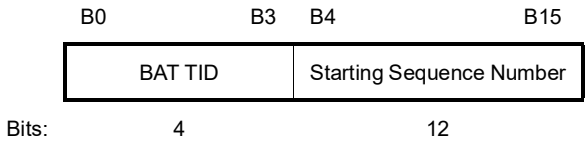

**Figure 9-1336—Starting Sequence Control field format**

### 9.8.5 PV1 Management frames

#### 9.8.5.1 Format of PV1 Management frames

The format of a PV1 Management frame is defined in Figure 9-1337 (PV1 Management frame format).

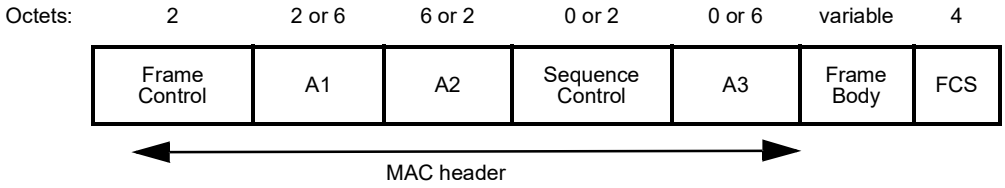

**Figure 9-1337—PV1 Management frame format**

The Frame Control, A1, and A2 fields are present in all PV1 Management frame subtypes.

The address fields A1 and A2 contain the receiver and transmitter addresses either of which can be (#4169)a SID field as described in 9.8.3.2 (Address fields).

The Sequence Control field is described in 9.2.4.4 (Sequence Control field) and is present in PV1 Management frames of subtype Action and Action No Ack.

The address field A3 (if present, as described in 9.8.3.2 (Address fields)) is set to the BSSID.

The frame body consists of the fields followed by the elements defined for each PV1 Management frame subtype. All fields and elements are mandatory unless stated otherwise and appear in the specified, relative order. STAs that encounter an element ID they do not recognize in the frame body of a received PV1 Management frame ignore that element and continue to parse the remainder of the PV1 Management frame body (if any) for additional elements with recognizable element IDs. See 10.28.7 (Vendor specific element parsing).

Table 9-673 (PV1 Management frame subtypes) defines the different PV1 Management frame subtypes.

**Table 9-673—PV1 Management frame subtypes**

| PTID/Subtype value b2 b1 b0(#1743) | Subtype description |
|---|---|
| 000 | Action |
| 001 | Action No Ack |
| 010 | PV1 Probe Response |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 9-673—PV1 Management frame subtypes**

| | |
|---|---|
| 011 | Resource Allocation |
| 100–111 | Reserved |

PV1 Management frames are Management frames.

### 9.8.5.2 Action and Action No Ack frames

The frame body of a PV1 Management frame of subtype Action is described in 9.3.3.13 (Action frame format) and the format of the Action field formats allowed is described in 9.6 (Action frame format details).(#6292)

The frame body of a PV1 Management frame of subtype Action No Ack is described in 9.3.3.14 (Action No Ack frame format) and the format of the Action field formats allowed is described in 9.6 (Action frame format details).(#6292)

### 9.8.5.3 PV1 Probe Response frame format

The format of the PV1 Probe Response frame is shown in Figure 9-1338 (PV1 Probe Response frame format(#8219)).

| | Frame Control | A1 | A2 | Times tamp | Change Sequence | Next TBTT (optional) | Short SSID (optional) | Access Network Options (optional) | Optional Elements | FCS |
|---|---|---|---|---|---|---|---|---|---|---|
| Octets: | 2 | 6 | 6 | 4 | 1 | 0 or 3 | 0 or 4 | 0 or 1 | variable | 4 |

**Figure 9-1338—PV1 Probe Response frame format(#8219)**

The A1 field contains the MAC address of the intended recipient of the frame.

The A2 field contains the MAC address of the transmitter sending the frame.

The Timestamp field contains the value of the 4 least significant octets of the STA's TSF timer at the time that the start of the data symbol containing the first bit of the Timestamp field appears at the transmit antenna connector.

The Change Sequence field is defined as an unsigned integer, initialized to 0, that increments when a critical update to the Beacon frame has occurred (see 10.45.2 (System information update procedure)).

The Next TBTT field is present if the Next TBTT Present subfield in the Frame Control field is 1 and indicates the most significant 3 octets of the 4 least significant octets of the next TBTT. Otherwise, it is not present.

Either a (#8219)Short SSID field or an SSID element is included in the PV1 Probe Response frame.

(#8219)A Short SSID field is present if the Full SSID Present subfield in the Frame Control field is 0 and it contains a 32-bit CRC calculated over the SSID contained in the Probe Response or S1G Beacon frame (calculation is performed as defined in 9.2.4.9 (FCS field) where the SSID is the calculation fields). An SSID element is not present if the Full SSID Present subfield in the Frame Control field is 0.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

An SSID element as defined in 9.4.2.2 (SSID element) is present in the Optional Elements field of the PV1 Probe Response frame if the Full SSID Present subfield in the Frame Control field is 1. (#8219)A Short SSID field is not present if the Full SSID Present subfield in the Frame Control field is 1.

The Access Network Options field is present if the ANO Present subfield in the Frame Control field is 1 and is defined in 9.4.2.90 (Interworking element). Otherwise, it is not present.

The Optional Elements field contains optional elements requested to be included in the PV1 Probe Response frame such as S1G Beacon Compatibility element. If the S1G Beacon Compatibility element is requested to be included, the PV1 Probe Response frame includes it as the first optional element.

The Frame Control field of the PV1 Probe Response frame is shown in Figure 9-1339 (Frame Control field of PV1 Probe Response frame format).

The Next TBTT present subfield is set to 1 if the Next TBTT field is included in the PV1 Probe Response frame and otherwise set to 0.

The Full SSID Present field indicates whether (#8129)an SSID or a (#8219)short SSID is included in the PV1 Probe Response frame. Setting the field to 1 indicates that an SSID element is included and (#8219)a Short SSID field is not included in the PV1 Probe Response frame. Setting the field to 0 indicates that (#8219)a Short SSID field is included and (#8219)an SSID element is not included in the PV1 Probe Response frame.

| | B0 B1 | B2 B4 | B5 B7 | B8 | B9 | B10 | B11 B13 | B14 | B15 |
|---|---|---|---|---|---|---|---|---|---|
| | Protocol Version | Type | PTID/ Subtype | Next TBTT Present | Full SSID Present | ANO Present | BSS BW | Security | 1 MHz Primary Channel Location |
| Bits: | 2 | 3 | 3 | 1 | 1 | 1 | 3 | 1 | 1 |

**Figure 9-1339—Frame Control field of PV1 Probe Response frame format**

The ANO Present subfield equals 1 if the Access Network Options field is present; otherwise, it equals 0.

The BSS BW subfield indicates the minimum and the maximum operating bandwidths of the BSS and is defined in Table 9-8 (Frame Control field BSS BW setting).

The Security subfield equals 1 if the transmitting STA is an RSNA STA.

The 1 MHz Primary Channel Location subfield indicates the location of the 1 MHz primary channel. If it is equal to 0, it indicates that the 1 MHz primary channel is located at lower side of 2 MHz primary channel. If it is equal to 1, it indicates that the 1 MHz primary channel is located at upper side of 2 MHz primary channel.

### 9.8.5.4 Resource Allocation frame format

The Resource Allocation (RA) frame is broadcasted to all non-AP STAs that belong to the RAW group identified by the RAW Group field of a previously transmitted RPS element with the RAW Type subfield indicating a generic RAW and the RAW Type Options subfield indicating an RA frame (see 9.4.2.190 (RPS element)). The RA frame signals the presence of downlink buffered data for paged STAs and their assigned RAW slots for both uplink and downlink service periods. The Resource Allocation frame has two kinds of format depending on the slot assignment mode indicated in the Frame Control field. The Resource Allocation frame formats are shown in Figure 9-1340 (Resource Allocation frame format when Slot

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Assignment Mode field is 0) and Figure 9-1341 (Resource Allocation frame format when Slot Assignment Mode field is 1).

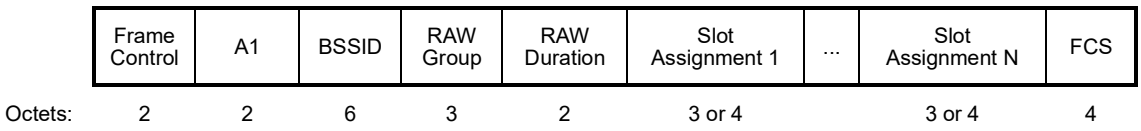

**Figure 9-1340—Resource Allocation frame format when Slot Assignment Mode field is 0**

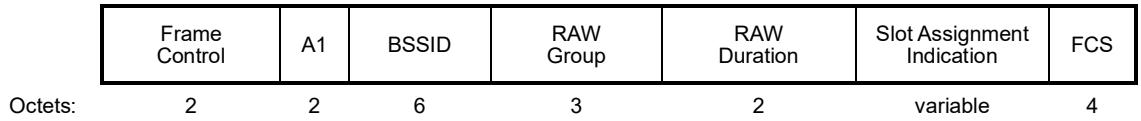

**Figure 9-1341—Resource Allocation frame format when Slot Assignment Mode field is 1**

The Slot Assignment Indication field formats are shown in Figure 9-1342 (Slot Assignment Indication field for MU group when Slot Assignment Mode field is 0 and the Group Indicator field is 1), Figure 9-1343 (Slot Assignment Indication field for a STA when Slot Assignment Mode is 0 and the Group Indicator field is 0), and Figure 9-1344 (Slot Assignment Indication field when Slot Assignment Mode field is 1).

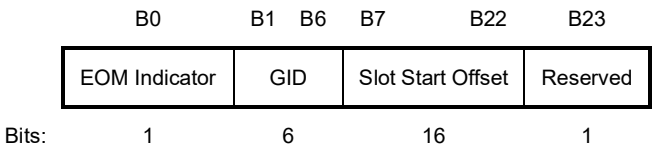

**Figure 9-1342—Slot Assignment Indication field for MU group when Slot Assignment Mode field is 0 and the Group Indicator field is 1**

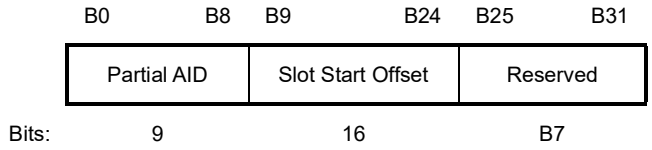

**Figure 9-1343—Slot Assignment Indication field for a STA when Slot Assignment Mode is 0 and the Group Indicator field is 0**

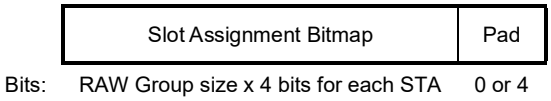

**Figure 9-1344—Slot Assignment Indication field when Slot Assignment Mode field is 1**

The Frame Control field of the Resource Allocation frame is shown in Figure 9-1345 (Frame Control field format for Resource Allocation frame(#3463)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

| | B0 B1 | B2 B4 | B5 B7 | B8 | B9 | B10 | B11 | B12 | B13 | B14 | B15 |
|---|---|---|---|---|---|---|---|---|---|---|---|
| | Protocol Version | Type | PTID/ Subtype | Slot Assignment Mode | More Fragments | Power Management | Group Indicator | Protected Frame | End of Service Period | Relayed Frame | Ack Policy Indicator |
| Bits: | 2 | 3 | 3 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

**Figure 9-1345—Frame Control field format for Resource Allocation frame(#3463)**

The subfields of the Frame Control field, except for the Slot Assignment Mode and the Group Indicator subfields, are defined in 9.8.3.1 (Frame Control field). The Slot Assignment Mode and the Group Indicator subfields are defined as follows:

- The Slot Assignment Mode subfield indicates the format of the Resource Allocation frame:
  - If the Slot Assignment Mode subfield is equal to 0, the Resource Allocation frame format is as shown in Figure 9-1340 (Resource Allocation frame format when Slot Assignment Mode field is 0).
  - If the Slot Assignment Mode subfield is equal to 1, the Resource Allocation frame format is as shown in Figure 9-1341 (Resource Allocation frame format when Slot Assignment Mode field is 1).
- The Group Indicator subfield indicates whether any subfield of MU group is included or no subfield of MU group exists in the Slot Assignment field if Slot Assignment mode field is equal to 0. Otherwise, it is reserved.

The A1 field is (#4169)a SID(#7172) that contains the value 0 in the AID subfield. A3 Present, A4 Present, and A-MSDU subfields (B13, B14, and B15) of the SID field are reserved.

The BSSID field indicates the address of the AP transmitting the Resource Allocation frame.

The RAW Group field indicates the STA AIDs that are assigned the RAW as defined in 9.4.2.190 (RPS element). The AIDs in this RAW Group are identical to the AIDs in the RAW Group subfield with the value in the RAW Type subfield set to 0 and the value in the RAW Type Options subfield set to 1 in the RAW Control subfield within the RPS element.(#6038)

The RAW Duration field is an unsigned integer expressed in TUs that indicates the duration of the current RAW where the Resource Allocation frame is broadcasted. The field is either set to the value of the RAW duration deduced from the value in the RAW Slot Definition subfield (9.4.2.190 (RPS element)) or is modified from the value indicated in the RAW Slot Definition subfield of the RPS element (9.4.2.190 (RPS element)).

The Slot Assignment field indicates a partial AID for a STA or a GID for STAs in the corresponding MU Group and their corresponding slot(s) of medium access within the current RAW. Since MU MIMO is used for DL traffic, the first bit, as called end of multi-user (EOM) Indicator, for the MU group block indicates whether the following subfields are used for the last MU group when this bit is 1 or more MU groups exist after subfields for this MU group when the bit is 0. This field is of length 3 octets for each MU Group and 4 octets for each STA and the length is determined based on the value in the EOM subfield.

If Slot Assignment Mode field is 0 and the Group Indicator field is 1, the Slot Assignment field is used for either MU group of STAs or an assigned STA as shown in Figure 9-1342 (Slot Assignment Indication field for MU group when Slot Assignment Mode field is 0 and the Group Indicator field is 1) and Figure 9-1343 (Slot Assignment Indication field for a STA when Slot Assignment Mode is 0 and the Group Indicator field is 0). If Slot Assignment Mode field is 0 and the Group Indicator field is 0, the Slot Assignment field is not

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

used for MU group of STAs. The Slot Assignment field for MU group of STAs is located first at the beginning of the Slot Assignment fields, if exists.

The Partial AID subfield indicates a partial AID for an assigned STA.

The Slot Start Offset subfield indicates the start time of a RAW slot, in TU, for a STA's or MU MIMO group of STAs' medium access, relative to the RAW Start Time field as defined in 9.4.2.190 (RPS element) and is of length 2 octets.

The RA frame contains Slot Assignment Indication field to indicate to each of the STAs in the RAW group the number of UL/DL slot allocations within the current RAW.

The Slot Assignment Bitmap subfield indicates the number of RAW slots allocated for all STAs in the RAW group in ascending order with each 4 bits corresponding to one STA. The decimal number represented by the 4 bits indicates the number of allocation units for a STA. For example, setting this subfield to 0 indicates no allocation for a STA. Setting this subfield to 1 indicates one RAW slot for a STA. All RAW slots have equal duration, in TUs, which is calculated by dividing the value of the RAW Duration field with the number of RAW slots allocated to all STAs in the RAW group. The first RAW slot starts at the end of the Resource Allocation frame while the start times of the remaining RAW slots are equal to the end times of their immediately preceding RAW slots as indicated in the Slot Assignment Bitmap subfield.

The Slot Assignment Bitmap subfield has a length in bits, $SAB_{\text{length}}$, which is determined as:

$$SAB_{\text{length}} = (\text{RAW End AID} - \text{RAW Start AID} + 1) \times 4$$

where
RAW End AID and RAW Start AID for the RAW group are defined in 9.4.2.190 (RPS element)

The Pad subfield contains 0 or 4 bits of 0s to make the total number of bits in the Slot Assignment Indication field equal to an integer number of octets.

## 9.9 MAC frame format for WUR frames(11ba)

### 9.9.1 Basic components

Each WUR frame except the WUR Short Wake-up frame consists of the following basic components:

— A *MAC header*, which comprises Frame Control, ID, and Type Dependent Control fields;
— A variable-length *frame body*, which, if present, contains information specific to the frame *type*;
— An *FCS*, which, depending on the Protected subfield in the Frame Control field, contains either a 16-bit CRC or a 16-bit MIC.

The format of a WUR Short Wake-up frame is defined in 9.9.3.5 (WUR Short Wake-up frame format).

### 9.9.2 General WUR frame format

#### 9.9.2.1 General

Figure 9-1346 (WUR frame format(11ba)) depicts the general MAC frame format for WUR frames.

The MAC header of the WUR frame consists of the Frame Control, ID, and Type Dependent Control fields, and is defined in 9.9.2.2 (MAC header).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

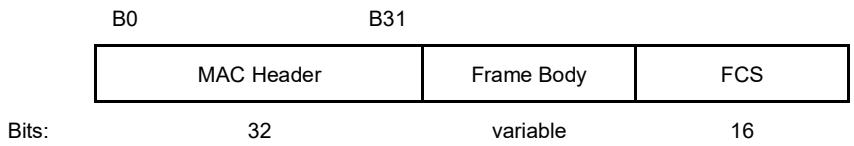

**Figure 9-1346—WUR frame format(11ba)**

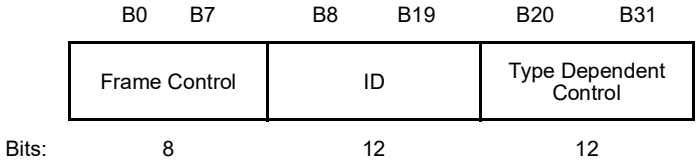

**Figure 9-1347—MAC header field format of the WUR frame(11ba)**

The Frame Body field is optionally present in certain WUR frame types and is defined in 9.9.2.3 (Frame Body field).

A WUR frame (except WUR Short Wake-up frame) that does not have a Frame Body field is referred to as a FL WUR frame. A WUR frame that has a Frame Body field is referred to as a VL WUR frame.

The FCS field is defined in 9.9.2.4 (Frame Check Sequence (FCS) field).

### 9.9.2.2 MAC header

#### 9.9.2.2.1 Frame Control field

The format of the Frame Control field is illustrated in Figure 9-1348 (Frame Control field format of WUR frame(11ba)).

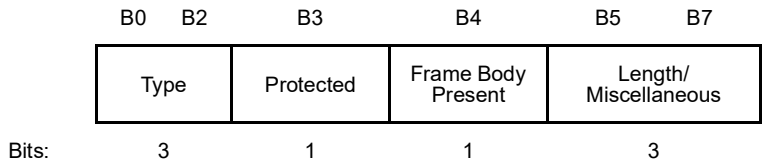

**Figure 9-1348—Frame Control field format of WUR frame(11ba)**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Type subfield indicates the type of the WUR frame, as defined in Table 9-674 (WUR frame types(11ba)).

**Table 9-674—WUR frame types(11ba)**

| Type | Type description |
|---|---|
| 0 | WUR Beacon |
| 1 | WUR Wake-up |
| 2 | WUR Vendor Specific |
| 3 | WUR Discovery |
| 4 | WUR Short Wake-up |
| 5–7 | Reserved |

The Protected subfield indicates whether the information carried in the WUR frame has been processed by a message integrity check (MIC) algorithm. The Protected subfield is set to 1 if the WUR frame is protected utilizing the MIC algorithm as defined in 29.10 (WUR frame protection); otherwise it is set to 0 to indicate that the WUR frame contains the 16-bit CRC as defined in 9.9.2.4.2 (Cyclic Redundancy Check (CRC) for WUR frames).

The Frame Body Present subfield indicates whether the Frame Body field is present or not.

The Length/Miscellaneous subfield contains the Length subfield when the Frame Body Present subfield is equal to 1; otherwise it contains the Miscellaneous subfield.

The Length subfield indicates the length in octets of the Frame Body field as defined in 9.9.2.3 (Frame Body field).(#7224)

The Miscellaneous subfield is reserved in all FL WUR frames except for broadcast and group addressed WUR Wake-up frames as defined in 9.9.3.2 (WUR Wake-up frame format).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

#### 9.9.2.2.2 ID field

(#8040)The ID field contains an identifier (or, in the case of WUR Vendor ID, a portion of an identifier) for the WUR frame. The nature of the identifier for various cases is shown in Table 9-675 (Identifiers of WUR frames(11ba)) and depends on the type of WUR frame (see 9.9.3 (Format of individual WUR frame types)).

**Table 9-675—Identifiers of WUR frames(11ba)**

| ID field | Identifier description |
|---|---|
| Transmitter ID | Identifier of the transmitting AP (see 29.5.3 (Transmitter ID)) |
| ID | Identifier of the nontransmitted BSSID (see 29.5.6 (Nontransmitter ID)) |
| WUR Group ID | Identifier of a group of receiving WUR non-AP STAs (see 29.5.4 (WUR Group ID)) |
| WUR ID | Identifier of an individual receiving WUR non-AP STA (see 29.5.5 (WUR ID)) |
| 12 LSB of WUR Vendor ID(#8041)(#6139) | The identifier is a public unique identifier assigned by the IEEE Registration Authority as a 24-bit OUI or a 24-bit CID (see [B15] and [B16]). The 12 LSBs of the identifier are carried in the ID field and the 12 MSBs are carried in the Type Dependent Control field(#6139) |

#### 9.9.2.2.3 Type Dependent Control field

The Type Dependent Control field contains control information that depends on the WUR frame type (see 9.9.3 (Format of individual WUR frame types)).

### 9.9.2.3 Frame Body field

The Frame Body field is a variable-length field that contains information specific to individual WUR frame types (see 9.9.3 (Format of individual WUR frame types)). The Frame Body field is not present when the Frame Body Present subfield of the Frame Control field is 0 (i.e., within FL WUR frames) and is present when the Frame Body Present subfield of the Frame Control field is 1 (i.e., within VL WUR frames).

If present, the length of the Frame Body field is (#7224)$2 \times (L + 1)$ octets, where $L$ is equal to value contained in the Length/Miscellaneous subfield in the Frame Control field.

NOTE—If present, the Frame Body field is between 2 and 16 octets in length.

### 9.9.2.4 Frame Check Sequence (FCS) field

#### 9.9.2.4.1 General

The FCS field contains a 16-bit CRC when the Protected subfield in the Frame Control field is 0 and contains a 16-bit MIC when the Protected subfield in the Frame Control field is 1 except for the WUR Vendor Specific frame (see 9.9.3.4 (WUR Vendor Specific frame format)). The 16-bit CRC is calculated as defined in 9.9.2.4.2 (Cyclic Redundancy Check (CRC) for WUR frames), and the MIC is calculated as defined in 29.10 (WUR frame protection).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

#### 9.9.2.4.2 Cyclic Redundancy Check (CRC) for WUR frames

The CRC is calculated over the *calculation fields*, which are all the fields present in the WUR frame except the CRC field and the Embedded BSSID field (if present in the *calculation fields*).

NOTE 1—The Embedded BSSID field, if present, is part of the *calculation fields* but is not part of the fields of the WUR frame transmitted over the *WM*.

NOTE 2—The Frame Body field is present in the *calculation fields* when the WUR frame is a VL WUR frame (see 9.9.2.3 (Frame Body field)); otherwise, the Frame Body field is not present.

The Embedded BSSID field, if present, is the last field of the *calculation fields*. The Embedded BSSID field contains the 16 MSBs of the compressed BSSID, which is defined in 29.5.2 (Compressed BSSID).

The Embedded BSSID field is present in the *calculation fields* of a WUR Beacon frame and of a WUR (Short) Wake-up frame. The Embedded BSSID field is not present in the *calculation fields* of a WUR Discovery frame. Whether the Embedded BSSID field is present or not in the *calculation fields* of a WUR Vendor Specific frame is vendor specific.

The CRC is the 1s complement of the remainder generated by the modulo 2 division of the *calculation fields* by the polynomial $x^{16}+x^{12}+x^5+1$, where the shift register state is preset to all 1s.

NOTE 3—The order of transmission of bits within the FCS field is defined in 9.2.2 (Conventions).

The *calculation fields* are processed in the order they would have been transmitted.

A schematic of the CRC processing is shown in Figure 9-1349 (CRC-16 implementation for WUR frames(11ba)), where the SERIAL DATA INPUT consists of the *calculation fields* ($B_L$, $B_{L-1}$..., $B_1$, $B_0$), with $B_L$ being the most significant bit of the *calculation fields*. The CRC computation and transmission is the same as the one depicted in Figure 15-2 (CRC-16 implementation(#1879)(#17)(#4029)).

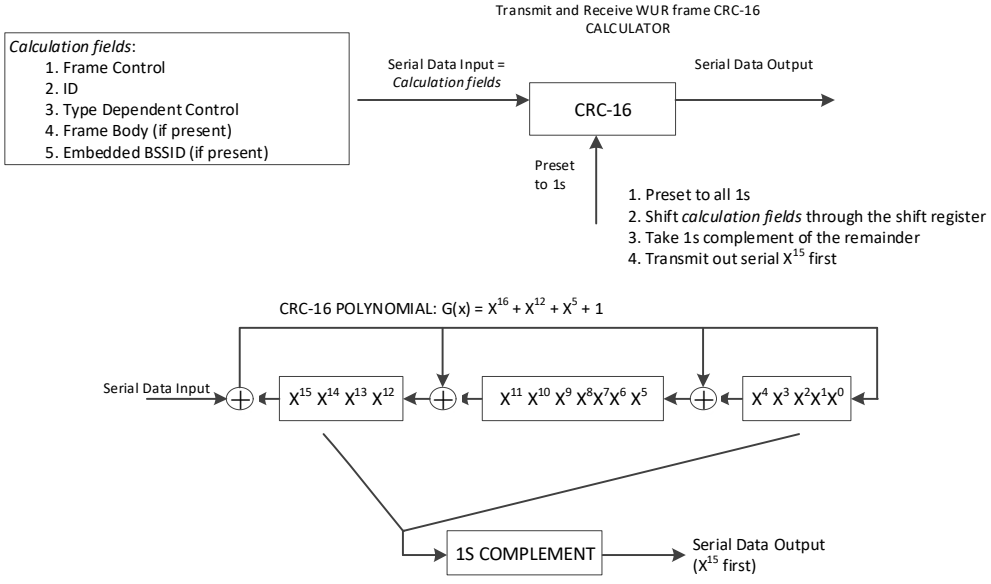

**Figure 9-1349—CRC-16 implementation for WUR frames(11ba)**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 9.9.3 Format of individual WUR frame types

#### 9.9.3.1 WUR Beacon frame format

The frame format of the WUR Beacon frame is defined in Figure 9-1346 (WUR frame format(11ba)).

The Frame Control field is defined in 9.9.2.2.1 (Frame Control field).

The Protected subfield of the Frame Control field is set to 0.

The Frame Body Present subfield of the Frame Control field is set to 0.

The Length/Miscellaneous subfield of the Frame Control field is reserved.

The ID field of the WUR Beacon frame is set to the transmitter ID.

The Type Dependent Control field contains the partial TSF that is generated as defined in 29.6.1 (General).

The Frame Body field is not present in the WUR Beacon frame.

The FCS field contains the CRC as defined in 9.9.2.4.2 (Cyclic Redundancy Check (CRC) for WUR frames).

#### 9.9.3.2 WUR Wake-up frame format

The frame format of the WUR Wake-up frame is defined in Figure 9-1346 (WUR frame format(11ba)).

The Frame Control field is defined in 9.9.2.2.1 (Frame Control field).

The ID field of the FL WUR Wake-up frame contains one of the following:

- The WUR ID when the frame is individually addressed to a WUR non-AP STA (see 29.5.5 (WUR ID)).
- The WUR group ID when the frame is group addressed to all WUR non-AP STAs belonging to the group identified by the WUR group ID (see 29.5.4 (WUR Group ID)).
- The transmitter ID when the frame is a broadcast frame transmitted by the WUR AP identified by the transmitter ID (see 29.5.3 (Transmitter ID)).
- The  ID when the frame is a broadcast frame transmitted by the WUR AP identified by the nontransmitted ID when dot11MultiBSSIDImplemented is true (see 29.5.6 (Nontransmitter ID)).

The ID field of the VL WUR Wake-up frame contains a WUR group ID, and the frame is group addressed to one or more WUR non-AP STAs that are identified by the WUR IDs included in the Frame Body field and belong to the group identified by the WUR group ID (see 29.5.4 (WUR Group ID)).

The Type Dependent Control field of a WUR Wake-up frame contains the Sequence Number subfield and the Counter subfield as defined in Figure 9-1350 (Type Dependent Control field format(11ba)(M118)).

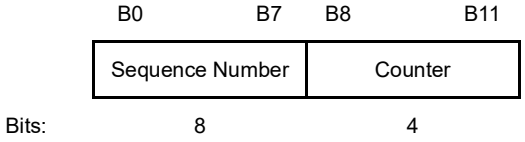

**Figure 9-1350—Type Dependent Control field format(11ba)(M118)**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Sequence Number subfield:

- Contains the TSF timer [9: 16] if the Protected subfield in the Frame Control field is 1 and the most recently sent WUR Operation element has the Common PN subfield equal to 1 (see 29.10.4.1 (Generation of the PN by a WUR AP)), or
- Contains PN0 (see 29.10 (WUR frame protection)) if Protected subfield in the Frame Control field is 1, and the most recently sent WUR Operation element has the Common PN subfield equal to 0, or
- Is reserved otherwise.

The Counter subfield:

- Contains the BSS Update Counter field if the WUR Wake-up frame is broadcast. The BSS Update Counter field is defined as an unsigned integer initialized to 0 that increments when a critical update to the BSS parameters has occurred (see 29.9.3 (WUR AP operation)), or
- Contains PN1[0:3] (see 29.10 (WUR frame protection)) if the WUR Wake-up frame is not broadcast, the Protected subfield in the Frame Control field is 1, and the most recently sent WUR Operation element has the Common PN subfield equal to 0, or
- Is reserved otherwise.

The Miscellaneous subfield is present if the Frame Body Present subfield is equal to 0. The format of Miscellaneous subfield is shown in Figure 9-1351 (Miscellaneous subfield format(11ba)) if the frame is broadcast or group addressed FL WUR Wake-up frame. The Miscellaneous subfield is reserved in FL WUR Wake-up frames that are neither broadcast nor group addressed.

NOTE—A broadcast WUR Wake-up frame is always a FL WUR Wake-up frame.

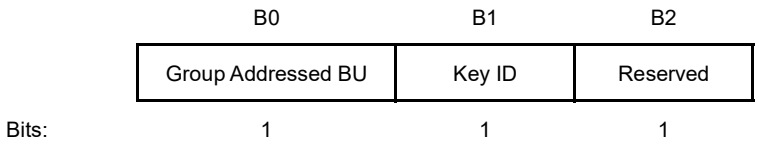

**Figure 9-1351—Miscellaneous subfield format(11ba)**

The Group Addressed BU subfield is set to 1 to indicate that one or more group addressed frames are buffered at the AP corresponding to the BSSID that is identified in the ID field. Otherwise, the Group Addressed BU subfield is set to 0. The Group Addressed BU subfield is reserved in a group addressed FL WUR Wake-up frame.

If the FL WUR Wake-up frame is broadcast or group addressed, and the Protected subfield of the Frame Control field is equal to 1, the Key ID subfield is set to 0 to indicate that the (#3493)WIGTK key ID of the WIGTK used to compute the MIC is 8. If the Protected subfield of the Frame Control field is equal to 1, the Key ID subfield is set to 1 to indicate that the (#3493)WIGTK key ID of the WIGTK used to compute the MIC is 9. Otherwise, the Key ID subfield is reserved.

The Frame Body field is present in a VL WUR Wake-up frame and contains one or more STA Info fields. The Frame Body field is not present otherwise. The format of the STA Info field is defined in Figure 9-1352 (STA Info field format(11ba)).

The WUR ID field is defined in 29.5 (Setting the identifiers of WUR frames).

The FCS field contains a CRC when the Protected field is equal to 0 and a MIC when the Protected field is equal to 1 (see 9.9.2.4 (Frame Check Sequence (FCS) field)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

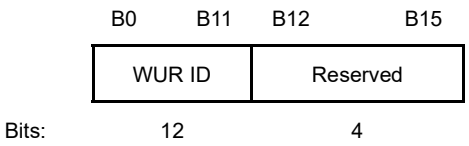

**Figure 9-1352—STA Info field format(11ba)**

### 9.9.3.3 WUR Discovery frame format

The frame format of the WUR Discovery frame is defined in Figure Figure 9-1346 (WUR frame format(11ba)).

The Frame Control field is defined in 9.9.2.2.1 (Frame Control field).

The Protected subfield in the Frame Control field is set to 0.

The Frame Body Present subfield in the Frame Control field is set to 1. The Length/Miscellaneous subfield is set to indicate that the Frame Body field is 4 octets in length.

The ID field is set to the transmitter ID.

The Type Dependent Control field is set to 12 MSBs of the compressed BSSID (see 29.5.2 (Compressed BSSID)).

The format of the Frame Body field is defined in Figure 9-1353 ( Frame Body field format of WUR Discovery frame(11ba)(M118)).

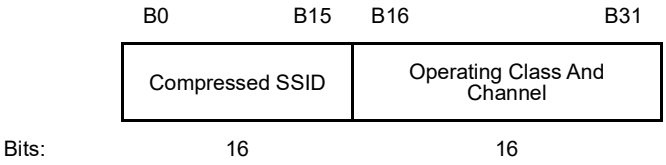

**Figure 9-1353— Frame Body field format of WUR Discovery frame(11ba)(M118)**

The Compressed SSID field contains the 16 LSBs of the short SSID as defined in 9.4.2.169.3 (Calculating the short SSID).

(#8218)NOTE—This is encoded per 9.2.2 (Conventions). For example, if the short SSID has the coefficient of the highest order term set, and the coefficient of the next-to-lowest order term set, and all other coefficients clear, then the Compressed SSID field contains 0x02 followed by 0x00.

The Operating Class And Channel field(#6181) defined in 9.4.1.22 (Operating Class And Channel field(#6181)) indicates the location of the primary channel of the BSS being advertised by the WUR Discovery frame.

The FCS field contains the 16-bit CRC as defined in 9.9.2.4.2 (Cyclic Redundancy Check (CRC) for WUR frames).

### 9.9.3.4 WUR Vendor Specific frame format

The frame format of the WUR Vendor Specific frame is defined in Figure 9-1346 (WUR frame format(11ba)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Frame Control field is defined in 9.9.2.2.1 (Frame Control field).

If the Frame Body Present subfield in the Frame Control field is set to 0, then the Length/Miscellaneous subfield contains vendor specific information that is outside the scope of the standard.

The ID field is set to the 12 LSBs of the (#8042)OUI or CID (see Table 9-675 (Identifiers of WUR frames(11ba))).

The Type Dependent Control field is set to the 12 MSBs of the OUI or CID (see Table 9-675 (Identifiers of WUR frames(11ba))).(#6139)

The Frame Body field, if present, contains vendor specific information that is out of scope of the standard.

The FCS field contains the CRC as defined in 9.9.2.4.2 (Cyclic Redundancy Check (CRC) for WUR frames) when the Protected field is equal to 0 and a MIC when the Protected field is equal to 1, wherein the MIC contains vendor specific control information that is out of scope of the standard.

### 9.9.3.5 WUR Short Wake-up frame format

The frame format of the WUR Short Wake-up frame is defined in Figure 9-1354 (WUR Short Wake-up frame format(11ba)).

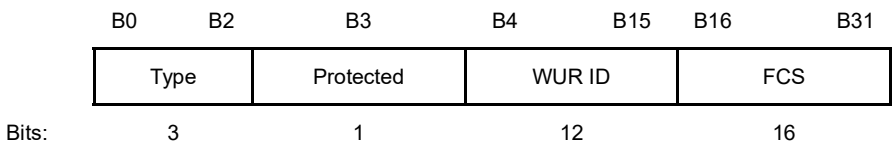

**Figure 9-1354—WUR Short Wake-up frame format(11ba)**

The Type field is defined in Table 9-674 (WUR frame types(11ba)).

The Protected field is set to 0.

The WUR ID field is defined in 29.5 (Setting the identifiers of WUR frames).

The FCS field is defined in 9.9.2.4 (Frame Check Sequence (FCS) field).

Copyright © 2024 IEEE. All rights reserved.

# 10. MAC sublayer functional description

## 10.1 Introduction

The MAC functional description is presented in this clause. The architecture of the MAC sublayer, including the distributed coordination function (DCF), the hybrid coordination function (HCF), the mesh coordination function (MCF), (11ax)the triggered UL access (TUA), and their coexistence in an IEEE 802.11 LAN are introduced in 10.2 (MAC architecture). These functions are expanded on in 10.3 (DCF), 10.23 (HCF), 10.24 (Mesh coordination function (MCF)), and 26.2 (HE channel access).(11ax) Fragmentation and defragmentation are defined in 10.4 (MSDU, (11ax)A-MSDU, and MMPDU fragmentation) and 10.5 (MSDU, (11ax)A-MSDU, and MMPDU defragmentation). Multirate support is addressed in 10.6 (Multirate support). A number of additional restrictions to limit the cases in which MSDUs are reordered or discarded are described in 10.7 (MSDU transmission restrictions). Operation across regulatory dmains is defined in 10.22 (Operation across regulatory domains). The block ack mechanism is described in 10.25 (Block acknowledgment (block ack)). The No Ack mechanism is described in 10.26 (No Acknowledgment (No Ack)). The protection mechanism is described in 10.27 (Protection mechanisms). Rules for processing MAC frames are described in 10.28 (MAC frame processing).

## 10.2 MAC architecture

### 10.2.1 General

The MAC architecture is shown in Figure 10-1 (STA MAC architecture (non-DMG non-CMMG non-S1G)(11ax)(11ba)(#2258)(Ed)), Figure 10-2 (S1G STA MAC architecture), and Figure 10-3 (DMG STA and CMMG STA architecture).

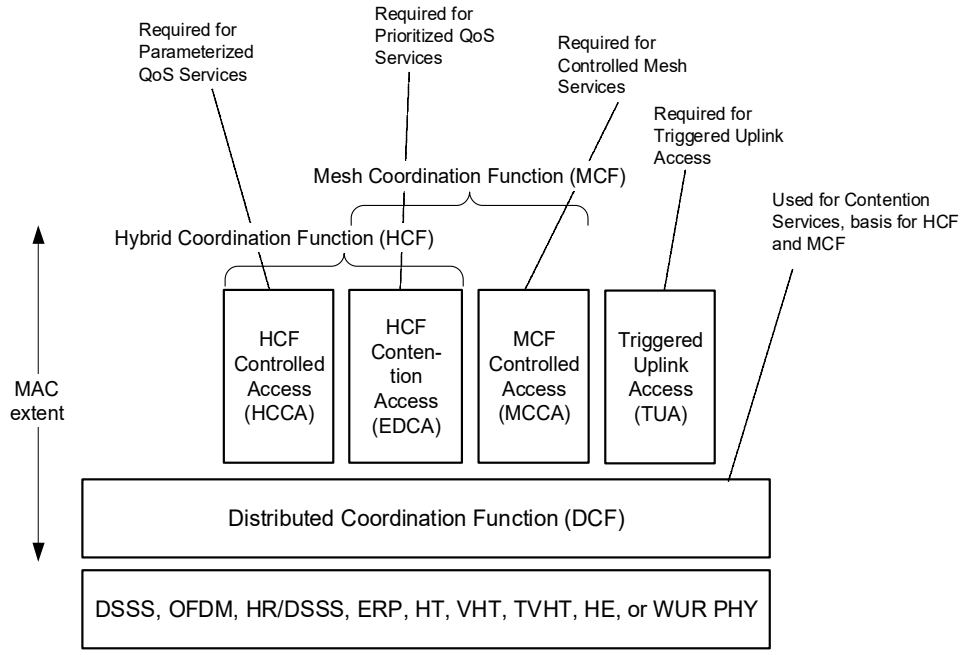

**Figure 10-1—STA MAC architecture (non-DMG non-CMMG non-S1G)(11ax)(11ba)(#2258)(Ed)**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

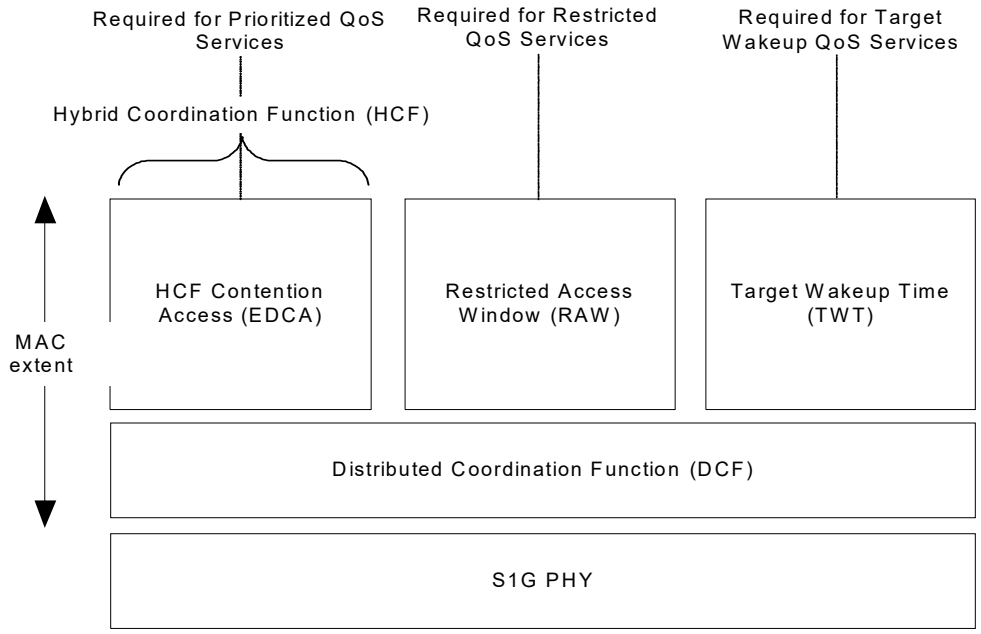

**Figure 10-2—S1G STA MAC architecture**

In a STA that is not a DMG STA, nor a CMMG STA, nor an S1G STA(#2258):

- The MAC provides the HCF, MCF, and TUA(11ax) service using the services of the DCF. The MAC also provides direct access to the DCF service.
- The HCF is present in QoS STAs and absent otherwise.
- The MCF is present in mesh STAs and absent otherwise.
- The TUA is present in non-AP HE STAs and absent otherwise.(11ax)

In an S1G STA:

- The MAC provides EDCA service using the services of the DCF.
- The RAW is optionally present.
- The TWT is optionally present.

In a DMG STA:

- The MAC provides services using the DMG channel access mechanisms.
- PBSS STAs (whether associated with the PCP or not) can receive group addressed frames from the PCP.(#1678)
- PBSS STAs (whether PCP or non-PCP STA) can receive group addressed frames from a non-PCP STA in the BSS.(#1678)

In a CMMG STA:

- The MAC provides services using the CMMG channel access mechanisms.

In either a DMG or CMMG STA:

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

— Specific rules apply for access during scheduled periods, which include the association beamforming training (A-BFT) period, announcement transmission interval (ATI), contention based access period (CBAP), and service period (SP).
— The DCF is used during contention based access periods.
— Dynamic allocation (10.38.7 (Dynamic allocation of service period)) is built on service period and contention based access period.

The MAC maintains information in local variables called *MAC variables*. MAC variables that hold state information are also called *state variables*.

NOTE—The MMPDU occupies a position in the management plane similar to that of the MAC service data unit (MSDU) in the data plane. An MSDU, A-MSDU(11ax), or MMPDU is transmitted in one or more MAC protocol data units (MPDUs) (with the Type field set to Data or Management, respectively). (11ax)An A-MSDU is transmitted in one MPDU. An MSDU, A-MSDU, or MMPDU can be carried (in an MPDU) in an aggregate MAC protocol data unit (A-MPDU).(#2019)

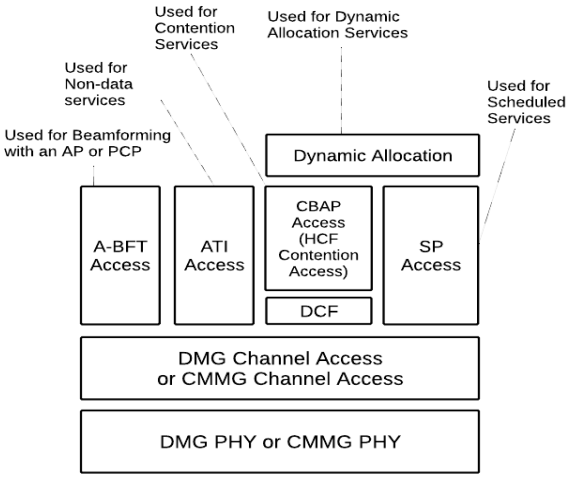

**Figure 10-3—DMG STA and CMMG STA architecture**

### 10.2.2 DCF

The fundamental access method of the MAC used by non-DMG STAs is a DCF known as *carrier sense multiple access with collision avoidance* (CSMA/CA). The DCF shall be implemented in all STAs.

For a STA to transmit, it shall sense the medium to determine if another STA is transmitting. If the medium is not determined to be busy (see 10.3.2.1 (CS mechanism)), the transmission may proceed. The CSMA/CA distributed algorithm mandates that a gap of a minimum specified duration exists between frame exchange sequences. A transmitting STA shall verify that the medium is idle for this required duration before attempting to transmit. If the medium is determined to be busy, a non-DMG STA shall defer until the end of the current transmission, and a DMG STA may defer until the end of the current transmission. After deferral, or prior to attempting to transmit again immediately after a successful transmission, the STA shall initialize a backoff counter to a random backoff count (#4181)(see Equation (10-1)) and shall decrement the backoff counter once per interval of aSlotTime (a backoff slot) while the medium is idle. A refinement of the method may be used under various circumstances to further minimize collisions—here the transmitting and receiving STA exchange short Control frames (RTS and CTS frames for non-DMG STAs, and RTS and DMG CTS frames

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

for DMG STAs) after determining that the medium is idle and after any deferrals or backoffs, prior to data transmission. The details of CSMA/CA, deferrals, and backoffs are described in 10.3 (DCF). RTS/CTS and RTS/DMG CTS exchanges are also presented in 10.3 (DCF).

### 10.2.3 Hybrid coordination function (HCF)

#### 10.2.3.1 General

(#1032)The QoS facility includes an additional coordination function called *HCF* that is usable only in QoS network configurations. The HCF shall be implemented in all QoS STAs except mesh STAs. Instead, mesh STAs implement the MCF. The HCF combines functions from the DCF with some enhanced, QoS-specific mechanisms and frame subtypes to allow a uniform set of frame exchange sequences to be used for QoS data transfers . The HCF uses both a contention based channel access method, called the *enhanced distributed channel access (EDCA)* mechanism for contention based transfer and a controlled channel access, referred to as the *HCF controlled channel access (HCCA)* mechanism, for contention free transfer.

A STA may obtain a TXOP using one or both of the channel access mechanisms specified in 10.23 (HCF). If a TXOP is obtained using the contention based channel access, it is defined as *EDCA TXOP*. If a TXOP is obtained using the controlled channel access, it is defined as *HCCA TXOP*. If an HCCA TXOP is obtained due to a QoS (+)CF-Poll frame from the HC, the TXOP is defined as a *polled TXOP*.

(#1707)Time priority Management frames are defined to be those that appear in a table that has a Time priority column and that have a value of Yes in that Time priority column. No other frames are time priority Management frames.

#### 10.2.3.2 HCF contention based channel access (EDCA)

The EDCA mechanism provides differentiated, distributed access to the WM for STAs using eight different UPs. The EDCA mechanism defines four access categories (ACs) that provide support for the delivery of traffic with UPs at the STAs. Six transmit queues are defined when dot11AlternateEDCAActivated is true, and four transmit queues otherwise. The transmit queue and AC are derived from the UPs as shown in Table 10-1 (UP-to-AC mappings(#68)).

NOTE 1—A DMG or S1G STA that implements a single AC (see 10.23.2.1 (Reference model)) has all of its UP values in Table 10-1 (UP-to-AC mappings(#68)) mapped to AC_BE.

For each AC an enhanced variant of the DCF, called an *enhanced distributed channel access function (EDCAF)*, contends for TXOPs using a set of EDCA parameters. When communicating Data frames outside the context of a BSS (dot11OCBActivated is true), the EDCA parameters are the corresponding default values or are as set by the SME in dot11EDCATable (except for TXOP limits, when the TXOP limits are set to 0 for each AC as specified in 10.23.2.9 (TXOP limits)).(#7073) (#7067)For a STA operating OCB the STA's transmit queue for an AC may be cleared by the invocation of the MLME-CANCELTX.request primitive (see 6.5.26 (Cancel transmissions of MSDUs(11bd)((#7067))). For a non-AP STA communicating within a non-mesh QoS BSS, the EDCA parameters used are from the EDCA Parameter Set element or (for a non-AP STA prior to associating with an AP of an infrastructure BSS, a mesh STA, or a STA that operates OCB) from the default values for the parameters. The parameters used by the EDCAF to control its operation are defined by dot11QAPEDCATable at the AP and by dot11EDCATable at the non-AP STA.

The following rules apply for HCF contention based channel access:

a) The minimum specified idle duration is not the constant value (DIFS) defined for DCF, but is a distinct value. This value is specified in table dot11QAPEDCATableAIFSN for an AP and in table dot11EDCATableAIFSN for a non-AP STA; see 10.23.2 (HCF contention based channel access (EDCA)). The minimum idle duration is assigned either by a management entity or by an AP.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 10-1—UP-to-AC mappings(#68)**

| Priority | UP(#67) | AC | Transmit queue (dot11Alternate-EDCAActivated false or not present) | Transmit queue (dot11Alternate EDCAActivated true) | Designation |
|---|---|---|---|---|---|
| Lowest | 1 | AC_BK | BK | BK | Background |
| | 2 | AC_BK | BK | BK | Background |
| | 0 | AC_BE | BE | BE | Best Effort |
| | 3 | AC_BE | BE | BE | Best Effort |
| | 4 | AC_VI | VI | A_VI | Video (alternate) |
| | 5 | AC_VI | VI | VI | Video (primary) |
| | 6 | AC_VO | VO | VO | Voice (primary) |
| Highest | 7 | AC_VO | VO | A_VO | Voice (alternate) |
| NOTE—The Designation column is an indication of general usage and guidance. Actual uses of each UP are implementation specific. | | | | | |

b) The contention window limits aCWmin and aCWmax, from which the random backoff is computed, are not fixed per PHY, as with DCF, but are variable (contained in tables dot11QAPEDCATableCWmin and dot11QAPEDCATableCWmax for an AP and in tables dot11EDCATableCWmin and dot11EDCATableCWmax for a non-AP STA) and assigned by a management entity or by an AP.

c) Collisions between contending EDCAFs in a STA are resolved within the STA, so that the Data frames from the higher priority AC receive the TXOP and the Data frames from the lower priority colliding AC(s) behave as if there were an external collision on the WM except that the Retry subfield in the MAC headers of MPDUs at the head of the lower priority ACs is not affected.

d) During an EDCA TXOP won by an EDCAF a STA may initiate multiple frame exchange sequences to transmit MMPDUs and/or MSDUs within the same AC. The duration of this EDCA TXOP is bounded, for an AC, by the value dot11QAPEDCATableTXOPLimit for an AP and by dot11EDCATableTXOPLimit for a non-AP STA. A value of 0 for this duration means that the EDCA TXOP is limited as defined by the rule for TXOP limit of 0 found in 10.23.2.9 (TXOP limits).

The QoS AP shall announce the EDCA parameters in selected Beacon frames and in all Probe Response and (Re)Association Response frames by the inclusion of the EDCA Parameter Set element using the information from the MIB entries in dot11EDCATable. If no such element has been received (e.g., prior to association in an infrastructure BSS), a non-AP QoS STA shall use the default values for the parameters. The EDCA Parameter Set element shall be included in all Beacon frames occurring within two delivery traffic indication map (DTIM) periods following a change in announced EDCA parameters, which provides all STAs an opportunity to receive the updated EDCA parameters; it may optionally be included in more Beacon frames. If any associated STAs are in WNM sleep mode or using FMS, these fields should be included by the AP for as many DTIM periods as needed to exceed the longest interval any STA is expected to not receive Beacon frames.

(11ax)An HE AP can additionally provide MU EDCA parameters for non-AP HE STAs as defined in 26.2.7 (EDCA operation using MU EDCA parameters).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

(#307)(#3440)A non-AP non-S1G QoS STA, on receiving an updated EDCA Parameter Set element, should update the dot11EDCATable as soon as practical in the implementation and shall update the dot11EDCATable within an interval of time equal to one beacon interval. The STA shall update the dot11EDCATable and store the EDCA Parameter Set Update Count subfield(#326) in the QoS Info field. A non-AP S1G STA shall update its dot11EDCATable if its STA type is indicated by the STA Type subfield contained in the received EDCA Parameter Set element (see 10.60 (S1G flow control)). An AP may change the EDCA access parameters by changing the EDCA Parameter Set element in the Beacon frame, Probe Response frame, and (Re)Association Response frame. However, the AP should change them only rarely. A non-AP QoS STA shall use the EDCA Parameter Set Update Count subfield(11ax) in the QoS Capability element of Beacon frames, when present, to determine whether the STA is using the current EDCA parameters. If the EDCA Parameter Set Update Count subfield in the QoS Capability element is different from the value that has been stored, it shall query the updated EDCA parameters(#1660) by sending a Probe Request frame to the AP.(#326)

The S1G AP shall set the STA Type subfield of EDCA Parameter Set elements it transmits as follows:

— 1 if it indicates support for sensor STAs but no support for non-sensor STAs
— 2 if it indicates support for non-sensor STAs but no support for sensor STAs

The S1G AP may set the STA Type subfield of EDCA Parameter Set elements to any value that is less than 3 if it indicates support for both sensor STAs and non-sensor STAs as described in 10.60 (S1G flow control).

(#1276)When an S1G AP assigns EDCA Parameters, if management frame protection is negotiated and both STAs set the Extended S1G Action Protection field in the RSNXE that they transmit to 1, the STAs shall:

— use individually addressed Protected EDCA Parameter Set frames instead EDCA Parameter Set frames and
— discard any individually addressed EDCA Parameter Set frame received from the peer STA, with which management frame protection is negotiated.

(#1276)STAs that exchange individually addressed Protected EDCA Parameter Set frames shall follow the rules defined in 12.6.17 (Protection of robust Management frames.).

(#1276)When management frame protection is not negotiated or the Extended S1G Action Protection field in the RSNXE transmitted by either STA is set to 0, the STAs shall not use the Protected EDCA Parameter Set frame.

An S1G AP may assign to an S1G STA EDCA parameters different from the ones in dot11EDCATable, by sending to the STA an EDCA Parameter Set frame with an EDCA Parameter Set element with the Override field equal to 1. An S1G STA receiving an EDCA Parameter Set element with the Override field equal to 1 shall update its MIB values of the EDCA parameters based on the values indicated by the EDCA Parameter Set element.

An S1G STA that receives an EDCA Parameter Set frame with an EDCA Parameter Set element with the Override field equal to 1 shall disregard any EDCA Parameter Set elements with the Override field equal to 0 received afterward during the current association until it receives the EDCA Parameter Set element with the Override field equal to 1 carried in an EDCA Parameter Set frame.

In the Beacon frame the EDCA Parameter Set Update Count subfield is incremented every time any of the announced EDCA parameters change.(#325)

An AP or PCP may use a different set of EDCA parameters(#1660) than it advertises to the STAs in its BSS.

(#1032)(#1670)(#170)A non-QoS STA shall use frames with the QoS subfield of the Subtype subfield set to 0 for data transmissions to other STAs. A STA shall use frames with the QoS subfield of the Subtype

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

subfield set to 0 for (#1775)group addressed Data frames that are not GCR frames unless the transmitting STA knows that all STAs in the BSS have QoS capability, in which case the STA shall use QoS Data frames. (#1772)A STA shall use frames with the QoS subfield of the Subtype subfield set to 0 for nonbroadcast (#1775)group addressed Data frames that are not GCR frames unless it is known to the transmitter that all STAs in the BSS that are members of the multicast group have QoS capability, in which case STAs shall use QoS Data frames. An AP with dot11RobustAVStreamingImplemented equal to true or a mesh STA with dot11MeshGCRImplemented equal to true uses frames with the QoS subfield of the Subtype subfield set to 1 for (#1775)GCR frames, as described in 11.21.16.3.5 (Concealment of GCR transmissions).

(#172)A QoS STA shall not transmit to another QoS STA an individually addressed frame with the Type subfield indicating Data and the QoS subfield of the Subtype subfield set to 0, except if the Subtype subfield indicates Null. A QoS STA should not transmit to another QoS STA an individually addressed frame with the Type subfield indicating Data and the Subtype subfield indicating Null.

(#170)A QoS STA that transmits a group addressed frame with the Type subfield indicating Data shall transmit it with the QoS subfield of the Subtype subfield set to 0 if non-QoS STAs are among the intended receivers, should transmit it with the QoS subfield set to 0 if non-QoS STAs might be among the intended receivers, and should transmit it with the QoS subfield set to 1 if no non-QoS STAs are among the intended receivers.

A QoS STA that transmits a Management frame determines access category used for medium access in transmission of the Management frame as follows:

- If dot11QMFActivated is false or not present and
  - If the Management frame is individually addressed to a non-QoS STA, category AC_BE should be selected.

    NOTE 2—AC_VO might be selected prior to completion of the (re)association procedure, to assist timely discovery of and joining a BSS.(#263)
  - If category AC_BE was not selected by the previous step, category AC_VO shall be selected.

    NOTE 3—Selection of AC_VO above is independent of whether the STA is associated with a BSS, or whether there is a QoS facility in the BSS.
- If dot11QMFActivated is true, the STA determines the access category as described in 11.24 (Quality-of-service Management frame (QMF)).

BlockAckReq and BlockAck frames shall be sent using the same access category for medium access as the corresponding QoS Data frames. When a BlockAckReq, Multi-TID BlockAckReq, or Multi-STA BlockAck frame is transmitted by an HE STA, its operation is defined in 26.4 (HE acknowledgment procedure).(11ax)

A non-S1G STA shall send PS-Poll frames using the access category AC_BE. This reduces the likelihood of collisions following a Beacon frame.

If an S1G STA receives an EDCA Parameter Set element from its associated AP and its STA type is indicated in the STA Type subfield in the received EDCA Parameter Set element, an S1G STA shall transmit PS-Poll frames, PS-Poll+BDT frames and NDP PS-Poll frames using the access category indicated in the PS-Poll ACI subfield. Otherwise, an S1G STA shall transmit PS-Poll frames, PS-Poll+BDT frames and NDP PS-Poll frames either using access category AC_VO when the S1G STA is a non-sensor STA or using access category AC_BE when the S1G STA is a sensor STA (see 10.60 (S1G flow control)).

When the first frame in a frame exchange sequence intended to carry a QoS Data, QoS Null or Management frame is an RTS or CTS frame, the RTS or CTS frame shall be transmitted using the access category of the corresponding QoS Data or QoS Null frame or the access category used for medium access of the Management frame.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Control Wrapper frames shall be sent using the access category that would apply to the carried Control frame.

(#2176)A beamformer may send an HE or VHT NDP Announcement frame or Beamforming Report Poll frame using any access category and without being restricted by admission control procedures.

PS-Poll frames and Management frames are exempted from any and all restrictions on transmissions arising from admission control procedures.

The operation rules of HCF contention based channel access are defined in 10.23.2 (HCF contention based channel access (EDCA)).

The alternate video (A_VI) and alternate voice (A_VO) transmit queues share the same EDCAF as VI and VO transmit queues, respectively, as shown in Figure 10-28 (Reference implementation model when dot11AlternateEDCAActivated is true). When dot11AlternateEDCAActivated is true, a scheduling function above the VO EDCAF selects from the primary or (#476)alternate EDCA transmit queue an MSDU, an A-MSDU, an MMPDU, or set of MSDUs to be the next to be passed to the VO EDCAF (as shown in Figure 10-28 (Reference implementation model when dot11AlternateEDCAActivated is true)) so that the MSDU(s), A-MSDU(s), or MMPDU(s) from the queue with the higher UP are selected with a higher probability than from the queue with the lower UP. When dot11AlternateEDCAActivated is true, a scheduling function above the VI EDCAF selects from the primary or (#476)alternate EDCA transmit queue an MSDU, an A-MSDU, an MMPDU, or set of MSDUs to be the next to be passed to the VI EDCAF so that the MSDU(s), A-MSDU(s), or MMPDU(s) from the queue with the higher UP are selected with a higher probability than from the queue with the lower UP. The default algorithm to select an MSDU, A-MSDU, or MMPDU from either the A_VI or VI queue and to select an MSDU, A-MSDU, or MMPDU from either the A_VO or VO queue is as follows:

— For each EDCAF, an MSDU, A-MSDU, or MMPDU is selected for transmission using the transmission selection procedures defined in 8.6.8 of IEEE Std 802.1Q using two queues, the primary and alternate.

— For a given AC, the order in which frames are selected for transmission shall maintain the requirements specified in 10.7 (MSDU transmission restrictions) of this standard.

Alternative prioritization algorithms that meet the requirements of 10.7 (MSDU transmission restrictions) may be used.(#390)

#### 10.2.3.3 HCF controlled channel access (HCCA)

(#7196)HCCA is deprecated.

The HCCA mechanism uses a QoS-aware centralized coordinator, called a *hybrid coordinator (HC)*. The HC is (#2210)colocated with the AP of the BSS and uses the HC's higher priority of access to the WM to initiate frame exchange sequences and to allocate TXOPs to itself and other STAs in order to provide limited-duration CAPs for contention free transfer of QoS data.

The HC traffic delivery and TXOP allocation may be scheduled to meet the QoS requirements of a particular TC or TS. TXOP allocations and contention free transfers of QoS traffic might be based on the HC's BSS-wide knowledge of the amounts of pending traffic belonging to different TS and/or TCs and are subject to BSS-specific QoS policies.

Implementers are cautioned that QoS STAs are not required to interpret data subtypes that include QoS +CF-Ack in frames not addressed to themselves unless they set the Q-Ack subfield in the QoS Capability element to 1.

The HCF protects the transmissions during each CAP using the virtual CS mechanism.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

A STA may initiate multiple frame exchange sequences during a polled TXOP of sufficient duration to perform more than one such sequence.

The operation rules of the HCCA are defined in 10.23.3 (HCF controlled channel access (HCCA)).

### 10.2.4 Mesh coordination function (MCF)

The mesh facility includes an additional coordination function called *MCF* that is usable only in an MBSS. A mesh STA shall implement the MCF only. MCF has both a contention based channel access and contention free channel access mechanism. The contention based mechanism is EDCA and the contention free mechanism is called the *MCF controlled channel access (MCCA)*. MCF uses the default values for the PTKSA, and GTKSA Replay Counters. The operation rules of the EDCA are defined in 10.23.2 (HCF contention based channel access (EDCA)). The operation rules of the MCCA are defined in 10.24.3 (MCF controlled channel access (MCCA)).

### 10.2.5 Triggered uplink access (TUA)(11ax)

A non-AP HE STA supports trigger-based UL access methods. Triggered UL access (TUA) is used when an HE AP triggers one or more non-AP HE STAs to transmit HE TB PPDUs simultaneously. The optional UL OFDMA-based random access (UORA) additionally allows a non-AP HE STA to access one of a number of resource units (RUs) designated for random access by the HE AP. See 26.5.2 (UL MU operation) and 26.5.4 (UL OFDMA-based random access (UORA))).

### 10.2.6 Combined use of DCF, HCF and TUA(11ax)

The DCF, HCF, and TUA(11ax) are defined so they may operate within the same BSS. The HCF access methods (controlled and contention based) operate sequentially. Sequential operation allows the polled and contention based access methods to alternate, within intervals as short as the time to transmit a frame exchange sequence, under rules defined in 10.23 (HCF). The TUA access methods (see 26.5.2 (UL MU operation) and 26.5.4 (UL OFDMA-based random access (UORA))) allow triggered uplink periods to be interspersed with polled and contention based access methods. In addition, triggered uplink periods support contention based random access.(#1233)

### 10.2.7 Fragmentation/defragmentation overview

The process of partitioning an MSDU, (#2195)A-MSDU, or an MMPDU into smaller MAC-level frames, MPDUs, is called *fragmentation*. Fragmentation creates MPDUs smaller than the original MSDU, (#2195)A-MSDU, or MMPDU length to increase reliability, by increasing the probability of successful transmission as defined in 10.2.2 (DCF) of the MSDU, (#2195)A-MSDU, or MMPDU when channel characteristics limit reception reliability for longer frames. A STA may use fragmentation to use the medium efficiently in consideration of the duration available in granted TXOPs, as long as the rules in 10.4 (MSDU, (11ax)A-MSDU, and MMPDU fragmentation) and 10.11 (A-MSDU operation)(#2195) are followed. Fragmentation is accomplished at each immediate transmitter. The process of recombining MPDUs into a single MSDU, (#2195)A-MSDU, or MMPDU is defined as *defragmentation*. Defragmentation is accomplished at each immediate recipient.

An MSDU transmitted under an HT-immediate block ack agreement shall not be fragmented even if its length exceeds dot11FragmentationThreshold. An MSDU or MMPDU transmitted within an A-MPDU that does not contain an S-MPDU (see 10.12.8 (Transport of S-MPDUs)) shall not be fragmented even if its length exceeds dot11FragmentationThreshold. (#1515)A group addressed MPDU shall not carry a fragment of an MSDU or MMPDU even if the MPDU length exceeds dot11FragmentationThreshold.

NOTE 1—A fragmented MSDU or MMPDU transmitted by an HT STA to another HT STA can be acknowledged only using immediate acknowledgment (i.e., transmission of an Ack frame after a SIFS).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

NOTE 2—As specified in 10.4 (MSDU, (11ax)A-MSDU, and MMPDU fragmentation) and 10.11 (A-MSDU operation), only dynamic fragmentation is supported for A-MSDUs.(#2195)

NOTE 3—A fragmented MSDU or MMPDU transmitted by an S1G STA(#371) can be acknowledged either using immediate acknowledgment (i.e., transmission of an (NDP) Ack frame after a SIFS) or using fragment BA described in 10.3.2.12 (Fragment BA procedure).

Except as described below, when an individually addressed MSDU is received from the LLC or an individually addressed MMPDU is received from the MLME that would result in an MPDU of length greater than dot11FragmentationThreshold, the MSDU or MMPDU shall be fragmented.(#1656) An MSDU or MMPDU may be fragmented even if this is not the case. An exception applies when an MSDU is transmitted using an HT-immediate block ack agreement or when the MSDU or MMPDU is carried in an A-MPDU that does not contain an S-MPDU, in which case the MSDU or MMPDU is transmitted without fragmentation. Each fragment is a frame no longer than dot11FragmentationThreshold, if security encapsulation is not invoked for the MPDU. If security encapsulation is active for the MPDU, then the fragments shall be expanded by the encapsulation overhead and this may result in a fragment larger than dot11FragmentationThreshold.(#1656) An illustration of fragmentation is shown in Figure 10-4 (Fragmentation).

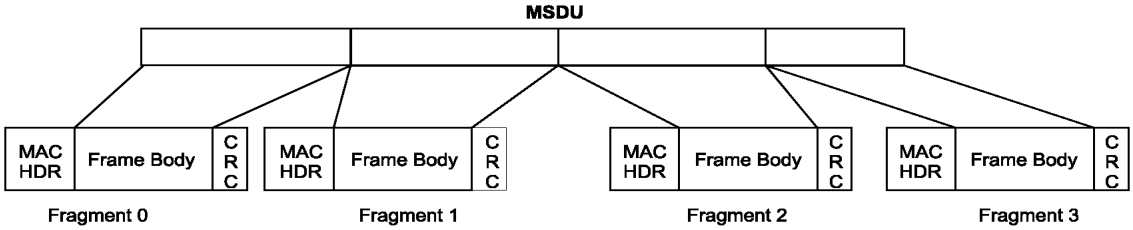

**Figure 10-4—Fragmentation**

The MPDUs resulting from the fragmentation of an MSDU or MMPDU are sent as independent transmissions, each of which is separately acknowledged. This permits transmission retries to occur per fragment, rather than per MSDU or MMPDU. The fragments of a single MSDU or MMPDU are either

— Sent as individual frames using the DCF, or

— Sent as a burst in an EDCA or HCCA TXOP, subject to TXOP limits and medium occupancy limits for the attached PHY.

A QoS Data frame with a TID matching a block ack agreement may be transmitted in a non-A-MPDU with Normal Ack ack policy.

Transmission of fragmented MPDUs by a DMG STA outside of an A-MPDU depends on setting of the No-Fragmentation field in the ADDBA Extension element within the ADDBA Response frame transmitted during the block ack agreement handshake. The MSDU shall not be fragmented if the No-Fragmentation field in the ADDBA Extension element within the ADDBA Response frame transmitted during the block ack agreement handshake is 1. If the No-Fragmentation field in the ADDBA Extension element within the ADDBA Response frame is 0, the originator may fragment an MSDU sent under the block ack agreement, with Normal Ack ack policy for the corresponding MPDUs.

### 10.2.8 MAC data service

The MAC data service provides the transport of MSDUs between MAC peer entities as characterized in 5.1.1 (Data service).

(#114)The transmission process is started by the MAC's receipt of one or more MA-UNITDATA.request primitives, each containing an MSDU and its associated parameters. This might cause one or more Data frames, containing the MSDU(s), to be transmitted.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

(#114)The reception process is started by the MAC's receipt of one or more Data frames containing one or more MSDUs. This might cause one or more MA-UNITDATA.indication primitives, each containing an MSDU and its associated parameters, to be issued.

When dot11SSPNInterfaceActivated is true, an AP shall distribute the group addressed message into the BSS only if dot11NonAPStationAuthSourceMulticast in the dot11InterworkingEntry identified by the source MAC address in the received message is true. When dot11SSPNInterfaceActivated is false, an AP shall distribute the group addressed message into the BSS, except when dot11RelayAPOperationActivated is true and the group addressed message is received from a STA. In that case, the group addressed message shall not be distributed into the BSS, and it shall be forwarded to the S1G relay STA in the same relay. The S1G relay STA shall send the group addressed message to the associated AP as an individually addressed frame using either a four address frame format (PV0 or PV1) or an A-MSDU format as specified in 10.53.4 (Addressing and forwarding of group addressed relay frames).

Unless the MPDU is delivered via DMS, the STA originating the message receives the message as a group addressed message (prior to any filtering). Therefore, a STA shall filter out group addressed messages that contain their address as the source address; the point at which such filtering occurs in the processing of received frames is an implementation choice. When dot11SSPNInterfaceActivated is false, group addressed MSDUs shall be propagated throughout the ESS. When dot11SSPNInterfaceActivated is true, group addressed MSDUs shall be propagated throughout the ESS only if dot11NonAPStationAuthSourceMulticast in the dot11InterworkingEntry identified by the source MAC address in the received message is true.

A STA transmitting on a general link also uses the addressing rules described in 10.64 (Addressing of GLK Data frame transmission).

(#2174)A MAC not contained within an S1G relay shall perform address filtering on the Address 1 field in each MPDU contained in a PPDU and, for non-GLK non-AP STAs, on the DA of each MSDU within an A-MSDU. In the case of a non-GLK STA receiver, when the Address 1 field or DA field contains a group address, address filtering is performed by (#1815)comparing the value in the Address 1 field or DA field to all values in the dot11GroupAddressesTable and the broadcast address value. The STA also validates the BSSID to verify that it either corresponds to the BSS of which the receiving STA is a member, or if dot11OCBActivated is true, that it contains the wildcard BSSID(#3522), indicating a Data frame sent outside the context of a BSS.(#1792) Address 1 filtering is as specified in 10.64 (Addressing of GLK Data frame transmission) when Address 1 is a SYNRA. A GLK AP does not perform any DA filtering for MPDUs received over a non-general link; all MSDUs so received are passed to the DS for further processing. A GLK STA does not perform DA filtering for MPDUs received over a general link; all MSDUs so received are passed to the GLK convergence function and from there to the bridge for further processing.

A mesh STA also uses the address matching rules described in 10.37.3 (Addressing and forwarding of individually addressed mesh Data frames), when it receives an individually addressed frame. When a mesh STA receives a frame with the Address 1 field equal to a group address, the mesh STA also checks the TA to determine whether the group addressed frame originated from one of its peer mesh STAs; if there is no match, the STA shall discard the frame. A mesh STA also uses the address matching rules described in 10.37.4 (Addressing and forwarding of group addressed mesh Data frames).

If the Address 1 field of an MPDU carrying an A-MSDU does not match any address at a receiving STA, then the entire A-MSDU is discarded.

In a QoS STA, the TID parameter of the MA-UNITDATA.request primitive results in a TID being specified for the transmitted MSDU. This TID associates the MSDU with the AC or TS queue for the indicated traffic.

## 10.3 DCF

### 10.3.1 General

The basic medium access protocol is a DCF that allows for automatic medium sharing between compatible PHYs through the use of CSMA/CA and a random backoff count following a busy medium condition. In addition, all individually addressed traffic uses immediate positive acknowledgment (Ack frame), in which retransmission is scheduled by the sender if no Ack frame is received.

The CSMA/CA protocol is designed to reduce the collision probability between multiple STAs accessing a medium, at the point where collisions would most likely occur. Just after the medium becomes idle following a busy medium (as indicated by the CS function) is when the highest probability of a collision exists. This is because multiple STAs could have been waiting for the medium to become available again. This is the situation that necessitates a random backoff procedure to resolve medium contention conflicts.

The DCF is modified for use by DMG STAs to allow sharing of the medium between compatible DMG PHYs (see 10.3.4 (DCF access procedure)). A DMG STA has no direct knowledge of when it might interfere (collide with the transmission of) another STA.

The CS function of a DMG STA might not indicate the medium busy condition due to the predominant nature of directional transmissions and receptions. The transmission of a STA might interfere (collide) with the transmission of another STA even though the CS function at the first STA does not indicate medium busy. The interference (collision) is identified when the expected response frame is not received. SPSH is achieved by the proper combination of the STA antenna configuration during the media access and data transfer phases.

CS shall be performed both through physical and virtual mechanisms.

The virtual CS mechanism is achieved by distributing reservation information announcing the impending use of the medium. The exchange of RTS and CTS frames prior to the actual Data frame is one means of distribution of this medium reservation information. The RTS and CTS frames contain a Duration field that defines the period of time that the medium is to be reserved to transmit the actual Data frame and the returning Ack frame. A STA receiving either the RTS frame (sent by the originating STA) or the CTS frame (sent by the destination STA) shall process the medium reservation. Thus, a STA might be unable to receive from the originating STA and yet still know about the impending use of the medium to transmit a Data frame. The exchange of an MU-RTS Trigger frame and simultaneous CTS frame (#1926)transmissions by HE STAs prior to the actual Data frames is another means of distribution of this medium reservation information.(11ax)

Another means of distributing the medium reservation information is the Duration/ID field in individually addressed frames. This field gives the time that the medium is reserved, either to the end of the immediately following Ack frame, or in the case of a fragment sequence, to the end of the Ack frame following the next fragment.

The RTS/CTS exchange also performs both a type of fast collision inference and a transmission path check. If the return CTS frame is not detected by the STA originating the RTS, the originating STA may repeat the process (after observing the other medium-use rules) more quickly than if the long Data frame had been transmitted and a return Ack frame had not been detected. An RTS/CTS exchange by VHT STAs also performs fast collision inference on the secondary 20 MHz channel, secondary 40 MHz channel, and secondary 80 MHz channel and helps the VHT STA transmitting the RTS to determine the available bandwidth at the responder.(11ay) Similarly, an RTS/DMG CTS exchange by EDMG STAs performs fast collision inference on the secondary channel, secondary1 channel, and secondary2 channel and helps the EDMG STA transmitting the RTS to determine the available bandwidth at the responder.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Another advantage of the RTS/CTS mechanism occurs where multiple BSSs utilizing the same channel overlap. The medium reservation mechanism works across the BSS boundaries. The RTS/CTS mechanism might also improve operation in a typical situation in which all STAs are able to receive from the AP, but might not be able to receive from all other STAs in the BSA.

Except for MPDUs transmitted via the GCR service, the RTS/CTS mechanism cannot be used for MPDUs with a group addressed immediate destination because there are multiple recipients for the RTS frame, and thus potentially multiple concurrent senders of the CTS frame in response. For MPDUs transmitted via the GCR service, an RTS frame may be used if it is directed to a STA within the GCR group (see 10.23.2.12.2 (Unsolicited retry procedure) and 10.25.8 (GCR and GLK-GCR block ack)). The RTS/CTS mechanism is not used for every Data frame transmission. Because the additional RTS and CTS frames add overhead inefficiency, the mechanism is not always justified, especially for short Data frames.

The use of the RTS/CTS mechanism under control of dot11RTSThreshold if dot11TXOPDurationRTSThreshold is 1023 or is not present(11ax) is described in 10.3.5 (Individually addressed MPDU transfer procedure).

(11ax)The use of the RTS/CTS mechanism is under the control of dot11TXOPDurationRTSThreshold if dot11TXOPDurationRTSThreshold is present and is not 1023. If this mechanism is enabled, a non-AP HE STA shall initiate a TXOP that is used for individually addressed frames with an RTS/CTS exchange as defined in 26.2.1 (TXOP duration-based RTS/CTS).

All non-DMG STAs that are members of a BSS are able to receive and transmit at all of the data rates in the BSSBasicRateSet parameter of the MLME-START.request primitive or BSSBasicRateSet parameter of the SelectedBSS parameter of the MLME-JOIN.request primitive; see 6.5.4.2.4 (Effect of receipt) and 6.5.11.2.4 (Effect of receipt).

NOTE—The operational rate or MCS set that a STA advertises does not necessarily contain all the mandatory rates or MCSs, respectively. The basic rate or MCS set that a STA starting a BSS advertises does not necessarily contain all the mandatory rates or MCSs, respectively. However, a STA has to be capable of receiving using a mandatory rate or MCS (when required by the rules in 10.6 (Multirate support)) even if it is not present in the operational rate or MCS set, respectively, that the STA advertises, and similarly has to be capable of transmitting using a mandatory rate or MCS (when required by the rules in 10.6 (Multirate support)) even if it is not present in the basic rate or MCS set, respectively. In this context, “mandatory” describes rates or MCSs that are so described, or described using “shall support”, in reference to the STA type, in the PHY clause applicable to the STA.

All HT STAs that are members of a BSS are able to receive and transmit using all of the MCSs in the Basic HT-MCS Set field of the HT Operation parameter of the MLME-START.request primitive or Basic HT-MCS Set field of the HT Operation parameter of the SelectedBSS parameter of the MLME-JOIN.request primitive; see 6.5.4.2.4 (Effect of receipt) and 6.5.11.2.4 (Effect of receipt).

All VHT STAs that are members of a BSS are able to receive and transmit using all of the <VHT-MCS, NSS> tuples in the basic VHT-MCS and NSS set (see 11.38.7 (Basic VHT-MCS and NSS set operation)) except as constrained by the rules of 10.6.13 (Rate selection constraints for VHT STAs).

All DMG STAs that are members of a BSS are able to receive and transmit using all of the MCSs in the OperationalRateSet parameter of the MLME-START.request primitive or OperationalRateSet parameter of the SelectedBSS parameter of the MLME-JOIN.request primitive; see 6.5.4.2.4 (Effect of receipt) and 6.5.11.2.4 (Effect of receipt).

To support the proper operation of the RTS/CTS by non-DMG STAs, RTS/DMG CTS by DMG STAs, and the virtual CS mechanism, (#181)a non-DMG STA shall interpret Control frames with the Subtype subfield equal to RTS or CTS, (#181)and a DMG STA shall interpret Control frames with the Subtype subfield equal to RTS or DMG CTS.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

A Data frame sent under the DCF shall have the Type subfield set to Data and the Subtype subfield set to Data or Null. A STA receiving a frame with the Type subfield equal to Data shall not indicate the frame to the LLC when the Subtype subfield is equal to Null, but shall indicate the frame to the LLC when the Subtype subfield is equal to Data, even if the frame body contains zero octets.

While in the awake state and operating under DCF but not transmitting, a DMG STA can configure its receive antenna to a quasi-omni pattern in order to receive frames transmitted by any STA that is covered by this antenna pattern.

### 10.3.2 Procedures common to the DCF and EDCAF

#### 10.3.2.1 CS mechanism

Physical and virtual CS functions are used to determine the state of the medium. When either function indicates a busy medium, the medium shall be considered busy; otherwise, it shall be considered idle.

A physical CS mechanism shall be provided by the PHY. See Clause 8 (PHY service specification) for how this information is conveyed to the MAC. The details of physical CS are provided in the individual PHY specifications.

A virtual CS mechanism, referred to as the NAV, shall be provided by all MACs. An additional virtual CS mechanism, referred to as response indication deferral (RID), shall be provided by S1G MACs.

The NAV maintains a prediction of future traffic on the medium based on duration information that is announced in RTS/CTS frames by non-DMG STAs, in MU-RTS Trigger/CTS frames by HE STAs as defined in 26.2.6 (MU-RTS Trigger/CTS frame exchange sequence procedure(#109)), and in RTS/DMG CTS frames by DMG STAs prior to the actual exchange of data.(11ax) The duration information is also available in the MAC headers of all frames other than PV1 MAC frames and PS-Poll frames, and during the BTI, the A-BFT, the ATI, the CBAP, and the SP. The duration information in a frame transmitted by an S1G STA is also available in PS-Poll+BDT frames, in NDP CTS frames, in NDP Ack frames whose Idle Indication field value is 0, and in NDP_2M PS-Poll-Ack frames whose Idle Indication field is 0. (11ax) The duration information might also be available in the RXVECTOR parameter TXOP_DURATION when an HE PPDU is received (see 26.11.5 (TXOP_DURATION)).

The mechanism for setting the NAV using RTS/CTS or RTS/DMG CTS in the DCF is described in 10.3.2.4 (Setting and resetting the NAV), and use of the NAV in HCF is described in 10.23.2.2 (EDCA backoff procedure) and 10.23.3.4 (NAV operation of a TXOP under HCCA). Additional details regarding NAV use appear in 10.3.2.6 (RTS/CTS with fragmentation), 10.3.2.15 (NAV distribution), 10.38.10 (Updating multiple NAVs), and 10.27 (Protection mechanisms).

The mechanism for setting the RID is described in 10.3.2.5 (Setting and resetting the RID).

The CS mechanism combines the NAV state, and in S1G STAs also the RID state, and the STA's transmitter status with physical CS to determine the busy/idle state of the medium. The NAV and RID might be thought of as counters that count down to 0 at a uniform rate. In non-S1G STAs, when the NAV counter is 0, the virtual CS indication is that the medium is idle; when the counter is nonzero, the indication is busy. In S1G STAs, when both NAV and RID counters are 0, the virtual CS indication is that the medium is idle; when either the NAV counter or the RID counter is nonzero the indication is that the medium is busy. (11ax)The virtual CS indication of medium for HE STAs with two NAVs is described in 26.2.4 (Updating two NAVs). If a DMG STA supports multiple NAVs as defined in 10.38.10 (Updating multiple NAVs) and all counters are 0, the virtual CS indication is that the medium is idle; when at least one of the counters is nonzero, the indication is busy. The medium shall be determined to be busy when the STA is transmitting.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

(#1058)(#6064)Immediately after aRxTxTurnaroundTime + aAirPropagationTime + 10% × (aSlotTime – aAirPropagationTime) after each MAC slot boundary as defined in 10.3.7 (DCF timing relations) and 10.23.2.4 (Obtaining an EDCA TXOP), the MAC shall issue a PHY-CCARESET.request primitive to the PHY, where aAirPropagationTime determined as described in 10.22.5 (Operation with coverage classes).

#### 10.3.2.2 MAC-level acknowledgments

The reception of some frames, as described in 10.3.2.11 (Acknowledgment procedure), requires the receiving STA to respond with an acknowledgment if the FCS of the received frame is correct. This technique is known as positive acknowledgment.

Lack of reception of an expected frame containing an acknowledgment indicates to the STA initiating the (#109)frame exchange sequence that an error has occurred. Note, however, that the destination STA may have received the frame correctly, and that the error may have occurred in the transfer or reception of the frame containing an acknowledgment. When a frame containing an acknowledgment is lost, the MAC that initiated the (#109)frame exchange sequence does not receive a protocol indication of whether the initial frame was correctly received.

A correctly received frame is one for which the PHY-RXEND.indication primitive does not indicate an error and the FCS indicates the frame is error free.

#### 10.3.2.3 IFS

##### 10.3.2.3.1 General

(#16)The time interval between certain adjacent PPDU[+SigExt]s is called the *IFS*. A STA shall determine that the medium is idle through the use of the CS function for the interval specified. Ten different IFSs are defined to provide priority levels for access to the wireless medium. Figure 10-5 (Some IFS relationships(#16)) shows some of these relationships. All timings are referenced from occurrence of the PHY interface primitives PHY-TXEND.confirm, PHY-TXSTART.confirm, PHY-RXSTART.indication, and PHY-RXEND.indication.

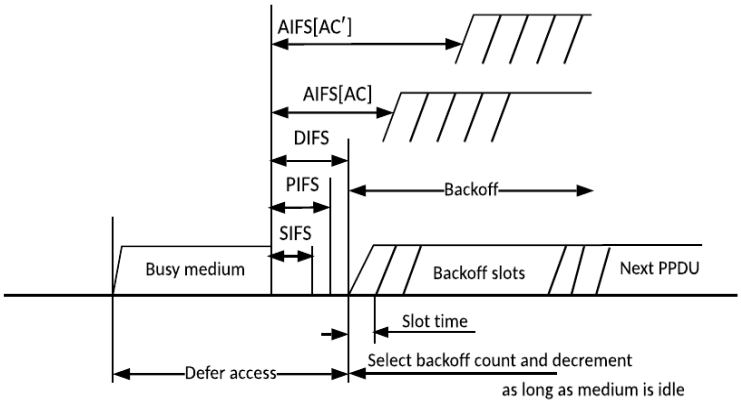

**Figure 10-5—Some IFS relationships(#16)**

The IFSs are as follows:

a) RIFS reduced interframe space
b) SIFS short interframe space
c) PIFS priority interframe space
d) DIFS DCF interframe space
e) AIFS[AC] AIFS arbitration interframe space (for the AC used by the QoS facility)

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

f) EIFS extended interframe space
g) SBIFS short beamforming interframe space
h) BRPIFS beam refinement protocol interframe space
i) MBIFS medium beamforming interframe space
j) LBIFS long beamforming interframe space

The different IFSs shall be independent of the STA bit rate. (#16)The IFS timings are defined as the nominal time gaps between primitives at the MAC after accounting for defined delays (see 10.3.7 (DCF timing relations)). The timing of primitives in turn depend on time gaps between PPDU[+SigExt]s on the medium. The IFS timings except AIFS are fixed for each PHY (even in multirate-capable PHYs). The IFSs are determined from attributes specified by the PHY.

(#16)NOTE—The "frame" in "interframe" is due to historical use of "frame" to signify "PHY frame", as a synonym for "PPDU".

#### 10.3.2.3.2 RIFS

The use of RIFS for a non-DMG STA is obsolete, and support for such use might be subject to removal in a future revision of the standard. A VHT or S1G STA shall not transmit frames separated by a RIFS.

RIFS is a means of reducing overhead and thereby increasing network efficiency.

RIFS may be used in place of SIFS to separate multiple transmissions from a single transmitter, when no SIFS-separated response transmission is expected and either of the following is true:

— The transmitter is not a DMG STA.
— The transmitter is a DMG STA, and each transmission occurs with the same transmit antenna configuration.

RIFS shall not be used between frames with different RA field(#3522). The duration of RIFS is defined by the aRIFS PHY characteristic (see Table 19-25 (HT PHY characteristics) and Table 20-30 (DMG PHY characteristics)). (#14)The RIFS is the time from the end of the previous PPDU to the beginning of the preamble of the subsequent PPDU as seen on the WM. A STA shall not allow the space between PPDUs that are defined to be separated by a RIFS, as measured on the medium, to vary from the nominal RIFS (aRIFSTime) by more than ± 10% of aRIFSTime. Two PPDUs separated by a RIFS shall both be HT PPDUs or shall both be DMG PPDUs.

An HT STA shall not transmit PPDUs separated by a RIFS unless the beacon or probe response most recently received from the BSS's AP contains an HT Operation element with RIFS Mode field equal to 1.

There are additional restrictions regarding when RIFS may be employed as defined in 10.29 (Reverse direction protocol)(#3263). See also 10.27.3.3 (RIFS protection).

#### 10.3.2.3.3 SIFS

(#14)The SIFS is the time from the end of the previous PPDU[+SigExt] to the beginning of the preamble of the subsequent PPDU as seen on the WM (#1570)at the STA transmitting the subsequent PPDU.

(#1570)NOTE—The time between these PPDUs as seen on the WM at any other STA in the BSS, including the STA transmitting the previous PPDU, might be anything from SIFS to SIFS + aAirPropagationTime. Because aSlotTime includes aAirPropagationTime, even in the worst case the beginning of the preamble of the subsequent PPDU will arrive before PIFS at any STA in the BSS.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

(#1106)(#3366)SIFS is the shortest of the IFSs between transmissions from different non-DMG STAs. SIFS shall be used when STAs have seized the medium and need to keep it for the duration of the frame exchange sequence to be performed. Using the smallest gap between transmissions within the frame exchange sequence prevents other STAs, which are required to wait for the medium to be idle for a longer gap, from attempting to use the medium, thus giving priority to completion of the frame exchange sequence in progress.

The SIFS shall be used prior to transmission of each of the following frames:

— An (NDP) Ack frame, a TACK frame, a STACK frame, NDP PS-Poll-Ack frame, a (NDP) CTS frame;
— A PPDU containing a BlockAck frame, NDP BlockAck frame, or BAT frame that is an immediate response to either a BlockAckReq frame or an A-MPDU;
— A DMG CTS frame, a DMG DTS frame, a Grant Ack frame;
— A response frame transmitted in the ATI, and the second or subsequent MPDU of a fragment burst;
— A frame within a series of NDP sector training frames transmitted by an S1G AP after a sector training announcement;
— An RTS frame that is sent as an immediate response to a PS-Poll(+BDT) frame.

The SIFS may also be used, and by an S1G STA for an (NDP) (#4258)PS-Poll frame or uplink trigger frame that is a response to an NDP Paging frame (see 10.46.6 (NDP paging setup)).

(#233)(#14)A non-DMG STA shall not allow the space between PPDU[+SigExt]s that are defined to be separated by a SIFS, as measured on the medium (#1570)at the STA, to vary from the nominal SIFS by more than ± 10% × (aSlotTime – aAirPropagationTime) for the PHY in use. (#233)A DMG STA shall not allow the space between PPDUs that are defined to be separated by a SIFS, as measured on the medium (#1570)at the STA, to vary from the nominal SIFS by more than –0% or +10% × (aSlotTime – aAirPropagationTime).(#1106)

When transmitting a response frame immediately following a SIFS, a DMG STA, or CMMG STA(#150) shall set the TXVECTOR parameter LAST_RSSI of the response frame to the power that was measured on the received PPDU, as reported in the RCPI field of the frame that elicited the response frame. The encoding of the value is as follows:

— Power values less than or equal to –68 dBm are represented as the value of 1.
— Power values between –68 dBm and –42 dBm are represented as $\left\lfloor \frac{p-(-71)+0.5}{2} \right\rfloor$, where $p$ is the power in dBm.
— Power values greater than or equal to –42 dBm are represented as the value 15.
— For all other cases, the STA shall set the TXVECTOR parameter LAST_RSSI of the transmitted frame to 0.

A DMG STA that transmits a PPDU containing at least one individually addressed MPDU shall set the TXVECTOR parameter TURNAROUND to 1 if the STA is required to listen for an incoming PPDU immediately following the transmission of the PPDU; otherwise, the STA shall set the TXVECTOR parameter TURNAROUND to 0. The STA shall set the TXVECTOR parameter TURNAROUND to 0 when it transmits an RTS frame.

(#1106)(11ax)An HE STA that transmits an HE TB PPDU a SIFS after the end of a received PPDU follows the procedure in 26.5.2.3 (Non-AP STA behavior for UL MU operation).

#### 10.3.2.3.4 PIFS

The PIFS is used to gain priority access to the medium.

The PIFS may be used as described in the following list and shall not be used otherwise:

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

- A STA transmitting a Channel Switch Announcement frame, as described in 11.8 (DFS procedures) or transmitting an Extended Channel Switch Announcement frame, as described in 11.9 (Extended channel switching (ECS))
- A STA transmitting a TIM frame, as described in 11.2.3.14 (TIM Broadcast)
- A STA transmitting a Beacon, DMG Beacon or S1G Beacon frame(#2063)
- An HC starting an HCCA TXOP, as described in 10.23.3.2.2 (CAP generation)
- A non-AP QoS STA that is a polled TXOP holder recovering from the absence of an expected reception in a CAP, as described in 10.23.3.2.3 (Recovery from the absence of an expected reception)
- An HT STA using dual CTS protection before transmission of the CTS2, as described in 10.3.2.10 (Dual CTS protection)
- A TXOP holder continuing to transmit after a transmission failure, as described in 10.23.2.8 (Multiple frame exchange sequences in an EDCA TXOP(#109))
- A TXOP holder transmitting an RTS with a bandwidth signaling TA within multiple frame exchange sequences(#109), as specified in 10.23.2.8 (Multiple frame exchange sequences in an EDCA TXOP(#109))
- An RD initiator continuing to transmit using error recovery, as described in 10.29.3 (Rules for RD initiator)(#3263)
- An HT STA performing clear channel assessment (CCA) in the secondary channel before transmitting a 40 MHz mask PPDU using EDCA channel access, as described in 11.15.9 (STA CCA sensing in a 20/40 MHz BSS)
- An AP continuing to transmit in a GCR block ack TXOP after the failure to receive a BlockAck frame, as described in 10.25.8 (GCR and GLK-GCR block ack)
- A VHT STA performing CCA in the secondary 20 MHz, 40 MHz, and 80 MHz channels before transmitting a 40 MHz, 80 MHz, 160 MHz, or 80+80 MHz mask PPDU using EDCA channel access, as described in 10.23.3 (HCF controlled channel access (HCCA))
- An AP or PCP continuing to transmit in the ATI after a transmission failure during the ATI (10.38.3 (ATI transmission rules))
- A source DMG STA of an SP continuing to transmit after a transmission failure, as described in 10.38.6.2 (Service period (SP) allocation)
- A DMG STA performing EDCA access during an allocated CBAP, as described in 10.38.5 (Contention based access period (CBAP) transmission rules)
- A TVHT STA performing CCA in the secondary TVHT_W and TVHT_2W channels before transmitting a TVHT_2W or TVHT_W+W mask PPDU and TVHT_4W or TVHT_2W+2W mask PPDU, respectively, using EDCA channel access, as defined in 10.23.3 (HCF controlled channel access (HCCA))
- An S1G STA performing clear channel assessment (CCA) in the secondary 2 MHz, 4 MHz, and 8 MHz channels before transmitting a 4 MHz, 8 MHz, or 16 MHz mask PPDU using EDCA channel access, as described in 10.23.2.6 (EDCA channel access in an S1G BSS)
- An S1G AP transmitting sounding NDP(s) within an SST sounding RAW
- (11ay)An EDMG STA performing CCA in the secondary, secondary1, and secondary2 channels before transmitting a 4.32 GHz, 6.48 GHz, 8.64 GHz, 2.16+2.16 GHz, or 4.32+4.32 GHz mask PPDU using EDCA channel access, as described in 10.23.2 (HCF contention based channel access (EDCA)).

With the exception of performing CCA in the secondary channel (where the timing is defined in 11.15.9 (STA CCA sensing in a 20/40 MHz BSS)(11ay) for an HT STA and defined in10.38.12.2 (Channel access over multiple channels) for an EDMG STA), a STA using PIFS starts its transmission after its CS mechanism (see

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

10.3.2.1 (CS mechanism)) determines that the medium is idle at the TxPIFS slot boundary, as defined in 10.3.7 (DCF timing relations) and 10.23.2.4 (Obtaining an EDCA TXOP).

#### 10.3.2.3.5 DIFS

The DIFS shall be used by STAs operating under the DCF to transmit Data frames (MPDUs) and Management frames (MMPDUs). A STA using the DCF may transmit if both:

— After it has correctly received a frame, its CS mechanism (see 10.3.2.1 (CS mechanism)) determines that the medium is idle at the TxDIFS slot boundary as defined in 10.3.7 (DCF timing relations).

— The STA's backoff counter has a value of zero.

#### 10.3.2.3.6 AIFS

The AIFS shall be used by QoS STAs that access the medium using the EDCAF to transmit: all Data frames (MPDUs) except during the ATI or an SP, all Management frames (MMPDUs) except during the ATI or an SP, all Extension frames except for the DMG Beacon frame, and the following Control frames:

— PS-Poll(+BDT)

— SSW (if first transmission by an initiator in a CBAP)

— Poll (if first transmission and when in a CBAP)

— Grant (if first transmission and when in a CBAP and not transmitted in response to an SPR frame)

— SPR (when in a CBAP and not transmitted as a response to a Poll)

— RTS (when not transmitted as a response to a PS-Poll(+BDT) frame by an S1G STA)

— CTS (when not transmitted as a response to an RTS frame)

— DMG CTS (when not transmitted as a response to an RTS frame)

— BlockAckReq

— BlockAck (when not transmitted as a response to a BlockAckReq frame)

— NDP PS-Poll

A STA using the EDCAF shall obtain a TXOP for an AC if the STA's CS mechanism (see 10.3.2.1 (CS mechanism)) determines that the medium is idle at the AIFS[AC] slot boundary (see 10.23.2.4 (Obtaining an EDCA TXOP)), after a correctly received frame, and the backoff counter for that AC has a value of zero.

A non-AP and non-PCP QoS STA computes the time periods for each AIFS[AC] from dot11EDCATableAIFSN. In an infrastructure BSS, QoS STAs update their dot11EDCATableAIFSN values using information in the most recent EDCA Parameter Set element of Beacon frames received from the AP of the BSS (see 9.4.2.27 (EDCA Parameter Set element)) if the STA is a non-DMG STA or the most recent EDCA Parameter Set element of DMG Beacon and Announce frames received from the AP or PCP of the BSS if the STA is a DMG STA. A QoS AP or PCP computes the time periods for each AIFS[AC] from dot11QAPEDCATableAIFSN.

#### 10.3.2.3.7 EIFS

(#14)A DCF shall use EIFS before transmission, when it determines that the medium is idle immediately following reception of a PPDU[+SigExt] for which the PHY-RXEND.indication primitive contained an error or a frame for which the FCS value was not correct. Similarly, a STA's EDCA mechanism under HCF shall use the EIFS–DIFS+AIFS[AC] interval. The duration of an EIFS is defined in 10.3.7 (DCF timing relations). The EIFS or EIFS–DIFS+AIFS[AC] interval shall begin following indication by the PHY that the medium is idle after detection of the erroneous PPDU or frame, without regard to the virtual CS mechanism. The STA shall not begin a transmission until the expiration of the later of the NAV and EIFS or EIFS–DIFS+AIFS[AC]. The EIFS and EIFS–DIFS+AIFS[AC] are defined to provide enough time for another STA

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

to acknowledge what was, to this STA, an incorrectly received PPDU or frame before this STA commences transmission. Reception of an error-free frame or reception of an HE PPDU with the RXVECTOR parameter TXOP_DURATION that is not set to UNSPECIFIED during the EIFS or EIFS-DIFS+AIFS[AC] resynchronizes the STA to the actual busy/idle state of the medium, so the EIFS or EIFS-DIFS+AIFS[AC] is terminated and medium access (using DIFS or AIFS as appropriate and, if necessary, backoff) continues following reception of the PPDU[+SigExt] containing error-free frame or following an expected end of the received HE PPDU. At the expiration or termination of the EIFS or EIFS-DIFS+AIFS[AC], the STA reverts to the NAV and physical CS to control access to the medium.(11ax)

EIFS shall not be invoked for an A-MPDU if one or more of its frames are received correctly. EIFS shall not be invoked if the RXVECTOR parameter TXOP_DURATION of a received HE PPDU is not set to UNSPECIFIED.(11ax)

#### 10.3.2.3.8 SBIFS

(11ay)The SBIFS shall separate PPDU transmissions in each of the following cases:

a) Back-to-back PPDU transmissions from a single transmitter during a receive sector sweep or TDD beamforming, or

b) Back-to-back PPDU transmissions when each PPDU transmission occurs with a different transmit antenna configuration and no SIFS-separated response transmission is expected, or

c) Back-to-back PPDU transmissions from a single transmitter when each PPDU transmission occurs with a different transmit RF chain and no SIFS-separated response transmission is expected.

(11ay)The duration of SBIFS is determined by the aSBIFSTime PHY characteristic. (#14)The SBIFS is the time from the end of the previous PPDU to the beginning of the preamble of the subsequent PPDU as seen on the WM. A STA shall not allow the space between (11ay)PPDUs that are defined to be separated by a SBIFS, as measured at the DMG antenna, to be less than aSBIFSTime or to be more than aSBIFSTime + aSBIFSAccuracy. (11ay)Two PPDUs separated by a SBIFS shall both be either DMG PPDUs or EDMG PPDUs.

#### 10.3.2.3.9 BRPIFS

The BRPIFS shall be used by STAs between transmissions of BRP frames. (#14)The BRPIFS is the maximum time from the end of the previous PPDU, or training field if present in the PPDU, to the beginning of the preamble of the subsequent PPDU as seen on the WM. The corresponding minimum time is SIFS. BRPIFS is defined to be equal to aBRPIFS+10%.

#### 10.3.2.3.10 MBIFS

The MBIFS shall be used between the BTI and the A-BFT and between the ISS, RSS, SSW-Feedback, and SSW-Ack. (11ay)In a BRP TXSS, MBIFS shall be used in between the first three transmitted BRP PPDUs (see 10.41.10.5 (BRP transmit sector sweep (BRP TXSS))). MBIFS is equal to 3×aSIFSTime. (#233)A DMG STA shall not allow the space between (#14)PPDUs containing frames that are defined to be separated by an MBIFS, as measured on the medium, to vary from the nominal MBIFS by more than –0% or +10% × (aSlotTime – aAirPropagationTime).

#### 10.3.2.3.11 LBIFS

The LBIFS shall be used (11ay)between two consecutive transmissions that use different DMG antennas but with common RF chain, and when the recipient STA is expected to switch DMG antennas. LBIFS is equal to TXTIME(SSW) + 2×SBIFS(11ay), except when used as part of an ISS or an RSS employing Short SSW PPDUs, in which case LBIFS is equal to 2×TXTIME(Short SSW) + 3×SBIFS. (#233)A DMG STA shall not allow the space between (#14)PPDUs containing frames that are defined to be separated by an LBIFS, as

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

measured on the medium, to vary from the nominal LBIFS by more than –0% or +10% × (aSlotTime – aAirPropagationTime).

### 10.3.2.4 Setting and resetting the NAV

This subclause describes the setting and resetting of the NAV for non-DMG STAs and DMG STAs that support a single NAV. DMG STAs that support multiple NAVs shall update their NAVs according to the procedures described in 10.38.10 (Updating multiple NAVs). HE STAs with two NAV timers shall update their NAV timers according to the procedures described in 26.2.4 (Updating two NAVs).(11ax)

(#2384)The duration information is indicated by a frame as follows:

— If there is a Duration field in the frame, then the duration information is indicated by the Duration field.

— If the frame is a PS-Poll, then the duration information is equal to the time, in microseconds, required to transmit one Ack frame plus one SIFS under the data rate selection rules. If the calculated duration information includes a fractional microsecond, that duration information is rounded up to the next higher integer.

A STA that receives at least one (#4179)frame in a PSDU can update its NAV with the information from any valid Duration field in the PSDU. When the received frame's RA is equal to the STA's own MAC address, the STA shall not update its NAV. Further, when the received frame is a DMG CTS frame and its TA is equal to the STA's own MAC address, the STA shall not update its NAV. For all other received frames the STA shall update its NAV when the received Duration is greater than the STA's current NAV value. Upon receipt of a PS-Poll frame, a STA, except for an S1G STA for which the RXVECTOR parameter RESPONSE_INDICATION of the received PS-Poll frame is NDP Response, shall update its NAV settings as appropriate under the data rate selection rules using a duration value equal to the time, in microseconds, required to transmit one Ack frame plus one SIFS, but only when the new NAV value is greater than the current NAV value. (#1490)If the value calculated for the Duration/ID field is not an integer, the value inserted in the Duration/ID field is rounded up to the next higher integer. When the NAV is reset, a PHY-CCARESET.request primitive shall be issued. This NAV update operation is performed when the PHY-RXEND.indication primitive is received, except when the PHY-RXEND.indication primitive is received before the end of the PPDU. In this exception, the NAV update is performed at the expected end of the PPDU.(11ax)

NOTE 1—An S1G STA that receives a (#3274)frame that does not include a valid Duration field does not update its NAV. However, it updates its RID as described in 10.3.2.5 (Setting and resetting the RID).

An S1G STA that receives a PS-Poll frame with the RXVECTOR parameter RESPONSE_INDICATION equal to NDP Response shall update its NAV using a duration value equal to NDPTxTime (10.3.2.5.2 (RID update)) plus one SIFS, but only when the new NAV value is greater than the current NAV value. The NDPTxTime is calculated according to additional RXVECTOR parameters as described in 10.3.2.5.2 (RID update).

In addition to the NAV update rules described in this subclause, an S1G STA shall also update its NAV to a new NAV value if it receives information that the NAV is greater than the STA's current NAV value. This information shall be received in the Duration field of the following frames: NDP CTS, NDP Ack, NDP_2M PS-Poll-Ack, and S1G Beacon, except when the received frame is one of the following:

— NDP CTS frame that is either addressed to the S1G STA as a response to an RTS frame, or that is an NDP CTS frame whose value of the Duration field can be disregarded as defined in 10.3.2.9 (CTS and DMG CTS procedure).

— NDP Ack frame that is either addressed to the S1G STA, or that has the Idle Indication field equal to 1 (see 10.3.2.11 (Acknowledgment procedure)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

- NDP_2M PS-Poll-Ack frame that is either addressed to that S1G STA, or that has the Idle Indication field equal to 1 (see 10.3.2.11 (Acknowledgment procedure)).
- S1G Beacon frame that includes at least one TIM element in which there is an indication of available BUs for the receiving STA in at least one of the TIM elements.
- S1G Beacon frame that includes at least one TIM element and at least one RPS element that indicate both of the following:
  - There is no indication of available BUs for the receiving STA in any of the TIM elements.
  - The receiving S1G STA is allowed to access the first RAW immediately following the S1G Beacon frame as specified in at least one of the RPS elements.

(11ax)An HE AP that is not a TXOP holder shall update the NAV with the duration information indicated by the RXVECTOR parameter TXOP_DURATION for an HE PPDU if all of the following conditions are met and shall not update the NAV with the duration information indicated by the RXVECTOR parameter TXOP_DURATION if one or more of the following conditions are not met:

- The RXVECTOR parameter TXOP_DURATION is not UNSPECIFIED.
- The HE AP does not receive a frame with a Duration field in the PPDU.
- The duration indicated by the RXVECTOR parameter TXOP_DURATION is greater than the current NAV value of the HE AP.

(11ax)An HE AP that is a TXOP holder shall update the NAV with the duration information indicated by the RXVECTOR parameter TXOP_DURATION for an HE PPDU if all of the following conditions are met and shall not update the NAV with the duration information indicated by the RXVECTOR parameter TXOP_DURATION if one or more of the following conditions are not met:

- The RXVECTOR parameter TXOP_DURATION is not UNSPECIFIED.
- The HE AP does not receive a frame with a Duration field in the PPDU.
- The duration indicated by the RXVECTOR parameter TXOP_DURATION is greater than the current NAV value of the HE AP.
- The RXVECTOR parameter BSS_COLOR is not equal to the BSS color of the HE AP.

NOTE 2—A non-AP HE STA maintains two NAVs, but an HE AP might maintain only one NAV (see 26.2.4 (Updating two NAVs)).

NOTE 3—If a STA receives an HE PPDU with the duration information indicated by both a frame with a Duration field and the RXVECTOR parameter TXOP_DURATION, then the duration information indicated by the RXVECTOR parameter TXOP_DURATION is ignored.

Figure 10-6 (RTS/CTS/data/Ack and NAV setting) indicates the NAV for STAs that might receive the RTS frame, while other STAs might receive only the CTS frame, resulting in the lower NAV bar as shown (with the exception of the STA to which the RTS frame was addressed).

A STA that used information from an RTS frame or MU-RTS Trigger frame as the most recent basis to update its NAV setting is permitted to reset its NAV if no (#3038)PHY-RXEARLYSIG.indication or PHY-RXSTART.indication primitive is received from the PHY during a NAVTimeout period starting when the MAC receives a PHY-RXEND.indication primitive corresponding to the detection of the RTS frame or MU-RTS Trigger frame.(11ax)

In (#8178)a non-DMG BSS, NAVTimeout period is equal to (2 × aSIFSTime) + (CTS_Time) + aRxPHYStartDelay + (2 × aSlotTime). In a non-S1G STA, (11ax)if an RTS frame is used for the most recent NAV update, CTS_Time shall be calculated using the length of the CTS frame and the data rate at which the RTS frame used for the most recent NAV update was received. (11ax)If an MU-RTS Trigger frame was used for the most recent NAV update, CTS_Time shall be calculated using the length of the CTS frame and the 6 Mb/s data rate (see 26.2.6 (MU-RTS Trigger/CTS frame exchange sequence procedure(#109))). In an S1G

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

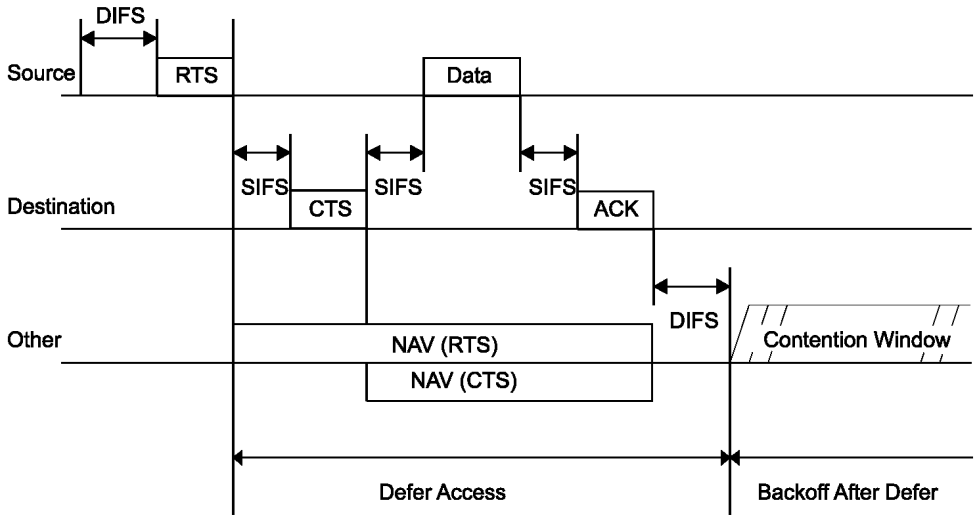

**Figure 10-6—RTS/CTS/data/Ack and NAV setting**

STA, (11ax)CTS_Time shall be calculated using the time required to transmit an NDP CTS frame that is equal to NDPTxTime, which is specified in 10.3.2.5.2 (RID update).

In DMG BSS, NAVTimeout period is equal to (2 × aSIFSTime) + $T_{DMG\text{-}CTS}$ + StartDelayCompensation + (2 × aSlotTime), where $T_{DMG\text{-}CTS}$ is the duration of a DMG CTS frame calculated using the TXVECTOR TRN_LEN parameter equal to the RXVECTOR TRN_LEN parameter of the received RTS frame and StartDelayCompensation is equal to aSlotTime.

NOTE 4—This value of StartDelayCompensation is a compromise over the possible values of aRxPHYStartDelay, which are dependent on both the implementation and the DMG PHY mode.

### 10.3.2.5 Setting and resetting the RID

#### 10.3.2.5.1 General

This subclause describes the setting and resetting of the RID for S1G STAs.

An S1G STA that receives a frame that is not an NDP CMAC PPDU shall update its RID counter based on the values of the received frame's RXVECTOR parameters FORMAT, PREAMBLE_TYPE, RESPONSE_INDICATION, AGGREGATION, MCS, PARTIAL_AID, COLOR, UPLINK_INDICATION, and CH_BANDWITH, as described in this subclause. An S1G STA that receives an NDP CMAC PPDU shall update its RID counter based on the values of the RXVECTOR parameter FORMAT, PREAMBLE_TYPE and the RESPONSE_INDICATION value, which is defined per type of NDP CMAC PPDU in Table 10-2 (RESPONSE_INDICATION value for NDP CMAC PPDUs).

A member PPDU is a PPDU transmitted by a STA that is a member of the same BSS of the receiving STA. A PPDU that is not a member PPDU is a nonmember PPDU.

An S1G STA that receives a member PPDU shall reset and update its RID counter, as defined in 10.3.2.5.2 (RID update), when the PHY-RXSTART.indication primitive corresponding to that PPDU is received. An S1G STA that receives a nonmember PPDU shall not reset the RID counter and shall update the RID counter, i.e., set it to a new value (as defined in 10.3.2.5.2 (RID update)) that is not less than the value that the RID counter will have at the instant of time that corresponds to the end of the received PPDU.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 10-2—RESPONSE_INDICATION value for NDP CMAC PPDUs**

| NDP CMAC PPDU type | RESPONSE_INDICATION value |
|---|---|
| NDP Ack or NDP PS-Poll-Ack (NDP (PS-Poll-)Ack) | No Response if either Idle Indication field value is 0 or the Duration field value is not 0<br><br>Long Response if Idle Indication field value is 1 and Duration field value is 0 |
| NDP Block Ack | No Response |
| NDP CTS | No Response |
| NDP PS-Poll | NDP Response |
| NDP Beamforming Report Poll | Long Response |
| NDP Paging | No Response |
| NDP Probe Request | No Response |
| NDP CF-End | No Response |

The S1G STA shall classify a received PPDU as a member PPDU if it is an NDP CMAC PPDU, or an S1G_1M PPDU. The S1G STA shall classify a received PPDU as a member PPDU if its PREAMBLE_TYPE is either S1G_LONG_PREAMBLE or S1G_SHORT_PREAMBLE and either of the conditions below is satisfied:

— UPLINK_INDICATION is 1 and the PARTIAL_AID indicates that the PPDU is addressed to the AP with which the non-AP STA is associated.

— UPLINK_INDICATION is 0 and the COLOR indicates that the PPDU is generated by the AP with which the STA is associated.

Because the PARTIAL_AID and COLOR values obtained from received PPDUs are not globally unique, an S1G STA that has classified a PPDU as a member PPDU based on PARTIAL_AID and/or COLOR may additionally use the information contained in a valid MAC header (i.e., neither A1 nor A2 field contain a MAC address that corresponds to a STA that is a member of the same BSS as known at the STA) from an MPDU carried in the received PPDU to change the classification of the PPDU to a nonmember PPDU. If the classification of a PPDU is changed from member to nonmember PPDU, then the STA shall:

— Reload the RID counter to the value that the RID counter had at the time of the receipt of the PHY-RXSTART.indication primitive corresponding to this PPDU minus the difference between the current time and that time; and

— Update the RID counter according to the rules for a nonmember PPDU.

NOTE 1—If the PHY-RXEND.indication primitive for the received S1G PPDU contains an ERROR or FormatViolation then the S1G STA sets the EIFS as described in 10.3.7 (DCF timing relations).

If the RID counter is updated then it shall start counting down the RID counter at the end of the received S1G PPDU, except when the PPDU either contains a valid nonzero Duration field that is used for setting the NAV, as described in 10.3.2.4 (Setting and resetting the NAV), or it is intended to the S1G STA. In both of these cases the RID shall be reset.

The received PPDU has an expected duration, in microseconds, of PSDU_RXTIME, starting from the moment the PHY-RXSTART.indication primitive is received. If the PPDU is an NDP CMAC PPDU, the PSDU_RXTIME is equal to 0. If the PPDU is not an NDP CMAC PPDU, the PSDU_RXTIME is calculated based on multiple RXVECTOR parameters and is equal to

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

— The RXTIME defined in Equation (23-69) for S1G_SHORT/S1G_1M formats.

— The RXTIME defined in Equation (23-69) if the PPDU has S1G_LONG format and is an SU PPDU.

— The RXTIME defined in Equation (23-70) minus ($T_{DSTF}$ + $N_{LTF}$ $D_{DLTF}$ + $T_{SIG\text{-}B}$) if the PPDU has S1G_LONG format and is an MU PPDU.

NOTE 2—$T_{DSTF}$, $T_{DLTF}$, and $T_{SIG\text{-}B}$ are defined in Table 23-5 (Timing-related constants) while $N_{LTF}$ is defined in Table 23-11 (Number of LTFs required for different numbers of space-time streams).

Figure 10-7 (Data/Ack with RID setting(#3114)) indicates the RID for STAs that receive the PHY header of the Data frame whose MAC portion does not contain a valid Duration field that updates the NAV. The RID for STAs that receive the PHY header of the Ack frame but not that of the Data frame is 0 (i.e., no response is expected to the Ack frame in this example). The RID is reset for the STA to which the Data was addressed.

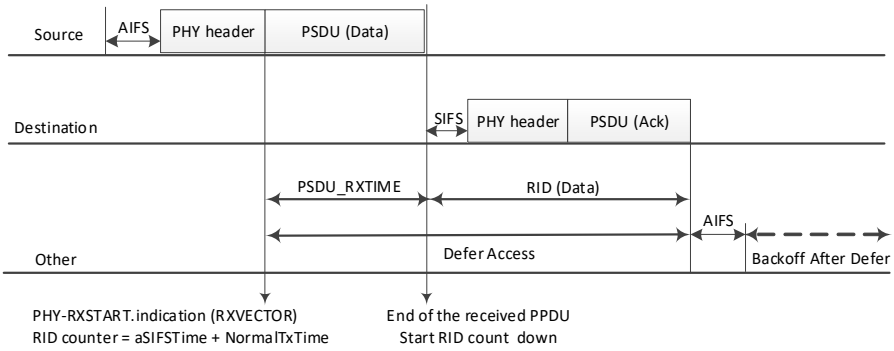

**Figure 10-7—Data/Ack with RID setting(#3114)**

#### 10.3.2.5.2 RID update

An S1G STA updates the value of the RID counter by setting it as described below.

If the value of the RESPONSE_INDICATION parameter is Long Response, the RID counter shall be set to LongTxTime + aSIFSTime, where LongTxTime is obtained as follows:

— If FORMAT is S1G and CH_BANDWIDTH is CBW1 or FORMAT is S1G_DUP_1M, then LongTxTime is equal to the S1G PPDU duration as defined in Table 9-34 (Maximum data unit sizes and durations(#1327)(#4013)).

— If FORMAT is S1G and PREAMBLE_TYPE is S1G_SHORT_PREAMBLE or S1G_LONG_PREAMBLE, then LongTxTime is equal to the largest value in the dot11EDCATableTXOPLimit.

— If FORMAT is S1G_DUP_2M then LongTxTime is equal to the largest value in the dot11EDCATableTXOPLimt(#39)

If the value of the RESPONSE_INDICATION parameter is Normal Response, the RID counter shall be set to NormalTxTime + aSIFSTime. NormalTxTime is calculated based on the RXVECTOR parameters PREAMBLE_TYPE, AGGREGATION, MCS and CH_BANDWIDTH following the rules listed in Table 10-3 (NormalTXTime duration based on RXVECTOR parameters).

If the value of RESPONSE_INDICATION parameter is NDP Response, the RID counter shall be set to NDPTxTime + aSIFSTime. NDPTxTime is calculated based on the RXVECTOR parameter PREAMBLE_TYPE and is equal to the time, in microseconds, required to transmit either an NDP_1M CMAC

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 10-3—NormalTXTime duration based on RXVECTOR parameters**

| PPDU format (see 23.1.4 (PPDU formats)) | AGGREGATION | Expected Response Length (Type) | NormalTxTime |
|---|---|---|---|
| S1G_1M | 0 | 14-octet MPDU (Ack) | The time, in microseconds, required to transmit one Ack frame, where the duration of the frame is calculated according to the rate selection rules described in 10.6.6.5 (Rate selection for control response frames) using its BSSBasicMCSSet parameter and with CH_BANDWIDTH RXVECTOR value equal to CBW1. |
| | 1 | 32-octet MPDU (BlockAck) | The time, in microseconds, required to transmit one BlockAck frame, where the duration of the frame is calculated according to the rate selection rules described in 10.6.6.5 (Rate selection for control response frames) using its BSSBasicMCSSet parameter and with CH_BANDWIDTH RXVECTOR value equal to CBW1 |
| S1G_SHORT or S1G LONG PREAMBLE | 0 | 14-octet MPDU (Ack) | The time, in microseconds, required to transmit one Ack frame, where the duration of the frame is calculated according to the rate selection rules described in 10.6.6.5 (Rate selection for control response frames) using its BSSBasicMCSSet parameter and channel width selection rules for Control frames described in 10.6.6.6 (Channel Width selection for Control frames). |
| | 1 | 32-octet MPDU (BlockAck) | The time, in microseconds, required to transmit one BlockAck frame, where the duration of the frame is calculated according to the rate selection rules described in 10.6.6.5 (Rate selection for control response frames) using its BSSBasicMCSSet parameter and channel width selection rules for Control frames described in 10.6.6.6 (Channel Width selection for Control frames). |

PPDU if the PPDU format is S1G_1M or an NDP_2M CMAC PPDU if the PPDU format is either S1G_SHORT or S1G_LONG (see 23.1.4 (PPDU formats)).

If the value of the RESPONSE_INDICATION parameter is No Response, the RID counter shall be set to 0.

### 10.3.2.6 RTS/CTS with fragmentation

The following is a description of using RTS/CTS for a fragmented MSDU or MMPDU. The RTS/CTS frames define the duration of the following frame and acknowledgment. The Duration/ID field in the Data and Ack frames specifies the total duration of the next fragment and acknowledgment. This is illustrated in Figure 10-8 (RTS/CTS with fragmented MSDU).

Each frame contains information that defines the duration of the next transmission. The duration information from RTS frames shall be used to update the NAV to indicate busy until the end of Ack frame 0. The duration information from the CTS frame shall also be used to update the NAV to indicate busy until the end of Ack frame 0. Both Fragment 0 and Ack frame 0 shall contain duration information to update the NAV to indicate busy until the end of Ack frame 1. This shall be done by using the Duration/ID field in the Data and Ack frames. This shall continue until the last fragment, which shall have a duration of one Ack time plus one SIFS, and its Ack frame, which shall have its Duration/ID field set to 0. Each fragment and Ack frame acts as a virtual RTS frame and CTS frame; therefore no further RTS/CTS frames need to be generated after the RTS/CTS that began the frame exchange sequence.(11ax)

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

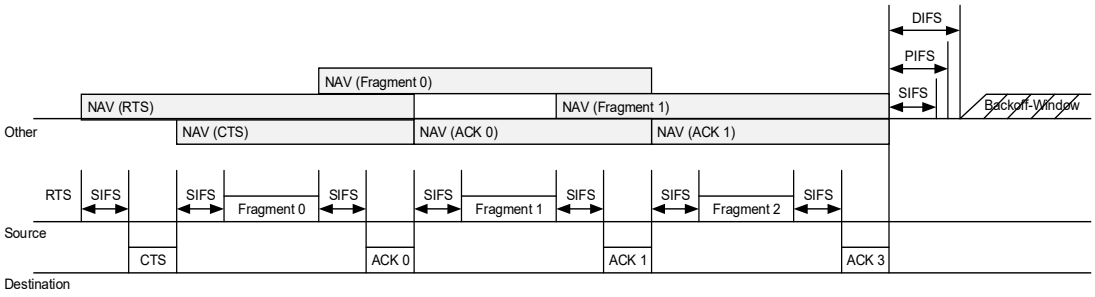

**Figure 10-8—RTS/CTS with fragmented MSDU**

In the case where an acknowledgment is sent but not received by the source STA, STAs that heard the fragment, or Ack frame, mark the channel busy for the next (#109)frame exchange sequence due to the NAV having been updated from these frames. This is the worst-case situation, and it is shown in Figure 10-9 (RTS/CTS with transmitter priority and missed acknowledgment). If an acknowledgment is not sent by the destination STA, STAs that can only hear the destination STA do not update their NAV and may attempt to access the channel when their NAV updated from the previously received frame reaches 0. All STAs that hear the source are free to access the channel after their NAV updated from the transmitted fragment has expired.

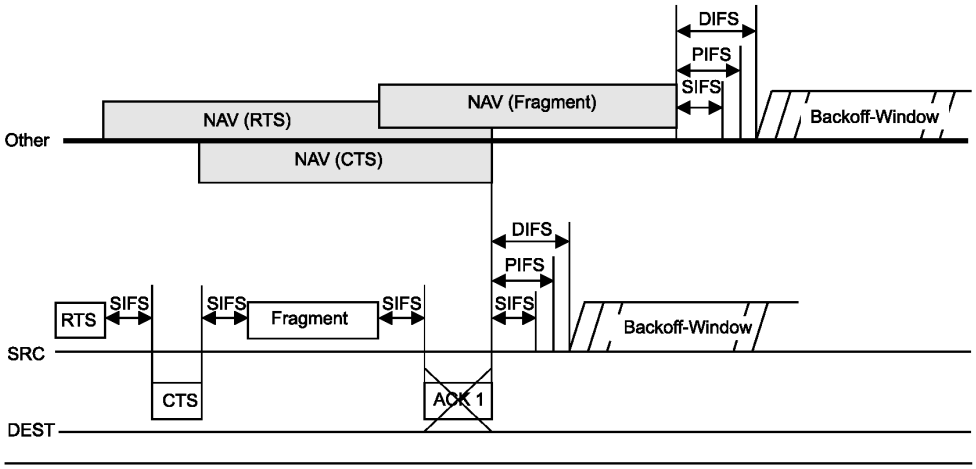

**Figure 10-9—RTS/CTS with transmitter priority and missed acknowledgment**

### 10.3.2.7 VHT and S1G RTS procedure

A VHT STA transmitting an RTS frame carried in non-HT or non-HT duplicate format and addressed to a VHT STA shall set the TA field to a bandwidth signaling TA and shall set the TXVECTOR parameters CH_BANDWIDTH_IN_NON_HT and CH_BANDWIDTH to the same value. (#1782)If the STA sending the RTS frame is capable of dynamic bandwidth operation as the RTS originator (see 10.3.2.9 (CTS and DMG CTS procedure)), the STA shall set the TXVECTOR parameter DYN_BANDWIDTH_IN_NON_HT to Dynamic. Otherwise, the STA shall set the TXVECTOR parameter DYN_BANDWIDTH_IN_NON_HT to Static.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

A VHT STA that initiates a TXOP by transmitting an RTS frame with the TA field set to a bandwidth signaling TA shall not send an RTS frame to a non-VHT STA for the duration of the TXOP.

NOTE—A non-VHT STA considers the bandwidth signaling TA as the address of the TXOP holder. If an RTS frame is sent to a non-VHT STA during a TXOP that is initiated by an RTS frame with a bandwidth signaling TA, the non-VHT STA does not recognize the RTS sender as the TXOP holder.

An S1G STA using dynamic bandwidth operation (see 10.3.2.9 (CTS and DMG CTS procedure)) that transmits an RTS carried in a greater than 2 MHz PPDU with the TXVECTOR parameter FORMAT set to S1G_DUP_2M shall set the Dynamic Indication field in the Frame Control field of the RTS frame to 1. Otherwise, the S1G STA shall set the Dynamic Indication field in the Frame Control field of the RTS carried in any other PPDU to 0 to indicate that it shall not use dynamic bandwidth operation (see 10.3.2.9 (CTS and DMG CTS procedure)).

An S1G STA that transmits an RTS frame to another STA shall set the TXVECTOR parameter RESPONSE_INDICATION to NDP_RESPONSE unless the Link Adaptation Without NDP CMAC PPDU Capable field of the S1G Capabilities element received from that STA contained a value of 1 in which case the S1G STA may set the RESPONSE_INDICATION to NORMAL_RESPONSE as described in 10.31.3 (Link adaptation using the VHT variant HT Control field).

(#371)An S1G STA that initiates a TXOP with a PV1 frame or an NDP CMAC PPDU shall not send an RTS frame for the duration of the TXOP.

### 10.3.2.8 CMMG RTS procedure

A CMMG STA shall transmit an RTS frame carried in CMMG or CMMG duplicate format (see 25.3.10 (CMMG duplication transmission on a 1080 MHz channel)). (#3088)(#1782)If the STA sending the RTS frame is capable of dynamic bandwidth operation as the RTS originator (see 10.3.2.9 (CTS and DMG CTS procedure)), the CMMG STA shall set the TXVECTOR parameter DYN_BANDWIDTH to Dynamic. Otherwise, the STA shall set the TXVECTOR parameter DYN_BANDWIDTH to Static.

### 10.3.2.9 CTS and DMG CTS procedure

A STA that receives an RTS frame addressed to it considers the NAV in determining whether to respond with CTS, unless the NAV was set by a frame originating from the STA sending the RTS frame (see 10.23.2.4 (Obtaining an EDCA TXOP))(#255). In this subclause for a non-S1G STA, “NAV indicates idle” means that the NAV count is 0 or that the NAV count is nonzero but the nonbandwidth signaling TA obtained from the TA field of the RTS frame matches the saved TXOP holder address. In an S1G STA, “NAV indicates idle” means that both NAV and RID counters are 0 or that either NAV or RID counter is nonzero but the TA field of the RTS frame matches the saved TXOP holder address.

A VHT STA that is addressed by an RTS frame in a non-HT or non-HT duplicate PPDU that has a bandwidth signaling TA and that has the RXVECTOR parameter DYN_BANDWIDTH_IN_NON_HT equal to Static behaves as follows:

— If the NAV indicates idle and CCA has been idle for all secondary channels (secondary 20 MHz channel, secondary 40 MHz channel, and secondary 80 MHz channel) in the channel width indicated by the RTS frame’s RXVECTOR parameter CH_BANDWIDTH_IN_NON_HT for a PIFS prior to the start of the RTS frame, then the STA shall respond with a CTS frame carried in a non-HT or non-HT duplicate PPDU after a SIFS. The CTS frame’s TXVECTOR parameters CH_BANDWIDTH and CH_BANDWIDTH_IN_NON_HT shall be set to the same value as the RTS frame’s RXVECTOR parameter CH_BANDWIDTH_IN_NON_HT.

— Otherwise, the STA shall not respond with a CTS frame.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

NOTE 1—A VHT STA that receives a CTS frame in response to an RTS frame the STA has transmitted with the TXVECTOR parameter DYN_BANDWIDTH_IN_NON_HT set to Static might ignore the RXVECTOR parameter CH_BANDWIDTH_IN_NON_HT as it will be the same as the TXVECTOR parameter CH_BANDWIDTH_IN_NON_HT in the RTS frame.(#438)

A VHT STA that is addressed by an RTS frame in a non-HT or non-HT duplicate PPDU that has a bandwidth signaling TA and that has the RXVECTOR parameter DYN_BANDWIDTH_IN_NON_HT equal to Dynamic behaves as follows:

— If the NAV indicates idle, then the STA shall respond with a CTS frame in a non-HT or non-HT duplicate PPDU after a SIFS. The CTS frame's TXVECTOR parameters CH_BANDWIDTH and CH_BANDWIDTH_IN_NON_HT shall be set to any channel width for which CCA on all secondary channels has been idle for a PIFS prior to the start of the RTS frame and that is less than or equal to the channel width indicated in the RTS frame's RXVECTOR parameter CH_BANDWIDTH_IN_NON_HT.

— Otherwise, the STA shall not respond with a CTS frame.

An S1G STA that is addressed by an RTS frame that has the Dynamic Indication field in the Frame Control field equal to 0 (Static) behaves as follows:

— If the NAV indicates idle and the CCA has been idle for all secondary channels within the channel width indicated in the Bandwidth Indication field of the Frame Control field of the RTS frame for a PIFS(#320) prior to the start of the RTS frame, then the STA shall respond with an (NDP) CTS frame after a SIFS. The STA shall set the TXVECTOR parameter CH_BANDWIDTH to a value that is equivalent to the value of the Bandwidth Indication field of the Frame Control field in the received RTS frame. The (NDP_2M) CTS frame shall have the Bandwidth Indication field set to the value of the Bandwidth Indication field of the received RTS frame.

— Otherwise the STA shall not respond with an (NDP) CTS frame.

An S1G STA that is addressed by an RTS carried in a 2 MHz duplicate frame that has the Dynamic Indication field in the Frame Control field equal to 1 (Dynamic) behaves as follows:

— If the NAV indicates idle, then the STA shall respond with an (NDP_2M) CTS frame after a SIFS. The (NDP) CTS frame's TXVECTOR parameter CH_BANDWIDTH may be set to any channel width for which the CCA on all secondary channels has been idle for a PIFS prior to the start of the RTS frame and that is equal to or less than the channel width indicated in the Bandwidth Indication field of the Frame Control field of the RTS frame. The (NDP_2M) CTS frame shall have the Bandwidth Indication field set to a value that is equivalent to the value of the TXVECTOR parameter's CH_BANDWIDTH.

— Otherwise the STA shall not respond with an (NDP) CTS frame.

NOTE 2—The NDP_1M CTS frame is not used for dynamic bandwidth indication.

A non-VHT and non-S1G STA that is addressed by an RTS frame or a VHT STA that is addressed by an RTS frame carried in a non-HT or non-HT duplicate PPDU that has a nonbandwidth signaling TA or a VHT STA that is addressed by an RTS frame in a format other than non-HT or non-HT duplicate behaves as follows:

— If the NAV indicates idle, the STA shall respond with a CTS frame after a SIFS.

— Otherwise, the STA shall not respond with a CTS frame.

The RA field of the CTS frame shall be set to the nonbandwidth signaling TA obtained from the TA field of the RTS frame to which this CTS frame is a response. The Duration field in the CTS frame shall be the duration field from the received RTS frame, adjusted by subtraction of aSIFSTime and the number of microseconds required to transmit the CTS frame at a data rate determined by the rules in 10.6 (Multirate support).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

After transmitting an RTS frame, the STA shall wait for a CTSTimeout interval with a value of aSIFSTime + aSlotTime + aRxPHYStartDelay. This interval begins when the MAC receives a PHY-TXEND.confirm primitive. If a (#3038)PHY-RXEARLYSIG.indication or PHY-RXSTART.indication primitive does not occur during the CTSTimeout interval, the STA shall conclude that the transmission of the RTS frame has failed, and this STA shall invoke its backoff procedure upon expiration of the CTSTimeout interval. If a (#3038)PHY-RXEARLYSIG.indication or PHY-RXSTART.indication primitive does occur during the CTSTimeout interval, the STA shall wait for the corresponding PHY-RXEND.indication primitive to determine whether the RTS frame transmission was successful. (#4179)The reception of a CTS frame addressed to the STA(#6184), corresponding to this PHY-RXEND.indication primitive, shall be interpreted as successful response, permitting the frame exchange sequence to continue(#109). (#4179)Anything else, including the reception of any other frame, shall be interpreted as failure of the RTS frame transmission. In this instance, the STA shall invoke its backoff procedure at the PHY-RXEND.indication primitive and may process the received frame.

A DMG STA follows the procedure defined in this subclause, except that it uses a DMG CTS frame instead of a CTS frame. A non-DMG STA does not transmit DMG CTS frames.

An S1G STA shall transmit NDP CTS frames instead of CTS frames with the following exception: transmission of an CTS frame is required if the link adaptation procedure is negotiated as described in 10.31 (Link adaptation).

The RA/Partial BSSID field of the NDP CTS shall be generated as described in 23.3.12.2.1 (NDP CTS). The Duration field in the NDP CTS frame shall be set to the same value as the Duration field from the received RTS frame, adjusted by subtracting the value of aSIFSTime and the NDPTxTime required to transmit the NDP CTS frame, where NDPTxTime is calculated according to 10.3.2.5.2 (RID update).

An S1G STA that receives an NDP CTS frame should disregard the value of the Duration field of the NDP CTS frame if any of the following conditions are satisfied:

— The Address Indicator field is equal to 1, and the Early Sector Indicator field is equal to 0, and the RA/PBSSID field is equal to the PBSSID of the BSS of which the non-AP STA is a member (see 10.52.4 (TXOP-based sectorization operation)).

— The Address Indicator field is equal to 0, and the RA/PBSSID indicates that the STA is the intended receiver of this frame, and the frame is received during the intervals of time negotiated with the UL-Sync capable AP (see 10.48 (Sync frame operation)).

A CMMG STA that receives an RTS frame in a CMMG or CMMG duplicate PPDU that has the RXVECTOR parameter DYN_BANDWIDTH equal to Static behaves as follows:

— If the NAV indicates idle and CCA has been idle for the secondary channel (secondary 540 MHz channel) in the channel width indicated by the RTS frame's RXVECTOR parameter CH_BANDWIDTH for a PIFS(#320) prior to the start of the RTS frame, then the STA shall respond with a CTS frame carried in a CMMG or CMMG duplicate PPDU after a SIFS. The CTS frame's TXVECTOR parameters CH_BANDWIDTH shall be set to the same value as the RTS frame's RXVECTOR parameter CH_BANDWIDTH.

— Otherwise, the STA shall not respond with a CTS frame.

A CMMG STA that is addressed by an RTS frame in a CMMG or CMMG duplicate PPDU that has the RXVECTOR parameter DYN_BANDWIDTH equal to Dynamic behaves as follows:

— If the NAV indicates idle, then the STA shall respond with a CTS frame in a CMMG or CMMG duplicate PPDU after a SIFS. The CTS frame's TXVECTOR parameters CH_BANDWIDTH may be set to any channel width for which CCA has been idle for a PIFS prior to the start of the RTS frame and that is equal to or less than the channel width indicated in the RTS frame's RXVECTOR parameter indicated in the RTS frame's RXVECTOR parameter CH_BANDWIDTH.

— Otherwise, the STA shall not respond with a CTS frame.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

(11ay)An EDMG STA that is addressed by an RTS frame sent in non-EDMG duplicate PPDU format to establish a TXOP shall behave as follows:

(11ay)If the NAV in the primary channel indicates idle, then

- The STA shall respond with a DMG CTS frame transmitted in non-EDMG or non-EDMG duplicate PPDU format after a SIFS.
- In case the DMG CTS frame is sent in a non-EDMG duplicate PPDU format in response to an RTS sent to establish a TXOP for the transmission of a SISO or an MU PPDU, the TXVECTOR shall be configured as follows:
  - The SCRAMBLER_INIT_SETTING parameter shall be set to indicate Channel_BW if the channel combinations are covered in Table 28-6 (Definition of Scrambler Initialization field when transmitted using the control mode and the Turnaround field is 1(11ay)); otherwise, it shall be set to indicate CONTROL_TRAILER and the parameter CT_TYPE shall be set to CTS_DTS.
  - If the CCA of all the channels that were indicated in the RTS's RXVECTOR parameter CH_BANDWIDTH_SIGNALING were idle for a duration of PIFS prior to the start of the RTS frame, the CH_BANDWIDTH parameter shall be exactly the same as that were indicated in the RTS's RXVECTOR parameter CH_BANDWIDTH_SIGNALING. Otherwise, the CH_BANDWIDTH parameter shall be set to a subset of the channels that were indicated in the RTS's RXVECTOR parameter CH_BANDWIDTH_SIGNALING encoded as defined in Table 28-6 (Definition of Scrambler Initialization field when transmitted using the control mode and the Turnaround field is 1(11ay)) or in the control trailer and where the CCA of such channels were idle for a duration of PIFS prior to the start of the RTS frame.
  - The CH_BANDWIDTH_SIGNALING parameter shall be set to the encoded value of the set of channels indicated by the CH_BANDWIDTH parameter as defined in Table 28-6 (Definition of Scrambler Initialization field when transmitted using the control mode and the Turnaround field is 1(11ay)) or in the control trailer.
- In case the DMG CTS is sent in a non-EDMG duplicate PPDU format in response to an RTS sent to establish a TXOP for the transmission of an SU MIMO PPDU, the TXVECTOR shall be configured as follows:
  - The SCRAMBLER_INIT_SETTING parameter shall be set to indicate CONTROL_TRAILER and the parameter CT_TYPE shall be set to CTS_DTS.
  - If the CCA of all the channels that were indicated in the RTS's RXVECTOR parameter CH_BANDWIDTH_SIGNALING were idle for a duration of PIFS prior to the start of the RTS frame, the CH_BANDWIDTH parameter shall be exactly the same as that were indicated in the RTS's RXVECTOR parameter CH_BANDWIDTH_SIGNALING. Otherwise, the CH_BANDWIDTH parameter shall be set to a subset of the channels that were indicated by the RTS's RXVECTOR parameter CH_BANDWIDTH and for which the CCA of such channels were idle for a duration of PIFS prior to the start of the RTS frame.

Otherwise,

- The STA shall not respond with a DMG CTS frame.
- Except in the case of an RTS frame used for MU-MIMO channel access (see 10.38.12.4.4 (MU-MIMO channel access procedure)), the STA may respond with a DMG DTS frame in a non-EDMG or non-EDMG duplicate PPDU after a SIFS. In case the DMG DTS frame is sent in a non-EDMG duplicate PPDU format, the STA shall set the Duration, NAV-SA and NAV-DA fields of the DMG DTS frame to zero and shall set the TXVECTOR parameters as follows:
  - The SCRAMBLER_INIT_SETTING parameter shall be set to indicate Channel_BW.
  - The CH_BANDWIDTH parameter shall be set to the channels that were indicated in the RTS's RXVECTOR parameter CH_BANDWIDTH_SIGNALING encoded as defined in Table 28-6 (Definition of Scrambler Initialization field when transmitted using the control mode and the Turnaround field is 1(11ay)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

— The CH_BANDWIDTH_SIGNALING parameter shall be set to the encoded value of the set of channels indicated by the CH_BANDWIDTH parameter as defined in Table 28-6 (Definition of Scrambler Initialization field when transmitted using the control mode and the Turnaround field is 1(11ay)).

An EDMG STA that is addressed by an RTS frame sent to establish TXOP for transmission of at least one MIMO PPDU shall follow the procedure defined in 10.38.12.4 (MIMO channel access).

### 10.3.2.10 Dual CTS protection

#### 10.3.2.10.1 Dual CTS protection procedure

The dual CTS mechanism is obsolete. Support for this mechanism might be removed in a later revision of the standard.

A VHT STA shall not transmit VHT PPDUs in a TXOP protected by dual CTS protection.

A VHT AP shall not transmit an HT Operation element with the Dual CTS Protection field set to 1.

If the Dual CTS Protection field of the HT Operation element has value 1 in the Beacon frames transmitted by its AP, a non-AP HT STA shall start every TXOP with an RTS frame addressed to the AP. The RTS frame shall be an STBC frame if the STBC transmit and receive capabilities of the non-AP HT STA allow it to receive and transmit STBC frames using a single spatial stream; otherwise, the RTS frame shall be a non-STBC frame. The AP shall respond with a dual CTS (CTS1 followed by CTS2) separated by PIFS or SIFS. Table 10-4 (Dual CTS rules) describes the sequence of CTS frame transmissions and the required timing.

**Table 10-4—Dual CTS rules**

| Type of RTS | CTS description | Timing |
|---|---|---|
| RTS (non-STBC frame) | CTS1: Same rate or MCS as the RTS frame (non-STBC frame)<br>CTS2: Basic STBC MCS (STBC frame) | (#6587)A PIFS shall be used as the interval between CTS1 and CTS2.<br><br>If the CS mechanism (see 10.3.2.1 (CS mechanism)) indicates that the medium is busy at the TxPIFS slot boundary (see Figure 10-29 (EDCA mechanism timing relationships(#14)(#1058))) following CTS1, CTS2 shall not be transmitted as part of this frame exchange. |
| RTS (STBC frame) | CTS1: Basic STBC MCS (STBC frame)<br>CTS2: Lowest basic rate (non-STBC frame) | (#6587)A SIFS shall be used as the interval between CTS1 and CTS2.<br>The STA resumes transmission a SIFS+CTS2+SIFS after receiving CTS1, instead of after a SIFS.(#6587) |

The dual CTS response applies only to the AP; a non-AP STA shall respond to an RTS frame with a single CTS frame.

If dual CTS Protection is enabled, the AP shall begin each EDCA TXOP with a CTS frame. This CTS frame uses STBC when the immediately following frame uses non-STBC and vice versa. The RA of this CTS frame shall be identical to the RA of the immediately following frame. The AP may continue a PIFS after the CTS frame, only if the CS mechanism (see 10.3.2.1 (CS mechanism)) indicates that the medium is IDLE at the TxPIFS slot boundary (see Figure 10-29 (EDCA mechanism timing relationships(#14)(#1058))) following the transmission of the CTS frame.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

To avoid the resetting of NAV by STAs that have set their NAV due to the reception of a non-STBC RTS frame that is part of a dual CTS exchange, but then do not hear the CTS2, a non-AP HT STA may create a NAV that is not resettable according to the RTS NAV reset rule defined in 10.3.2.4 (Setting and resetting the NAV) at the receiving STAs by initiating the TXOP with a non-STBC CTS addressed to the AP (known as *CTS-to-AP*).

NOTE 1—Sending a CTS-to-AP allows NAV protection to be established without causing the AP to update its NAV, as opposed to, for example, the sending of a CTS-to-self frame, which would potentially have caused the AP NAV to become set and then prevented it from responding to the subsequent RTS frame. The AP does not set a NAV in the CTS-to-AP case and is able to respond to the following RTS frame. The NAV at receiving STAs is not updated by the RTS frame because its duration does not exceed the duration of the preceding CTS frame, and subsequently, the NAV cannot be reset during CTS2.

An STBC CTS addressed to the AP may be transmitted prior to an STBC RTS frame to set a NAV that is not resettable according to the RTS NAV reset rule defined in 10.3.2.4 (Setting and resetting the NAV) at receiving STAs.

NOTE 2—When an HT STA sends an RTS frame to the AP that is a non-STBC frame, the AP returns a CTS frame that is a non-STBC frame to the STA and then immediately transmits a CTS frame that is an STBC frame. The original non-AP STA is now free to transmit. But a non-HT STA that has set its NAV based on the original RTS frame might reset its NAV and then decrement its backoff counter, given that a SIFS + the duration of CTS2 is longer than a DIFS (i.e., the STA does not detect (#3038)a PHY-RXEARLYSIG.indication or PHY-RXSTART.indication primitive within the period specified in 10.3.2.4 (Setting and resetting the NAV)). Thus, without sending a CTS-to-AP, the NAV reservation might not always work.

If dual CTS protection is enabled and a STA obtains a TXOP and does not have any frames to transmit before the expiration of the TXOP duration, the STA may indicate truncation of the TXOP provided that the remaining duration of the TXOP after the transmission of the last frame can accommodate the CF-End frame, a CF-End frame that is an STBC frame duration at the basic STBC MCS, a CF-End frame that is a non-STBC frame at the lowest basic rate, and three SIFSs. The STA indicates truncation of the TXOP by transmitting a CF-End frame with TXVECTOR parameter restrictions as specified in 10.6.6.3 (Rate selection for CF-End frames).

On receiving a CF-End frame from a STA with a matching BSSID, an AP whose last transmitted HT Operation element contained the Dual CTS Protection field equal to 1 shall respond with dual CF-End frames, one CF-End frame that is an STBC frame at the basic STBC MCS and one CF-End frame that is a non-STBC frame at the lowest basic rate, after a SIFS. Dual CF-End frames eliminate unfairness toward STAs that are not of the same mode as the one that owns the TXOP being truncated.

If the TXOP is owned by the AP and dual CTS protection is enabled in the system, the AP may send dual CF-End frames if it runs out of frames to transmit, provided that the remaining TXOP duration after the transmission of the last frame can accommodate an STBC CF-End frame duration at the lowest STBC basic rate, a CF-End frame that is a non-STBC frame at the lowest basic rate, and two SIFSs.

The spacing between the dual CF-End frames sent by the AP shall be SIFS. The first CF-End frame shall use the same encoding (STBC frame versus non-STBC frame) used for transmissions in the TXOP being truncated, and the second CF-End frame shall use the other encoding.

An STBC-capable STA shall choose between control frame operation using either STBC frames or non-STBC frames. In the non-STBC frame case, it discards Control frames that are STBC frames it receives. In the STBC frame case, it discards Control frames that are non-STBC frames received from its own BSS. This choice is a matter of policy local at the STA.

An S1G STA shall not support the Dual CTS Protection procedure defined in 10.3.2.10 (Dual CTS protection).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

#### 10.3.2.10.2 Dual CTS protection examples

Figure 10-10 (Example of dual CTS mechanism (STBC initiator)) shows an example of the operation of the dual CTS protection mechanism. In this example, the initiating STA is an STBC non-AP STA.

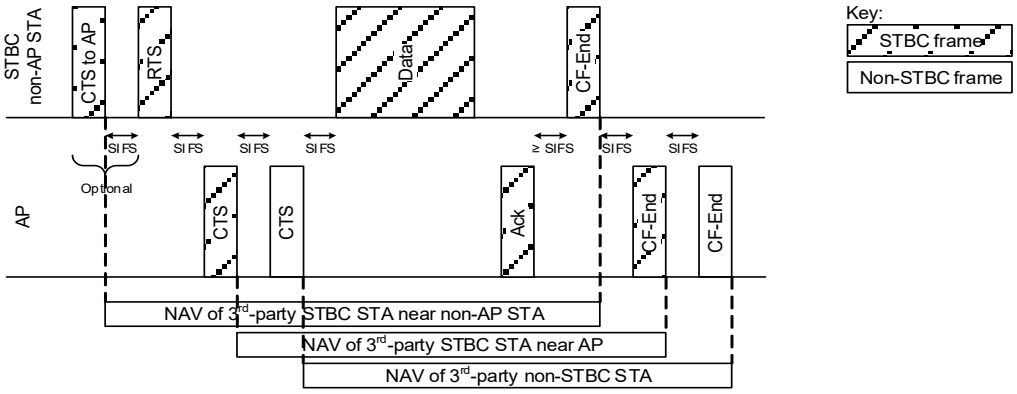

**Figure 10-10—Example of dual CTS mechanism (STBC initiator)**

Figure 10-11 (Example of dual CTS mechanism (non-STBC initiator)) shows an example of the operation of the dual CTS protection mechanism. In this example, the initiating STA is a non-STBC non-AP HT STA.

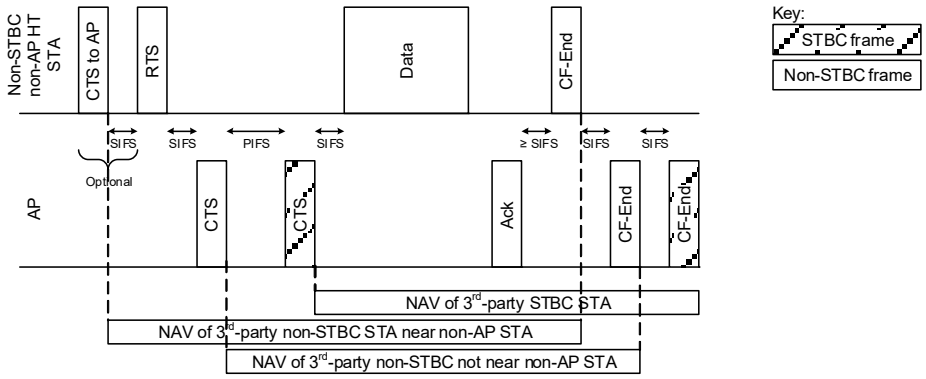

**Figure 10-11—Example of dual CTS mechanism (non-STBC initiator)**

#### 10.3.2.11 Acknowledgment procedure

The following frames require immediate acknowledgment:

- Individually addressed Management frames other than Action No Ack frames
- Individually addressed non-QoS Data frames
- Individually addressed QoS Data frames with Normal Ack or Implicit BAR ack policy
- BlockAck frames not sent in immediate response to A-MPDU
- BlockAckReq frames
- PS-Poll frames, which can be acknowledged by generating a Data frame

During a TWT SP, either the STACK frame or TACK frame can be used in place of the (NDP) Ack frame according to the procedure described in 10.46 (Target wake time (TWT)) and otherwise shall not be used.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

A STA shall not transmit an Ack frame in response to a Management frame of subtype Action No Ack. A STA shall not transmit an Ack or BlockAck frame in response to a group addressed frame. An MPDU that does not require immediate acknowledgment is implicitly considered acknowledged, as if an explicit acknowledgment had been sent.

NOTE 1—Group addressed MSDUs are sent to an AP in individually addressed frames.

Otherwise, upon reception of a frame that requires immediate acknowledgment and, for an AP, with the To DS subfield equal to 1, a STA shall transmit an Ack or BlockAck frame after a SIFS, without regard to the busy/idle state of the medium. (See Figure 10-12 (Individually addressed data/Ack/BlockAck frame).)

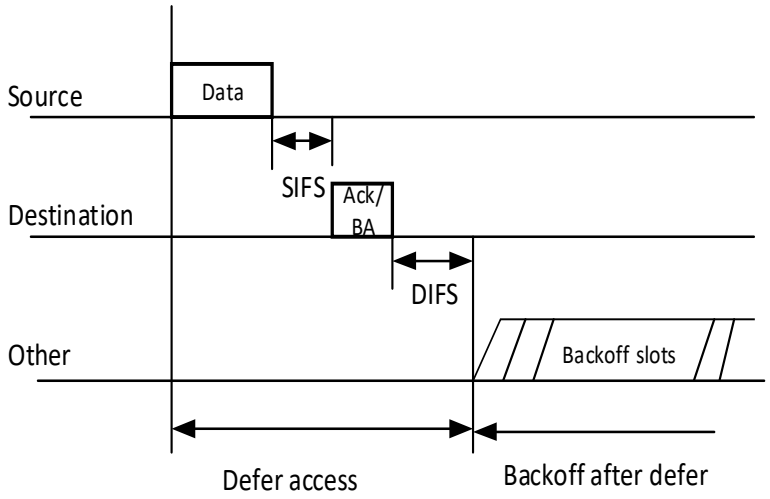

**Figure 10-12—Individually addressed data/Ack/BlockAck frame**

(11ay)A STA operating in an SP with TDD channel access (see 10.38.6.2.2 (SP with TDD channel access(11ay))), upon reception of a frame that requires acknowledgment shall transmit an Ack or BlockAck frame at the start of the earliest occurring TDD slot the STA is assigned to, with the Bitmap and Access Type Schedule field of the TDD slot set to TX, and with slot category of the TDD slot set to Basic TDD slot, as indicated in the TDD Slot Schedule element (see 9.4.2.281 (TDD Slot Schedule element(11ay))).

After transmitting an MPDU that requires an Ack or BlockAck frame as a response(#109), the STA shall wait for an AckTimeout interval, with a value of aSIFSTime + aSlotTime + aRxPHYStartDelay, starting at the PHY-TXEND.confirm primitive. If a (#3038)PHY-RXEARLYSIG.indication or PHY-RXSTART.indication primitive does not occur during the AckTimeout interval, the STA concludes that the transmission of the MPDU has failed, and this STA shall invoke its backoff procedure upon expiration of the AckTimeout interval.

If a (#3038)PHY-RXEARLYSIG.indication or PHY-RXSTART.indication primitive does occur during the AckTimeout interval, the STA shall wait for the corresponding PHY-RXEND.indication primitive to determine whether the MPDU transmission was successful. If the STA (#4179)receives an Ack frame addressed to the STA and corresponding to this PHY-RXEND.indication primitive, this shall be interpreted as successful acknowledgment.

(11ay)A STA operating in an SP with TDD channel access (see 10.38.6.2.2 (SP with TDD channel access(11ay))) has AckTimeout interval value equal to the duration from the PHY-TXEND.confirm primitive of the current frame to the end of the earliest occurring TDD slot the addressed recipient of the MPDU is assigned to, with the Bitmap and Access Type Schedule field of the TDD slot set to RX, and with slot category of the TDD slot set to Basic TDD slot, as indicated in the TDD Slot Schedule element (see 9.4.2.281 (TDD Slot Schedule element(11ay))).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

(11ay)When a STA operating in an SP with TDD channel access transmits, in a TDD slot, an MPDU that has an Ack Policy of Normal Ack, the STA shall not transmit another MPDU that has an Ack Policy of Normal Ack to the same receiver until the corresponding Ack frame is received or the end of the AckTimeout interval, whichever comes first.

If the STA does not (#4179)receive an Ack frame addressed to the STA, this condition shall be interpreted as failure of its MPDU transmission, except as defined below. In this instance, the STA shall invoke its backoff procedure at the PHY-RXEND.indication primitive and may process the received frame. If the STA has transmitted a PS-Poll frame, then the STA's receipt (#4179)of a Data or Management frame transmitted by the recipient of the PS-Poll frame (#6258)and addressed to the STA shall also be accepted as successful acknowledgment of the PS-Poll frame.

NOTE 2—The backoff procedure in the specific case of reception of a corrupted Ack or BlockAck frame results in EIFS rather than DIFS or AIFS being used after the AckTimeout interval and subsequent reception of the corrupted Ack or BlockAck frame (see 10.3.4.3 (Backoff procedure for DCF) and 10.23.2.4 (Obtaining an EDCA TXOP) respectively).

NOTE 3—The receiver STA performs the acknowledgment procedure on all received frames requiring immediate acknowledgment, even if an MSDU or A-MSDU is carried partly or wholly within the frame and is subsequently discarded due to drop eligibility (see DEI subfield in 9.2.4.6.2 (HT variant)).

NOTE 4—The rules that specify the contents of BlockAck frames are defined in 10.25 (Block acknowledgment (block ack)).

Additional exceptions exist for S1G STAs for accepting a (#4179)frame as successful acknowledgment as described in the following three paragraphs:

1) A STA that has enabled the implicit Ack procedure (see 10.53.5.3 (Implicit Ack procedure)) shall consider a received S1G_SHORT/S1G_LONG PPDU as successful acknowledgment of a previously transmitted MPDU that was carried in an S1G_SHORT/S1G_LONG PPDU only in the following two cases:
   a) The STA is a non-AP STA associated to an S1G relay AP and all the conditions below are satisfied:
      — A (#3038)PHY-RXEARLYSIG.indication or PHY-RXSTART.indication primitive that corresponds to the received PPDU is detected within the AckTimeout interval that started as a result of the previously transmitted MPDU.
      — The RXVECTOR parameter PARTIAL_AID is equal to the PARTIAL_AID that corresponds to the BSSID of the parent AP's BSS, or the RXVECTOR parameter PARTIAL_AID is equal to 0 and the PPDU contains an RTS frame with RA equal to the BSSID of the parent AP's BSS.
      — The RXVECTOR parameter UPLINK_INDICATION is equal to 1.
   b) The STA is an AP that has an S1G relay STA associated to it and all the conditions below are satisfied:
      — A (#3038)PHY-RXEARLYSIG.indication or PHY-RXSTART.indication primitive that corresponds to the received PPDU is detected within the AckTimeout interval that started as a result of the previously transmitted MPDU.
      — The RXVECTOR parameter PARTIAL_AID is equal to the 6 LSBs of the PARTIAL_AID that corresponds to the DA of the non-AP STA or the RXVECTOR parameter PARTIAL_AID is equal to 0 and the received PPDU contains an RTS frame with RA equal to the DA of the non-AP STA.
      — The RXVECTOR parameter UPLINK_INDICATION is equal to 0 and the RXVECTOR parameter COLOR is equal to the COLOR value of the S1G relay AP.
2) Under BDT operation as described in 10.49 (Bidirectional TXOP): If a Data frame is sent as an immediate response to an MPDU requiring immediate acknowledgment, the reception of the Data frame shall be accepted as successful acknowledgment of the eliciting MPDU.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

3) The (#4179)reception of an S1G RTS frame(#6298) sent by the recipient of a PS-Poll frame or of a PS-Poll+BDT frame shall be accepted as successful acknowledgment of the PS-Poll or of the PS-Poll+BDT frame.

An S1G STA shall transmit NDP Ack frames for acknowledgment with the following exceptions:

1) Transmission of an Ack frame is required if link adaptation procedure is negotiated as described in 10.31 (Link adaptation).
2) Transmission of a TACK frame or a STACK frame is required if target wake time is negotiated as described in 10.46 (Target wake time (TWT)).
3) Transmission of a TACK frame is required as a response to a PS-Poll frame with the Poll Type subfield equal to 1 as described in 10.47.2 (Rescheduling of awake/doze cycle).
4) Transmission of an NDP PS-Poll-Ack frame is required as a response to an NDP PS-Poll frame.

An S1G STA that satisfies any of the first three exceptions above shall transmit an Ack frame, TACK frame, or STACK frame instead of an NDP Ack frame as a response to an eliciting PPDU for which the RXVECTOR parameter RESPONSE_INDICATION is equal to Normal Response. The control response frame shall have a duration that is equal to NormalTXTime value for a 32-octet MPDU (see Table 10-3 (NormalTXTime duration based on RXVECTOR parameters)) if the eliciting PPDU contains an S-MPDU.

A non-S1G STA shall not transmit NDP Ack and NDP PS-Poll-Ack frames.

An S1G STA that transmits or receives an NDP Ack or NDP PS-Poll-Ack frame shall follow the same rules described above for Ack frames with the following exceptions that apply only to NDP Ack and NDP PS-Poll-Ack frames:

1) An S1G STA that transmits an NDP Ack frame for acknowledgment shall generate the Ack ID field of the NDP Ack frame as described in 23.3.12.2.4 (NDP Ack).
2) An S1G AP that transmits an NDP PS-Poll-Ack frame for acknowledgment of an NDP PS-Poll frame shall generate the Ack ID field of the NDP PS-Poll-Ack frame as described in 23.3.12.2.5 (NDP PS-Poll-Ack). In addition, if the eliciting NDP PS-Poll is an NDP_1M PS-Poll frame the Duration field of the NDP_1M PS-Poll-Ack is set as follows:
    a) If the eliciting NDP_1M PS-Poll frame has a value of the Preferred MCS field equal to “No Preference” the Duration field should indicate an idle period (i.e., the Idle Indication field should be set to 1 as described in 23.3.12.2.5 (NDP PS-Poll-Ack)).
    b) Otherwise, the Duration field should indicate an Ack ID extension (i.e., the Idle Indication field should be set to 0 as described in 23.3.12.2.5 (NDP PS-Poll-Ack)).
3) An S1G STA that expects an NDP Ack frame as a response(#1213) shall consider a received NDP Ack frame as a successful response if the Ack ID field of the NDP Ack frame equals the bit sequence generated from the (#8126)scrambler initialization value and the FCS field of its immediately previously transmitted PSDU as described in 23.3.12.2.4 (NDP Ack).
4) An S1G STA that expects an NDP PS-Poll-Ack frame as a response to an NDP PS-Poll(#1214) shall consider a received NDP PS-Poll-Ack frame as a successful response if the Ack ID field, together with the extension of the Ack ID if present in the Duration field, of the frame equals the bit sequence generated from the RA, TA and CRC fields of its immediately previously transmitted NDP PS-Poll frame as described in 23.3.12.2.5 (NDP PS-Poll-Ack).

Upon reception of a PV1 frame that requires acknowledgment with the (#278)From DS subfield equal to 1, an S1G STA shall generate an acknowledgment frame in response if the AID subfield of A1 field is equal to the AID of the S1G STA and the A2 field is equal to the MAC address of its associated AP. Upon reception of a PV1 frame that requires acknowledgment with the (#278)From DS subfield equal to 0, an S1G STA shall generate an acknowledgment frame in response if A1 field is equal to the MAC address of the S1G STA.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

In an S1G BSS, the AckTimeout interval depends on the TXVECTOR parameter PREAMBLE_TYPE. When the TXVECTOR parameter PREAMBLE_TYPE is equal to S1G_SHORT_PREAMBLE or S1G_LONG PREAMBLE, the AckTimeout interval is calculated with aRxPHYStartDelay value for ≥ 2 MHz short/long preamble except when the receiving STA has indicated use of 1 MHz control responses as described in 10.6.6.6 (Channel Width selection for Control frames) in which case the AckTimeout interval is calculated with aRxPHYStartDelay value for S1G_1M preamble. When the TXVECTOR parameter PREAMBLE_TYPE is equal to S1G_1M preamble, the AckTimeout interval is calculated with aRxPHYStartDelay value for S1G_1M preamble.

During a TWT SP, the BAT frame can be used in place of the (NDP) BlockAck frame, as described in 10.25 (Block acknowledgment (block ack)) and otherwise, is not used.

#### 10.3.2.12 Fragment BA procedure

An S1G STA can partition an MSDU or an MMPDU into multiple fragments as described in 10.4 (MSDU, (11ax)A-MSDU, and MMPDU fragmentation) and send the frames containing the fragments of the MSDU or of the MMPDU as independent transmissions.

An S1G STA indicates support for fragment BA using the Fragment BA Support subfield of the S1G Capabilities Information field in the S1G Capabilities element. An S1G STA shall set the Fragment BA Support subfield to 1 in S1G Capabilities element if dot11FragmentBAOptionImplemented is true. Otherwise, the S1G STA shall set the Fragment BA Support subfield to 0. An S1G STA (known as the originator STA) with dot11FragmentBAOptionImplemented equal to true sending an MSDU or MMPDU (whether fragmented or not) to another S1G STA shall use the fragment BA procedure as described in this subclause if it has received from the STA (known as the recipient STA) a frame that included an S1G Capabilities element with the Fragment BA Support subfield equal to 1. Otherwise an S1G STA shall not use the fragment BA procedure. Non-S1G STAs shall not use the fragment BA procedure.

An originator STA may send fragments with Block Ack ack policy.

The receiving STA that is the intended receiver of either a fragment with Implicit BAR ack policy or a BlockAckReq frame shall send an NDP BlockAck frame after a SIFS, without regard of the idle/busy state of the medium, that is:

— An NDP_1M BlockAck frame if the eliciting fragment is either carried in an S1G_1M PPDU or the receiving STA has indicated use of 1 MHz control response frames as described in 10.6.6.6 (Channel Width selection for Control frames).

— An NDP_2M BlockAck frame if the eliciting fragment is carried in an S1G_SHORT/S1G_LONG PPDU and the receiving STA has not indicated use of 1 MHz control response frames as described in 10.6.6.6 (Channel Width selection for Control frames).

The receiving STA shall generate the BlockAck ID and the Starting Sequence Control field of the NDP BlockAck as described in 23.3.12.2.6 (NDP BlockAck).

The receiving STA shall include the receipt status of a set of the fragments in the BlockAck Bitmap field of the NDP BlockAck frame as follows:

1) If the originator STA elicits an NDP_1M BlockAck frame as a response, the BlockAck Bitmap field of the NDP BlockAck frame indicates the receipt status of a set of fragments which depends on the value of the Fragment Number subfield in the Sequence Control field of the fragment that elicited the response:
    a) If the Fragment Number subfield is not greater than 7 then the BlockAck Bitmap field shall indicate the receipt status of fragments with fragment numbers from 0 to 7.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

b) If the Fragment Number subfield is greater than 7 then the BlockAck Bitmap field shall indicate the receipt status of fragments with fragment numbers from 8 to 15.

2) If the originator STA elicits an NDP_2M BlockAck frame as a response, the BlockAck Bitmap field of the NDP BlockAck frame shall indicate the receipt status of the fragments with fragment numbers from 0 to 15.

NOTE 1—An NDP_1M BlockAck frame can acknowledge only a limited number of consecutive fragments because its BlockAck Bitmap field size is 8. Instead, an NDP_2M BlockAck frame can acknowledge up to the maximum number of fragments because its BlockAck Bitmap field size is 16.

The bitmap of the NDP BlockAck frame is protected using the encoding procedure described in 10.56 (Bitmap protection for NDP BlockAck frames).

An originator STA that elicits an NDP_1M BlockAck frame as a response shall not transmit a fragment that has a Fragment Number subfield greater than 7 if it has not previously received an NDP_1M BlockAck frame that indicates reception of all fragments with fragment numbers from 0 to 7.

The originator STA shall consider an NDP_1M BlockAck frame (or an NDP_2M BlockAck frame) as received if the BlockAck ID field value equals the 2 LSBs (or 6 LSBs) of the (#8126)scrambler initialization value in the (#3409)SERVICE field and the Starting Sequence Control field value equals the Sequence Number of the fragment that elicited the response.

NOTE 2—(#6277)(#8126)The scrambler initialization value is obtained from the PHY-TXEND.confirm parameter SCRAMBLER_OR_CRC. The values of the BlockAck ID and Starting Sequence Number fields(#4200) are obtained after decoding the NDP BlockAck frame as described in 10.56 (Bitmap protection for NDP BlockAck frames).

If the originator STA does not receive an NDP BlockAck frame as an immediate response, it may retransmit the last transmitted fragment to resolicit an immediate NDP BlockAck response.

### 10.3.2.13 MU acknowledgment procedure

#### 10.3.2.13.1 Acknowledgment procedure for DL MU PPDU in SU PPDU(11ax)

The acknowledgment procedure performed by a STA that receives MPDUs that were transmitted within a VHT MU PPDU or an HE MU PPDU is the same as the acknowledgment procedure for MPDUs that were not transmitted within a VHT MU PPDU or an HE MU PPDU sent by an AP, except if the STA is an HE STA that follows the rules defined in 26.3 (Fragmentation and defragmentation) and in 26.4 (HE acknowledgment procedure).(11ax)

NOTE 1—All MPDUs transmitted within a VHT MU PPDU (11ax)or an HE MU PPDU are contained within A-MPDUs, and the rules specified in 9.7.3 (A-MPDU contents) prevent an immediate response (11ax)carried in an SU PPDU to more than one of the A-MPDUs.

Responses to A-MPDUs within a VHT MU PPDU (11ax)or an HE MU PPDU for DL transmission that are not immediate responses to the VHT MU PPDU (11ax)or the HE MU PPDU are transmitted in response to explicit BlockAckReq frames by the AP. Examples of VHT MU PPDU frame exchange sequences are shown in Figure 10-13 (Example of TXOP containing VHT MU PPDU transmission with immediate

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

acknowledgment to VHT MU PPDU) and Figure 10-14 (Example of TXOP containing VHT MU PPDU transmission with no immediate acknowledgment to VHT MU PPDU).

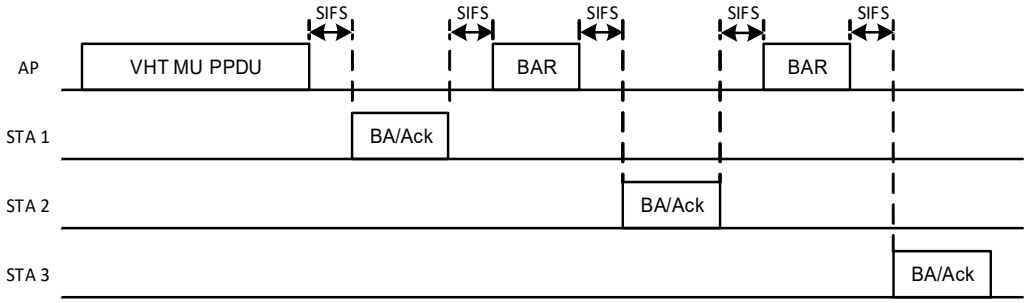

**Figure 10-13—Example of TXOP containing VHT MU PPDU transmission with immediate acknowledgment to VHT MU PPDU**

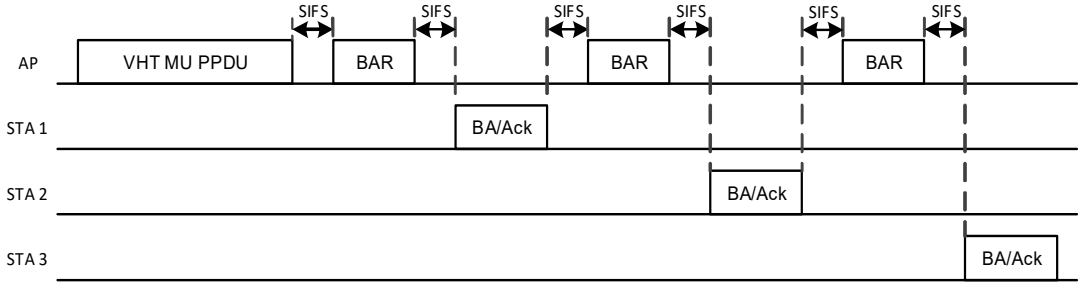

**Figure 10-14—Example of TXOP containing VHT MU PPDU transmission with no immediate acknowledgment to VHT MU PPDU**

Recovery within the TXOP that contains a VHT MU PPDU or an HE MU PPDU can be performed according to the rules of 10.23.2.8 (Multiple frame exchange sequences in an EDCA TXOP(#109)). BlockAckReq frames related to A-MPDUs within a VHT MU PPDU or an HE MU PPDU can be transmitted in a TXOP separate from the one that contained the VHT MU PPDU or the HE MU PPDU.(11ax)

(11ay)An EDMG STA indicates that it is DL MU-MIMO capable by setting the MU-MIMO Supported subfield in the STA's EDMG Capabilities element to 1. An EDMG MU-MIMO initiator shall not transmit an EDMG MU-MIMO PPDU to an EDMG STA that does not have the MU-MIMO Supported subfield equal to 1.

(11ay)An EDMG STA that is DL MU-MIMO capable shall support the (#4251)EDMG Multi-TID BlockAck frame. An MU-MIMO initiator may transmit an MPDU with TID for which a block ack agreement(#3741) does not exist. In this case, the MU-MIMO responder shall respond to the MPDU with (#4251)an EDMG Multi-TID BlockAck frame following the rules defined in 10.70.2 (Acknowledgment context in an EDMG Multi-TID BlockAck frame(#4251)).

(11ay)An EDMG STA that is DL MU-MIMO capable and that has the EDMG Multi-TID Aggregation Support subfield of its EDMG Capabilities element set to a nonzero value

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

— May set the EDMG All Ack Support subfield in the STA's EDMG Capabilities element to 1 and
— Shall follow rules defined in 10.70 (EDMG A-MPDU with multiple TIDs(11ay)).

(11ay)The acknowledgment procedure performed by EDMG STAs that receive an MPDU within an EDMG MU PPDU from an MU-MIMO initiator shall follow the schedule defined by the MU-MIMO initiator.

(11ay)An MU-MIMO initiator shall set the ack policy of MPDUs contained in each A-MPDU transmitted within an EDMG MU PPDU to Scheduled Ack and shall include at least one Block Ack Schedule frame in each A-MPDU transmitted within an EDMG MU PPDU. Each Block Ack Schedule frame shall contain the scheduling information for the EDMG STA that is an intended receiver of the A-MPDU. An MU-MIMO initiator shall set the value of the Response Duration subfield of the Block Ack Schedule frame equal to the duration of the expected BlockAck frame or EDMG Multi-TID BlockAck frame (see 10.25.5 (Selection of BlockAck and BlockAckReq variants)) transmission from a STA addressed by an A-MPDU within a transmitted MU PPDU. The value of the expected transmission should be calculated using MCS 0. The values of all subfields of the Block Ack Schedule frame shall not change if transmitted multiple times in the same A-MPDU. An MU-MIMO initiator shall set the value of the Response Offset subfield of the Block Ack Schedule frame to SIFS in an A-MPDU transmitted to a STA that is expected to be the first responder.

(11ay)An EDMG STA shall transmit a BlockAck frame or EDMG Multi-TID BlockAck frame in response to a received EDMG MU PPDU immediately after a period of time equal to the value of the Response Offset subfield from the end of EDMG MU PPDU. The Response Offset subfield is contained in the Block Ack Schedule frame within the MU PPDU.

(11ay)If an MU-MIMO initiator does not intend to elicit a BlockAck frame or EDMG Multi-TID BlockAck frame from a STA addressed by an A-MPDU within a transmitted MU PPDU, it shall set the Ack Policy field equal to No Ack or Block Ack as defined in Table 9-13 (Ack policy) and shall set the values of the Response Offset field and Response Duration field within the frame to 0.

(11ay)If an expected BlockAck frame or EDMG Multi-TID BlockAck frame from a STA was not received by an MU-MIMO initiator, the initiator may transmit a BlockAckReq frame or Multi-TID BlockAckReq frame (see 10.25.5 (Selection of BlockAck and BlockAckReq variants)) to that STA immediately after a period of time equal to the value of the Next PPDU Start Offset subfield starting from the end of EDMG MU PPDU. The Next PPDU Start Offset subfield is contained in the Block Ack Schedule frame within the MU PPDU.

(11ay)The entire MU sequence shall not exceed the established TXOP duration.

(11ay)An example of an A-MPDU transmitted in an EDMG MU PPDU is shown in Figure 10-15 (Example of A-MPDU transmitted in EDMG MU PPDU(11ay)). In this example, an A-MPDU contains three Block Ack Schedule frames: one at the beginning and two at the end of the A-MPDU.

| | | | | | | |
|---|---|---|---|---|---|---|
| **Block Ack Schedule** | QoS Data frame (Ack Policy=01) | QoS Data frame (Ack Policy=01) | … | QoS Data frame (Ack Policy=01) | **Block Ack Schedule** | **Block Ack Schedule** |

**Figure 10-15—Example of A-MPDU transmitted in EDMG MU PPDU(11ay)**

(11ay)An example of the EDMG MU PPDU frame acknowledgment procedure for three EDMG STAs with the illustration of scheduling information delivered to them is shown in Figure 10-16 (Example of TXOP containing EDMG MU PPDU transmission(11ay)). In this example, the value of the Next PPDU Start Offset field is the same for all STAs.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

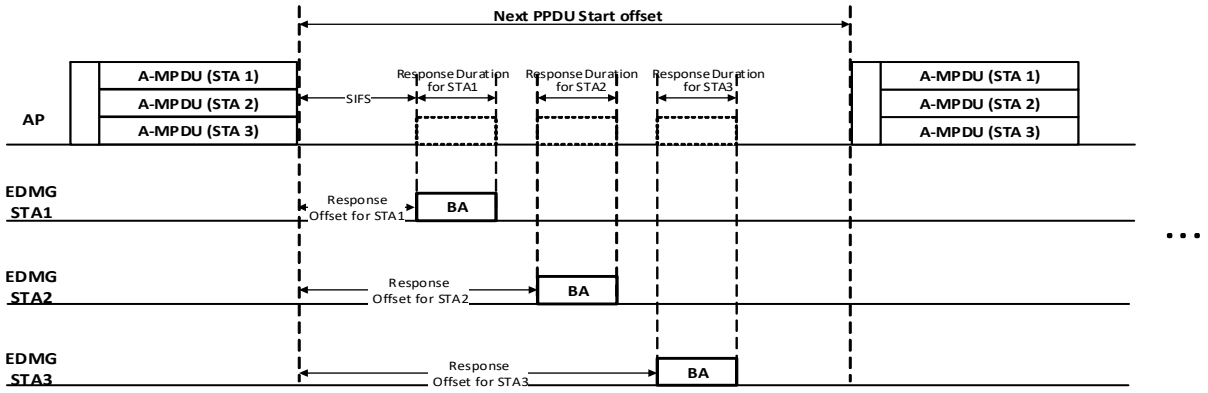

**Figure 10-16—Example of TXOP containing EDMG MU PPDU transmission(11ay)**

NOTE 2—A BlockAck frame is sent in immediate response to the BlockAckReq frame for HT-immediate block ack. An Ack frame might be sent in immediate response carried in an SU PPDU to an S-MPDU in the VHT MU PPDU or the HE MU PPDU. Responses to S-MPDUs for more than one STA contained in an HE MU PPDU are transmitted as specified in 10.3.2.13.2 (Acknowledgment procedure for DL MU PPDU in MU format(11ax)). A Multi-STA BlockAck frame is sent in immediate response to a Multi-TID BlockAckReq frame.(11ax)

NOTE 3—A BlockAckRequest frame would typically not be sent to a STA in the case where the A-MPDU to the STA contained no MPDUs requiring immediate acknowledgment. It could be sent if MPDUs in a previous A-MPDU remain unacknowledged.

### 10.3.2.13.2 Acknowledgment procedure for DL MU PPDU in MU format(11ax)

A non-AP STA shall not set the ack policy to HETP Ack.

A non-AP STA that is the recipient, within an HE MU PPDU, of a QoS Data frame or QoS Null frame with HETP Ack ack policy, of an MU-BAR Trigger frame or a GCR MU-BAR Trigger frame, or of a Management frame that solicits acknowledgment, shall send the immediate response according to the scheduling information that is carried either in the Trigger frame(s) or TRS Control subfield. If a Basic Trigger frame (see 9.3.1.22 (Trigger frame format(11ax))) or frame carrying a TRS Control subfield (see 9.2.4.7.1 (TRS Control)) is not received, then the STA shall not respond.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

An example of UL OFDMA acknowledgment to an HE MU PPDU is shown in Figure 10-17 (Example of HE MU PPDU transmission with immediate UL OFDMA acknowledgment(11ax)).

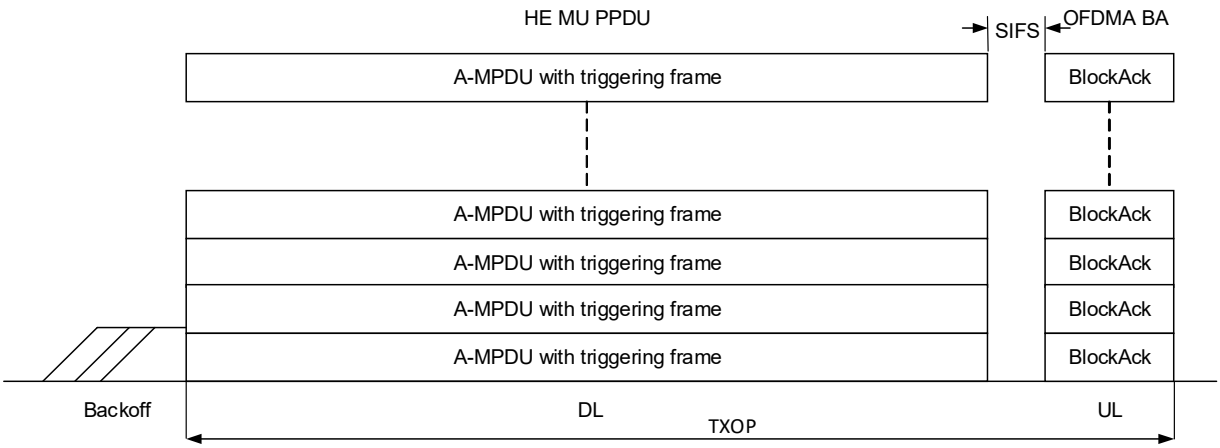

**Figure 10-17—Example of HE MU PPDU transmission with immediate UL OFDMA acknowledgment(11ax)**

An AP may use an MU-BAR Trigger frame or a GCR MU-BAR Trigger frame to solicit acknowledgment frames from multiple HE STAs to which the AP has sent QoS Data frames with Block Ack ack policy or from which the AP has not received immediate acknowledgment frames after sending QoS Data frames with HETP Ack ack policy in an HE MU PPDU.

### 10.3.2.13.3 Acknowledgment procedure for UL MU transmission(11ax)

An AP that receives frames from more than one STA that are part of (#2318)a UL MU transmission (see 9.42.2) and that require an immediate acknowledgment (i.e., a QoS Data frame with Normal Ack or Implicit BAR ack policy or a Management frame other than an Action No Ack frame), shall send an immediate acknowledgment in either an SU PPDU (see 26.4.4.5 (Responding to an HE TB PPDU with an SU PPDU)) or an HE MU PPDU (see 26.4.4.6 (Responding to an HE TB PPDU with an HE MU PPDU)). The Multi-STA BlockAck frame may be transmitted in a non-HT PPDU, non-HT duplicate PPDU, HT PPDU, VHT PPDU, HE SU PPDU, HE ER SU PPDU, or HE MU PPDU. After the reception of (#2318)a UL frame requiring acknowledgment, transmission of the DL acknowledgment shall commence after a SIFS, without regard to the busy/idle state of the medium. When an AP transmits an immediate acknowledgment in an HE MU PPDU in response to an A-MPDU sent in an HE TB PPDU, the AP should send it within the 20 MHz channel(s) where the pre-HE modulated fields of the HE TB PPDU sent by the STA are located. The immediate acknowledgment is an Ack frame, Compressed BlockAck frame, or Multi-STA BlockAck frame.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

An example of multiple BlockAck frames sent in DL MU is shown in Figure 10-18 (Example of UL MU transmission with immediate DL MU transmission containing individually addressed BlockAck frames acknowledging frames received from respective STAs(11ax)).

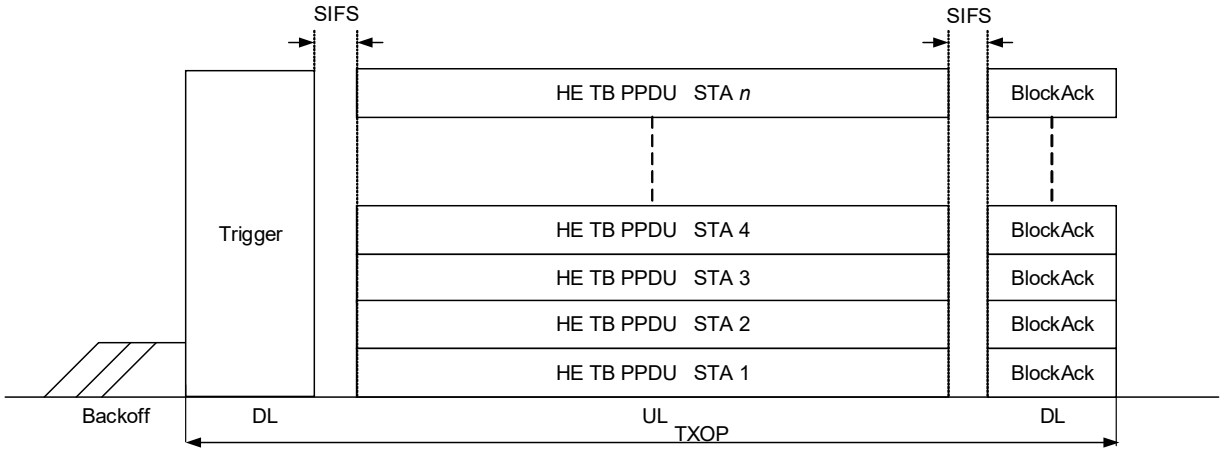

**Figure 10-18—Example of UL MU transmission with immediate DL MU transmission containing individually addressed BlockAck frames acknowledging frames received from respective STAs(11ax)**

An example of a Multi-STA BlockAck frame acknowledgment in a non-HT PPDU, HT PPDU, VHT PPDU, HE SU PPDU, or HE ER SU PPDU is given in Figure 10-19 (Example of UL MU transmissions with immediate Multi-STA BlockAck frame acknowledging MPDUs(11ax)).

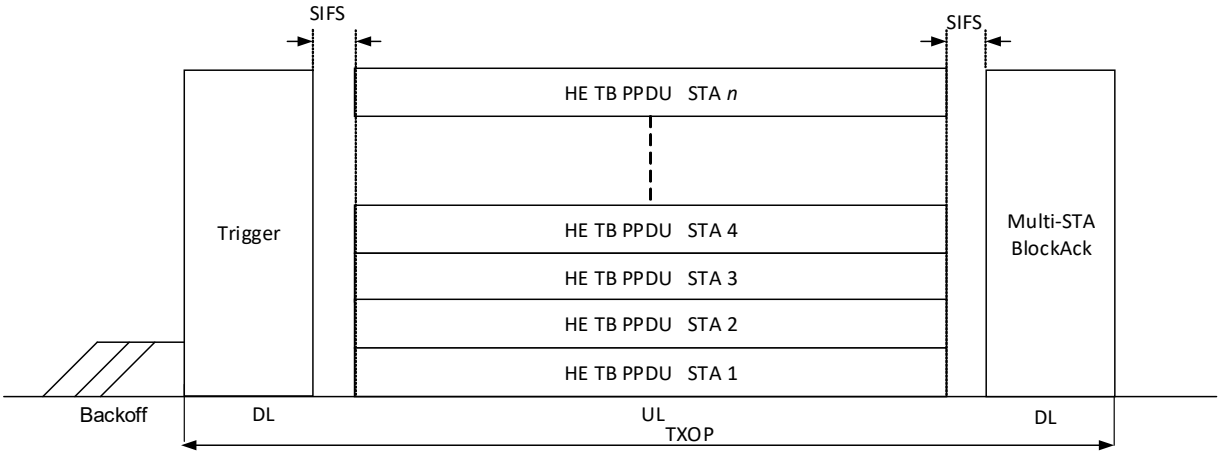

**Figure 10-19—Example of UL MU transmissions with immediate Multi-STA BlockAck frame acknowledging MPDUs(11ax)**

An example of a Multi-STA BlockAck frame acknowledgment in a non-HT duplicate PPDU is given in Figure 10-20 (Example of UL MU transmissions with immediate DL non-HT duplicate PPDU containing Multi-STA BlockAck frame(11ax)).

The Ack Policy Indicator subfield of a QoS Data frame sent in an HE TB PPDU shall not be set to Block Ack.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

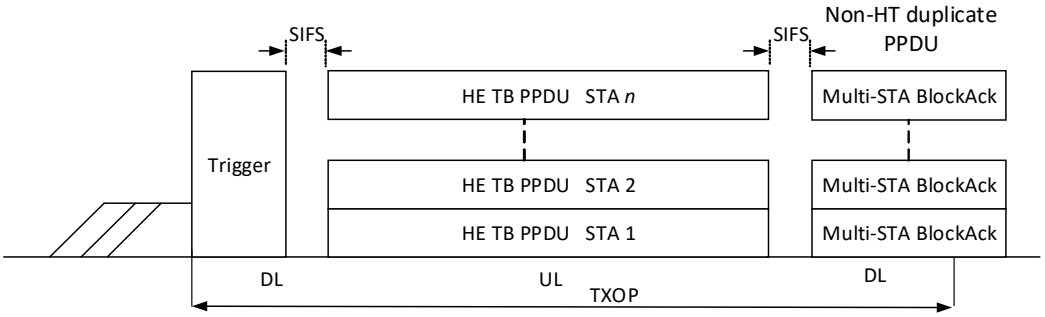

**Figure 10-20—Example of UL MU transmissions with immediate DL non-HT duplicate PPDU containing Multi-STA BlockAck frame(11ax)**

A STA may send a BlockAckReq frame or Multi-TID BlockAckReq frame to solicit the acknowledgment frame(s) from an AP.

### 10.3.2.14 Duplicate detection and recovery

#### 10.3.2.14.1 General

Because MAC-level acknowledgments and retransmissions are incorporated into the protocol, there is the possibility that a frame may be received more than once. The procedures defined in this subclause attempt to filter out these duplicates. Additional duplicate filtering is performed during Receive Buffer Operation for frames that are part of a block ack agreement as described in 10.25.6 (HT-immediate block ack extensions).

Duplicate frame filtering is facilitated through the inclusion of a Sequence Control field (consisting of a sequence number and fragment number) within Data, Management, and Extension frames, a TID subfield in the QoS Control field within QoS Data frames, and an ACI subfield in the Sequence Number field within QMFs, and a PTID/Subtype subfield in the Frame Control field within PV1 Data frames.

NOTE—In 10.3.2.14 (Duplicate detection and recovery), Data frames with a value of 1 in the QoS subfield of the Subtype subfield are collectively referred to as *QoS Data frames*.

#### 10.3.2.14.2 Transmitter requirements

A STA maintains one or more sequence number spaces that are used when transmitting a frame to determine the sequence number for the frame. When multiple sequence number spaces are supported, the appropriate sequence number space is determined by information from the MAC control fields of the frame to be transmitted. Except as noted below, (#270)each sequence number space is represented by a modulo 4096 counter, starting at 0 and incrementing by 1, for each MSDU (if not in an A-MSDU), A-MSDU or MMPDU transmitted using that sequence number space. If dot11MACPrivacyActivated is true, the counter in each sequence number space shall be set to a random number modulo 4096 when the STA's MAC address is changed.

(11ay)NOTE 1—Under a block ack agreement using segmentation and reassembly (see 10.69 (DMG segmentation and reassembly operation(11ay))), the MPDU sequence number is represented by a $2^{\text{MPDU Modulo}}$ counter and the MSDU sequence number is represented by $2^{\text{MSDU Modulo}}$ counter (see 9.2.4.4.2 (Sequence Control field structure when SAR is used(11ay))), where MPDU Modulo and MSDU Modulo are as defined in the SAR Configuration element (see 9.4.2.279 (SAR Configuration element(11ay))).

NOTE 2(11ay)—Group addressed retransmissions of BUs use the same sequence number as the initial group addressed transmission of the BU. Individually addressed retransmissions of a group addressed BU delivered via DMS use the

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

same sequence number as the initial individually addressed transmission of the BU. When a BU is delivered both using group addressing and individual addressing (e.g., when DMS is active but there are other associated STAs not using DMS), the sequence number might differ between the group addressed and individually addressed transmissions of the same BU.

MPDUs that are part of the same MSDU or A-MSDU shall have the same sequence number. (#270)Different MSDUs (if not in an A-MSDU), A-MSDUs or MMPDUs have (with a high probability) a different sequence number.

A transmitting STA shall support the applicable sequence number spaces defined in Table 10-5 (Transmitter sequence number spaces). Applicability is defined by the Applies to column. The Status column indicates the level of support that is required if the Applies to column matches the transmission. The Multiplicity column indicates whether the sequence number space contains a single counter, or multiple counters and in the latter case identifies any (#4136)indices. The Transmitter requirements column identifies requirements for the operation of this sequence number space. The referenced requirements are defined at the end of the table.

**Table 10-5—Transmitter sequence number spaces**

| Sequence number space identifier | Sequence number space | Applies to | Status | Multiplicity | Transmitter requirements |
|---|---|---|---|---|---|
| SNS1 | Baseline | A STA transmitting a frame that is not covered by any of the other sequence number spaces. | Mandatory | Single Instance | TR1 |
| SNS2 | Individually addressed QoS Data | A STA transmitting an individually addressed QoS Data frame, excluding SNS5 | Mandatory | Indexed by <Address 1, TID> | |
| SNS3 | Time Priority Management | A QoS STA transmitting a Time Priority Management frame | Optional | Indexed by <Address 1, TID> | |
| SNS4 | QMF | A QMF STA transmitting a QMF that is neither a Protected Fine Timing frame nor a Public Action LMR(11az) | Mandatory | Indexed by <Address 1, AC> | TR2 |
| SNS5 | QoS (+)Null | A STA transmitting a QoS (+)Null frame | Mandatory | None | TR3 |
| SNS6 | Individually addressed PV1 Data frame | A STA operating as an S1G STA transmitting a PV1 Data frame | Mandatory | Indexed by <STA MAC Address identified by Address 1, PTID> | TR4 (#7012) |
| SNS7 | Individually addressed PV1 Management frame | A STA operating as an S1G STA transmitting a PV1 Management frame | Mandatory | Indexed by <STA MAC Address identified by Address 1> | |

**Table 10-5—Transmitter sequence number spaces *(continued)***

| Sequence number space identifier | Sequence number space | Applies to | Status | Multiplicity | Transmitter requirements |
|---|---|---|---|---|---|
| SNS8(11az) | Protected Fine Timing frame and Public Action LMR frame(#8165) | A STA transmitting Protected Fine Timing frames or Public Action LMR frames(#8165-ED1) | Mandatory | Single Instance | |
| TR1: A transmitting STA should cache the last used sequence number per RA for frames that are assigned sequence numbers from this sequence number space. The STA should check that the successively assigned sequence numbers for frames transmitted to a single RA do not have the same value as is found in the cache for that RA. If the check fails the STA should increment the counter by 2, rather than 1.<br>TR2: The STA shall assign the sequence number from one modulo 1024 counter per <Address 1, AC> tuple starting at 0 and incrementing by 1 for each MMPDU carried in one or more QMFs with Address 1 and ACI fields matching the <Address 1, AC> tuple values corresponding to that counter.<br>TR3: Sequence numbers for transmitted QoS (+)Null frames may be set to any value.<br>(#7012)TR4: The same modulo 4096 counter per <STA MAC Address identified by Address 1, PTID> tuple shall be used for both PV1 Type 0 (QoS Data) and Type 3 (QoS Data) frames. | | | | | |

### 10.3.2.14.3 Receiver requirements

A STA maintains one or more duplicate detection caches. Table 10-6 (Receiver caches) defines the conditions under which a duplication detection cache is supported and the rules followed by the receiver for the cache. When a Data, Management or Extension frame is received, a record of that frame is inserted in an appropriate cache. That record is identified by a sequence number and possibly other information from the MAC control fields of the frame. When a Data, Management or Extension frame is received in which the Retry subfield of the Frame Control field is equal to 1, the appropriate cache, if any, is searched for a matching frame. In DMG, when a group addressed frame is received the appropriate cache is searched for a matching frame. When a PV1 Data frame or PV1 Management frame is received, the appropriate cache, if any,(#303) is searched for a matching frame, (#1945)despite the absence of a Retry subfield in the Frame Control field. If the search is successful, the frame is considered to be a duplicate. Duplicate frames are discarded.

NOTE—The receiver STA performs the Ack and (for an AP) PS procedures on all received frames requiring immediate acknowledgment, even if the frame is discarded due to duplicate filtering.

There is a small possibility that a frame may be improperly rejected due to such a match; however, this occurrence is rare and simply results in a lost frame (similar to an FCS error in other LAN protocols).

A receiving STA shall implement the applicable receiver requirements defined in Table 10-6 (Receiver caches) with Status indicated as Mandatory. A receiving STA should implement the applicable receiver requirements defined in Table 10-6 (Receiver caches) with Status indicated as Recommended. A receiving STA may implement the applicable receiver requirements defined in Table 10-6 (Receiver caches) with Status indicated as Optional. Applicability is defined by the Applies to column. The Status column indicates the level of support that is required if the Applies to column matches the received frame. The Multiplicity/Cache size column indicates the (#4136)indices that identify a cache entry and the number of entries that shall be supported. The Receiver requirements column identifies requirements for the operation of this cache. The referenced requirements are defined at the end of the table. The requirements relate to caching information that identifies a cache entry and discarding duplicate MPDUs.

**Table 10-6—Receiver caches *(continued)***

| Receiver cache identifier | Cache name | Applies to | Status | Multiplicity/Cache size | Receiver requirements |
|---|---|---|---|---|---|
| RC13(11az) | Protected Fine Timing frame and Public Action LMR frame(#8165) | A STA receiving Protected Fine Timing frames or Public Action LMR frames(#8165-Ed1) | Mandatory | Indexed by: <Address 2, sequence number, fragment number>. At least the most recent cache entry per <Address 2>. | RR1<br>RR2<br>RR5 |

RR1: A receiving non-DMG STA with dot11QMFActivated false or not present and with dot11RobustAVStreamingImplemented false or not present should omit tuples obtained from group addressed frames from this cache.

RR2: A receiving STA should omit tuples obtained from ATIM frames from this cache.

RR3: A receiving QMF STA that is a non-DMG STA with dot11RobustAVStreamingImplemented false or not present shall omit from the cache all tuples obtained from group addressed Data frames.

RR4: For the purposes of duplicate detection using receiver caches, QoS (+)Null frames and, in a non-DMG BSS, QoS Data frames under a block ack agreement, shall be ignored.

RR5: The STA shall discard the frame if the Retry subfield of the Frame Control field is 1 and it matches an entry in the cache.

RR6: The STA shall discard the frame if it matches an entry in the cache.

#### 10.3.2.15 NAV distribution

When a node needs to distribute NAV information, for instance, to reserve the medium for a transmission of a nonbasic rate frame (that might not be heard by other nodes in the BSS), the node may first transmit a CTS frame with the RA field equal to its own MAC address (CTS-to-self) if the node is a non-DMG STA, or it may transmit a DMG CTS frame with the RA field equal to its own MAC address and the TA field equal to the MAC address of the peer STA for which the forthcoming transmission of the node is intended (DMG CTS-to-self) if the node is a DMG STA. A duration value in the frame protects the pending transmission, plus possibly an Ack frame.

The CTS-to-self and DMG CTS-to-self NAV distribution mechanisms are lower in network overhead cost than are the RTS/CTS and RTS/DMG CTS NAV distribution mechanisms, respectively, but CTS-to-self and DMG CTS-to-self are less robust against hidden nodes and collisions than RTS/CTS and RTS/DMG CTS-to-self, respectively. STAs employing a NAV distribution mechanism should choose a mechanism that is appropriate for the given network conditions. If errors occur when employing the CTS-to-self or DMG CTS-to-self mechanism, STAs should switch to a more robust mechanism.

When the NDP CTS frame is a CTS-to-self, the value in the Duration field of the NDP CTS frame shall protect the pending transmission, plus any expected (NDP) Ack frame in response.

#### 10.3.2.16 Operation of aSlotTime

(#2154)An AP with the MAC variable aSlotTime equal to the long slot time shall set the Short Slot Time subfield in transmitted Beacon, Probe Response, Association Response, and Reassociation Response frames to 0. An AP with the MAC variable aSlotTime equal to the short slot time shall set the Short Slot Time

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

subfield in transmitted Beacon, Probe Response, Association Response, and Reassociation Response frames to 1.

(#2154)A non-AP STA in which dot11ShortSlotTimeOptionImplemented and dot11ShortSlotTimeOptionActivated are true shall set the MAC variable aSlotTime to the short slot time upon reception of Beacon, Measurement Pilot, Probe Response, Association Response, and Reassociation Response frames with the Short Slot Time subfield value equal to 1 from the AP that the STA is associated or associating to. (#6387)A non-AP STA in which dot11ShortSlotTimeOptionImplemented and dot11ShortSlotTimeOptionActivated are true shall set the MAC variable aSlotTime to the long slot time upon reception of Beacon, Measurement Pilot, Probe Response, Association Response, and Reassociation Response frames with the Short Slot Time subfield value equal to 0 from the AP that the STA is associated or associating to. See also 11.1.3.2 (Beacon generation in non-DMG infrastructure networks).(#1761)

(#6387)A STA in which either dot11ShortSlotTimeOptionImplemented or dot11ShortSlotTimeOptionActivated is false shall set the MAC variable aSlotTime to the long slot (#2154)time at all times. A STA in which dot11ShortSlotTimeOptionImplemented is not present, or whose PHY supports only a single slot time value shall set the MAC variable aSlotTime to the PHY characteristic aSlotTime.

NOTE—The MAC variable aSlotTime is distinct from the PHY characteristic aSlotTime. Outside this subclause, the MAC uses the MAC variable aSlotTime whenever the value of aSlotTime is required.

### 10.3.2.17 Response Indication procedure

An S1G STA distributes RID information in order to protect the response frame expected SIFS after the frame that elicits that response. The TXVECTOR parameter RESPONSE_INDICATION for S1G non-NDPs shall be set based on the expected response type, as described in Table 10-7 (Setting the TXVECTOR parameter RESPONSE_INDICATION). The TXVECTOR parameter RESPONSE_INDICATION for S1G NDPs other than NDP CMAC PPDUs is set as described in 10.35.7 (Transmission of an S1G NDP).

NOTE—The TXVECTOR parameter RESPONSE_INDICATION is not present for NDP CMAC PPDUs.

**Table 10-7—Setting the TXVECTOR parameter RESPONSE_INDICATION**

| RESPONSE_INDICATION | Solicited Immediate Response |
|---|---|
| 0 (No Response) | No immediate response.<br><br>None of the MPDUs in the PPDU solicit an immediate acknowledgment (e.g., a QoS Data frame whose ack policy is neither Normal Ack nor Implicit BAR (see 9.2.4.5.4 (Ack Policy Indicator subfield) and 9.8.3.1 (Frame Control field)), Action No Ack frame). |
| 1 (NDP Response) | The addressed recipient returns an individual NDP CMAC PPDU:<br>— NDP Ack frame, as described in 10.3.2.11 (Acknowledgment procedure),<br>— NDP CTS frame, as described in 10.3.2.9 (CTS and DMG CTS procedure),<br>— NDP BlockAck frame, as described in 10.25.6 (HT-immediate block ack extensions) and 10.3.2.12 (Fragment BA procedure).<br><br>At least one of the MPDUs in the PPDU solicits an immediate acknowledgment, (e.g., a QoS Data frame whose ack policy is either Normal Ack or Implicit BAR, Action frame). |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 10-7—Setting the TXVECTOR parameter RESPONSE_INDICATION *(continued)***

| RESPONSE_INDICATION | Solicited Immediate Response |
|---|---|
| 2 (Normal Response) | The addressed recipient returns an individual control response frame:<br>— Ack frame, as described in 10.3.2.11 (Acknowledgment procedure),<br>— CTS frame, as described in 10.3.2.9 (CTS and DMG CTS procedure),<br>— BlockAck frame or BAT frame, as described in 10.3.2.11 (Acknowledgment procedure) and 10.46 (Target wake time (TWT)),<br>— TACK frame or STACK frame as described in 10.46 (Target wake time (TWT)).<br><br>At least one of the MPDUs in the PPDU solicits an immediate acknowledgment (e.g., a QoS Data frame whose ack policy is Normal Ack or Implicit BAR; or an Action frame). |
| 3 (Long Response) | The addressed recipient may return a response frame, which is not an individual control response frame. More details are provided in 10.49 (Bidirectional TXOP), 10.29 (Reverse direction protocol), 10.33.3 (Explicit feedback beamforming), and 10.53.5.2 (Explicit Ack procedure). |

An S1G STA shall not cause its intended receiver to generate a control response frame that is not an NDP CMAC PPDU except as specified below:

a) If the intended receiver has indicated that it supports generating +HTC Control frames then the S1G STA can solicit +HTC Control frames of the types described in 10.31 (Link adaptation).

b) If the intended receiver has negotiated with the S1G STA the generation of TACK frame or STACK frames then the S1G STA can solicit TACK frames or STACK frames as described in 10.46 (Target wake time (TWT)).

c) If the intended receiver has indicated that it supports generating TACK frames then the S1G STA can solicit a TACK frame as described in 10.47.2 (Rescheduling of awake/doze cycle).

d) If the intended receiver has negotiated with the S1G STA the use of either BlockAck or BAT frames then the S1G STA can solicit either BlockAck or BAT frames as described in 10.25.5 (Selection of BlockAck and BlockAckReq variants).

e) If the intended receiver has negotiated with the S1G STA the generation of control response frames with different MCSs than the primary MCS as described in 10.6.6.5.6 (Control response MCS negotiation).

An S1G STA transmitting a PPDU that expects an NDP Response shall calculate the Duration/ID field of the transmitted PPDU as described in 9.2.5.2 (Setting for single and multiple protection under enhanced distributed channel access (EDCA)) where the estimated duration of "CTS frame," "Ack frame," or "BlockAck frame" is equal to NDPTxTime. NDPTxTime depends on the TXVECTOR parameter PREAMBLE_TYPE and is equal to the time in microseconds, required to transmit:

— An NDP_1M MAC frame if PREAMBLE_TYPE is an S1G_1M preamble or the intended receiver has indicated the use of 1 MHz control response frames (see 10.6.6.6 (Channel Width selection for Control frames)).

— An NDP_2M MAC frame if PREAMBLE_TYPE is a ≥ 2 MHz short/long preamble and the intended receiver has not indicated the use of 1 MHz control response frames.

An S1G STA that expects a Normal Response that is a BAT frame or TACK frame shall calculate the Duration/ID field of the PPDU as described in 9.2.5.2 (Setting for single and multiple protection under enhanced distributed channel access (EDCA)) using the same estimated duration of a BlockAck frame. An

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

S1G STA that expects a Normal Response that is a STACK frame shall use the estimated duration of an Ack frame.

An S1G STA that expects a Long Response shall calculate the Duration/ID field of the PPDU as described in 9.2.5.2 (Setting for single and multiple protection under enhanced distributed channel access (EDCA)) for multiple protection settings.

An S1G STA transmitting an eliciting frame for which it expects a response that is a BAT frame or BlockAck frame as described in 10.25.6 (HT-immediate block ack extensions) or a TACK frame as described in 10.46 (Target wake time (TWT)) and 10.47.2 (Rescheduling of awake/doze cycle) shall carry the eliciting frame in an A-MPDU or in an S-MPDU (i.e., sets the TXVECTOR parameter AGGREGATION to 1). The intended recipient selects the type of control response frame based on the type of the eliciting frame and other information available in the PSDU such as Ack Policy Indicator field, EOF/ Tag(#4367) field, etc.

An S1G STA transmitting an eliciting frame for which it expects a response that is an Ack frame as described in 10.31 (Link adaptation) or a STACK frame as described in 10.46 (Target wake time (TWT)) shall carry the eliciting frame in an MPDU (i.e., sets the TXVECTOR parameter AGGREGATION to 0) except when the intended receiver has set the A-MPDU Supported field in the most recently transmitted S1G Capabilities element to 1, in which case the S1G STA may transmit the eliciting frame as an S-MPDU.

An S1G STA transmitting a CF-End frame shall set the TXVECTOR parameter RESPONSE_INDICATION to No Response.

An S1G AP sending an NDP Ack frame with the More Data field equal to 1 as a response to an eliciting PS-Poll frame may set the Duration field of the NDP Ack frame to the estimated duration of the BU frame that the S1G AP has buffered for the polling STA, plus SIFS, plus the duration of the response from the (#306)non-AP S1G STA, if required.

An S1G AP that sends an NDP_2M PS-Poll-Ack frame with the Idle Indication field equal to 0 and the More Data field equal to 1 as a response to an eliciting NDP PS-Poll frame may set the Duration field of the NDP_2M PS-Poll-Ack frame to the estimated duration of the BU frame that the S1G AP has buffered for the polling STA, plus SIFS, plus the duration of the response from the (#306)non-AP S1G STA, if required. An S1G AP that sends an NDP_2M PS-Poll-Ack frame with the Idle Indication field equal to 0 and the More Data field equal to 0 as a response to an eliciting NDP PS-Poll frame shall set the Duration field of the NDP_2M PS-Poll-Ack frame to 0.

(#111)An S1G STA should protect the sequence of two or more SIFS-separated PV1 frames for which it does not follow the BDT rules defined in 10.49 (Bidirectional TXOP) with a protective mechanism that uses multiple protection as described in 9.2.5.2 (Setting for single and multiple protection under enhanced distributed channel access (EDCA)).

#### 10.3.2.18 EDMG RTS procedure(11ay)

In order to establish a TXOP with a peer EDMG STA, an EDMG STA shall transmit an RTS frame. For channel combinations covered in Table 28-6 (Definition of Scrambler Initialization field when transmitted using the control mode and the Turnaround field is 1(11ay)), the TXVECTOR parameter CH BANDWIDTH shall be set according to rules specified in 10.23.2.14 (EDCA channel access in an EDMG BSS(11ay)). For those combinations that are not covered in Table 28-6 (Definition of Scrambler Initialization field when transmitted using the control mode and the Turnaround field is 1(11ay)), the TXVECTOR parameter SCRAMBLER_INIT_SETTING shall be set to CONTROL_TRAILER.

If a TXOP is established to send at least one SU MIMO or MU MIMO PPDU, and the number of bits set to 1 in the TXVECTOR parameter CH_BANDWIDTH is greater than 1, the RTS frame shall be sent in non-

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

EDMG duplicate PPDU format, the TXVECTOR parameter SCRAMBLER_INIT_SETTING shall be set to indicate CONTROL_TRAILER and the parameter CT_TYPE shall be set to GRANT_RTS_CTS2Self.

If a TXOP is established to send at least one SU MIMO or MU MIMO PPDU, and the number of bits set to 1 in the TXVECTOR parameter CH_BANDWIDTH is equal to 1, the RTS frame shall be sent in non-EDMG PPDU format, the TXVECTOR parameter SCRAMBLER_INIT_SETTING shall be set to indicate CONTROL_TRAILER and the parameter CT_TYPE shall be set to GRANT_RTS_CTS2Self.

If a TXOP is established to send PPDUs using a single transmit chain and the number of bits set to 1 in the CH_BANDWIDTH parameter is greater than 1:

— The RTS frame shall be sent in non-EDMG duplicate PPDU format.
— The TXVECTOR parameter SCRAMBLER_INIT_SETTING shall be set to Channel_BW for channel combinations covered in Table 28-6 (Definition of Scrambler Initialization field when transmitted using the control mode and the Turnaround field is 1(11ay)); otherwise, for those combinations that are not covered in Table 28-6 (Definition of Scrambler Initialization field when transmitted using the control mode and the Turnaround field is 1(11ay)) the TXVECTOR parameter SCRAMBLER_INIT_SETTING shall be set to CONTROL_TRAILER.
— The TXVECTOR parameter CH_BANDWIDTH_SIGNALING shall be set to the encoded value of the set of channels indicated by the CH_BANDWIDTH parameter as defined in Table 28-6 (Definition of Scrambler Initialization field when transmitted using the control mode and the Turnaround field is 1(11ay)).

If the number of bits set to 1 in the CH_BANDWIDTH parameter is equal to 1, STA may perform one of the following:

— Follow the procedure defined in the paragraph above, or
— Transmit the RTS in non-EDMG format and follow the procedure defined in 10.3.2.4 (Setting and resetting the NAV).

A CF-End frame sent to truncate a TXOP initiated by RTS frame carried in a non-EDMG duplicate PPDU format shall be sent using a non-EDMG duplicate PPDU format. The TXVECTOR parameters CHANNEL_AGGREGATION and CH_BANDWIDTH_SIGNALING of the CF-End frame shall be set to the same values as indicated by the RXVECTOR parameters of the DMG CTS frame, if received, or to the same values as indicated by the TXVECTOR parameters of the RTS frame otherwise.

An EDMG STA transmitting an RTS frame to establish a TXOP for the transmission of at least one MIMO PPDU or a SISO PPDU using multiple transmit chains with hybrid beamforming follows the procedure defined in 10.38.12.4 (MIMO channel access).

### 10.3.3 Random backoff procedure

A STA desiring to initiate transfer of Data frames and/or Management frames using the DCF shall invoke the CS mechanism (see 10.3.2.1 (CS mechanism)) to determine the busy/idle state of the medium. If the medium is busy, the STA shall defer until the medium is determined to be idle without interruption for a period of time equal to EIFS when the last transition to idle medium was a result of a frame detected on the medium that was not received correctly, or equal to DIFS otherwise. After this DIFS or EIFS medium idle time, the STA shall then generate a random backoff count [defined by Equation (10-1)] for an additional deferral time before transmitting, unless the backoff counter already contains a nonzero value, in which case the selection of a random number is not needed and not performed. This process minimizes collisions during contention between multiple STAs that have been deferring to the same event.

$$\text{Backoff Count} = \text{Random}() \tag{10-1}$$

where

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Random() = Pseudorandom integer drawn from a uniform distribution over the interval [0,CW], where CW is an integer within the range of values of the PHY characteristics aCWmin and aCWmax, aCWmin ≤ CW ≤ aCWmax.

NOTE 1—It is important that designers recognize the need for statistical independence of the random number streams between STAs.

The contention window (CW) parameter shall take an initial value of aCWmin. Every STA shall maintain a STA short retry count (SSRC) as well as a STA long retry count (SLRC), both of which shall take an initial value of 0. The SSRC shall be incremented when any short retry count (SRC) associated with any MPDU with the Type subfield equal to Data or Management is incremented. The SLRC shall be incremented when any long retry count (LRC) associated with any MPDU with the Type subfield equal to Data or Management is incremented. The CW shall take the next value in the series every time an unsuccessful attempt to transmit an MPDU causes either STA retry count to increment, until the CW reaches the value of aCWmax. (#109)(#1325) Once it reaches aCWmax, the CW shall remain at the value of aCWmax until the CW is reset. This improves the stability of the access protocol under high-load conditions. See Figure 10-21 (Example of exponential increase of CW).

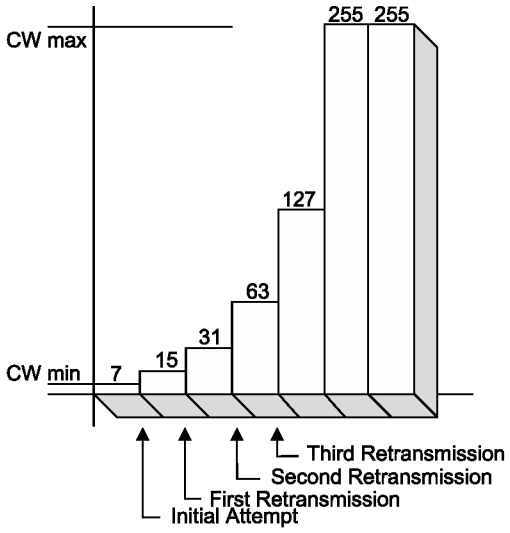

**Figure 10-21—Example of exponential increase of CW**

The CW shall be reset to aCWmin after every successful attempt to transmit a Data or Management frame, or when SSRC reaches dot11ShortRetryLimit.

The SSRC shall be reset to 0 when a CTS frame is received in response to an RTS frame, when a BlockAck frame is received in response to a BlockAckReq frame, when an Ack frame is received in response to the transmission of a frame containing all or part of an MSDU or MMPDU that is contained in a PSDU of length less than or equal to dot11RTSThreshold, or when a frame with a group address in the Address 1 field is transmitted.

The SLRC shall be reset to 0 when an Ack frame is received in response to transmission of a frame containing all or part of an MSDU or MMPDU that is contained in a PSDU of length greater than dot11RTSThreshold, or when a frame with a group address in the Address 1 field is transmitted.

NOTE 2—For non-HE STAs that use DCF for channel access, dot11TXOPDurationRTSThreshold is not present and the use of the RTS/CTS mechanism is under the control of dot11RTSThreshold.(11ax)

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The set of CW values shall be sequentially ascending integer powers of 2, minus 1, beginning with a PHY-specific aCWmin value, and continuing up to a PHY-specific aCWmax value.

### 10.3.4 DCF access procedure

#### 10.3.4.1 Introduction

The CSMA/CA access method is the foundation of the DCF.

#### 10.3.4.2 Basic access

Basic access refers to the core mechanism a STA uses to determine whether it may transmit using the DCF.

A STA may transmit an MPDU when it is operating under the DCF access method, when the STA determines that the medium is idle when a frame is queued for transmission, and remains idle for a period of a DIFS, or an EIFS (10.3.2.3.7 (EIFS)) from the end of the immediately preceding medium-busy event, whichever is the greater, and the backoff counter has a value of zero. Otherwise the random backoff procedure described in 10.3.4.3 (Backoff procedure for DCF) shall be followed.

A DMG STA operating under the DCF access method should transmit frames with its transmit antenna pattern directed toward the intended receiver.

A DMG STA operating under the DCF access method that does not operate in a TXOP exchange may configure its receiving antenna array to a quasi-omni antenna pattern to be ready to receive frames from any DMG STA.

NOTE—The steady state of the antenna configuration might depend on the actual applications in which a DMG STA is involved. For example, a DMG STA that expects transactions with several STAs during a CBAP configures the receiving antenna to a quasi-omni pattern to be ready to receive transmission from any of the STAs. A DMG STA that expects transactions with a single STA (e.g., AP or PCP) might keep its receiving antenna directed to the peer STA.

A DMG STA operating under the DCF access method that is participating in a TXOP exchange should configure its receiving antenna array to be directed toward the other transmitter involved in the TXOP.

The basic access mechanism is illustrated in Figure 10-22 (Basic access method).

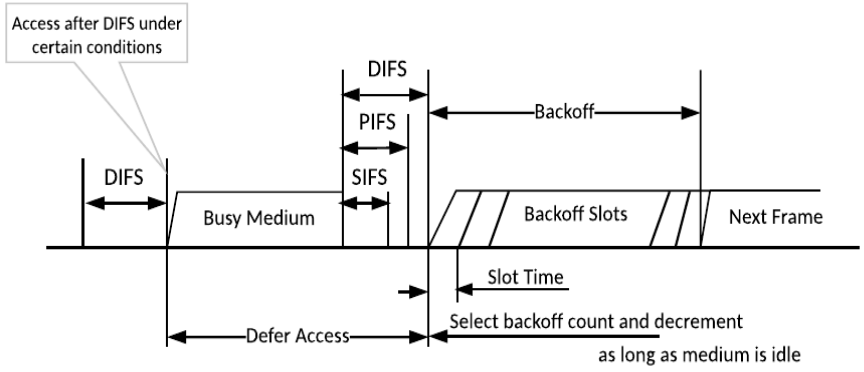

**Figure 10-22—Basic access method**

#### 10.3.4.3 Backoff procedure for DCF

This subclause describes backoff procedure that is to be invoked when DCF is used. For the backoff procedure when EDCA is used, see 10.23.2.2 (EDCA backoff procedure).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

A STA shall invoke the backoff procedure to transfer a frame when finding the medium busy as indicated by either the physical or virtual CS mechanism (see Figure 10-23 (Backoff procedure)). A transmitting STA shall invoke the backoff procedure when the STA infers a failed transmission as defined in 10.3.2.9 (CTS and DMG CTS procedure) or 10.3.2.11 (Acknowledgment procedure).

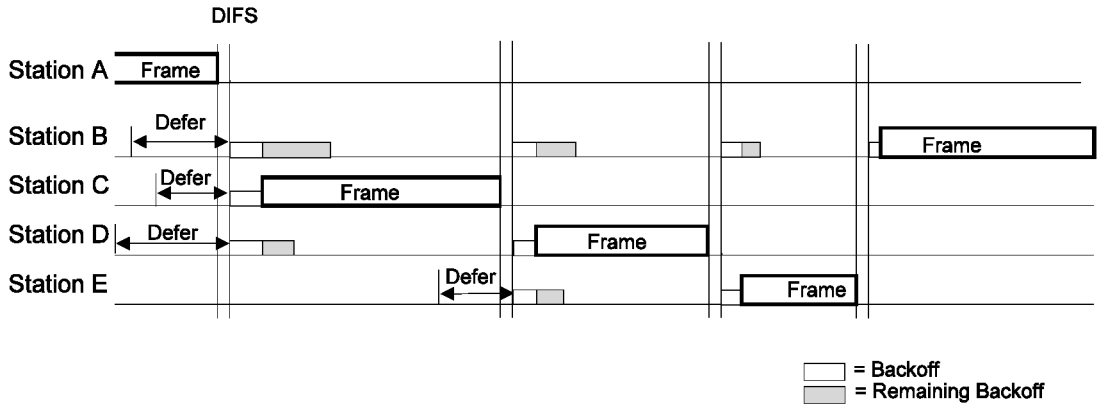

**Figure 10-23—Backoff procedure**

To begin the backoff procedure, the STA shall set its backoff counter to a random value using the equation in 10.3.3 (Random backoff procedure). All backoff slots occur following a DIFS or EIFS as appropriate (see 10.3.3 (Random backoff procedure) and 10.3.2.3.7 (EIFS)) except that no backoff slots for DCF occur during the BTI, the A-BFT, the ATI, and non-CBAP portions of the DTI.

A STA performing the backoff procedure shall use the CS mechanism (see 10.3.2.1 (CS mechanism)) to determine whether there is activity during each backoff slot. If no medium activity is indicated for the duration of a particular backoff slot, then the backoff procedure shall decrement its backoff counter.

If the medium is determined to be busy at any time during a backoff slot, then the backoff counter shall not be decremented for that slot. The backoff counter is next decremented after the medium has been determined to be idle for the duration of a DIFS or EIFS, as appropriate (see 10.3.3 (Random backoff procedure) and 10.3.2.3.7 (EIFS)), plus aSlotTime.

Transmission shall commence when the backoff counter equals 0.

A backoff procedure shall be performed immediately after the end of every transmission with the More Fragments bit equal to 0 of an MPDU with the Type subfield equal to Data, Management, or Control with subtype PS-Poll, even if no additional transmissions are currently queued. In the case of successful acknowledged transmissions, this backoff procedure shall begin at the end of the received Ack frame. In the case of unsuccessful transmissions requiring an immediate response, this backoff procedure shall begin at the end of the AckTimeout interval (as defined in 10.3.2.11 (Acknowledgment procedure)) or CTSTimeout interval (as defined in 10.3.2.9 (CTS and DMG CTS procedure)). An unsuccessful transmission is one where a control response frame is not received from the STA addressed by the RA field of the transmitted frame and the value of the RA field is an individual address. If the transmission is successful, the CW value reverts to aCWmin before the random backoff count is chosen, and the SSRC and/or SLRC are updated as described in 10.3.3 (Random backoff procedure). The result of this procedure is that transmitted frames from a STA are always separated by at least DIFS.

The effect of this procedure is that when multiple STAs are deferring and go into random backoff, then the STA selecting the smallest backoff count using the random function wins the contention (assuming all of the contending STAs detect the same instances of WM activity at their respective receivers, a situation that is not

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

always true, due to hidden node effects and interference events). The number of DMG STAs that are able to detect each WM transmission is reduced even further due to SPSH.

In an IBSS the backoff counter for a pending non-Beacon or non-ATIM transmission shall not decrement in the period from the TBTT until the expiration of the ATIM window, and the backoff counter for a pending ATIM frame shall decrement only within the ATIM window. (See Clause 11 (MLME).) Within an IBSS a separate backoff count shall be generated to precede the transmission of a Beacon frame, as described in 11.1.3.5 (Beacon generation in an IBSS).

At the start of an awake window, a DMG STA shall suspend decrementing its backoff counter(s) for any transmission of non-ATIM frames for the duration of the awake window as indicated in the most recently received Awake Window element. At the end of the awake window, the DMG STA shall resume decrementing the backoff counter(s) for non-ATIM frames. A DMG STA shall not decrement the backoff counter for a pending ATIM frame outside the awake window.

(#124)DMG STAs may use different receiving antenna pattern for CCA. Hence, NAV setting behavior might be different depending on the receiving antenna pattern of the STA, even though they are in the same neighborhood. An example of the backoff procedure is described in V.2 (Backoff procedure for DMG STAs(#124)).

#### 10.3.4.4 Recovery procedures and retransmit limits

Under DCF, error recovery is always the responsibility of the STA that initiates a frame exchange sequence(#109). Many circumstances might cause an error to occur that requires recovery. For example, the CTS frame might not be returned after an RTS frame is transmitted. This may happen due to a collision with another transmission, due to interference in the channel during the RTS or CTS frame, or because the STA receiving the RTS frame has an active virtual CS condition (indicating a busy medium time period).

Error recovery shall be attempted by retrying transmissions for frame exchange sequences that the initiating STA infers have failed. Retries shall continue, for each failing frame exchange sequence, until the transmission is successful, or until the relevant retry limit or lifetime is reached, whichever occurs first. A STA shall maintain an SRC and an LRC for each MSDU or MMPDU awaiting transmission. These counts are incremented and reset independently of each other.

After an RTS frame is transmitted, the STA shall perform the CTS procedure, as defined in 10.3.2.9 (CTS and DMG CTS procedure). If the RTS frame transmission fails, the SRC for the MSDU or MMPDU and the SSRC are incremented. This process shall continue until the number of attempts to transmit that MSDU or MMPDU reaches dot11ShortRetryLimit.

After transmitting a frame that requires immediate acknowledgment, the STA shall perform the acknowledgment procedure, as defined in 10.3.2.11 (Acknowledgment procedure). The SRC for an MPDU with the Type subfield equal to Data or Management and of length less than or equal to dot11RTSThreshold and the SSRC shall be incremented every time transmission of that MPDU fails. This SRC and the SSRC shall be reset when transmission of that MPDU succeeds. The LRC for an MPDU with the Type subfield equal to Data or Management and of length greater than dot11RTSThreshold and the SLRC shall be incremented every time transmission of that MPDU fails. This LRC and the SLRC shall be reset when transmission of that MPDU succeeds. All retransmission attempts for an MPDU with the Type subfield equal to Data or Management that has failed the acknowledgment procedure one or more times shall be made with the Retry subfield set to 1.

NOTE 1—These rules do not apply for frames sent under EDCAF by a non-DMG STA under a block ack agreement(#3741) (see 10.23.2.12.1 (General)).(#1468)

NOTE 2—For non-HE STAs that use DCF for channel access, dot11TXOPDurationRTSThreshold is not present, and the use of the RTS/CTS mechanism is under the control of dot11RTSThreshold.(11ax)

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Retries for failed transmission attempts shall continue until the SRC for the MPDU with the Type subfield equal to Data or Management is equal to dot11ShortRetryLimit or until the transmit MSDU timer for the MSDU or any undelivered fragments of that MSDU exceeds dot11MaxTransmitMSDULifetime (see 10.4 (MSDU, (11ax)A-MSDU, and MMPDU fragmentation)). When any of these limits is reached, retry attempts shall cease, and the MPDU with the Type subfield Data (and any MSDU of which it is a part) or Management shall be discarded. A DMG STA, in addition to using random access within a CBAP, may transmit retries in available scheduled SPs.

A STA in PS mode, in an infrastructure BSS, initiates a frame exchange sequence by transmitting a PS-Poll frame to request data from an AP. If no Ack, Data, or Management frame is received from the AP in response to a PS-Poll frame, then the STA shall retry the sequence, by transmitting another PS-Poll frame.

(#1338)If the AP sends a Data or Management frame in response to a PS-Poll frame, but fails to receive the Ack frame acknowledging this Data or Management frame, the next PS-Poll frame from the same STA might cause a retransmission of the last MSDU.(#1338)

NOTE 3—This duplicate MSDU is filtered at the receiving STA using the duplicate frame filtering mechanism.(#1338)

If the AP responds to a PS-Poll frame by transmitting an Ack frame, then responsibility for the Data or Management frame delivery error recovery shifts to the AP because the data are transferred in a subsequent frame exchange sequence, which is initiated by the AP. The AP shall attempt to deliver one buffered BU to the STA that transmitted the PS-Poll frame, using any frame exchange sequence valid for an individually addressed BU. If the PS STA that transmitted the PS-Poll frame returns to doze state after transmitting the Ack frame in response to receipt of this BU, but the AP fails to receive this Ack frame, then the AP retries transmission of this BU until the relevant retry limit is reached. See 11.2.3.7 (Receive operation for STAs in PS mode) for details on filtering of extra PS-Poll frames.

An AP that fails to receive an acknowledgment after the AP transmits a frame with the More Data subfield set to 0 to a non-AP VHT STA that is in TXOP power save mode retransmits the frame within the current TXOP under certain conditions as described in 11.2.3.16 (VHT TXOP power save).

A CMMG AP that fails to receive an acknowledgment after the AP transmits a frame with the More Data field set to 0 to a non-AP CMMG STA in CMMG TXOP power save mode may retransmit the frame within the current TXOP under certain conditions as described in 11.2.3.18 (CMMG TXOP power save).

### 10.3.4.5 Control of the channel

The SIFS is used to provide an efficient MSDU delivery mechanism. Once the STA has contended for the channel, that STA shall continue to send fragments until either all fragments of a single MSDU or MMPDU have been sent or an acknowledgment is not received. Should the sending of the fragments be interrupted due to one of these reasons, when the next opportunity for transmission occurs the STA shall resume transmission. The algorithm by which the STA decides which of the outstanding MSDUs shall next be attempted after an unsuccessful transmission (as defined in 10.3.4.3 (Backoff procedure for DCF)) attempt is beyond the scope of this standard, but any such algorithm shall comply with the restrictions listed in 10.7 (MSDU transmission restrictions).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Figure 10-24 (Transmission of a fragmented MSDU using SIFS) illustrates the transmission of a fragmented MSDU using the SIFS.

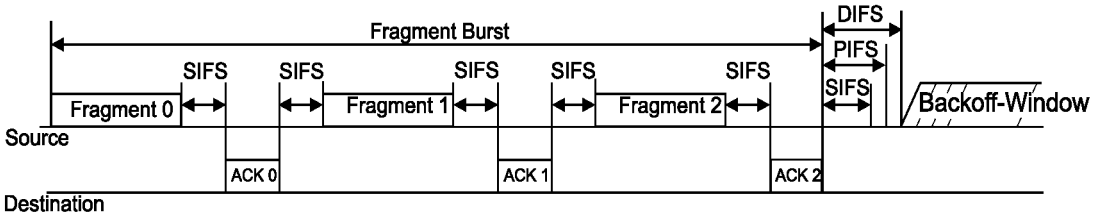

**Figure 10-24—Transmission of a fragmented MSDU using SIFS**

When the source STA transmits a fragment, it shall release the channel, then immediately monitor the channel for an acknowledgment as described in 10.3.2.11 (Acknowledgment procedure).

When the destination STA has finished sending the acknowledgment, the SIFS following the acknowledgment shall be reserved for the source STA to continue (if necessary) with another fragment. The STA sending the acknowledgment shall not transmit on the channel immediately following the acknowledgment.

The process of sending multiple fragments after contending for the channel is defined as a fragment burst.

If the source STA does not receive an acknowledgment frame, it shall attempt to retransmit the failed MPDU or another eligible MPDU, as defined in 10.7 (MSDU transmission restrictions), after performing the backoff procedure and the contention process.

After a STA contends for the channel to retransmit a fragment of an MSDU, it shall start with the last fragment that was not acknowledged. The destination STA shall receive the fragments in order (because the source sends them in order and they are individually acknowledged). It is possible, however, that the destination STA may receive duplicate fragments. It shall be the responsibility of the receiving STA to detect and discard duplicate fragments.

A STA shall transmit after the SIFS only under the following conditions during a fragment burst:

— The STA has just received a fragment that requires immediate acknowledgment.
— The source STA has received an acknowledgment for a previous fragment and has more fragment(s) for the same MSDU to transmit.

The following rules shall also apply:

— When a STA has transmitted a frame other than an initial or intermediate fragment, that STA shall not transmit on the channel following the acknowledgment for that frame, without performing the backoff procedure.
— When an MSDU has been successfully delivered or all retransmission attempts have been exhausted, and the STA has a subsequent MSDU to transmit, then that STA shall perform a backoff procedure.

### 10.3.5 Individually addressed MPDU transfer procedure

(11ax)If dot11TXOPDurationRTSThreshold is 1023 or not present, a STA shall use an RTS/CTS preceding a frame exchange including an individually addressed Data or Management frame when the length of the PSDU is greater than the length threshold indicated by dot11RTSThreshold. (11ax)If dot11TXOPDurationRTSThreshold is present and is not 1023, a non-AP HE STA using EDCA shall use an RTS/CTS exchange as defined in 26.2.1 (TXOP duration-based RTS/CTS). A STA may also use an RTS/CTS

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

exchange (11ax)to protect the transmission of individually addressed frames when it is necessary to distribute the NAV, or when it is necessary to establish protection (see 10.27 (Protection mechanisms)), or for other purposes.

NOTE 1—If dot11RTSThreshold is 0, an RTS/CTS exchange precedes all (#109)frame exchange sequences including an individually addressed Data or Management frame, except for a non-AP STA with dot11TXOPDurationRTSThreshold present and not equal to 1023. In this exception, use of an RTS/CTS exchange is controlled by dot11TXOPDurationRTSThreshold (see 26.2.1 (TXOP duration-based RTS/CTS)).(11ax)

NOTE 2—A non-AP STA that transmits an HE TB PPDU outside the context of an RDG is exempt from requirements related to dot11RTSThreshold and dot11TXOPDurationRTSThreshold because the STA is not the TXOP holder.(11ax)

(11ax)If an RTS/CTS exchange is used, the PPDU containing the PSDU shall be transmitted starting one SIFS after the end of the CTS frame.

NOTE 3—No regard is given to the busy or idle status of the medium when transmitting this PSDU.

(11ax)If an RTS/CTS exchange is not used, the PSDU shall be transmitted following the success of the basic access procedure. With or without the use of the RTS/CTS exchange procedure, the STA that is the destination of a Data frame shall follow the acknowledgment procedure.

### 10.3.6 Group addressed MPDU transfer procedure

When a STA transmits group addressed MPDUs in which the To DS subfield is 0, the STA shall use the basic access procedure, unless these MPDUs are delivered using the group addressed transmission service (GATS). When GATS is not used to deliver group addressed MPDUs, the STA shall not use an RTS/(NDP) CTS or RTS/DMG CTS exchange, regardless of the length of the frame. In addition, no recipient of the frame shall transmit an Ack frame. A STA that transmits a group addressed MPDU in which the To DS subfield is 1 shall, in addition to complying with the basic access procedure of CSMA/CA, obey the rules for RTS/CTS exchange and the acknowledgment procedure because the MPDU is directed to the AP. For DMG STAs, the MPDU transmission shall also comply with the access procedures defined in 10.38 (DMG and CMMG channel access).

There is no MAC-level recovery on group addressed frames, except for the following:

— Frames in which the To DS subfield is 1
— Group addressed frames transmitted via the GATS

As a result, the reliability of this traffic is reduced, relative to the reliability of individually addressed traffic, due to the increased probability of lost frames from interference, collisions, or time-varying channel properties.

A DMG STA may transmit a copy of the same group addressed MPDU using different antenna configurations. This might be needed to provide a quasi-omni coverage or to enable transmission by an MCS that is higher than MCS 0. (11bd)A DMG STA with dot11DMGOCBActivated equal to true may transmit copies of the same group addressed MPDU using different antenna configurations to provide sufficient coverage to communicate with peer STAs with which the DMG STA is maintaining beam links and may omit transmissions that use an antenna configuration over which a beamformed link is not maintained. If multiple copies of a group addressed MPDU with a To DS subfield equal to 0 are transmitted, the STA shall not transmit a different frame before the completion of the transmission of all copies of the group addressed MPDU.

NOTE—The following paragraph addresses the Dual CTS protection mechanism. The use of the Dual CTS protection mechanism is obsolete.

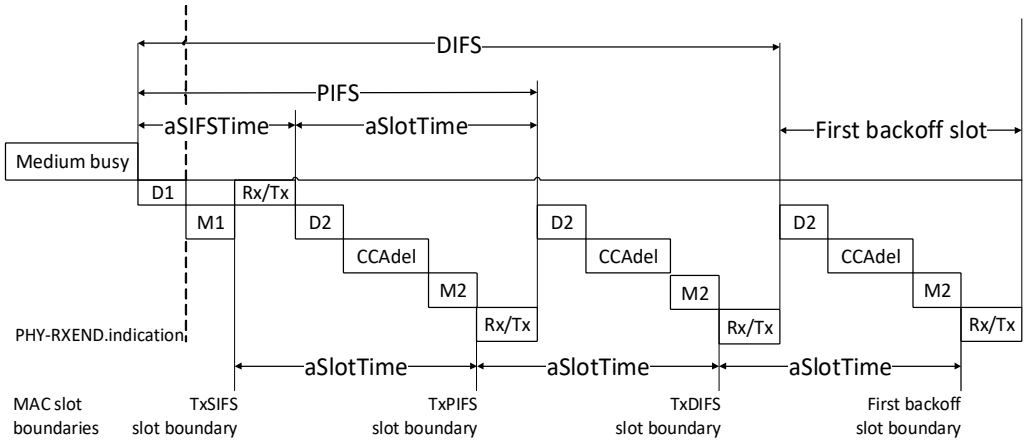
Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

An STBC-capable STA shall discard either all received group addressed Data frames that are STBC frames or all received group addressed Data frames that are non-STBC frames. How it makes this decision is outside the scope of this standard.

A STA that is not an S1G relay STA shall discard an MPDU with a group address in the Address 1 field unless one of the following cases applies: (1) the value in the Address 1 field matches any value in the dot11GroupAddressesTable or is the broadcast address(#3522), or (2) the STA is a GLK STA and the address in the Address 1 field is a SYNRA. A GLK STA shall process an MPDU with a SYNRA in the Address 1 field as described in 10.65 (SYNRA filtering operation). If an MPDU originates from an S1G relay STA's associated AP and if the MPDU has any group address in its Address 1 field, then the STA shall forward that MPDU to the S1G relay AP.

### 10.3.7 DCF timing relations

The IFSs are periods of time on the medium. The attributes of the IFSs are determined by the specific PHY (see Figure 10-25 (DCF timing relationships(#14)(#1058)(#3297))). The IFSs apply to transmission under EDCA,



D1 = aRxPHYDelay (referenced from the end of the last PPDU[+SigExt] on the medium)
D2 = aAirPropagationTime
Rx/Tx = aRxTxTurnaroundTime (begins with a PHY-TXSTART.request)
M1 = M2 = aMACProcessingDelay
CCAdel = aCCATime

**Figure 10-25—DCF timing relationships(#14)(#1058)(#3297)**

too (see Figure 10-29 (EDCA mechanism timing relationships(#14)(#1058))).

All medium timings that are referenced from the end of the transmission are referenced from the end (#14)of the PPDU[+SigExt]. The beginning of transmission refers to the (#14)start of the preamble of the next PPDU. All MAC timings are referenced from the PHY-TXEND.confirm, PHY-TXSTART.confirm, PHY-RXSTART.indication, and PHY-RXEND.indication primitives.

aSIFSTime and aSlotTime are determined per PHY, aSIFSTime is fixed, and aSlotTime can change dynamically as aAirPropagationTime changes (see 10.22.5 (Operation with coverage classes)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The STA may employ any non-negative value for each of the parameters:

— aRxPHYDelay
— aMACProcessingDelay
— aTxPHYDelay
— aTxRampOnTime
— aCCATime
— aRxTxSwitchTime

provided that the constraints in Equation (10-2), Equation (10-3), and Equation (10-4) are met, and provided that the CCA sensitivity specification for the attached PHY is met (see 15.4.6.5 (CCA), 16.3.8.5 (CCA), 17.3.10.6 (CCA requirements), 18.4.6 (CCA performance), 19.3.19.6 (CCA sensitivity), 20.4.4.2.2 (CCA sensitivity), 20.5.4.2.2 (CCA sensitivity), 21.3.18.5 (CCA sensitivity), and 22.3.18.6 (CCA sensitivity)).

$$aSIFSTime = aRxPHYDelay + aMACProcessingDelay + aRxTxTurnaroundTime \quad (10\text{-}2)$$

$$aSlotTime = aCCATime + aMACProcessingDelay + aRxTxTurnaroundTime + aAirPropagationTime \quad (10\text{-}3)$$

$$aRxTxTurnaroundTime = aTxPHYDelay + aRxTxSwitchTime + aTxRampOnTime \quad (10\text{-}4)$$

where

aAirPropagationTime is determined as described in 10.22.5 (Operation with coverage classes)

aSlotTime, aSIFSTime, and aRxTxTurnaroundTime are the values indicated in the PLME-CHARACTERISTICS.confirm primitive

the other attribute values are the values implemented

The PIFS and DIFS are derived by the Equation (10-5) and Equation (10-6), as illustrated in Figure 10-25 (DCF timing relationships(#14)(#1058)(#3297)).

$$PIFS = aSIFSTime + aSlotTime \quad (10\text{-}5)$$

$$DIFS = aSIFSTime + 2 \times aSlotTime \quad (10\text{-}6)$$

In a non-S1G STA, when dot11DynamicEIFSActivated is false or not defined, the EIFS is derived from the SIFS and the DIFS and the length of time it takes to transmit an Ack frame at the lowest PHY mandatory rate or MCS by Equation (10-7).

$$EIFS = aSIFSTime + AckTxTime + DIFS \quad (10\text{-}7)$$

where AckTxTime is the time expressed in microseconds required to transmit an Ack frame, including preamble, PHY header and any additional PHY dependent information, at the lowest PHY mandatory rate or MCS.

In an S1G STA, the EIFS is equal to DIFS if the PPDU that causes the EIFS does not generate a PHY-RXEND.indication(FormatViolation) primitive. Otherwise, the EIFS for the S1G STA is derived by Equation (10-7), where ACKTxTime is equal to NDPTxTime as defined in 10.3.2.5.2 (RID update).

When dot11DynamicEIFSActivated is true, EIFS is based on an estimated duration of the PPDU that is the possible response to the PPDU that causes the EIFS. The estimation is based on properties of the PHY header of the PPDU that causes the EIFS, such as modulation, rate/MCS, or length.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

NOTE 1—If the L-SIG field is used, as it does not have CRC protection, this information might not always be correct.

In a non-DMG and non-S1G STA, when dot11DynamicEIFSActivated is true, if the PPDU that causes the EIFS does not contain a single MPDU with a length equal to 14 or 32 octets, and the modulation of the PPDU that causes the EIFS is included in Table 10-8 (Determination of the EstimatedAckTxTime based on properties of the PPDU causing the EIFS), then EIFS is determined as shown in Equation (10-8).

$$EIFS = aSIFSTime + EstimatedAckTxTime + DIFS \quad (10\text{-}8)$$

where EstimatedAckTxTime is based on an estimated duration of the PPDU that is the possible response to the PPDU that causes the EIFS, as specified in Table 10-8 (Determination of the EstimatedAckTxTime based on properties of the PPDU causing the EIFS).

**Table 10-8—Determination of the EstimatedAckTxTime based on properties of the PPDU causing the EIFS**

| Modulation of PPDU causing EIFS | Rate/MCS of PPDU causing EIFS | Other properties of PPDU causing EIFS | Presumed response | Presumed response rate | EstimatedAck TxTime (μs) |
|---|---|---|---|---|---|
| (HR-)DSSS | 1 Mb/s | | Ack | 1 Mb/s | 304 |
| (HR-)DSSS | ≥ 2 Mb/s (long preamble) | | Ack | 2 Mb/s | 248 |
| (HR-)DSSS | ≥ 2 Mb/s (short preamble) | | Ack | 2 Mb/s | 152 |
| (ERP-)OFDM | BPSK | | Ack | 6 Mb/s | 44 |
| (ERP-)OFDM | QPSK | | Ack | 12 Mb/s | 32 |
| (ERP-)OFDM | ≥16-QAM | | Ack | 24 Mb/s | 28 |
| HT | BPSK | Aggregation = 0 | Ack | 6 Mb/s | 44 |
| HT | QPSK | Aggregation = 0 | Ack | 12 Mb/s | 32 |
| HT | ≥16-QAM | Aggregation = 0 | Ack | 24 Mb/s | 28 |
| HT | BPSK | Aggregation = 1 | BlockAck | 6 Mb/s | 68 |
| HT | QPSK | Aggregation = 1 | BlockAck | 12 Mb/s | 44 |
| HT | ≥16-QAM | Aggregation = 1 | BlockAck | 24 Mb/s | 32 |
| VHT | BPSK | | BlockAck | | 68 |
| VHT | QPSK | | BlockAck | | 44 |
| VHT | ≥16-QAM | | BlockAck | | 32 |

NOTE 2—This also applies to an HE STA with dot11DynamicEIFSActivated set to true that receives an HE PPDU with the RXVECTOR parameter TXOP_DURATION set to UNSPECIFIED that causes the EIFS.(11ax)

When dot11DynamicEIFSActivated is true and the PPDU that causes the EIFS contains a single MPDU with a length equal to 14 or 32 octets, EIFS is equal to DIFS. This reflects the fact that a 14-octet or 32-octet MPDU is very likely an Ack or a BlockAck frame, which does not cause a response PPDU to be transmitted.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

When dot11DynamicEIFSActivated is true and the modulation of the PPDU that causes the EIFS does not occur in Table 10-8 (Determination of the EstimatedAckTxTime based on properties of the PPDU causing the EIFS), then EIFS is determined as shown in Equation (10-7).

Figure 10-25 (DCF timing relationships(#14)(#1058)(#3297)) illustrates the relation between the SIFS, PIFS, and DIFS as they are measured on the medium and the different MAC slot boundaries TxSIFS, TxPIFS, and TxDIFS. These slot boundaries define when the transmitter shall be turned on by the MAC to meet the different IFS timings on the medium, after subsequent detection of the CCA result of the previous slot time.

Equation (10-9), Equation (10-10), and Equation (10-11) define the MAC slot boundaries using attributes provided by the PHY, which are such that they compensate for implementation timing variations. The starting reference of these slot boundaries is again (#14)the end of the previous PPDU[+SigExt].

$$TxSIFS = SIFS - aRxTxTurnaroundTime \quad (10\text{-}9)$$

$$TxPIFS = TxSIFS + aSlotTime \quad (10\text{-}10)$$

$$TxDIFS = TxSIFS + 2 \times aSlotTime \quad (10\text{-}11)$$

NOTE 3—The tolerance for SIFS is defined in 10.3.2.3.3 (SIFS).

### 10.3.8 Signal extension

Transmissions of PSDUs with the TXVECTOR parameter FORMAT of type NON_HT with NON_HT_MODULATION values of ERP-OFDM and NON_HT_DUP_OFDM and transmissions of frames with the TXVECTOR parameter FORMAT with values of HT_MF, (11ax)HT_GF, HE_SU, HE_MU, HE_ER_SU, or HE_TB (#14)are immediately followed by a period of no transmission of duration aSignalExtension, except for RIFS transmissions. The purpose of this signal extension is to enable the NAV value of Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification) STAs to be set correctly.

When an HT STA transmits a PPDU using a RIFS and with the TXVECTOR parameter FORMAT equal to NON_HT with the NON_HT_MODULATION parameter equal to one of ERP-OFDM and NON_HT_DUP_OFDM or a PPDU using a RIFS and with the TXVECTOR parameter FORMAT equal to HT_MF or HT_GF, it shall set the TXVECTOR parameter NO_SIG_EXTN to true. Otherwise, it shall set the TXVECTOR parameter NO_SIG_EXTN to false.

### 10.3.9 Determination of PLME aCWmin characteristics

In the case of the Clause 18 (Extended Rate PHY (ERP) specification) ERP, the aCWmin value is dependent on the requester's characteristic rate set. The characteristic rate set is equal to the IBSS's basic rate set when the STA is an IBSS STA. It is equal to the AP's operational rate set when the STA is associated with an AP. At all other times, it is equal to the STA's mandatory rate set.

If the PHY characteristic aCWmin is a vector, then the MAC variable aCWmin is set to the PHY characteristic aCWmin(0) if the characteristic rate set includes only rates in the set 1, 2, 5.5, 11 and to aCWmin(1) otherwise. If the PHY characteristic aCWmin is a scalar, then the MAC variable aCWmin is set to the PHY characteristic aCWmin.

NOTE—The MAC variable aCWmin is distinct from the PHY characteristic aCWmin. Outside this subclause, the MAC uses the MAC variable aCWmin whenever the value of aCWmin is required.

## 10.4 MSDU, (11ax)A-MSDU, and MMPDU fragmentation

The MAC may fragment and reassemble MSDUs or MMPDUs that are carried in individually addressed MPDUs. The fragmentation and defragmentation mechanisms allow for fragment retransmission.

(#2198)Dynamic fragmentation allows A-MSDUs to be fragmented. An HE STA may use dynamic fragmentation as defined in 26.3.2 (Dynamic fragmentation) if the conditions in 26.3.2.1 (General) are met. Transmission and retransmission of A-MSDU fragments shall follow the procedures defined in this subclause except where superseded by 26.3 (Fragmentation and defragmentation).

The length of each fragment shall be an equal number of octets for all fragments except the last, which may be smaller. The length of each fragment shall be an even number of octets, except for the last fragment of an MSDU or MMPDU, which may be either an even or an odd number of octets. The length of a fragment shall never be larger than dot11FragmentationThreshold unless security encapsulation is invoked for the MPDU. If security encapsulation is active for the MPDU, then the MPDU shall be expanded by the encapsulation overhead and this may result in a fragment larger than dot11FragmentationThreshold.

A fragment is an MPDU, the Frame Body field of which carries only a portion of an MSDU, (11ax)A-MSDU, or MMPDU. When data are to be transmitted, the number of octets in the fragment (before processing by the security mechanism) shall be limited by dot11FragmentationThreshold and the number of octets in the MPDU that have yet to be assigned to a fragment at the instant the fragment is constructed for the first time. Once a fragment is transmitted for the first time, its frame body content and length shall be fixed until it is successfully delivered to the immediate receiving STA.

(#2128)NOTE 1—Packet numbers for consecutive fragments of an MSDU, A-MSDU or MMPDU in an RSNA are required to increment in steps of 1(#3089) (see 12.5.2.3.2 (PN processing) and 12.5.4.3.2 (PN processing)).

A STA shall support(#546) receiving MPDUs, containing all or part of an MSDU, of arbitrary length that is less than or equal to the maximum MSDU size as(11ax) specified in 9-34 (Maximum data unit sizes and durations(#1327)(#4013)), plus any security encapsulation overhead, plus MAC header and FCS.

A STA shall support(#546) receiving MPDUs, containing all or part of an MMPDU, of arbitrary length that is less than or equal to the minimum of

— The maximum MMPDU size as defined in 9.3.3.1 (Format of (PV0) Management frames), plus any security encapsulation overhead, plus MAC header and FCS
— Any maximum MPDU length advertised by the STA

If a fragment requires retransmission, its frame body content and length shall remain fixed for the lifetime of the MSDU or MMPDU at that STA. Each fragment contains a Sequence Control field, which comprises a sequence number and fragment number. When a STA is transmitting a fragmented MSDU or MMPDU or dynamically fragmented A-MSDU,(#2198) the sequence number shall remain the same for all fragments of that MSDU, A-MSDU,(#2198) or MMPDU. The fragments shall be sent in order of lowest fragment number to highest fragment number, where the fragment number value starts at 0, and increases by 1 for each successive fragment. The Frame Control field also contains a bit, the More Fragments bit, that is equal to 0 to indicate the last fragment of the MSDU, A-MSDU,(#2198) or MMPDU (or that the MSDU, A-MSDU(#2198) or MMPDU was not fragmented, if the Fragment Number subfield is also equal to 0).

The source STA shall maintain a transmit MSDU/MMPDU timer for each MSDU/MMPDU being transmitted. The attribute dot11MaxTransmitMSDULifetime specifies the maximum amount of time allowed to transmit an MSDU/MMPDU. The timer starts on the initial attempt to transmit the MSDU/MMPDU, or first fragment of the MSDU/MMPDU if the MSDU/MMPDU is fragmented. If the timer exceeds dot11MaxTransmitMSDULifetime, then any remaining fragments are discarded by the source STA and no attempt is made to complete transmission of the MSDU/MMPDU.(#2198)

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

NOTE 2—A STA might interleave fragments of MSDUs with different TIDs sent to the same receiver, subject to any constraint caused by the number of replay counters.

## 10.5 MSDU, (11ax)A-MSDU, and MMPDU defragmentation

(#4157)(#2200)(#3775)Reception and reassembly of A-MSDU fragments shall follow the procedures defined in this subclause except where superseded by 26.3 (Fragmentation and defragmentation).

The header of each fragment contains the following information that is used by the destination STA to reassemble the MSDU, A-MSDU,(#2200) or MMPDU:

- Frame type
- Address of the sender, obtained from the Address 2 field
- Destination address
- *Sequence Control field:* This field allows the destination STA to check that all incoming fragments belong to the same MSDU, A-MSDU,(#2200) or MMPDU, and the sequence in which the fragments should be reassembled. The sequence number within the Sequence Control field remains the same for all fragments of an MSDU, A-MSDU,(#2200) or MMPDU, while the fragment number within the Sequence Control field increments for each fragment.
- Traffic identifier, for frames with a QoS Control field.
- *More Fragments indicator:* Indicates to the destination STA that this is not the last fragment of a fragmented MSDU, A-MSDU,(#2200) or MMPDU. Only the last fragment of a fragmented MSDU, A-MSDU,(#2200) or MMPDU shall have this bit set to 0. All other fragments of a fragmented MSDU, A-MSDU,(#2200) or MMPDU shall have this bit set to 1.

The destination STA shall reconstruct the MSDU or MMPDU by combining the fragments in order of fragment number subfield of the Sequence Control field. If security encapsulation has been applied to the fragment, it shall be deencapsulated and decrypted before the fragment is used for defragmentation of the MSDU, A-MSDU,(#2200) or MMPDU. If the fragment with the More Fragments bit equal to 0 has not yet been received, then the destination STA knows that the MSDU, A-MSDU,(#2200) or MMPDU is not yet complete. As soon as the STA receives the fragment with the More Fragments bit equal to 0, the STA knows that no more fragments will be received for the MSDU, A-MSDU,(#2200) or MMPDU.

(#2128)An MSDU or MMPDU shall not be reassembled from fragments that were encrypted with different keys, or from a mixture of encrypted and unencrypted fragments.

(#2128)NOTE 1—Packet numbers for consecutive fragments of an MSDU, A-MSDU or MMPDU in an RSNA are required to increment in steps of 1(#3089) (see 12.5.2.4.4 (PN and replay detection) and 12.5.4.4.4 (PN and replay detection) under d)).(#3141)

(#2128)NOTE 2—All the fragments of an MSDU or A-MSDU are required to have the same indication of whether they are fragments of an MSDU or of an A-MSDU (see 26.3.3.1 (General)).

A STA shall support the concurrent reception of fragments of at least three MSDUs or MMPDUs. A STA should support the concurrent reception of fragments of at least one MSDU per access category. An AP should support the concurrent reception of at least one MSDU per access category per associated STA. Note that a STA receiving more than three fragmented MSDUs or MMPDUs concurrently might experience a significant increase in the number of frames discarded.

NOTE 3—The three MSDUs or MMPDUs might be from different peers (e.g., in an IBSS or MBSS).

The destination STA shall maintain a Receive Timer for each MSDU or MMPDU being received, for a minimum of three MSDUs or MMPDUs. The STA may implement additional timers to be able to receive additional concurrent MSDUs or MMPDUs. The receiving STA shall discard all fragments that are part of an

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

MSDU or MMPDU for which a timer is not maintained. There is also dot11MaxReceiveLifetime, that specifies the maximum amount of time allowed to receive an MSDU. The receive timer starts on the reception of the first fragment of a fragmented MSDU or MMPDU. If the receive timer exceeds dot11MaxReceiveLifetime, then all received fragments of this MSDU or MMPDU shall be discarded by the destination STA. If additional fragments of this MSDU or MMPDU are subsequently received, those fragments shall be acknowledged and discarded.

To properly reassemble MPDUs into an MSDU, A-MSDU,(#2200) or MMPDU, a destination STA shall discard any duplicated fragments received. A STA shall discard duplicate fragments as described in 10.3.2.14 (Duplicate detection and recovery). However, a duplicate fragment of an individually addressed MSDU, A-MSDU,(#2200) or MMPDU shall be acknowledged.(#2200)

## 10.6 Multirate support

### 10.6.1 Overview

Some PHYs have multiple data transfer rate capabilities that allow implementations to perform dynamic rate switching with the objective of improving performance. The algorithm for performing rate switching is beyond the scope of this standard, but in order to provide coexistence and interoperability on multirate-capable PHYs, this standard defines a set of rules to be followed by all STAs.

Only the data transfer rates of the mandatory rate set of the attached PHY are guaranteed to be supported when a STA for which dot11OCBActivated is true transmits a Management or Data frame. A higher layer protocol entity within a STA in which dot11OCBActivated is true might negotiate a rate outside the mandatory rate set.

A STA that transmits a frame shall select a rate defined by the rules for determining the rates of transmission of protection frames in 10.27 (Protection mechanisms) when the following conditions apply:

- The STA's protection mechanism for non-ERP receivers is enabled.
- The frame is a protection mechanism frame.
- The frame initiates an exchange.

Otherwise, a non-DMG and non-CMMGSTA shall transmit the frame using a rate that is in accordance with rules defined in 10.6.5 (Rate selection for Data and Management frames) and 10.6.6 (Rate selection for Control frames). A DMG STA shall transmit the frame using a rate that is in accordance with rules defined in 10.6.7 (Multirate support for DMG STAs). A CMMG STA shall transmit the frame using a rate that is in accordance with rules defined in 10.6.8 (Multirate support for CMMG STAs).

For specific PHYs, the value of the Duration/ID field is determined using the PLME-TXTIME.request primitive and the PLME-TXTIME.confirm primitive. These specific PHYs are defined in:

- Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification) for HR/DSSS
- Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) for OFDM
- Clause 18 (Extended Rate PHY (ERP) specification) for ERP
- Clause 19 (High Throughput (HT) PHY specification(#2297)) for HT
- Clause 20 (Directional multi-gigabit (DMG) PHY specification) for DMG
- Clause 21 (Very high throughput (VHT) PHY specification) for VHT
- Clause 22 (Television very high throughput (TVHT) PHY specification) for TVHT
- Clause 24 (China directional multi-gigabit (CDMG) PHY specification) for CDMG
- Clause 25 (China millimeter-wave multi-gigabit (CMMG) PHY specification) for CMMG
- Clause 27 (High-efficiency (HE) PHY specification(11ax)) for HE(11ax)

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The two PLME-TXTIME primitives are defined in the respective PHY specifications:

- 16.3.4 (HR/DSSS TXTIME calculation) for HR TXTIME calculation
- 17.4.3 (OFDM TXTIME calculation) for OFDM TXTIME calculation
- 18.5.3.2 (ERP-OFDM TXTIME calculations) for ERP-OFDM TXTIME calculation
- 19.4.3 (TXTIME calculation) for HT TXTIME calculation
- 20.11.3 (TXTIME calculation) for DMG PLME TXTIME calculation
- 21.4.3 (TXTIME and PSDU_LENGTH calculation) for VHT PLME TXTIME calculation
- 22.4.3 (TXTIME and PSDU_LENGTH calculation) for TVHT PLME TXTIME calculation
- 25.14.3 (TXTIME calculation) for CMMG PLME TXTIME calculation
- 27.4.3 (TXTIME and PSDU_LENGTH calculation) for HE PLME TXTIME calculation(11ax)

The Duration/ID field in a frame transmitted by a QoS STA may cover multiple frames and might involve using the PLME-TXTIME.request primitive several times.

### 10.6.2 Basic HT-MCS Set field

An AP that transmits a frame containing an HT Operation element with either the Dual Beacon field or the Dual CTS Protection field equal to 1 shall include at least one MCS that has only one spatial stream in the Basic HT-MCS Set field of the HT Operation element of that frame.

### 10.6.3 Basic STBC MCS

The basic STBC MCS has the value null when any of the following conditions is true:

- The Dual Beacon field in the HT Operation element is equal to 0, and the Dual CTS Protection field in the HT Operation element is equal to 0.
- No HT Operation element is present in the Association Response frame received from the current AP.
- The Basic HT-MCS Set field of the HT Operation parameter of the MLME-START.request primitive or Basic HT-MCS Set field of the HT Operation parameter of the SelectedBSS parameter of the MLME-JOIN.request primitive is empty or does not exist.
- The lowest MCS of the Basic HT-MCS Set field of the HT Operation parameter of the MLME-START.request primitive or Basic HT-MCS Set field of the HT Operation parameter of the SelectedBSS parameter of the MLME-JOIN.request primitive has NSS value greater than 1 (the mapping of MCS to NSS is PHY dependent, for the HT PHY see 19.5 (Parameters for HT-MCSs)).

If none of the above conditions is true, then the basic STBC MCS is the lowest MCS index of the Basic HT-MCS Set field of the HT Operation parameter of the MLME-START.request primitive or Basic HT-MCS Set field of the HT Operation parameter of the SelectedBSS parameter of the MLME-JOIN.request primitive.

When an MCS from the basic STBC MCS is required in 10.6.5 (Rate selection for Data and Management frames) and 10.6.6 (Rate selection for Control frames) but the basic STBC MCS has the value null, the STA shall select a mandatory MCS of the attached PHY.

### 10.6.4 Basic rate set, basic HT-MCS set, and basic VHT-MCS and NSS set for mesh STA

A mesh STA shall not establish a mesh peering with a mesh STA using a different BSSBasicRateSet (see 14.3.7 (Candidate peer mesh STA) and 14.3.8 (Establishing or becoming a member of a mesh BSS)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The SME of a Mesh STA should use the mandatory PHY rates as the default BSSBasicRateSet in the MLME-START.request primitive to reduce the risk that a candidate peer mesh STA utilizes a different BSSBasicRateSet. If the mesh STA is also an HT STA, it should adopt the mandatory HT-MCSs as the default basic HT-MCS set. If the mesh STA is also a VHT STA, it should adopt <VHT-MCS, NSS> tuples formed from the mandatory VHT-MCSs and NSS = 1 as the default basic VHT-MCS and NSS set (see 11.38.7 (Basic VHT-MCS and NSS set operation)).

### 10.6.5 Rate selection for Data and Management frames

#### 10.6.5.1 Rate selection for non-STBC Beacon (#3263)frames

In an S1G STA, non-STBC S1G Beacon frames shall be transmitted in an S1G 1 MHz PPDU, an S1G 2 MHz PPDU with short preamble, an S1G 1 MHz duplicate PPDU, or an S1G 2 MHz duplicate PPDU with short preamble using one of the mandatory PHY rates.

If the BSSBasicRateSet parameter is not empty, (#3263)a non-STBC Beacon frame that is not an ER beacon or HE beacon shall be transmitted in a non-HT PPDU using one of the rates included in the BSSBasicRateSet parameter. An ER beacon is transmitted as defined in 26.15.5 (Additional rules for ER beacons and group addressed frames), and an HE beacon is transmitted as defined in 26.15.6 (Additional rules for HE beacons and group addressed frames).(11ax)

If the BSSBasicRateSet parameter is empty, the frame shall be transmitted in a non-HT PPDU using one of the mandatory PHY rates.

#### 10.6.5.2 Rate selection for STBC group addressed Data and Management frames

When a STA has dot11TxSTBCOptionActivated true, it shall use the basic STBC MCS when it transmits an STBC Beacon frame or when it transmits a group addressed Data or Management frame that is an STBC frame.

#### 10.6.5.3 Rate selection for EBCS Info, EBCS UL, and EBCS Data frames(11bc)

The transmission rate for EBCS Info frames and EBCS UL frames is determined from dot11EBCSInfoPHYType and dot11EBCSInfoTxRate. When dot11EBCSInfoPHYType is equal to 255, the AP may select a transmission rate following the rules specified in 10.6.5.4 (Rate selection for other group addressed Data and Management frames).

The transmission rate for EBCS Data frames is determined from dot11EBCSTrafficStreamPHYType and dot11EBCSTrafficStreamTxRate. When dot11EBCSTrafficStreamPHYType is equal to 255, the AP may select a transmission rate following the rules specified in 10.6.5.4 (Rate selection for other group addressed Data and Management frames).

#### 10.6.5.4 Rate selection for other group addressed Data and Management frames

This subclause describes the rate selection rules for group addressed Data and Management frames, excluding the following:

- Non-STBC Beacon (#3263)frames
- ER beacon and HE beacon(11ax)
- STBC group addressed Data and Management frames
- Data frames located in an FMS stream (see 11.21.8 (FMS multicast rate processing))
- Group addressed frames transmitted to the GCR concealment address (see 11.21.16.3.5 (Concealment of GCR transmissions))

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

- Group addressed Data and Management frames transmitted in an HE ER SU PPDU (see 26.15.5 (Additional rules for ER beacons and group addressed frames))(11ax)
- Group addressed Data and Management frames transmitted in an HE SU PPDU (see 26.15.6 (Additional rules for HE beacons and group addressed frames))(11ax)
- Group addressed Data and Management frames transmitted in an HE MU PPDU (see 26.15.7 (Additional rules for group addressed frames in an HE MU PPDU))(11ax)
- EBCS Info frames, EBCS UL frames and EBCS Data frames(11bc)

If the BSSBasicRateSet parameter is not empty, a Data or Management frame (excluding the frames listed above) with a group address in the Address 1 field shall be transmitted in a non-HT PPDU using one of the rates included in the BSSBasicRateSet parameter or the rate chosen by the AP, described in 11.21.8 (FMS multicast rate processing), if the Data frames are part of an FMS stream.

If the BSSBasicRateSet parameter is empty and the Basic HT-MCS Set field of the HT Operation parameter of the MLME-START.request primitive or Basic HT-MCS Set field of the HT Operation parameter of the SelectedBSS parameter of the MLME-JOIN.request primitive is not empty, the frame shall be transmitted in an HT PPDU using one of the MCSs included in the Basic HT-MCS Set field of the HT Operation parameter of the MLME-START.request primitive or Basic HT-MCS Set field of the HT Operation parameter of the SelectedBSS parameter of the MLME-JOIN.request primitive.

If the BSSBasicRateSet parameter is empty and the Basic HT-MCS Set field of the HT Operation parameter of the MLME-START.request primitive or Basic HT-MCS Set field of the HT Operation parameter of the SelectedBSS parameter of the MLME-JOIN.request primitive is empty and the basic VHT-MCS and NSS set is not empty, the frame shall be transmitted in a VHT PPDU using one of the <VHT-MCS. NSS> tuples included in the basic VHT-MCS and NSS set.

In a non-S1G STA, if the BSSBasicRateSet parameter, the Basic HT-MCS Set field of the HT Operation parameter of the MLME-START.request primitive or Basic HT-MCS Set field of the HT Operation parameter of the SelectedBSS parameter of the MLME-JOIN.request primitive, and the basic VHT-MCS and NSS set are empty (e.g., a scanning STA that is not yet associated with a BSS), the frame shall be transmitted in a non-HT PPDU using one of the mandatory PHY rates.

In an S1G STA, if the BSSBasicS1GMCS_NSSSet parameter is empty (e.g., a scanning STA that is not yet associated with a BSS), the frame shall be transmitted in an S1G PPDU using one of the mandatory PHY rates.

If the BSSBasicS1GMCS_NSSSet is not empty, the frame shall be transmitted in an S1G PPDU using an MCS and NSS from one of the <S1G-MCS, NSS> tuples included in the BSSBasicS1GMCS_NSSSet parameter.

#### 10.6.5.5 Rate selection for polling frames

A Data frame of a subtype that includes CF-Poll that does not also include CF-Ack shall be transmitted at a rate selected as follows:

a) If an initial exchange has already established protection and the Duration/ID field in the frame establishing protection covers the entire TXOP, the rate or MCS is selected according to the rules in 10.6.5.8 (Rate selection for other individually addressed Data and Management frames).

b) Otherwise, the Data frame shall be transmitted at a rate or MCS as defined in 10.6.5.4 (Rate selection for other group addressed Data and Management frames), treating the frame as though it has a group address in the Address 1 field, solely for the purpose of determining the appropriate rate or MCS.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

#### 10.6.5.6 Rate selection for +CF-Ack frames

For a frame of type Data +CF-Ack, Data +CF-Poll+CF-Ack, or CF-Poll +CF-Ack, the rate or MCS and TXVECTOR parameter CH_BANDWIDTH used to transmit the frame shall be chosen from among those supported by both the addressed recipient STA and the STA to which the Ack frame is intended.

#### 10.6.5.7 Rate selection for Data frames sent within an FMS stream

Data frames sent within an FMS stream are sent at a rate negotiated during the establishment of the FMS stream. See 11.21.8 (FMS multicast rate processing).

#### 10.6.5.8 Rate selection for other individually addressed Data and Management frames

A Data or Management frame not identified in 10.6.5.1 (Rate selection for non-STBC Beacon (#3263)frames) to 10.6.5.7 (Rate selection for Data frames sent within an FMS stream) shall be sent using any data rate, MCS, <VHT-MCS, NSS> tuple, or <S1G-MCS, NSS> tuple subject to the following constraints:

- A STA shall not transmit a frame using a rate or MCS that is not supported by the receiver STA, as reported in any Supported Rates and BSS Membership Selectors element, Extended Supported Rates and BSS Membership Selectors element, or Supported MCS Set field in Management frames transmitted by the receiver STA.
- A STA shall not transmit a frame using a <VHT-MCS, NSS> tuple that is not supported by the receiver STA, as reported in any Supported VHT-MCS and NSS Set field in Management frames transmitted by the receiver STA.
- A STA shall not transmit a frame using a <S1G-MCS, NSS> tuple that is not supported by the receiver STA, as reported in any Supported S1G-MCS and NSS Set field in Management frames transmitted by the receiver STA.
- If at least one Operating Mode field with the Rx NSS Type subfield equal to 0 was received from the receiver STA:
  - A STA shall not transmit a frame with the number of spatial streams greater than that indicated in the Rx NSS subfield in the most recently received Operating Mode field with the Rx NSS Type subfield equal to 0 from the receiver STA.
- If at least one Operating Mode field with the Rx NSS Type subfield equal to 1 was received from the receiver STA:
  - A STA shall not transmit an SU PPDU frame using a beamforming steering matrix with the number of spatial streams greater than that indicated in the Rx NSS subfield in the most recently received Operating Mode field with the Rx NSS Type subfield equal to 1 from the receiver STA if the beamforming steering matrix was derived from a VHT Compressed Beamforming report with Feedback Type subfield indicating MU in the VHT Compressed Beamforming frame(s).
- A STA shall not transmit a frame using a value for the CH_BANDWIDTH parameter of the TXVECTOR that is not supported by the receiver STA, as reported in any HT Capabilities element, VHT Capabilities element, or S1G Capabilities element received from the intended receiver.
- An HT STA that is a member of a BSS and that is not a VHT STA shall not transmit a frame using a value for the CH_BANDWIDTH parameter of the TXVECTOR that is not permitted for use in the BSS, as reported in the most recently received HT Operation element, with the exception of transmissions on an off-channel TDLS direct link, which follow the rules described in 11.20.6.2 (General behavior on the off-channel) and 11.20.6.3 (Setting up a 40 MHz TDLS direct link(#2152)).
- A VHT STA that is a member of a BSS shall not transmit a frame using a value for the CH_BANDWIDTH parameter of the TXVECTOR that is not permitted for use in the BSS, as reported in the most recently received VHT Operation element with the following exceptions:

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

- Transmissions on an off-channel TDLS direct link follow the rules described in 11.20.6.2 (General behavior on the off-channel) and 11.20.6.3 (Setting up a 40 MHz TDLS direct link(#2152)).
- Transmissions by a VHT STA on a (#2152)TDLS direct link follow the rules described in 11.20.1 (General) and 11.20.6.5 (Setting up a wide bandwidth off-channel TDLS direct link(#2152)).

— An S1G STA that is a member of a BSS shall not transmit a frame using a value for the CH_BANDWIDTH parameter of the TXVECTOR that is not permitted for use in the BSS, as reported in the most recently received S1G Operation element with the following exceptions:

- Transmissions on a TDLS off-channel link follow the rules described in 11.20.6.2 (General behavior on the off-channel) and 11.20.6.3 (Setting up a 40 MHz TDLS direct link(#2152)).
- Transmissions by an S1G STA on a (#2152)TDLS direct link follow the rules described in 11.20.1 (General) and 11.20.6.5 (Setting up a wide bandwidth off-channel TDLS direct link(#2152)).

Additionally, the value of the CH_BANDWIDTH parameter for a transmission by an S1G STA that is operating as an SST STA is limited by the Maximum permitted PPDU bandwidth as indicated in the Maximum Transmission Width field of the most recently received SST element or RPS element (see 10.51 (Subchannel selective transmission (SST)) and 10.23.5 (Restricted access window (RAW) operation).

— If at least one Operating Mode field with the Rx NSS Type subfield equal to 0 was received from the receiver STA:

- A STA shall not transmit a frame using a value for the TXVECTOR parameter CH_BANDWIDTH that is not supported by the receiver STA as reported in the most recently received Operating Mode field with the Rx NSS Type subfield equal to 0 from the receiver STA.

When the operational rate set of the receiving STA or STAs is not known, the transmitting STA shall transmit using a rate in the BSSBasicRateSet parameter, or an MCS in the Basic HT-MCS Set field of the HT Operation parameter of the MLME-START.request primitive or Basic HT-MCS Set field of the HT Operation parameter of the SelectedBSS parameter of the MLME-JOIN.request primitive, or a <VHT-MCS, NSS> tuple in the basic VHT-MCS and NSS set, or an <S1G-MCS, NSS> tuple in the BSSBasicS1GMCS_NSSSet parameter, or a rate from the mandatory rate set of the attached PHY if the BSSBasicRateSet, the Basic HT-MCS Set field of the HT Operation parameter of the MLME-START.request primitive or Basic HT-MCS Set field of the HT Operation parameter of the SelectedBSS parameter of the MLME-JOIN.request primitive, and the basic VHT-MCS and NSS set, and the BSSBasicS1GMCS_NSSSet are empty.

The rules in this subclause also apply to A-MPDUs that aggregate MPDUs with the Type subfield equal to Data or Management with any other types of MPDU.

### 10.6.6 Rate selection for Control frames

#### 10.6.6.1 General rules for rate selection for Control frames

Control frames carried in an A-MPDU that does not contain an S-MPDU shall be sent at a rate selected from the rules defined in 10.6.5.8 (Rate selection for other individually addressed Data and Management frames).

NOTE—The rules defined in 10.6.6.2 (Rate selection for Control frames that initiate a TXOP) to 10.6.6.5 (Rate selection for control response frames) apply only to Control frames not carried in an A-MPDU that does not contain an S-MPDU.

A Control frame shall be carried in an S1G PPDU with NSS equal to 1 without using long preamble, short GI, LDPC coding, STBC format, and traveling pilots when the Control frame is transmitted by an S1G STA.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The following rules determine whether a Control frame is carried in a non-HT, HT or VHT PPDU:

a) A control response frame shall be carried in an HT PPDU when the Control frame is a response to a frame that meets any of the following conditions:
   1) The frame eliciting the response included an HT variant HT Control field with the TRQ field equal to 1 and the HT NDP Announcement subfield equal to 0, and this responder set the Implicit Transmit Beamforming Receiving Capable field to 1 in its last transmitted HT Capabilities element; or
   2) The frame eliciting the response was an RTS frame carried in an HT PPDU; or
   3) The frame eliciting the response was an STBC frame, and the Dual CTS Protection field was equal to 1 in the last HT Operation element received from its AP or transmitted by the STA (see 10.3.2.10 (Dual CTS protection)).

b) A Control frame may be carried in an HT PPDU when the Control frame meets any of the following conditions:
   1) The Control frame contains an HT variant HT Control field with the MRQ subfield equal to 1, or
   2) The Control frame contains an HT variant HT Control field with the TRQ field equal to 1.

c) A Control frame may be carried in a VHT PPDU when the Control frame contains an HT Control field.

d) A Control frame shall be carried in an HT PPDU or a VHT PPDU when the Control frame is sent using an STBC frame.

e) A control response frame shall be carried in a VHT PPDU if the eliciting frame was an RTS frame carried in a VHT PPDU that contains an HT Control field with MRQ subfield equal to 1.

f) A control response frame may be carried in a VHT PPDU or HT PPDU if the eliciting frame was (#8020)an FTM frame(#7223) carried in a VHT PPDU or HT PPDU, respectively.(11ax)

Otherwise, the Control frame shall be carried in a non-HT PPDU. The requirements specified in 10.30 (Sounding PPDUs), 10.31.2 (Link adaptation using the HT variant HT Control field), and 10.33 (Transmit beamforming) further constrain the choice of non-HT, HT, or VHT PPDU.

If an Operating Mode field has been received from the intended receiver STA, the following constraints also apply:

— If at least one Operating Mode field with the Rx NSS Type subfield equal to 0 was received from the receiver STA:
  — A STA shall not transmit a frame with the number of spatial streams greater than that indicated in the Rx NSS subfield in the most recently received Operating Mode field with the Rx NSS Type subfield equal to 0 from the receiver STA.
— If at least one Operating Mode field with the Rx NSS Type subfield equal to 1 was received from the receiver STA:
  — A STA shall not transmit an SU PPDU frame using a beamforming steering matrix with the number of spatial streams greater than that indicated in the Rx NSS subfield in the most recently received Operating Mode field with the Rx NSS Type subfield equal to 1 from the receiver STA if the beamforming steering matrix was derived from a VHT Compressed Beamforming report with Feedback Type subfield indicating MU in the VHT Compressed Beamforming frame(s).

Selection of channel width is defined in 10.6.6.6 (Channel Width selection for Control frames).

A control response frame is a Control frame that is transmitted as a response to the reception of a frame a SIFS after the PPDU containing the frame that elicited the response, e.g., a CTS frame in response to an RTS frame reception, an Ack frame in response to a Data frame reception, a BlockAck frame in response to a BlockAckReq frame reception. In some situations, the transmission of a Control frame is not a control response transmission, such as when a CTS frame is used to initiate a TXOP.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

(11ax)An HE STA that transmits a Trigger frame, Multi-STA BlockAck frame, or HE/VHT NDP Announcement frame addressed to more than one STA shall use a rate, HT-MCS, <VHT-MCS, NSS> tuple, or <HE-MCS, NSS> tuple that is supported by all recipient STAs.

#### 10.6.6.2 Rate selection for Control frames that initiate a TXOP

This subclause describes the rate selection rules for Control frames that initiate a TXOP and that are either an S-MPDU or not carried in an A-MPDU.

If a Control frame is carried in a non-HT PPDU, the transmitting STA shall transmit the frame using one of the rates in the BSSBasicRateSet parameter or a rate from the mandatory rate set of the attached PHY if the BSSBasicRateSet is empty.

NOTE—Because of their utility in resolving contention and in establishing a NAV, most control subtype frames that initiate a (#109)frame exchange sequence are subject to explicit limitations regarding the choice of transmission rate with the intent of ensuring maximum possible coverage and receivability of the frame.

An HT STA shall select an MCS from the Basic HT-MCS Set field of the HT Operation parameter of the MLME-START.request primitive or Basic HT-MCS Set field of the HT Operation parameter of the SelectedBSS parameter of the MLME-JOIN.request primitive when protection is required (as defined in 10.27 (Protection mechanisms)) and shall select an MCS from the SupportedMCSSet parameter of the intended receiver when protection is not required.

When transmitting a VHT PPDU, a STA shall select a <VHT-MCS, NSS> tuple from the basic VHT-MCS and NSS set when protection is required (as defined in 10.27 (Protection mechanisms)) and shall select a <VHT-MCS, NSS> tuple from the operational VHT-MCS and NSS set parameter of the intended receiver when protection is not required.

#### 10.6.6.3 Rate selection for CF-End frames

A STA that transmits a CF-End frame that is not at the end of a TXOP that was obtained through the use of the dual CTS mechanism shall transmit the frame using a rate in BSSBasicRateSet or from the mandatory rate set of the attached PHY if the BSSBasicRateSet is empty.

A STA that transmits a CF-End frame at the end of a TXOP that was obtained by a non-AP STA through the use of the dual CTS mechanism shall transmit the CF-End frame with the same value for the TXVECTOR parameter STBC, TXVECTOR parameter MCS (if present), and TXVECTOR parameter RATE as was used for the transmission of the matching Control frame at the beginning of the TXOP. The matching Control frame is defined as follows:

- For the first CF-End frame transmitted in the TXOP, the matching Control frame is the first RTS frame transmitted in the TXOP.
- For the second CF-End frame transmitted in the TXOP, the matching Control frame is the first CTS frame that follows the first RTS frame transmitted in the TXOP.
- For the third CF-End frame transmitted in the TXOP, the matching Control frame is the second CTS frame that follows the first RTS frame transmitted in the TXOP.

A STA that transmits a CF-End frame at the end of a TXOP that was obtained by an AP through the use of the dual CTS mechanism shall transmit the CF-End frame with the same value for the TXVECTOR parameter STBC, TXVECTOR parameter MCS (if present), and TXVECTOR parameter RATE as was used for the transmission of the matching Control frame at the beginning of the TXOP. The matching Control frame is defined as follows:

- For the first CF-End frame transmitted in the TXOP, the matching Control frame is the first CTS-to-self frame transmitted in the TXOP.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

— For the second CF-End frame transmitted in the TXOP, the matching Control frame is the first RTS transmitted in the TXOP.

#### 10.6.6.4 Rate selection for Control frames that are not control response frames

This subclause describes the rate selection rules for Control frames that are not control response frames, are not the frame that initiates a TXOP, are not the frame that terminates a TXOP, and are either an S-MPDU or not carried in an A-MPDU.

A frame other than a BlockAckReq or BlockAck that is carried in a non-HT PPDU shall be transmitted by the STA using a rate no higher than the highest rate in the BSSBasicRateSet parameter that is less than or equal to the rate or non-HT reference rate (see 10.6.11 (Non-HT basic rate calculation)) of the previously transmitted frame that was directed to the same receiving STA. If no rate in the BSSBasicRateSet parameter meets these conditions, the Control frame shall be transmitted at a rate no higher than the highest mandatory rate of the attached PHY that is less than or equal to the rate or non-HT reference rate (see 10.6.11 (Non-HT basic rate calculation)) of the previously transmitted frame that was directed to the same receiving STA.

A BlockAckReq or BlockAck frame that is carried in a non-HT PPDU shall be transmitted by the STA using a rate supported by the receiver STA, as reported in the Supported Rates and BSS Membership Selectors element and/or Extended Supported Rates and BSS Membership Selectors element in frames transmitted by that STA. When the operational rate set of the receiving STA or STAs is not known, the transmitting STA shall transmit using a rate from the BSSBasicRateSet parameter or from the mandatory rate set of the attached PHY if the BSSBasicRateSet is empty.

A frame that is carried in an HT PPDU shall be transmitted by the STA using an MCS supported by the receiver STA, as reported in the Supported MCS Set field in the HT Capabilities element received from that STA. When the supported MCS set of the receiving STA or STAs is not known, the transmitting STA shall transmit using an MCS in the Basic HT-MCS Set field of the HT Operation parameter of the MLME-START.request primitive or Basic HT-MCS Set field of the HT Operation parameter of the SelectedBSS parameter of the MLME-JOIN.request primitive.

A frame that is carried in a VHT PPDU shall be transmitted by the STA using a <VHT-MCS, NSS> tuple supported by the receiver STA. A <VHT-MCS, NSS> tuple is supported if reported as such in the Supported VHT-MCS and NSS Set field in the VHT Capabilities element received from that STA. When the Supported VHT-MCS and NSS set of the receiving STA or STAs is not known, the transmitting STA shall transmit using a <VHT-MCS, NSS> tuple in the basic VHT-MCS and NSS set.

A frame that is carried in an S1G PPDU shall be transmitted by the STA using a <S1G-MCS, NSS> tuple supported by the receiver STA, as reported in the Supported S1G-MCS and NSS Set field in the S1G Capabilities element received from that STA. When the Supported S1G-MCS for NSS set of the receiving STA or STAs is not known, the transmitting STA shall transmit using a <S1G-MCS, NSS> tuple in the BSSBasicS1GMCS_NSSSet parameter.

#### 10.6.6.5 Rate selection for control response frames

##### 10.6.6.5.1 Introduction

Subclauses 10.6.6.5.2 (Selection of a rate or MCS) to 10.6.6.5.7 (Control response frame TXVECTOR parameter restrictions) describe the rate selection rules for control response frames that are either an S-MPDU or not carried in an A-MPDU.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

#### 10.6.6.5.2 Selection of a rate or MCS

To allow the transmitting STA to calculate the contents of the Duration/ID field, a STA responding to a received frame transmits its control response frame at a primary rate, or at an alternate rate, or at an MCS, as specified by the following rules:

- If a CTS or Ack frame is carried in a non-HT PPDU, the primary rate is defined to be the highest rate in the BSSBasicRateSet parameter that is less than or equal to the rate (or non-HT reference rate; see 10.6.11 (Non-HT basic rate calculation)) of the previous frame. If no rate in the BSSBasicRateSet parameter meets these conditions, the primary rate is defined to be the highest mandatory rate of the attached PHY that is less than or equal to the rate (or non-HT reference rate; see 10.6.11 (Non-HT basic rate calculation)) of the previous frame. The STA may select an alternate rate according to the rules in 10.6.6.5.4 (Selection of an alternate rate or MCS for a control response frame). The STA shall transmit the non-HT PPDU CTS or Ack frame at either the primary rate or the alternate rate, if one exists.
- If a BlockAck frame is sent as an immediate response to either an Implicit BAR request or to a BlockAckReq frame that was carried in an HT or VHT PPDU and the BlockAck frame is carried in a non-HT PPDU, the primary rate is defined to be the highest rate in the BSSBasicRateSet parameter that is less than or equal to the rate (or non-HT reference rate; see 10.6.11 (Non-HT basic rate calculation)) of the previous frame. If no rate in the BSSBasicRateSet parameter meets these conditions, the primary rate is defined to be the highest mandatory rate of the attached PHY that is less than or equal to the rate (or non-HT reference rate; see 10.6.11 (Non-HT basic rate calculation)) of the previous frame. The STA may select an alternate rate according to the rules in 10.6.6.5.4 (Selection of an alternate rate or MCS for a control response frame). The STA shall transmit the non-HT PPDU BlockAck frame at either the primary rate or the alternate rate, if one exists.
- If a BlockAck frame is sent as an immediate response to either an Implicit BAR request or to a BlockAckReq frame that was carried in an S1G PPDU, the primary rate is defined to be the highest rate in the BSSBasicS1GMCS_NSSSet parameter that is less than or equal to the rate of the previous frame. If no rate in the BSSBasicS1GMCS_NSSSet parameter meets these conditions, the primary rate is defined to be the highest mandatory rate of the attached PHY that is less than or equal to the rate of the previous frame. The STA may select an alternate rate according to the rules in 10.6.6.5.4 (Selection of an alternate rate or MCS for a control response frame). The STA shall transmit the BlockAck control response frame at either the primary rate or the alternate rate, if one exists.
- When in asymmetric BA operation, the S1G STA shall transmit the BlockAck frame at the MCS according to the rules in 10.6.6.5.5 (MCS for asymmetric BA operation).
- When the S1G STA is not following asymmetric BA operation, then
  - If the STA receives an Accept in the Control Response MCS Negotiation Response frame from a responding STA, then it shall transmit the BlockAck frame to the responding STA with the rate described in 10.6.6.5.3 (Control response frame MCS computation).
  - Otherwise, the STA shall transmit the BlockAck frame at either the primary rate or the alternate rate (according to the rules in 10.6.6.5.4 (Selection of an alternate rate or MCS for a control response frame)), if one exists.
- If a Basic BlockAck frame is sent as an immediate response to a BlockAckReq frame that was carried in a non-HT PPDU and the Basic BlockAck frame is carried in a non-HT PPDU, the primary rate is defined to be the same rate and modulation class as the BlockAckReq frame, and the STA shall transmit the Basic BlockAck frame at the primary rate.
- If a Compressed BlockAck frame is sent as an immediate response to a BlockAckReq frame that was carried in a non-HT PPDU and the Compressed BlockAck frame is carried in a non-HT PPDU, the primary rate is defined to be the highest rate in the BSSBasicRateSet parameter that is less than or equal to the rate (or non-HT reference rate; see 10.6.11 (Non-HT basic rate calculation)) of the previous frame. If no rate in the BSSBasicRateSet parameter meets these conditions, the primary rate is defined to be the highest mandatory rate of the attached PHY that is less than or equal to the rate (or non-HT reference rate; see 10.6.11 (Non-HT basic rate calculation)) of the previous frame.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The STA may select an alternate rate according to the rules in 10.6.6.5.4 (Selection of an alternate rate or MCS for a control response frame). The STA shall transmit the non-HT PPDU Compressed BlockAck frame at either the primary rate or the alternate rate, if one exists.

— If the control response frame is carried in an HT or VHT PPDU, then it is transmitted using an MCS or <VHT-MCS, NSS> tuple as determined by the procedure defined in 10.6.6.5.3 (Control response frame MCS computation).

— If the control response frame is carried in an S1G PPDU, then it is transmitted using an <S1G-MCS, NSS> tuple as determined by the procedure defined in 10.6.6.5.3 (Control response frame MCS computation).

The modulation class of the PSDU containing the control response frame shall be selected according to the following rules:

— If the PSDU containing the received frame is of a modulation class other than HT, VHT, or S1G and the control response frame is carried in a non-HT PPDU, the control response frame shall be transmitted in a PSDU using the same modulation class as the PSDU containing the received frame. In addition, the control response frame shall be sent using the same value for the TXVECTOR parameter PREAMBLE_TYPE as the received frame.

— If the PSDU containing the received frame is of the modulation class HT or VHT and the control response frame is carried in a non-HT PPDU, the control response frame shall be transmitted in a PSDU using one of the ERP-OFDM or OFDM modulation classes.

— If the control response frame is carried in an HT PPDU, the modulation class shall be HT.

— If the control response frame is carried in a VHT PPDU, the modulation class shall be VHT.

— If the control response frame is carried in an S1G PPDU, the modulation class shall be S1G.

The selection of the value for the channel width (CH_BANDWIDTH parameter of the TXVECTOR) of the response transmission is defined in 10.6.6.6 (Channel Width selection for Control frames).

#### 10.6.6.5.3 Control response frame MCS computation

If a control response frame is to be transmitted within an HT or VHT PPDU, the channel width (CH_BANDWIDTH parameter of the TXVECTOR) shall be selected first according to 10.6.6.6 (Channel Width selection for Control frames), and then the MCS or <VHT-MCS, NSS> tuple shall be selected from a set of MCSs and <VHT-MCS, NSS> tuples called the *CandidateMCSSet* as described in this subclause.

If a control response frame is to be transmitted within an S1G PPDU, the channel width (CH_BANDWIDTH parameter of the TXVECTOR) shall be selected first according to 10.6.6.6 (Channel Width selection for Control frames), and then the <S1G-MCS, NSS> tuple shall be selected from a set of <S1G-MCS, NSS> tuples called the *CandidateMCSSet* as described in this subclause.

If the frame eliciting the response was transmitted by an HT STA that is not a VHT STA, the Rx Supported MCS Set is determined from the Supported MCS Set field in the HT Capabilities element received from the STA as follows:

— If a bit in the Rx MCS Bitmask subfield is equal to 0, the corresponding MCS is not supported.

— If a bit in the Rx MCS Bitmask subfield is equal to 1 and the integer part of the data rate (expressed in Mb/s(#4148)) of the corresponding MCS is less than or equal to the rate represented by the Rx Highest Supported Data Rate subfield, then the MCS is supported by the STA on receive. If the Rx Highest Supported Data Rate subfield is equal to 0 and a bit in the Rx MCS Bitmask is equal to 1, then the corresponding MCS is supported by the STA on receive.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

If the frame eliciting the response was transmitted by a VHT STA, the Rx Supported MCS Set is determined for VHT PPDUs as described in 10.6.13 (Rate selection constraints for VHT STAs) and for HT PPDUs from the Supported MCS Set field in the HT Capabilities element received from the STA as follows:

- If a bit in the Rx MCS Bitmask subfield is equal to 0, the corresponding MCS is not supported.
- If a bit in the Rx MCS Bitmask subfield is equal to 1 and the integer part of the data rate (expressed in Mb/s(#4148)) of the corresponding MCS is less than or equal to the rate represented by the Rx Highest Supported Data Rate subfield, then the MCS is supported by the STA on receive. If the Rx Highest Supported Data Rate subfield is equal to 0 and a bit in the Rx MCS Bitmask is equal to 1, then the corresponding MCS is supported by the STA on receive.

The Rx Supported MCS Set is determined for S1G PPDUs as described in 10.6.14 (Rate selection constraints for S1G STAs).

The CandidateMCSSet is determined using the following rules:

- If the frame eliciting the response was an STBC frame and the Dual CTS Protection bit is equal to 1, the CandidateMCSSet shall contain only the basic STBC MCS.
- For S1G STAs, if none of the above conditions is true, the CandidateMCSSet is the BSSBasicS1GMCS_NSSSet parameters. If the frame eliciting the response was an RTS frame, then the CandidateMCSSet may additionally include the <S1G-MCS, NSS> tuple with the same MCS and number of spatial streams as the S1G PPDU. If the combined BSSBasicMCSSet parameter is empty, the CandidateMCSSet shall consist of the set of mandatory <S1G-MCS, NSS> tuples corresponding to the mandatory S1G PHY MCSs with NSS = 1.
- For non-S1G STAs, if none of the above conditions is true, the CandidateMCSSet is the union of the Basic HT-MCS Set field of the HT Operation parameter of the MLME-START.request primitive or Basic HT-MCS Set field of the HT Operation parameter of the SelectedBSS parameter of the MLME-JOIN.request primitive and the basic VHT-MCS and NSS set. If the frame eliciting the response was an RTS frame carried in a VHT PPDU, then the CandidateMCSSet may additionally include the <VHT-MCS, NSS> tuple with the same MCS and number of spatial streams as the VHT PPDU. If the combined Basic HT-MCS Set field of the HT Operation parameter of the MLME-START.request primitive or Basic HT-MCS Set field of the HT Operation parameter of the SelectedBSS parameter of the MLME-JOIN.request primitive is empty, the CandidateMCSSet shall consist of
  - The set of mandatory HT PHY MCSs if the STA eliciting the response is an HT STA that is not a VHT STA
  - The set of mandatory HT-MCSs plus the set of <VHT-MCS, NSS> tuples corresponding to the mandatory VHT PHY MCSs with NSS = 1 if the STA eliciting the response is a VHT STA

MCS values from the CandidateMCSSet that cannot be transmitted with the selected CH_BANDWIDTH parameter value shall be eliminated from the CandidateMCSSet.

The choice of a response MCS is made as follows:

a) If the frame eliciting the response is within a non-HT PPDU,
   1) Eliminate from the CandidateMCSSet all <VHT-MCS, NSS> tuples. Eliminate all MCSs that have a data rate greater than the data rate of the received PPDU (the mapping of MCS to data rate is defined in 19.5 (Parameters for HT-MCSs)).
   2) Find the highest indexed MCS from the CandidateMCSSet. The index of this MCS is the index of the MCS that is the primary MCS for the response transmission.
   3) If the CandidateMCSSet is empty, the primary MCS is the lowest indexed MCS of the mandatory MCSs.
b) If the frame eliciting the response is within an HT PPDU,

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

1) Eliminate from the CandidateMCSSet all <VHT-MCS, NSS> tuples. Eliminate all MCSs that have an index that is higher than the index of the MCS of the received frame. Also eliminate all MCSs that have a number of spatial streams greater than that indicated in the Rx NSS subfield in the most recent Operating Mode field with the Rx NSS Type subfield equal to 0 from the intended receiver STA, if at least one Operating Mode field with the Rx NSS Type subfield equal to 0 was received from the intended receiver STA.

2) Determine the highest number of spatial streams ($N_{SS}$) value of the MCSs in the CandidateMCSSet that is less than or equal to the $N_{SS}$ value of the MCS of the received frame. Eliminate all MCSs from the CandidateMCSSet that have an $N_{SS}$ value that is not equal to this $N_{SS}$ value. The mapping from MCS to $N_{SS}$ is dependent on the attached PHY. For the HT PHY, see 19.5 (Parameters for HT-MCSs).

3) Find the highest indexed MCS of the CandidateMCSSet for which the modulation value of each stream is less than or equal to the modulation value of each stream of the MCS of the received frame and for which the coding rate is less than or equal to the coding rate of the MCS from the received frame. This MCS is the primary MCS for the response transmission. The mapping from MCS to modulation and coding rate is dependent on the attached PHY. For the HT PHY, see 19.5 (Parameters for HT-MCSs). For the purpose of comparing modulation values, the following sequence shows increasing modulation values: BPSK, QPSK, 16-QAM, 64-QAM.

4) If no MCS meets the condition in step 3), remove each MCS from the CandidateMCSSet that has the highest value of $N_{SS}$ in the CandidateMCSSet. If the resulting CandidateMCSSet is empty, then set the CandidateMCSSet to the HT PHY mandatory MCSs. Repeat step 3) using the modified CandidateMCSSet.

c) If the frame eliciting the response is within a VHT PPDU,

1) Eliminate from the CandidateMCSSet all MCSs and all <VHT-MCS, NSS> tuples that meet any of the following conditions:

i) Have a data rate that is higher than the data rate of the <VHT-MCS, NSS> tuple of the received frame using the largest possible value of CH_BANDWIDTH that is no larger than the value of CH_BANDWIDTH of the received frame

ii) Have a number of spatial streams greater than that indicated in the Rx NSS subfield in the most recent Operating Mode field with the Rx NSS Type subfield equal to 0 from the intended receiver STA, if at least one Operating Mode field with the Rx NSS Type subfield equal to 0 was received from the intended receiver STA

iii) Have a number of spatial streams greater than that indicated in the Rx NSS subfield in the most recent Operating Mode field with the Rx NSS Type subfield equal to 1 from the intended receiver STA if at least one Operating Mode field with the Rx NSS Type subfield equal to 1 was received from the receiver STA and the control response frame is an SU PPDU frame with a beamforming steering matrix and the beamforming steering matrix was derived from a VHT Compressed Beamforming report with Feedback Type subfield indicating MU in the VHT Compressed Beamforming frame(s)

2) Determine the highest number of spatial streams ($N_{SS}$) value of the MCSs and <VHT-MCS, NSS> tuples in the CandidateMCSSet that is less than or equal to the $N_{SS}$ value of the received frame. Eliminate all MCSs from the CandidateMCSSet that have an $N_{SS}$ value that is not equal to this $N_{SS}$ value. The mapping from MCS to $N_{SS}$ is dependent on the attached PHY. For the HT PHY, see 19.5 (Parameters for HT-MCSs).

3) Find the highest rate MCS or <VHT-MCS, NSS> tuple of the CandidateMCSSet for which the modulation value of each stream is less than or equal to the modulation value of each stream of the MCS of the received frame and for which the coding rate is less than or equal to the coding rate of the MCS from the received frame. This MCS or <VHT-MCS, NSS> tuple is the primary MCS for the response transmission. The mapping from MCS or <VHT-MCS, NSS> tuple to modulation and coding rate is dependent on the attached PHY. For the HT PHY, see 19.5

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

(Parameters for HT-MCSs); for the VHT PHY, see 21.5 (Parameters for VHT-MCSs). For the purpose of comparing modulation values, the following sequence shows increasing modulation values: BPSK, QPSK, 16-QAM, 64-QAM, 256-QAM.

4) If no MCS meets the condition in step 3), remove each MCS or <VHT-MCS, NSS> tuple from the CandidateMCSSet that has the highest value of $N_{SS}$ in the CandidateMCSSet. If the resulting CandidateMCSSet is empty, then set the CandidateMCSSet to the VHT PHY mandatory MCSs. Repeat step 3) using the modified CandidateMCSSet.

d) If the frame eliciting the response is within an S1G PPDU,

1) Eliminate from the CandidateMCSSet all MCSs and all <S1G-MCS, NSS> tuples that meet any of the following conditions:

i) Have a data rate that is higher than the data rate of the <S1G-MCS, NSS> tuple of the received frame using the largest possible value of CH_BANDWIDTH that is no larger than the value of CH_BANDWIDTH of the received frame

ii) Have a number of spatial streams greater than one

2) Find the highest rate MCS or <S1G-MCS, NSS> tuple of the CandidateMCSSet for which the modulation value of each stream is less than or equal to the modulation value of each stream of the MCS of the received frame and for which the coding rate is less than or equal to the coding rate of the MCS from the received frame. This MCS or <S1G-MCS, NSS> tuple is the primary MCS for the response transmission. The mapping from MCS or <S1G-MCS, NSS> tuple to modulation and coding rate is dependent on the attached PHY; see 23.5 (Parameters for S1G-MCSs). For the purpose of comparing modulation values, the following sequence shows increasing modulation values: BPSK, QPSK, 16-QAM, 64-QAM, 256-QAM, 1024-QAM.(M102)

3) If no MCS meets the condition in step 2), then set the CandidateMCSSet to the S1G PHY mandatory MCSs. Repeat step 2) using the modified CandidateMCSSet.

Once the primary MCS, <VHT-MCS, NSS> tuple, or <S1G-MCS, NSS> tuple has been selected, the STA may select an alternate MCS according to 10.6.6.5.4 (Selection of an alternate rate or MCS for a control response frame). If the STA has not negotiated the control response MCS negotiation as described in 10.6.6.5.6 (Control response MCS negotiation) or has received a Reject indication in the Control Response MCS Negotiation Response frame, then it shall transmit the control response frame using either the primary MCS or the alternate MCS, if one exists. If the STA has received an Accept indication in the Control Response MCS Negotiation Response frame from a responding STA, then it shall transmit the control response frame to the responding STA using the negotiated MCS or alternative MCS provided that the duration of the frame at the alternate MCS is the same as the duration of the frame at the negotiated MCS, if one exists. Negotiated MCS is computed as the highest MCS less than or equal to the MCS that is MCSDifference lower than the primary MCS if one exists, or the MCS 10 otherwise.

#### 10.6.6.5.4 Selection of an alternate rate or MCS for a control response frame

An alternate rate may be selected provided that all of the following conditions are met:

— The duration of frame at the alternate rate is the same as the duration of the frame at the primary rate determined by 10.6.6.5.2 (Selection of a rate or MCS).

— The alternate rate is in either the BSSBasicRateSet parameter or is a mandatory rate of the attached PHY.

— The modulation class of the frame at the alternate rate is the same class as that of the primary rate selected by 10.6.6.5.2 (Selection of a rate or MCS).

An alternate MCS may be selected provided that both of the following conditions are met:

— The duration of the frame at the alternate MCS is the same as the duration of the frame at the primary MCS.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

— The alternate MCS is in the CandidateMCSSet that was generated according to the procedure of 10.6.6.5.3 (Control response frame MCS computation).

#### 10.6.6.5.5 MCS for asymmetric BA operation

The primary MCS for asymmetric BA operation is defined as the MCS that is MCSDifference (see 10.25.2 (Setup and modification of the block ack parameters)) lower than that of the eliciting A-MPDU. An alternate MCS may be selected provided that the duration of the frame at the alternate MCS is the same as the duration of the frame at the primary MCS.

#### 10.6.6.5.6 Control response MCS negotiation

Control response MCS negotiation allows two STAs with power imbalance to send the control responses with different MCSs than the primary MCS as defined by the rules in 10.6.6.5.3 (Control response frame MCS computation). A STA may initiate the Control Response Negotiation by sending a Control Response MCS Request frame. After reception of a Control Response MCS Response frame that indicates Accept, the STA sends the control response frames with the Negotiated MCS as defined in 10.6.6.5.3 (Control response frame MCS computation).

An S1G STA with dot11MCSNegotiation equal to true shall set the MCS Negotiation Support field of the S1G Capabilities element to 1. An S1G STA with dot11MCSNegotiation equal to false shall set the MCS Negotiation Support field of the S1G Capabilities element to 0.

An S1G STA shall not transmit a Control Response MCS Negotiation Request frame to another S1G STA unless the MCS Negotiation Support field of the S1G Capabilities element received from that STA contained a value of 1 and dot11MCSNegotiation is true.

An S1G STA shall transmit the Control Response MCS Negotiation Response frame to a STA from which it has received a Control Response MCS Negotiation Request frame. The STA shall include a value that indicates either Accept or Reject in the Command field of the Response frame as defined in Table 9-633 (Command values).

#### 10.6.6.5.7 Control response frame TXVECTOR parameter restrictions

A STA shall not transmit a control response frame with the TXVECTOR parameter GI_TYPE set to SHORT_GI unless it is in response to a frame with the RXVECTOR parameter GI_TYPE equal to SHORT_GI.

A STA shall not transmit a control response frame with the TXVECTOR parameter FEC_CODING set to LDPC_CODING unless it is in response to a frame with the RXVECTOR parameter FEC_CODING equal to LDPC_CODING.

A STA shall not transmit a control response frame with the TXVECTOR parameter FORMAT set to HT_GF.

### 10.6.6.6 Channel Width selection for Control frames

The rules in this subclause, combined with the rules in 10.6.6.1 (General rules for rate selection for Control frames), determine the format of control response frames.

(11ax)If a VHT or HE STA transmits to another VHT or HE STA a Control frame that is not an RTS frame or a CF-End frame, if that Control frame is an HE NDP Announcement frame or elicits a control response frame, a VHT Compressed Beamforming frame, or an HE Compressed Beamforming/CQI frame, and

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

- If the Control frame is transmitted in a non-HT duplicate PPDU (channel width 40 MHz or wider), the transmitting (11ax)VHT or HE STA shall set the TA field to a bandwidth signaling TA.
- If the Control frame is transmitted in a non-HT PPDU (channel width 20 MHz), the transmitting (11ax)VHT or HE STA may set the TA field to a bandwidth signaling TA.

If the TA is a bandwidth signaling TA, the transmitting VHT STA shall set the TXVECTOR parameters CH_BANDWIDTH_IN_NON_HT and CH_BANDWIDTH to the same value.

NOTE 1—Such Control frames are BlockAckReq frames, PS-Poll frames, VHT NDP Announcement frames, and Beamforming Report Poll frames.

NOTE 2—Control Wrapper frames follow the rules pertaining to the carried Control frame (see 10.9 (Control Wrapper operation)).

Channel width selection rules for RTS frames are described in 10.3.2.7 (VHT and S1G RTS procedure).

A VHT STA that transmits a CF-End frame in a non-HT duplicate PPDU (channel width 40 MHz or wider) addressed to a VHT AP shall set the Individual/Group bit in the BSSID(TA) field to 1.

A VHT STA that transmits a CF-End frame in a non-HT PPDU (channel width 20 MHz) addressed to a VHT AP may set the Individual/Group bit in the BSSID(TA) field to 1.

If the Individual/Group bit in the BSSID(TA) field of the CF-End frame is(M118) 1, the transmitting VHT STA shall set the TXVECTOR parameters CH_BANDWIDTH_IN_NON_HT and CH_BANDWIDTH to the same value.

A STA that sends a Control frame in response to a frame carried in an HT PPDU or a VHT PPDU shall set the TXVECTOR parameter CH_BANDWIDTH to indicate a channel width that is the same as the channel width indicated by the RXVECTOR parameter CH_BANDWIDTH of the frame eliciting the response.

A STA that sends a Control frame in response to a frame carried in a non-HT or non-HT duplicate PPDU with a nonbandwidth signaling TA

- Should set the TXVECTOR parameter CH_BANDWIDTH to the same value as the RXVECTOR parameter CH_BANDWIDTH for the frame eliciting the response.
- Shall not set the TXVECTOR parameter CH_BANDWIDTH to a value greater than the RXVECTOR parameter CH_BANDWIDTH for the frame eliciting the response.

NOTE 3—According to this rule, a STA can respond with a 20 MHz PPDU if it receives a non-HT duplicate frame but is not able to detect the channel width occupied by the frame (whether by design or because the frame was received over a channel that is narrower than the channel on which it was transmitted).

A VHT STA that sends a Control frame that is in response to a non-HT or non-HT duplicate format frame with a bandwidth signaling TA and that is not a CTS shall set the channel width indicated by the TXVECTOR parameter CH_BANDWIDTH to the same value as the channel width indicated by the RXVECTOR parameter CH_BANDWIDTH_IN_NON_HT for the frame eliciting the response. The RA field of a Control frame that is not a CF-End frame and that is sent in response to a Control frame with a bandwidth signaling TA shall be set to a nonbandwidth signaling TA obtained from the TA field of the immediately previous Control frame. For the channel width selection rules for CTS sent in response to an RTS with a bandwidth signaling TA, see 10.3.2.9 (CTS and DMG CTS procedure).

A frame that is intended to provide protection is transmitted using a channel width selected by the rules defined in 10.27 (Protection mechanisms).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

An HT STA that uses a non-HT duplicate frame to establish protection of its TXOP shall send any CF-End frame using a non-HT duplicate frame.

The TXOP holder should set the TXVECTOR parameter CH_BANDWIDTH of a CF-End frame to the maximum bandwidth allowed by the rules in 10.23.2.8 (Multiple frame exchange sequences in an EDCA TXOP(#109)).

NOTE 4—A CF-End frame transmitted by an AP a SIFS duration after receiving a CF-End frame is considered a control response frame.

An S1G STA that has set the 1 MHz Control Response Preamble Support field to 1 in the S1G Capabilities element transmitted to its peer STA shall use S1G_1M preamble transmission as the response of S1G_SHORT_PREAMBLE or S1G_LONG_PREAMBLE as follows:

— An S1G STA that sends a Control frame in response to a frame carried in an S1G PPDU shall set the TXVECTOR parameter CH_BANDWIDTH to indicate a channel width that is the same or lower as the channel width indicated by the RXVECTOR parameter CH_BANDWIDTH of the frame eliciting the response.
— In a TXOP, a STA shall not set the TXVECTOR parameter CH_BANDWIDTH to a value greater than the RXVECTOR parameter CH_BANDWIDTH for the next frame exchange sequence.

Otherwise, in S1G BSS, S1G_1M preamble transmission as the response of S1G_SHORT_PREAMBLE or S1G_LONG_PREAMBLE is not allowed and the S1G STA behaves as follows:

— An S1G STA that sends a Control frame in response to a frame carried in an S1G PPDU shall set the TXVECTOR parameter CH_BANDWIDTH to indicate a channel width that is the same as the channel width indicated by the RXVECTOR parameter CH_BANDWIDTH of the frame eliciting the response, except when the frame eliciting the response is an S1G RTS frame with the Dynamic Indication field in the Frame Control field equal to 1.

When both transmitting STA and receiving STA indicate OBSS mitigation support in the OBSS Mitigation Support subfield of the S1G Capabilities element, the receiving STA operating in a 2/4/8/16 MHz BSS that sends a (duplicate) NDP_2M Ack frame or NDP_2M BlockAck frame in response to a frame carried in an S1G PPDU may set the TXVECTOR parameter CH_BANDWIDTH to indicate a channel width that is less than or equal to the channel width indicated by the RXVECTOR parameter CH_BANDWIDTH of the frame eliciting the response.

An S1G STA transmitting a Control frame or an NDP CMAC PPDU shall set the TXVECTOR parameter FORMAT depending on the value of the TXVECTOR parameter CH_BANDWIDTH:

— If CH_BANDWIDTH is equal to CBW1 then the FORMAT shall be S1G
— If CH_BANDWIDTH is equal to CBW2 then the FORMAT shall be:
  — S1G_DUP_1M if the RXVECTOR parameter CH_BANDWIDTH of the eliciting Control frame is equal to CBW1 and the Bandwidth Indication field in the Frame Control field is 1.
  — S1G_DUP_1M if the S1G STA intends to transmit a duplicate 1 MHz Control frame to an S1G STA that supports duplicate 1 MHz frames as indicated in the duplicate 1 MHz Support field of the S1G Capabilities element received from that S1G STA.
  — S1G otherwise.
— Otherwise, the FORMAT shall be S1G DUP_2M.

#### 10.6.6.7 Control frame TXVECTOR parameter restrictions

A STA shall not transmit a Control frame that initiates a TXOP with the TXVECTOR parameter GI_TYPE set to a value of SHORT_GI.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

A STA shall not transmit a Control frame that initiates a TXOP with the TXVECTOR parameter FEC_CODING set to a value of LDPC_CODING.

### 10.6.7 Multirate support for DMG STAs

#### 10.6.7.1 Usage of DMG Control modulation class

The DMG Control modulation class has only one MCS, which is DMG MCS 0 defined in Clause 20 (Directional multi-gigabit (DMG) PHY specification). The DMG Beacon, SSW-Feedback, SSW-Ack, RTS, DMG CTS, DMG CTS-to-self, DMG DTS, CF-End, Grant, SPR, Poll(11ay), Sector Ack, TDD Beamforming frames (i.e., TDD SSW, TDD SSW Feedback and TDD SSW Ack), and first BRP PPDU in beam refinement shall be transmitted using the DMG Control modulation class. In the case of an RXSS that was specified through the Beamforming Control field with the value of the RXSSTxRate subfield equal to 1 and the RXSSTxRate Supported field in the DMG Capabilities element of the STA performing the RXSS is 1, the first SSW frame of the RXSS shall be transmitted using the DMG Control modulation class, and the remaining frames of the RXSS shall be transmitted using MCS 1 of the DMG SC modulation class. In all other cases, the SSW frames shall be transmitted using the DMG Control modulation class. Other DMG beamforming training frames may be transmitted using the DMG Control modulation class or the DMG SC modulation class.

#### 10.6.7.2 Rate selection rules for Control frames transmitted by DMG STAs

This subclause describes the rate selection rules for Control frames transmitted by DMG STAs. The rate selection rules apply only for MCSs defined in Clause 20 (Directional multi-gigabit (DMG) PHY specification)(11ay) and in Clause 28 (Enhanced directional multi-gigabit (EDMG) PHY specification(11ay)).

A Control frame that does not have an MCS defined in 10.6.7.1 (Usage of DMG Control modulation class) and that is not a control response frame shall be transmitted using an MCS from the mandatory MCS set of the DMG SC modulation class or DMG Control modulation class.

A STA transmitting an Ack or a BlockAck frame that is a response to a frame sent using the DMG low-power SC modulation class shall use an MCS from the DMG low-power SC Supported MCS set of the STA that transmitted the frame that elicited the response as long as (a) the selected MCS has a Data Rate that does not exceed the Data Rate of the frame that elicited the response, and (b) no other MCS satisfying condition (a) results in a shorter frame transmission time.

A STA transmitting a Grant Ack frame shall use the DMG Control modulation class or any MCS from the mandatory MCS set of the DMG SC modulation class.

A STA transmitting an Ack or a BlockAck frame that is a response to a frame sent using the DMG Control modulation class shall use the DMG Control modulation class.

A STA transmitting an Ack frame or a BlockAck frame in response to a frame sent using the DMG SC modulation class shall use an MCS from the mandatory MCS set of the DMG SC modulation class as long as (a) the selected MCS has a Data Rate that does not exceed the Data Rate of the (11ay)last frame that elicited the response, and (b) no other MCS satisfying condition (a) results in a shorter frame transmission time.

(11ay)An EDMG STA transmitting an Ack frame or a BlockAck frame in response to a frame sent using the EDMG SC modulation class or EDMG OFDM modulation class shall

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

- Use the rules applicable to an DMG STA rules when the number of bits set to 1 in the CH_BANDWIDTH parameter in the RXVECTOR of the received EDMG PPDU is equal to 1 (i.e., a single 2.16 GHz channel).
- Use MCS1 when the Ack or BlockAck frame is sent within a non-EDMG duplicate PPDU and the number of bits set to 1 in the CH_BANDWIDTH parameter is greater than 1.
- Use one of MCS 1 through MCS 4 from the mandatory MCS set of the EDMG SC modulation class when the ACK or BlockAck frame is sent within an EDMG PPDU as long as (a) the selected MCS has a Data Rate that does not exceed the Data Rate of the frame that elicited the response, and (b) no other MCS satisfying condition (a) results in a shorter frame transmission time.
- In case the PPDU containing the Ack frame or a BlockAck frame carries a control trailer that provides spatial stream feedback, it shall be transmitted using MCS 0 and shall follow the rules defined in 10.42.4 (EDMG spatial stream feedback(11ay)).

(11ay)The rules in this subclause and in 10.6.7.7 (Control frame TXVECTOR parameter restrictions(11ay)) do not apply to Block Ack Schedule frames carried within an A-MPDU. The rate selection rules that apply to a Block Ack Schedule frame are those applying to Data frames (see 10.6.7.4 (Rate selection for individually addressed Data and Management frames transmitted by DMG STAs)).

(11ay)Rules for channel width selection of Control frames for an EDMG STA are specified in 10.6.7.6 (Channel Width selection for Control frames transmitted by EDMG STAs(11ay)).

NOTE—A control response frame is a Control frame that is transmitted within an MPDU as a response to a reception SIFS after the PPDU containing the frame that elicits the response, e.g., a DMG CTS frame in response to an RTS frame reception, an Ack frame in response to a Data frame reception, a BlockAck frame in response to a BlockAckReq frame reception. In some situations, the transmission of some of these Control frames is not a control response transmission, such as when a DMG CTS frame is used to initiate a TXOP.

Except in an A-MPDU consisting of one of the combinations listed below, the rules in this subclause do not apply to Control frames that are contained in A-MPDUs that also include at least one MPDU with the Type subfield equal to Data or Management. In the following cases, the rate selection rules are the same as those for a standalone Ack or BlockAck frame:

- An Ack frame and a QoS Null frame
- A BlockAck frame and a QoS Null frame
- A BlockAckReq frame and a QoS Null frame
- A BlockAck frame, a BlockAckReq frame, and a QoS Null frame

### 10.6.7.3 Rate selection for group addressed Data and Management frames transmitted by DMG STAs

This subclause describes the rate selection rules for group addressed Data and Management frames transmitted by DMG STAs. The rate selection rules apply only for MCSs defined in Clause 20 (Directional multi-gigabit (DMG) PHY specification)(11ay) and in Clause 28 (Enhanced directional multi-gigabit (EDMG) PHY specification(11ay)).

If the transmit antenna pattern of a single transmission of a group addressed frame covers more than one receiver, then the sender shall employ an MCS that is supported by all of the receivers. Furthermore, the sender shall not employ π/2-8-PSK modulation unless all receivers support π/2-8-PSK modulation. If the capability of any receiver is not known, the frame shall be transmitted using an MCS from the mandatory MCS set of the DMG control or SC mode.

If the transmit antenna pattern of a single transmission of a group addressed frame covers only one receiver, the frame shall be transmitted following the rate selection rules of individually addressed frames as

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

described in 10.6.7.4 (Rate selection for individually addressed Data and Management frames transmitted by DMG STAs).

(11ay)Group addressed DMG STA Directional Transmit Activity Report frames shall be transmitted using DMG MCS 0.

### 10.6.7.4 Rate selection for individually addressed Data and Management frames transmitted by DMG STAs

This subclause describes the rate selection rules for individually addressed Data and Management frames as transmitted by DMG STAs. The rate selection rules apply only for MCSs defined in Clause 20 (Directional multi-gigabit (DMG) PHY specification)(11ay) and in Clause 28 (Enhanced directional multi-gigabit (EDMG) PHY specification(11ay)).

An individually addressed Data or Management frame(11ay) transmitted to a non-EDMG STA shall be sent using an MCS supported by the receiver STA, as reported in the maximum receive MCS subfields in the Supported MCS Set field(11ay) of the DMG STA Capability Information field and in the Extended SC MCS Capabilities field of the DMG Capabilities element carried in Management frames transmitted by the receiver STA.

(11ay)An individually addressed Data, Management, and Block Ack Schedule frame transmitted to an EDMG STA shall be sent using a combination of MCSs, number of spatial streams and bandwidth supported by the STA, as reported in the

- Maximum receive MCS subfields in the Supported MCS Set subfield within the DMG STA Capability Information field and within the Extended SC MCS Capabilities field of the STA's last transmitted DMG Capabilities element.
- Maximum receive MCS subfields within the Supported MCS field of the STA's last transmitted EDMG Capabilities element.
- Maximum PHY Rate subfield within the Supported MCS field of the STA's last transmitted EDMG Capabilities element.
- If present in the STA's last transmitted EDMG Capabilities element, the maximum number of spatial streams and LDPC codeword supported subfields.

When the Supported MCS set of the receiving STA is not known, the transmitting STA shall transmit using an MCS from the mandatory MCS set of the DMG control or SC mode.

(11ay)When the capabilities of the receiving STA are not known, the transmitting STA shall transmit using an MCS from the mandatory MCS set of the DMG control or SC mode.(11ay) In addition for an EDMG STA, the TXVECTOR parameter LDPC_CW_TYPE shall be set to SHORT.

A DMG STA shall transmit a TPA Request frame and a TPA Response frame using MCS 1.

An individually addressed Data or Management frame with MCS 10 or MCS 11 shall only employ π/2-8-PSK modulation if the receiving STA supports π/2-8-PSK. The receiving STA indicates support by setting the π/2-8-PSK Capable subfield(#402) to 1 in the Supported MCS Set subfield of the DMG STA Capability Information field of the DMG Capabilities element all DMG Capabilities fields that are included in transmitted Management frames.

The rules in this subclause also apply to A-MPDUs that contain at least one MPDU with Type subfield equal to Control and at least one MPDU with Type subfield equal to Data or Management.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

#### 10.6.7.5 Rate selection for BRP PPDUs

The first BRP PPDU transmitted from the initiator to the responder after the SLS phase shall use MCS 0.

The first BRP PPDU transmitted from the responder to the initiator after the SLS phase shall use MCS 0.

A BRP PPDU transmitted during beam refinement at the start of an SP (as defined in 10.38.6.2 (Service period (SP) allocation)) should use MCS 0, otherwise a BRP PPDU transmitted during beam refinement should use MCS 1. A BRP PPDU transmitted during beam refinement shall not use any MCS greater than MCS 12.

BRP PPDUs transmitted during the BRP setup subphase, the MID subphase, and the BC subphase shall use MCS 0.

BRP PPDUs transmitted during a BC subphase, as part of a BC subphase only training, may use MCS 0 to MCS 12.

BRP PPDUs transmitted during beam tracking may use any MCS.

(11ay)If an EDMG BRP PPDU is sent during a BRP transaction to perform beamforming training over a 2.16 GHz, 4.32 GHz, 6.48 GHz, 8.64 GHz, 2.16+2.16 GHz or 4.32+4.32 GHz channel, the EDMG BRP PPDU should be transmitted with MCS 0.

#### 10.6.7.6 Channel Width selection for Control frames transmitted by EDMG STAs(11ay)

The rules in this subclause, combined with the rules in 10.6.7.2 (Rate selection rules for Control frames transmitted by DMG STAs), determine the format of Control frames that are not RTS, DMG CTS, DMG DTS or CF-End frames.

Channel width selection rules for DMG CTS and DMG DTS frames are specified in 10.3.2.9 (CTS and DMG CTS procedure).

Channel width selection rules for RTS and CF-End frames are specified in 10.3.2.18 (EDMG RTS procedure(11ay)).

An EDMG STA that sends a Control frame in response to a frame carried in an EDMG PPDU shall set the TXVECTOR parameters CH_BANDWIDTH and CHANNEL_AGGREGATION to the value indicated by the RXVECTOR parameters CH_BANDWIDTH and CHANNEL_AGGREGATION of the frame eliciting the response.

An EDMG STA that sends a Control frame in response to a frame carried in a non-EDMG duplicate PPDU shall set the TXVECTOR parameters CH_BANDWIDTH and CHANNEL_AGGREGATION as follows:

— If the frame that elicited the response includes the channel bandwidth information in the RXVECTOR parameter CH_BANDWIDTH_SIGNALING or BW_IN_CT, CH_BANDWIDTH and CHANNEL_AGGREGATION shall be set to a value that represents the equivalent channels indicated by the CH_BANDWIDTH_SIGNALING or BW_IN_CT parameter, respectively.

— Otherwise, if the STA received at least one EDMG PPDU as part of the current frame exchange sequence, CH_BANDWIDTH and CHANNEL_AGGREGATION shall be set to respectively, the value of the RXVECTOR parameters CH_BANDWIDTH and CHANNEL_AGGREGATION of the last received EDMG PPDU in the current frame exchange sequence.

— Otherwise, if the STA transmitted at least one EDMG PPDU or non-EDMG duplicate PPDU as part of the current frame exchange sequence, CH_BANDWIDTH and CHANNEL_AGGREGATION shall be set to, respectively, the value of the TXVECTOR parameters CH_BANDWIDTH and

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

CHANNEL_AGGREGATION of the last EDMG PPDU or non-EDMG duplicate PPDU, whichever came later, transmitted by the STA in the current frame exchange sequence.

— Otherwise, CH_BANDWIDTH and CHANNEL_AGGREGATION shall be set to, respectively, the estimated value of the RXVECTOR parameters CH_BANDWIDTH and CHANNEL_AGGREGATION of the frame that elicited the response.

#### 10.6.7.7 Control frame TXVECTOR parameter restrictions(11ay)

A STA shall not transmit a Control frame with the TXVECTOR parameter GI_TYPE set to a value that is not equal to NORMAL.

A STA shall not transmit a Control frame with the TXVECTOR parameter EDMG_MODULATION set to EDMG_OFDM_MODE.

A STA shall not transmit a Control frame with the TXVECTOR parameter NUM_STS set to a value greater than one.

A STA shall not transmit a Control frame with the TXVECTOR parameter NUM_USERS set to a value greater than one.

A STA shall not transmit a Control frame with the TXVECTOR parameter LDPC_CW_TYPE set to LONG.

#### 10.6.7.8 Channel Width selection for individually addressed Data and Management frames transmitted by EDMG STAs(11ay)

A TXOP holder that transmits a Data or Management frame during a TXOP that was established using the bandwidth negotiation procedures specified in 10.3.2.9 (CTS and DMG CTS procedure) and 10.3.2.18 (EDMG RTS procedure(11ay)) shall set the TXVECTOR parameters CH_BANDWIDTH and CHANNEL_AGGREGATION according to the following rules:

— The CH_BANDWIDTH and CHANNEL_AGGREGATION parameters shall be set to channels that were indicated in the RXVECTOR parameter CH_BANDWIDTH_SIGNALING, if a control trailer is not present, or parameter BW_IN_CT, if a control trailer is present, of the DMG CTS frame transmitted in a non-EDMG duplicate or non-EDMG PPDU that established the TXOP.

— The CH_BANDWIDTH and CHANNEL_AGGREGATION parameters may indicate a subset of the channels that were indicated as used in an immediately preceding received PPDU in the TXOP, if any, provided the transmitted PPDU is an EDMG PPDU.

— The CH_BANDWIDTH and CHANNEL_AGGREGATION parameters shall not indicate channels that were not used by all previous PPDUs sent in same TXOP.

A TXOP responder that transmits a PPDU as a result of a reverse direction grant shall set the TXVECTOR parameters CH_BANDWIDTH and CHANNEL_AGGREGATION of the PPDU to the value of the RXVECTOR parameters CH_BANDWIDTH and CHANNEL_AGGREGATION of the received EDMG PPDU addressed to the TXOP responder and that granted the reverse direction.

### 10.6.8 Multirate support for CMMG STAs

#### 10.6.8.1 Usage of CMMG Control modulation class

The CMMG Control modulation class has only one MCS, which is CMMG-MCS 0 defined in 25.6.8.14 (CMMG preamble format for sounding PPDU) with the spreading factor set to 13. The DMG Beacon, SSW-Feedback, SSW-Ack, RTS, CTS, and first BRP PPDU in beam refinement shall be transmitted using the CMMG Control modulation class. In the case of an RXSS that was specified through the Beamforming Control field in which the RXSSTxRate subfield is 1 and the RXSSTxRate Supported field in the CMMG Capabilities

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

element of the STA performing the RXSS is 1, the first SSW frame of the RXSS shall be transmitted using the CMMG Control modulation class, and the remaining frames of the RXSS shall be transmitted using MCS 0 of the CMMG SC modulation class. In all other cases, the SSW frames shall be transmitted using the CMMG Control modulation class. Other CMMG beamforming training frames may be transmitted using the CMMG Control modulation class or the CMMG SC modulation class.

#### 10.6.8.2 Rate selection rules for Control frames transmitted by CMMG STAs

This subclause describes the rate selection rules for Control frames transmitted by CMMG STAs. The rate selection rules apply only for MCSs defined in Clause 25 (China millimeter-wave multi-gigabit (CMMG) PHY specification).

A Control frame that does not have an MCS defined in 10.6.8.1 (Usage of CMMG Control modulation class) and that is not a control response frame shall be transmitted using an MCS from the mandatory MCS set of the CMMG SC modulation class or CMMG Control modulation class.

A STA transmitting a Grant Ack frame shall use the CMMG Control modulation class or any MCS from the mandatory MCS set of the CMMG SC modulation class.

A STA transmitting an Ack or a BlockAck frame that is a response to a frame sent using the CMMG Control modulation class shall use the CMMG Control modulation class.

A STA transmitting an Ack frame or a BlockAck frame in response to a frame sent using the CMMG SC modulation class or CMMG OFDM modulation class shall use an MCS from the mandatory MCS set of the CMMG SC modulation class as long as

a) The selected MCS has a data rate that does not exceed the data rate of the frame that elicited the response, and
b) No other MCS satisfying condition a) results in a shorter frame transmission time.

NOTE—A control response frame is a Control frame that is transmitted within an MPDU as a response to a reception SIFS after the PPDU containing the frame that elicits the response, e.g., a CTS frame in response to an RTS frame reception, an Ack frame in response to a Data frame reception, a BlockAck frame in response to a BlockAckReq frame reception. In some situations, the transmission of some of these Control frames is not a control response transmission, such as when a DMG CTS frame is used to initiate a TXOP.

Except in an A-MPDU consisting of one of the combinations listed below, the rules in this subclause do not apply to Control frames that are contained in A-MPDUs that also include at least one MPDU with the Type subfield equal to Data or Management. In the following cases, the rate selection rules are the same as those for a standalone Ack or BlockAck frame:

— An Ack frame and a QoS Null frame
— A BlockAck frame and a QoS Null frame
— A BlockAckReq frame and a QoS Null frame
— A BlockAck frame, a BlockAckReq frame, and a QoS Null frame

#### 10.6.8.3 Rate selection for group addressed Data and Management frames transmitted by CMMG STAs

This subclause describes the rate selection rules for group addressed Data and Management frames transmitted by CMMG STAs. The rate selection rules apply only for MCSs defined in Clause 25 (China millimeter-wave multi-gigabit (CMMG) PHY specification).

If the transmit antenna pattern of a single transmission of a group addressed frame covers more than one receiver and the supported set of each of the receivers is known to the sender, then the MCS used for the

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

transmission shall be an MCS common to the supported MCS sets of all of the receivers. If such an MCS is not known, the frame shall be transmitted using an MCS from the mandatory MCS set of the CMMG control or SC mode.

If the transmit antenna pattern of a single transmission of a group addressed frame covers only one receiver, the frame shall be transmitted following the rate selection rules of individually addressed frames as described in 10.6.8.4 (Rate selection for individually addressed Data and Management frames transmitted by CMMG STAs).

For SC and OFDM MIMO transmission, if the BSSBasicRateSet parameter is empty, the BSSBasicMCSSet parameter is empty, and the BSS basic CMMG-MCS and NSS set is not empty, then the frame shall be transmitted in a CMMG PPDU using one of the <CMMG-MCS, NSS> tuples included in the BSS basic CMMG-MCS and NSS set.

### 10.6.8.4 Rate selection for individually addressed Data and Management frames transmitted by CMMG STAs

This subclause describes the rate selection rules for individually addressed Data and Management frames as transmitted by CMMG STAs. The rate selection rules apply only for MCSs defined in Clause 25 (China millimeter-wave multi-gigabit (CMMG) PHY specification).

An individually addressed Data or Management frame shall be sent using an MCS supported by the receiver STA, as reported in the maximum receive MCS subfields in the Supported MCS Set field in Management frames transmitted by the receiver STA.

When the supported MCS set of the receiving STA is not known, the transmitting STA shall transmit using an MCS from the mandatory MCS set of the CMMG control or SC mode.

The rules in this subclause also apply to A-MPDUs that contain at least one MPDU with Type subfield equal to Control and at least one MPDU with Type subfield equal to Data or Management.

A Data frame or Management frame for SC and OFDM MIMO transmission shall be sent using any data rate, MCS, or <CMMG-MCS, NSS> tuple subject to the following constraints:

- A STA shall not transmit a frame using a rate or MCS that is not supported by the receiver STA, as reported in any Supported Rates and BSS Membership Selectors element, Extended Supported Rates and BSS Membership Selectors element, or Supported MCS Set field in the Management frames transmitted by the receiver STA.
- A STA shall not transmit a frame using a <CMMG-MCS, NSS> tuple that is not supported by the receiver STA, as reported in any Supported CMMG-MCS and NSS Set field in the Management frames transmitted by the receiver STA.
- If at least one CMMG Operating Mode field with the Rx NSS Type subfield equal to 0 was received from the receiver STA:
  - A STA shall not transmit a frame with the number of spatial streams greater than that indicated in the Rx NSS subfield in the most recently received CMMG Operating Mode field with the Rx NSS Type subfield equal to 0 from the receiver STA.
- A STA shall not transmit a frame using a value for the CH_BANDWIDTH parameter of the TXVECTOR that is not supported by the receiver STA, as reported in any CMMG Capabilities element received from the intended receiver.
- A STA that is a member of a BSS shall not transmit a frame using a value for the CH_BANDWIDTH parameter of the TXVECTOR that is not permitted for use in the BSS, as reported in the most recently received CMMG Operation element with the following exceptions:

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

- Transmissions on a TDLS off-channel link follow the rules described in 11.20 (Tunneled direct link setup(#1356)).
- Transmissions by a CMMG STA on a (#2152)TDLS direct link follow the rules described in 11.20 (Tunneled direct link setup(#1356)).

— If at least one CMMG Operating Mode field with the Rx NSS Type subfield equal to 0 was received from the receiver STA:

- A STA shall not transmit a frame using a value for the TXVECTOR parameter CH_BANDWIDTH that is not supported by the receiver STA as reported in the most recently received CMMG Operating Mode field with the Rx NSS Type subfield equal to 0 from the receiver STA.

When the supported rate set of the receiving STA or STAs is not known, the transmitting STA shall transmit using a rate in the BSSBasicRateSet parameter, or an MCS in the BSSBasicMCSSet parameter, or a <CMMG-MCS, NSS> tuple in the BSS basic CMMG-MCS and NSS set, or a rate from the mandatory rate set of the attached PHY if the BSSBasicRateSet, the BSSBasicMCSSet, and the BSS basic CMMG-MCS and NSS set are empty.

The rules in this subclause also apply to A-MPDUs that aggregate MPDUs of type Data or Management with any other types of MPDU.

#### 10.6.8.5 Rate selection for BRP PPDUs for CMMG STAs

The first BRP PPDU transmitted from the initiator to the responder after the SLS phase shall use MCS 0.

The first BRP PPDU transmitted from the responder to the initiator after the SLS phase shall use MCS 0.

BRP PPDUs transmitted during beam refinement should use MCS 0 and shall not use any MCS greater than MCS 8. BRP PPDUs transmitted during beam refinement should use MCS 0 if the BRP PPDU is sent at start of an SP as defined in 10.38.6.2 (Service period (SP) allocation).

BRP PPDUstransmitted during the BRP setup subphase, the MID subphase, and the BC subphase shall use MCS 0.

BRP PPDUs transmitted during a BC subphase, as part of a BC subphase only training, may use MCS 0 to MCS 8. BRP PPDUs transmitted during beam tracking may use any MCS.

### 10.6.9 Multiple BSSID rate selection(#2162)

If the multiple BSSID capability is supported, Beacon frames shall be transmitted using any basic rate valid for all of the BSSs supported. If no such rate exists, then Beacon frames shall be transmitted using any mandatory PHY rate for any PHY type that all BSSs have in common.

### 10.6.10 Modulation classes

Table 10-9 (Modulation classes) defines modulation classes for the rules for response frames in 10.6 (Multirate support).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 10-9—Modulation classes**

| Description of modulation | Condition that selects this modulation class | | | |
|---|---|---|---|---|
| | **Clause 15 (DSSS PHY specification for the 2.4 GHz band designated for ISM applications) to Clause 18 (Extended Rate PHY (ERP) specification) PHYs or Clause 20 (Directional multi-gigabit (DMG) PHY specification) PHY, or Clause 24 (China directional multi-gigabit (CDMG) PHY specification) PHY, Clause 25 (China millimeter-wave multi-gigabit (CMMG) PHY specification) PHY, or Clause 28 (Enhanced directional multi-gigabit (EDMG) PHY specification(11ay)) PHY(11ay)** | **Clause 19 (High Throughput (HT) PHY specification(#2297)) PHY** | **Clause 21 (Very high throughput (VHT) PHY specification) PHY** | **Clause 27 (High-efficiency (HE) PHY specification(11ax)) PHY(11ax)** |
| DSSS and HR/ DSSS | Clause 15 (DSSS PHY specification for the 2.4 GHz band designated for ISM applications) or Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification) transmission | FORMAT is NON_HT. NON_HT_MODULATION is ERP-DSSS or ERP-CCK. | N/A | FORMAT is NON_HT. NON_HT_MODULATION is ERP-DSSS or ERP-CCK. |
| ERP-OFDM | 18.4 (ERP operating specifications (general)) transmission | FORMAT is NON_HT. NON_HT_MODULATION is ERP-OFDM. | N/A | FORMAT is NON_HT. NON_HT_MODULATION is ERP-OFDM. |
| OFDM | Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) transmission | FORMAT is NON_HT. NON_HT_MODULATION is OFDM or NON_HT_DUP_OFDM. | FORMAT is NON_HT. ### 10.6.11 Non-HT basic rate calculation

This subclause defines how to convert an HT-MCS, (11ax)a VHT-MCS, or an HE-MCS to a non-HT basic rate for the purpose of determining the rate of the response frame. It consists of two steps as follows:

a) Use the modulation and coding rate determined from the HT-MCS (defined in 19.5 (Parameters for HT-MCSs)), VHT-MCS (defined in 21.5 (Parameters for VHT-MCSs)), or HE-MCS (defined in 27.5 (Parameters for HE-MCSs))(11ax) to locate a non-HT reference rate by lookup into Table 10-10 (Non-HT reference rate).[26] In the case of an MCS with UEQM, the modulation of stream 1 is used.

b) (#4078)The non-HT basic rate is the highest rate in the BSSBasicRateSet that is less than or equal to this non-HT reference rate.

**Table 10-10—Non-HT reference rate**

| Modulation | Coding rate (R) | Non-HT reference rate (Mb/s) |
|---|---|---|
| BPSK | 1/2 | 6 |
| BPSK | 3/4 | 9 |
| QPSK | 1/2 | 12 |
| QPSK | 3/4 | 18 |
| 16-QAM | 1/2 | 24 |
| 16-QAM | 3/4 | 36 |
| 64-QAM | 1/2 | 48 |
| 64-QAM | 2/3 | 48 |
| 64-QAM | 3/4 | 54 |
| 64-QAM | 5/6 | 54 |

[26] For example, if an HT PPDU transmission uses 64-QAM and coding rate of 3/4, the related non-HT reference rate is 54 Mb/s.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 10-10—Non-HT reference rate *(continued)***

| Modulation | Coding rate (R) | Non-HT reference rate (Mb/s) |
|---|---|---|
| 256-QAM | 3/4 | 54 |
| 256-QAM | 5/6 | 54 |
| 1024-QAM(11ax) | 3/4 | 54 |
| 1024-QAM(11ax) | 5/6 | 54 |

NOTE 1—The selection of a non-HT basic rate for the frame sent in response to an HE PPDU is not influenced by DCM encoding in the HE PPDU.(11ax)

NOTE 2—In a TVWS band, the non-HT reference rate is scaled as described in 22.2.4 (Support for NON_HT and HT formats).

### 10.6.12 Channel Width in non-HT and non-HT duplicate PPDUs

A non-VHT STA shall include neither the CH_BANDWIDTH_IN_NON_HT parameter nor the DYN_BANDWIDTH_IN_NON_HT parameter in either of the TXVECTOR or RXVECTOR for NON_HT PPDUs. A non-VHT STA shall not set the TA field to a bandwidth signaling TA. A VHT STA shall include neither the CH_BANDWIDTH_IN_NON_HT parameter nor the DYN_BANDWIDTH_IN_NON_HT parameter in the TXVECTOR of a non-HT PPDU containing frames addressed to a non-VHT STA. A VHT STA shall not set the TA field to a bandwidth signaling TA in a frame addressed to a non-VHT STA. (11ax)The TA field shall not be set to a bandwidth signaling TA in a frame carried in a DSSS/CCK PPDU. A VHT STA that includes the DYN_BANDWIDTH_IN_NON_HT parameter in the TXVECTOR shall also include the CH_BANDWIDTH_IN_NON_HT parameter in the TXVECTOR. A VHT STA shall not include the DYN_BANDWIDTH_IN_NON_HT parameter in the TXVECTOR for transmitted frames other than RTS frames with bandwidth signaling TA and that are sent in a non-HT PPDU. A STA that transmits an RTS frame with a bandwidth signaling TA shall include the DYN_BANDWIDTH_IN_NON_HT parameter in the TXVECTOR. A VHT STA shall include both the CH_BANDWIDTH_IN_NON_HT and DYN_BANDWIDTH_IN_NON_HT parameters in the RXVECTOR if the PPDU format is NON_HT.

A bandwidth signaling TA may be included in non-HT and non-HT duplicate PPDUs and shall not be included in other PPDUs. If the TXVECTOR parameter CH_BANDWIDTH_IN_NON_HT is present and a Control frame other than a CTS is being transmitted, then the TA field shall be set to a bandwidth signaling TA; otherwise, the TA field shall be set to an individual address.

NOTE—A CTS frame, even though it does not have a TA field, can also be transmitted with the TXVECTOR parameter CH_BANDWIDTH_IN_NON_HT present.

An S1G STA transmitting a Control frame that is not a control response frame shall set the Bandwidth Indication field in the Frame Control field of the frame to a value that is equivalent to the TXVECTOR parameter CH_BANDWIDTH.

An S1G STA shall not transmit a Control frame or an NDP CMAC PPDU with the TXVECTOR parameter S1G_DUP_1M to another S1G STA, unless the Duplicate 1 MHz Support field of the S1G Capabilities element received from that STA contained a value of 1.

An S1G STA transmitting a Control frame that is sent as a response to a Control frame shall set the Bandwidth Indication field in the Frame Control field of the frame to the value of the Bandwidth Indication field in the Frame Control field of the eliciting frame, except for an S1G STA that has indicated the use

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

of 1 MHz control response frames (see 10.6.6.6 (Channel Width selection for Control frames)) in which case the Bandwidth Indication field in the Frame Control field of the solicited Control frame shall be set to 0.

An S1G STA shall set the Dynamic Indication field in the Frame Control field of Control frames, other than RTS frame, to 0.

The TXVECTOR parameter CH_BANDWIDTH_IN_NON_HT shall not be present in PPDUs carrying Management or Data frames.

### 10.6.13 Rate selection constraints for VHT STAs

#### 10.6.13.1 Rx Supported VHT-MCS and NSS Set

The Rx Supported VHT-MCS and NSS Set of a first VHT STA is determined by a second VHT STA for each <VHT-MCS, NSS> tuple NSS = 1, …, 8 and bandwidth (20 MHz, 40 MHz, 80 MHz, and 160 MHz or 80+80 MHz) from the Supported VHT-MCS and NSS Set field received from the first STA as follows:

- If support for the VHT-MCS for NSS spatial streams at that bandwidth is mandatory (see 21.5 (Parameters for VHT-MCSs)), then the <VHT-MCS, NSS> tuple at that bandwidth is supported by the first STA on receive.
- Otherwise, if the Max VHT-MCS For *n* SS subfield (*n* = NSS) in the Rx VHT-MCS Map subfield indicates support and the Rx Highest Supported Long GI Data Rate subfield is equal to 0, then
  - the <VHT-MCS, NSS> tuple at that bandwidth is supported by the first STA on receive, except that if dot11VHTExtendedNSSBWCapable of the second STA is true, the supported bandwidth values and NSS values of each <VHT-MCS, NSS> tuple are updated according to Table 9-314 (Setting of the Supported Channel Width Set subfield and Extended NSS BW Support subfield at a STA transmitting the VHT Capabilities Information field) if no Operating Mode Notification frame(#7113) has been received from the first STA, otherwise, according to Table 9-111 (Setting of the Channel Width subfield and 160/80+80 BW subfield at a VHT STA transmitting the Operating Mode field), wherein the VHT Capabilities Information field and the Operating Mode field have been transmitted by the first STA.
- Otherwise, if the Max VHT-MCS For *n* SS subfield (*n* = NSS) in the Rx VHT-MCS Map subfield indicates support and the data rate for long GI of the MCS for NSS spatial streams at that bandwidth (expressed as the largest integer in Mb/s that is less than or equal to the data rate) is less than or equal to the rate represented by the Rx Highest Supported Long GI Data Rate subfield, then
  - the <VHT-MCS, NSS> tuple at that bandwidth is supported by the first STA on receive, except that if dot11VHTExtendedNSSBWCapable of the second STA is true, the supported bandwidth values and NSS values of each <VHT-MCS, NSS> tuple are updated according to Table 9-314 (Setting of the Supported Channel Width Set subfield and Extended NSS BW Support subfield at a STA transmitting the VHT Capabilities Information field) if no Operating Mode Notification frame(#7113) has been received from the first STA, otherwise, according to Table 9-111 (Setting of the Channel Width subfield and 160/80+80 BW subfield at a VHT STA transmitting the Operating Mode field), wherein the VHT Capabilities Information field and the Operating Mode field have been transmitted by the first STA.
- Otherwise, the <VHT-MCS, NSS> tuple at that bandwidth is not supported by the first STA on receive.

The <VHT-MCS, NSS> tuples excluded by 10.6.13.3 (Additional rate selection constraints for VHT PPDUs) are also eliminated from the Rx Supported VHT-MCS and NSS Set.

A VHT STA shall not, unless explicitly stated otherwise, transmit a VHT PPDU unless the <VHT-MCS, NSS> tuple and bandwidth used are in the Rx Supported VHT-MCS and NSS Set of the receiving STA(s).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

NOTE 1—Support for a <VHT-MCS, NSS> tuple at a given bandwidth implies support for both long GI and short GI on receive, if short GI is supported at that bandwidth.

NOTE 2—A STA can determine the expected interpretation of its Supported Channel Width Set and Channel Width and 160/80+80 BW and Extended NSS BW Support fields at a recipient by examining the VHT Extended NSS BW Capable field value in the Supported VHT-MCS and NSS Set field of the recipient.

### 10.6.13.2 Tx Supported VHT-MCS and NSS Set

The Tx Supported VHT-MCS and NSS Set of a first VHT STA is determined by a second STA for each <VHT-MCS, NSS> tuple NSS = 1, …, 8 and bandwidth (20 MHz, 40 MHz, 80 MHz, and 160 MHz or 80+80 MHz) from the Supported VHT-MCS and NSS Set field received from the first STA as follows:

- If support for the <VHT-MCS, NSS> tuple at that bandwidth is mandatory (see 21.5 (Parameters for VHT-MCSs)), then the <VHT-MCS, NSS> tuple at that bandwidth is supported by the first STA on transmit.
- Otherwise, if the Max VHT-MCS for *n* SS subfield (*n* = NSS) in the Tx VHT-MCS Map subfield indicates support and the Tx Highest Supported Long GI Data Rate subfield is equal to 0, then
  - The <VHT-MCS, NSS> tuple at that bandwidth is supported by the first STA on transmit, except that if dot11VHTExtendedNSSBWCapable of the second STA is true, the supported bandwidth values and NSS values of each <VHT-MCS, NSS> tuple are updated according to Table 9-314 (Setting of the Supported Channel Width Set subfield and Extended NSS BW Support subfield at a STA transmitting the VHT Capabilities Information field) if no Operating Mode Notification frame(#7113) has been received from the first STA, otherwise, according to Table 9-111 (Setting of the Channel Width subfield and 160/80+80 BW subfield at a VHT STA transmitting the Operating Mode field), wherein the VHT Capabilities Information field and the Operating Mode field have been transmitted by the first STA.
- Otherwise, if the Max VHT-MCS for *n* SS subfield (*n* = NSS) in the Tx VHT-MCS Map subfield indicates support and the data rate for long GI of the <VHT-MCS, NSS> tuple at that bandwidth (expressed as the largest integer in Mb/s that is less than or equal to the data rate) is less than or equal to the rate represented by the Tx Highest Supported Long GI Data Rate subfield, then
  - The <VHT-MCS, NSS> tuple at that bandwidth is supported by the first STA on transmit, except that if dot11VHTExtendedNSSBWCapable of the second STA is true, the supported bandwidth values and NSS values of each <VHT-MCS, NSS> tuple are updated according to Table 9-314 (Setting of the Supported Channel Width Set subfield and Extended NSS BW Support subfield at a STA transmitting the VHT Capabilities Information field) if no Operating Mode Notification frame(#7113) has been received from the first STA, otherwise, according to Table 9-111 (Setting of the Channel Width subfield and 160/80+80 BW subfield at a VHT STA transmitting the Operating Mode field), wherein the VHT Capabilities Information field and the Operating Mode field have been transmitted by the first STA.
- Otherwise, the <VHT-MCS, NSS> tuple at that bandwidth is not supported by the first STA on transmit.

NOTE 1—In contrast to reception, support for short GI transmissions by a STA cannot be determined by other STAs.

NOTE 2—A STA can determine the expected interpretation of its Supported Channel Width Set and Channel Width and 160/80+80 BW and Extended NSS BW Support fields at a recipient by examining the VHT Extended NSS BW Capable field value in the Supported VHT-MCS and NSS Set field of the recipient.

### 10.6.13.3 Additional rate selection constraints for VHT PPDUs

(11ax)A STA should not transmit a 20 MHz or 40 MHz VHT PPDU with a <VHT-MCS, NSS> tuple that has VHT-MCS 0, 1, 2, or 3 and NSS less than or equal to 4 to a receiver STA that has marked as unsupported the HT-MCS with value VHT-MCS + 8 × (NSS – 1) in the Rx MCS Bitmask subfield in the

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Supported MCS Set field in the HT Capabilities element it transmits. The transmission of a 20 MHz or 40 MHz VHT PPDU with VHT-MCS greater than 3 is not subject to this constraint.

(11ax)A STA should not transmit an 80 MHz, 160 MHz, or 80+80 MHz VHT PPDU with a <VHT-MCS, NSS> tuple that has VHT-MCS 0 or 1 and NSS less than or equal to 4 to a receiver STA that has marked as unsupported the HT-MCS values of both 2 × VHT-MCS + 8 × (NSS – 1) and 2 × VHT-MCS + 1 + 8 × (NSS – 1) in the Rx MCS Bitmask subfield in the Supported MCS Set field in the HT Capabilities element it transmits. The transmission of an 80 MHz, 160 MHz, or 80+80 MHz VHT PPDU with VHT-MCS greater than 1 is not subject to this constraint.

An example tabulation of this behavior is given in Table 10-11 (Example of rate selection for VHT PPDUs).

**Table 10-11—Example of rate selection for VHT PPDUs**

| HT-MCSs that are marked as unsupported | <VHT-MCS, NSS> tuples that are not used for CBW20 and CBW40 | <VHT-MCS, NSS> tuples that are not used for CBW80, CBW160, and CBW80+80 |
|---|---|---|
| 0, 8, 16 | <0, 1>, <0, 2>, <0, 3> | — |
| 1, 9 | <1, 1>, <1, 2> | — |
| 10 | <2, 2> | — |
| 3 | <3, 1> | — |
| 0, 1 | <0, 1>, <1, 1> | <0, 1> |
| 2, 3 | <2, 1>, <3, 1> | <1, 1> |
| 0, 1, 8, 9 | <0, 1>, <1, 1>, <0, 2>, <1, 2> | <0, 1>, <0, 2> |

### 10.6.14 Rate selection constraints for S1G STAs

#### 10.6.14.1 RX Supported S1G-MCS and NSS Set

The Rx Supported S1G-MCS and NSS Set of an S1G STA is determined for each <S1G-MCS, NSS> tuple NSS = 1, …, 4 and bandwidth (1 MHz, 2 MHz, 4 MHz, 8 MHz, and 16 MHz) from its Supported S1G-MCS and NSS Set field and Extended Supported S1G-MCS and NSS Set field(M102) as follows:

— If the Extended Supported S1G-MCS and NSS Set field is present then if the Ext Max S1G-MCS For n SS subfield (n = NSS) in the Ext Rx S1G-MCS Map field indicates support then the <S1G-MCS, NSS> tuple at that bandwidth is supported by the STA on receive.(M102)

— Otherwise(M102), if support for the S1G-MCS for NSS spatial streams at that bandwidth is mandatory (see 23.5 (Parameters for S1G-MCSs)), then the <S1G-MCS, NSS> tuple at that bandwidth is supported by the STA on receive.

— Otherwise, if the Max S1G-MCS For n SS subfield (n = NSS) in the Rx S1G-MCS Map field indicates support and the Rx Highest Supported Long GI Data Rate subfield is equal to 0, then the <S1G-MCS, NSS> tuple at that bandwidth is supported by the STA on receive.

— Otherwise, if the Max S1G-MCS For n SS subfield (n = NSS) in the Rx S1G-MCS Map subfield indicates support and the data rate (expressed in Mb/s(#4148)) for long GI of the MCS for NSS spatial streams at that bandwidth (if the data rate is not an integer, the data rate value is rounded down to the next integer) is less than or equal to the rate represented by the Rx Highest Supported Long GI Data Rate subfield, then the <S1G-MCS, NSS> tuple at that bandwidth is supported by the STA on receive.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

— Otherwise the <S1G-MCS, NSS> tuple at that bandwidth is not supported by the STA on receive.

An S1G STA shall not, unless explicitly stated otherwise, transmit an S1G PPDU unless the <S1G-MCS, NSS> tuple and bandwidth used are in the Rx Supported S1G-MCS and NSS Set of the receiving STA(s) or the Extended Supported S1G-MCS and NSS Set.(M102)

NOTE—Support for a <S1G-MCS, NSS> tuple at a given bandwidth implies support for long GI.

### 10.6.14.2 TX Supported S1G-MCS and NSS Set

The Tx Supported S1G-MCS and NSS Set of an S1G STA is determined for each <S1G-MCS, NSS> tuple NSS = 1, …, 4 and bandwidth (1 MHz, 2 MHz, 4 MHz, 8 MHz, and 16 MHz) from its Supported S1G-MCS and NSS Set field and Extended Supported S1G-MCS and NSS Set field(M102) as follows:

— If the Extended Supported S1G-MCS and NSS Set field is present then if the Ext Max S1G-MCS for n SS subfield (n = NSS) in the Ext Tx S1G-MCS Map subfield indicates support then the <S1G-MCS, NSS> tuple at that bandwidth is supported by the STA on transmit.(M102)

— Otherwise(M102), if support for the <S1G-MCS, NSS> tuple at that bandwidth is mandatory (see 23.5 (Parameters for S1G-MCSs)), then the <S1G-MCS, NSS> tuple at that bandwidth is supported by the STA on transmit.

— Otherwise if the Max S1G-MCS for n SS subfield (n = NSS) in the Tx S1G-MCS Map subfield indicates support and the Tx Highest Supported Long GI Data Rate subfield is equal to 0, then the <S1G-MCS, NSS> tuple at that bandwidth is supported by the STA on transmit.

— Otherwise if the Max S1G-MCS for n SS subfield (n = NSS) in the Tx S1G-MCS Map subfield indicates support and the data rate (expressed in Mb/s(#4148)) for long GI of the <S1G-MCS, NSS> tuple at that bandwidth (if the data rate is not an integer, the data rate value is rounded down to the next integer) is less than or equal to the rate represented by the Tx Highest Supported Long GI Data Rate subfield, then the <S1G-MCS, NSS> tuple at that bandwidth is supported by the STA on transmit.

— Otherwise the <S1G-MCS, NSS> tuple at that bandwidth is not supported by the STA on transmit.

### 10.6.14.3 Additional rate selection constraints for S1G PPDUs

The following apply for a STA that transmits an S1G PPDU:

— If the channel width of the PPDU is equal to CBW1, CBW2, CBW4, CBW8 or CBW16, then the STA should not use a <S1G-MCS, NSS> tuple if the S1G-MCS is equal to 0 and the Min S1G-MCS For n SS subfield in the Basic S1G-MCS and NSS Set field of the S1G Operation element of the receiver STA is equal to 1.

— If the channel width of the PPDU is equal to CBW1, CBW2, CBW4, CBW8 or CBW16, then the STA should not use a <S1G-MCS, NSS> tuple if the S1G-MCS is equal to 0 or 1 and the Min S1G-MCS For n SS subfield in the Basic S1G-MCS and NSS Set field of the S1G Operation element of the receiver STA is equal to 2.

If the channel width of the PPDU is equal to CBW1, then the STA should not use a <S1G-MCS, NSS> tuple if the S1G-MCS is equal to 10 and the B7 of the Channel Width subfield in the S1G Operation Information field of the S1G Operation element of the receiver STA is equal to 0.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 10.6.15 Rate selection constraints for CMMG STAs

#### 10.6.15.1 Rx supported CMMG-MCS and NSS set

The Rx supported CMMG-MCS and NSS set of a CMMG STA is determined for each <CMMG-MCS, NSS> tuple NSS = 1,…, 4 and bandwidth (540 MHz and 1080 MHz) from its Supported CMMG-MCS and NSS Set field as follows:

— If support for the CMMG-MCS for NSS spatial streams at that bandwidth is mandatory (see 25.15 (Parameters for CMMG-MCSs)), then the <CMMG-MCS, NSS> tuple at that bandwidth is supported by the STA on receive.

— Otherwise, the <CMMG-MCS, NSS> tuple at that bandwidth is not supported by the STA on receive.

A CMMG STA shall not, unless explicitly stated otherwise, transmit a CMMG PPDU unless the <CMMG-MCS, NSS> tuple and bandwidth used are in the Rx Supported CMMG-MCS and NSS Set of the receiving STA(s).

#### 10.6.15.2 Tx supported CMMG-MCS and NSS set

The Tx supported CMMG-MCS and NSS set of a CMMG STA is determined for each <CMMG-MCS, NSS> tuple NSS = 1,…, 4 and bandwidth (540 MHz and 1080 MHz) from its Supported CMMG-MCS and NSS Set field as follows:

— If support for the <CMMG-MCS, NSS> tuple at that bandwidth is mandatory (see 25.15 (Parameters for CMMG-MCSs)), then the <CMMG-MCS, NSS> tuple at that bandwidth is supported by the STA on transmit.

— Otherwise, the <CMMG-MCS, NSS> tuple at that bandwidth is not supported by the STA on transmit.

## 10.7 MSDU transmission restrictions

To avoid reordering MSDUs between pairs of LLC entities and/or unnecessarily discarding MSDUs, the following restrictions shall be observed by any STA that is able to concurrently process multiple outstanding MSDUs for transmission. The term *outstanding* refers to an MPDU containing all or part of an MSDU or MMPDU for which transmission has been started, and for which delivery of the MSDU or MMPDU has not yet been completed (i.e., an acknowledgment of the final fragment or only corresponding MPDU has not been received and the MSDU or MMPDU has not been discarded due to retries, lifetime, or for some other reason). A STA may have any number (greater than or equal to one) of eligible MSDUs outstanding concurrently, subject to the restrictions below.

A non-QoS STA shall have outstanding at any time:

— No more than one MSDU from any particular SA, and

— No more than one MMPDU

transmitted in one or more MPDUs with a particular individual RA.

NOTE 1—A simpler, more restrictive alternative to the rule in the above paragraph that might be used is that no more than one MSDU transmitted in one or more MPDUs with a particular individual RA be outstanding at any time.

For frames that are not sent within the context of a block ack agreement, a QoS STA shall have outstanding at any time:

— No more than one MSDU or A-MSDU for each TID from any particular SA, and

— No more than one MMPDU

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

transmitted in one or more MPDUs with a particular individual RA.

NOTE 2—A simpler, more restrictive alternative to the rule in the above paragraph that might be used is that no more than one MSDU or A-MSDU with any particular TID transmitted in one or more MPDUs with a particular individual RA be outstanding at any time.

A STA should select a value of dot11MaxTransmitMSDULifetime that is sufficiently large that the STA does not discard MSDUs or MMPDUs due to the transmit MSDU/MMPDU timer being exceeded, under normal operating conditions.

An A-MSDU shall contain only MSDUs of a single service class and inherits that service class for the purpose of the following rules. For MSDUs or A-MSDUs belonging to the service class of QoSAck when the receiver is a QoS STA, the QoS Data frames that are used to send these MSDUs or A-MSDUs shall have Normal Ack, Implicit BAR, (#3263)or Block Ack ack policy. For MSDUs or A-MSDUs belonging to the service class of QoSNoAck when the receiver is a QoS STA, the QoS Data frames that are used to send these MSDUs or A-MSDUs shall have No Ack ack policy.

## 10.8 HT Control field operation

If dot11HTControlFieldSupported is true, a STA shall set the +HTC-HT Support subfield of the HT Extended Capabilities field of the HT Capabilities element to 1 in HT Capabilities elements that it transmits. If dot11VHTControlFieldOptionImplemented is true, a STA shall set the +HTC-VHT Support subfield of the VHT Capabilities Information field of the VHT Capabilities element to 1 in VHT Capabilities elements that it transmits. If dot11HEControlFieldOptionImplemented is true, a STA shall set the +HTC-HE Support subfield in the HE MAC Capabilities Information field to 1 in the HE Capabilities elements that it transmits.(11ax)

A STA in which at least one of dot11RDResponderOptionImplemented, dot11MCSFeedbackOptionImplemented, and dot11AlternateEDCAActivated is (11ax)equal to true shall set dot11HTControlFieldSupported or dot11VHTControlFieldOptionImplemented or both equal to true. A STA that has at least one of dot11TRSOptionImplemented, dot11OMIOptionImplemented, dot11HEBSRControlImplemented, dot11HEBQRControlImplemented, dot11RDResponderOptionImplemented, and dot11SRResponderOptionImplemented equal to true or has dot11HEMCSFeedbackOptionImplemented greater than zero shall set dot11HEControlFieldOptionImplemented to true. An HE AP shall set dot11HEControlFieldOptionImplemented to true.(11ax)

An HT variant HT Control field shall not be present in a frame addressed to a STA unless that STA declares support for +HTC-HT in the HT Extended Capabilities field of its HT Capabilities element (see 9.4.2.54 (HT Capabilities element)).

A VHT variant HT Control field shall not be present in a frame addressed to a STA unless that STA declares support for +HTC-VHT in the VHT Capabilities Information field of its VHT Capabilities element or in the S1G Capabilities Information field of S1G Capabilities elements that it transmits.

NOTE—An HT STA that does not support +HTC (HT, VHT or HE(11ax) variant) that receives a +HTC frame addressed to another STA still performs the CRC on the actual length of the MPDU and uses the Duration/ID field to update the NAV, as described in 10.3.2.4 (Setting and resetting the NAV).

(11ax)An HE variant HT Control field shall not be present in a frame addressed to a STA, unless that STA declares support for +HTC-HE in the HE MAC Capabilities Information field in the HE Capabilities element.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The HE variant HT Control field carried in the frame may contain one or more Control subfields under the conditions listed in Table 10-12 (Conditions for including Control subfield variants(11ax)).

**Table 10-12—Conditions for including Control subfield variants(11ax)**

| Control subfield variant | Condition |
|---|---|
| TRS | The transmitting AP expects an HE TB PPDU that follows the TRS information as described in 26.5.2.2 (Rules for soliciting UL MU frames) and the recipient non-AP STA has set the TRS Support subfield in the HE MAC Capabilities Information field in the HE Capabilities elements it transmits to 1. |
| OM | The transmitting STA changes its operating mode, as described in 26.9 (Operating mode indication) and the recipient STA has set the OM Control Support subfield in the HE MAC Capabilities Information field in the HE Capabilities elements it transmits to 1. |
| HLA | The transmitting STA follows the HE link adaptation procedure, as described in 26.13 (Link adaptation using the HLA Control subfield) and the recipient STA has set the HE Link Adaptation Support subfield in the HE MAC Capabilities Information field in the HE Capabilities elements it transmits to a nonzero value. |
| BSR | The transmitting non-AP STA follows the corresponding buffer status report procedure, as described in 26.5.5 (Buffer status report operation) and the recipient AP has set the BSR Support subfield in the HE MAC Capabilities Information field in the HE Capabilities elements it transmits to 1. |
| UPH | The transmitting non-AP STA follows the UL MU operation procedure, as described in 26.5.2.3 (Non-AP STA behavior for UL MU operation). |
| BQR | The transmitting non-AP STA follows the bandwidth query report procedure, as described in 26.5.2 (UL MU operation) and the recipient AP has set the BQR Support subfield in the HE MAC Capabilities Information field in the HE Capabilities elements it transmits to 1. |
| CAS | The transmitting STA follows either:<br>— The reverse direction protocol procedure described in 10.29 and the recipient STA has set the RD Responder in the HT Extended Capabilities field in the HT Capabilities elements it transmits to 1, or<br>— The PSR procedure described in 26.10.3 (PSR-based spatial reuse operation) and the recipient STA has set the PSR Responder subfield of the HE MAC Capabilities Information field in the HE Capabilities elements it transmits to 1.(#3034) |
| ONES | The transmitting STA may include a ONES Control subfield in an MPDU that is not carried in an HE TB PPDU (see 26.5.2.4 (A-MPDU contents in an HE TB PPDU)). |

If the HT Control field is present in an MPDU aggregated in an A-MPDU, then all MPDUs of the same frame type (i.e., having the same value for the Type subfield of the Frame Control field) aggregated in the same A-MPDU shall contain the same HT Control field. If MSDU(s) received in an MPDU are delivered via an MA-UNITDATA.indication, the drop eligible parameter of the MA-UNITDATA.indication is set to true if the MPDU contains an HT variant HT Control field and the DEI subfield is equal to 1 and set to false otherwise.

(11ax)An HE STA that transmits a frame containing an A-Control subfield shall include at least one Control subfield in the A-Control subfield, and the included Control subfields shall be those that are supported by the receiving STAs, unless the Control ID subfield is 15.

(11ax)An HE STA that receives a Control subfield in an A-Control subfield with a Control ID subfield value that is not recognized or not supported by the HE STA shall ignore the Control subfield and the remainder of

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

the A-Control subfield. If more than one Control subfield is present in an A-Control subfield, the Control subfields shall not have the same Control ID value.

(11ax)An HE STA that receives a ONES Control subfield shall ignore the remainder of the A-Control subfield.

If the HT variant HT Control field is present in an MPDU, the DEI subfield provides information on the drop eligibility of the contents of the received MPDU. (#7143)With the information from the DEI subfield, a STA may selectively (#3683)discard frames with the DEI subfield set to 1 in preference to frames with the DEI subfield set to 0, if resources are insufficient. Note that this might not help in the recovery in all conditions, and the STA might still have to fall back to (#7143)an arbitrary discard strategy. The mechanisms for determining whether resources are insufficient or when to discard MSDUs or A-MSDUs are beyond the scope of this standard.

If the value of dot11S1GControlFieldOptionImplemented is true, an S1G STA shall set the +HTC-VHT Capable subfield of the S1G Capabilities Information field of the S1G Capabilities element that it transmits to 1.

An S1G shall not use an HT Control field other than a VHT variant HT Control field. An S1G STA shall not use a VHT variant HT Control field for any purpose other than link adaptation (see 10.31.3 (Link adaptation using the VHT variant HT Control field)).

## 10.9 Control Wrapper operation

A STA supporting the HT Control field that receives a Control Wrapper frame shall process it as though it received a frame of the subtype of the wrapped frame(#6145). An HE STA shall not send a Control Wrapper frame to another HE STA. (11ax)

## 10.10 MSDU processing

A STA can use the U-PID element transmitted in ADDTS Request, DMG ADDTS Request, ADDTS Response and DMG ADDTS Response frames to indicate the upper layer protocol responsible for handling MSDUs corresponding to the TID indicated within the frame carrying the U-PID element (see 11.4.4.4 (TS setup procedures for both AP and non-AP STA initiation)).

A STA that participates in a successful ADDTS exchange that included a U-PID element in the ADDTS Response or DMG ADDTS Response frame with the LLC Header Removed field equal to 1 shall strip the number of octets in the LLC Header Copy field of the U-PID element from the start of an MSDU (received in an MA-UNITDATA.request.primitive) corresponding to the TID indicated in the ADDTS exchange before transmission of the MSDU to the peer STA.

(#6025)NOTE 1—The MSDU in the MA-UNITDATA.request.primitive must start with the octets specified in the LLC Header Copy field.

NOTE 2—The STA does not verify that the MSDU does indeed start with the octets specified in the LLC Header Copy field.

A STA that participates in a successful ADDTS exchange that included a U-PID element in the ADDTS Response or DMG ADDTS Response frame with the LLC Header Removed field equal to 1 and that receives from the peer STA an MSDU corresponding to the TID indicated in the ADDTS exchange shall insert the octets in the LLC Header Copy field of the U-PID element at the start of the MSDU before delivery of the MSDU (in an MA-UNITDATA.indication.primitive).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

NOTE 3—If the LLC Header Removed field is equal to 0, the LLC Header Copy field in the U-PID element is ignored, except for possible implementation-dependent local optimizations.

## 10.11 A-MSDU operation

An A-MSDU contains only MSDUs whose DA parameter values map to a single RA (#462)field value and whose SA parameter values map to a single TA(#3522) (see 9.3.2.2 (Aggregate MSDU (A-MSDU) format)).

(#462)Specifically, for a frame containing an A-MSDU, if the frame is a three-address frame, or a four-address frame in a context defined by this standard:

NOTE 1—This standard defines use of four-address frames in the content of transmissions by a mesh STA (see 10.37 (Mesh forwarding framework)), an S1G relay STA or AP (see 10.53 (S1G relay operation)) or a GLK STA (see 10.64 (Addressing of GLK Data frame transmission)).

— The RA may be a group address if all of the following conditions are met:
  — the frame is from an AP or PCP, or between IBSS, PBSS or mesh STAs
  — the DAs in all A-MSDU subframe headers are group addresses, or the frame is transmitted under GLK and the RA is a SYNRA

  Otherwise, the RA shall be an individual address.

  NOTE 2—STAs conformant with a previous revision of this standard might not accept a group addressed frame containing an A-MSDU, outside the context of a GCR concealment address or a GLK SYNRA, where supported.

— Each DA shall be the RA or, except if the A-MSDU is transmitted on a TDLS direct link, a group address, if none of the following conditions is met:
  — the frame is to an AP or associated PCP
  — the frame is transmitted under DMG relay or S1G relay operation
  — the frame is from a GLK STA
  — the frame is from a mesh STA

  Otherwise, there is no restriction on each DA, except that the first six octets of the first A-MSDU subframe header (the mesh DA, if the frame is from a mesh STA, or the DA in a Basic A-MSDU not from a mesh STA) shall not be AA-AA-03-00-00-00.

  NOTE 3—The address AA-AA-03-00-00-00 is that which results from an attack in which an encrypted QoS Data frame not containing an A-MSDU (whose unencrypted frame body therefore starts with an LLC header followed by a SNAP header constructed per IETF RFC 1042) has the A-MSDU Present subfield changed to 1 by an attacker to cause it to appear to be a payload protected A-MSDU (PP A-MSDU) with multiple MSDUs (each preceded by an A-MSDU subframe header, which starts with the DA or mesh DA).

— Each SA shall be the nonbandwidth signaling TA if none of the following conditions is met:
  — the frame is from an AP or PCP
  — the frame is transmitted under DMG relay or S1G relay operation
  — the frame is from a GLK STA
  — the frame is from a mesh STA

  Otherwise, each SA shall be an individual address.

  NOTE 4—The DA and SA are contained in the DA and SA subfields, respectively, where present, in A-MSDU subframes that are not transmitted in mesh Data frames (Basic A-MSDU subframes transmitted in mesh Data frames contain the mesh DA and mesh SA).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

NOTE 5—Frames not to an AP or associated PCP and frames not from an AP or PCP include frames transmitted between TDLS peer STAs or between IBSS, non-PCP PBSS or mesh STAs.

— In an MBSS,
  — each mesh STA, including the mesh SA in the Address 3 or Address 4 field if present (see Table 9-77 (Address field contents for mesh Data and Multihop Action frames(#462)(#419))), shall be the same individual address
  — in an individually addressed frame, each mesh DA that is an individual address, including the mesh DA in the Address 3 field (see Table 9-77 (Address field contents for mesh Data and Multihop Action frames(#462)(#419))), shall be the same individual address
  — in a group addressed frame, each mesh DA, and the DA in the Address 1 field (see Table 9-77 (Address field contents for mesh Data and Multihop Action frames(#462)(#419))), shall be the same group address.

(#462)A STA that receives a frame containing an A-MSDU that violates these rules should discard it[27].

For the Short A-MSDU case, an A-MSDU contains only MSDUs whose SAs are all the same, and whose DAs are all the same.(#1324) The Short A-MSDU subframe structure is used only between a pair of STAs that communicate directly (see 9.3.2.1 (Format of Data frames)). The Short A-MSDU subframe structure cannot be used for frame forwarding. The constituent MSDUs of an A-MSDU shall all have the same priority parameter value from the corresponding MA-UNITDATA.request primitive.

If the recipient STA has omitted the HE Capabilities element or the recipient STA has transmitted an HE Capabilities element with the A-MSDU Fragmentation Support subfield in the MAC Capabilities Information field set to 0, then an A-MSDU shall be carried, without fragmentation, within a single QoS Data frame. If the recipient STA has transmitted an HE Capabilities element with the A-MSDU Fragmentation Support subfield set to 1, then an A-MSDU may be fragmented, and each fragment is sent to the recipient in a QoS Data frame.(11ax)(#462)(#2195)

The channel access rules for a QoS Data frame carrying an A-MSDU (or fragment thereof)(11ax) are the same as a Data frame carrying an MSDU (or fragment thereof) of the same TID.

The expiration of the A-MSDU lifetime timer occurs only when the lifetime timer of all of the constituent MSDUs of the A-MSDU have expired.

NOTE 6—This rule implicitly allows an MSDU that is a constituent of an A-MSDU to potentially be transmitted after the expiration of its lifetime.

NOTE 7—Selecting any other value for the timeout would result in loss of MSDUs. Selecting the maximum value avoids this loss of MSDUs at the cost of transmitting MSDUs that have exceeded their lifetime.

The following rules in this paragraph apply to the transmission of an A-MSDU:

— A non-DMG and non-S1G STA that has a value of false for dot11HighthroughputOptionImplemented shall not transmit an A-MSDU.
— A non-DMG and non-S1G STA shall not transmit an A-MSDU to a STA from which it has not received a frame containing an HT Capabilities element.

[27]The check on the DA in the first A-MSDU subframe header is important to defend against attacks from malicious outsiders when signaling and payload protected A-MSDUs (SPP A-MSDUs) are not being used. The other checks on the DAs and the checks on the SAs are important to defend against impersonation attacks from malicious insiders (which means there is no protection against malicious APs or PCPs, DMG or S1G relays, GLK STAs, and mesh STAs). The lack of checks on the SA and DA in the case of mesh and relay operation presents an attack surface that is outside the scope of remediation in this standard. In the case of GLK, use of a SYNRA for an individually addressed MSDU with multiple links indicated in the station vector parameter also presents such an attack surface, which can be avoided by transmitting multiple individually addressed MPDUs instead (see 10.64 (Addressing of GLK Data frame transmission)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

An S1G STA shall not transmit an A-MSDU to an S1G STA from which it received a frame containing an S1G Capabilities element with the A-MSDU Supported subfield equal to 0.

An S1G STA transmitting an A-MSDU shall use only the Dynamic A-MSDU subframe format (see 9.3.2.2.5 (Dynamic A-MSDU format)). The DA Present and SA Present subfields in the Subframe Control field of each Dynamic A-MSDU subframe shall be set to 1 unless the frame carrying the A-MSDU is a PV1 frame (see 9.8 (MAC frame format for PV1 frames)(#1358)).

An A-MSDU carried in a PV1 frame shall include the DA field in a Dynamic A-MSDU subframe if the value of this field

— Is not equal to the value of the A3 stored at the recipient.
— Is not equal to the value of the A3 field of the frame when an A3 is not stored at the recipient.
— Is not equal to the value of the address identified by the A1 field when an A3 field is not present in the frame and an A3 is not stored at the recipient.

Otherwise, the DA field shall not be included in the Dynamic A-MSDU subframe.

An A-MSDU carried in a PV1 frame shall include the SA field in a Dynamic A-MSDU subframe if the value of this field

— Is not equal to the value of the A4 stored at the recipient.
— Is not equal to the value of the A4 field of the frame when an A4 is not stored at the recipient.
— Is not equal to the value of the address identified by the A2 field when an A4 field is not present in the frame and an A4 is not stored at the recipient.

Otherwise, the SA field shall not be included in the Dynamic A-MSDU subframe.

A non-S1G STA transmitting an A-MSDU shall not use the Dynamic A-MSDU format(#1996). A non-DMG STA transmitting an A-MSDU shall not use the Short A-MSDU format.(#1725)(#1996)

The length of an A-MSDU transmitted in an S1G PPDU is limited by the maximum MPDU size supported by the recipient STA (see 10.12.5 (Transport of A-MPDU by the PHY data service)).

A STA shall support the reception of an A-MSDU, where the A-MSDU is carried in a QoS Data frame with Normal Ack ack policy in the following cases:

— By an HT STA (11ax)if the A-MSDU is not aggregated within an A-MPDU
— By a VHT (11ax)or HE STA if the A-MSDU is sent as an S-MPDU
— For a CMMG STA (11ax)if the A-MSDU is not aggregated within an A-MPDU

The use of an A-MSDU carried in a QoS Data frame under a block ack agreement is determined for each block ack agreement. A STA shall not transmit an A-MSDU within a QoS Data frame under a block ack agreement unless the recipient indicates support for A-MSDU by setting the A-MSDU Supported field to 1 in (#4193)the Block Ack Parameter Set field of the ADDBA Response frame.

An HE STA shall not transmit an A-MSDU that is carried in a QoS Data frame for which no block ack agreement exists and that is part of an ack-enabled single-TID A-MPDU, unless the recipient has set the A-MSDU Not Under BA In Ack-Enabled A-MPDU Support subfield in the HE MAC Capabilities Information field in the HE Capabilities element to 1.(11ax)

A STA shall not transmit an A-MSDU in an HT PPDU if the A-MSDU length exceeds the value indicated by the Maximum A-MSDU Length field of the HT Capabilities element received from the recipient STA.(#1439)

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

A VHT STA that sets the value of the Maximum MPDU Length subfield in the VHT Capabilities Information field of the VHT Capabilities element to indicate 3895 octets shall set the Maximum A-MSDU Length in the HT Capabilities element to indicate 3839 octets. A VHT STA that sets the Maximum MPDU Length in the VHT Capabilities element to indicate 7991 octets or 11 454 octets shall set the Maximum A-MSDU Length in the HT Capabilities element to indicate 7935 octets.

The length of an A-MSDU transmitted in a VHT PPDU(#4371) is limited by the maximum MPDU size supported by the recipient STA (see 10.12.5 (Transport of A-MPDU by the PHY data service)).

(#4371)The length of an A-MSDU transmitted in an HE PPDU is limited by the maximum MPDU length capability supported by the recipient STA (see 10.12.5 (Transport of A-MPDU by the PHY data service), 26.17.1 (Basic HE BSS operation), and 26.17.2.1 (General)).

NOTE 8—An A-MSDU that meets the A-MSDU length limit for transmission in a VHT PPDU or HE PPDU(11ax) might exceed the A-MSDU length limit for an HT PPDU, in which case it cannot be retransmitted in an HT PPDU.

NOTE 9—Support for A-MSDU aggregation does not affect the maximum size of MSDU transported by the MA-UNITDATA primitives.

A VHT STA shall not transmit an A-MSDU that includes a number of MSDUs greater than the value indicated by the Max Number Of MSDUs In A-MSDU field in any Extended Capabilities element sent by the recipient STA. An HT STA (#4366)that is not a VHT STA should not transmit an A-MSDU that includes a number of MSDUs greater than the value indicated by the Max Number Of MSDUs In A-MSDU field in any Extended Capabilities element sent by the recipient STA. A STA shall not transmit an A-MSDU in a CMMG PPDU to a STA if the A-MSDU length exceeds the value indicated by the Maximum A-MSDU Length field of the CMMG Capabilities element received from the recipient STA.

A DMG STA shall not transmit an A-MSDU that includes a number of Basic A-MSDU subframes greater than the value indicated by the Maximum Number Of Basic A-MSDU Subframes In A-MSDU subfield in any DMG Capabilities element sent by the recipient STA. A DMG STA shall not transmit an A-MSDU that includes a number of Short A-MSDU subframes greater than the value indicated by the Maximum Number Of Short A-MSDU Subframes In A-MSDU subfield in any DMG Capabilities element sent by the recipient STA. A DMG STA that sets the A-MSDU Subframe subfield to 1 in a DMG Attributes field of TSPEC element (9.4.2.28 (TSPEC element)), which indicates Short A-MSDU subframe support, shall support(#546) receiving at least 32 Short A-MSDU subframes in A-MSDU. A CMMG STA that sets the Maximum MPDU Length subfield in the CMMG Capabilities element to indicate 3895 octets shall set the maximum A-MSDU length in the CMMG Capabilities element to indicate 3839 octets. A CMMG STA that sets the Maximum MPDU Length subfield in the CMMG Capabilities element to indicate 7991 octets or 11 454 octets shall set the maximum A-MSDU length in the CMMG Capabilities element to indicate 7935 octets.

The transmitter of frames for a TID established using a PTP TSPEC shall use an A-MSDU subframe format that is the result of the PTP TSPEC negotiation for that TID. The A-MSDU subframe format is negotiated using the PTP TSPEC (9.4.2.28 (TSPEC element)): the Short A-MSDU subframe format shall not be used for frames of the corresponding TID if the A-MSDU subframe field of the PTP TSPEC element is 0 either in the ADDTS Request frame or in the ADDTS Response frame used to set up the TID. Prior to PTP TSPEC negotiation, a STA shall use the Basic A-MSDU subframe format if the STA employs MSDU aggregation.

A non-PCP DMG STA in a PBSS may use the PCP of the PBSS to forward MSDUs to another non-PCP STA in the PBSS if the value of the PCP Forwarding field within the PCP's DMG Capabilities element is 1. A non-PCP DMG STA in a PBSS shall not use the PCP to forward MSDUs if the value of the PCP Forwarding field within the PCP's DMG Capabilities element is 0. To forward an MSDU via the PCP, a non-PCP STA shall encapsulate the MSDU (#2004)within an A-MSDU in an individually addressed MPDU sent to the PCP. The DA field of the A-MSDU shall be set to the destination's individual or group address.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The length of an A-MSDU transmitted in a CMMG PPDU is limited by the maximum MPDU size supported by the recipient STA (see 10.12.5 (Transport of A-MPDU by the PHY data service)).

A CMMG STA shall not transmit to a recipient CMMG STA an A-MSDU that includes a number of MSDUs greater than the value indicated by the Max Number of MSDUs in A-MSDU field in the Extended Capabilities element received from the recipient STA.

A non-DMG STA indicates support for payload protected A-MSDUs (PP A-MSDUs) or signaling and payload protected A-MSDUs (SPP A-MSDUs), when dot11RSNAActivated is true, in its RSNXE. A non-DMG STA and its peer STA both determine and maintain a record of whether an encrypted A-MSDU sent to its peer is to be a PP A-MSDU or an SPP A-MSDU based on the SPP A-MSDU Capable subfield of the Extended RSN Capabilities field of the RSNXE (see 9.4.2.240 (RSNXE(#1776))). If a STA and its peer STA are DMG STAs or both have their SPP A-MSDU Capable subfields equal to 1, A-MSDUs shall be transmitted as SPP A-MSDUs and shall not be transmitted in PV1 MPDUs.(#1555) Otherwise, A-MSDUs shall be transmitted as PP A-MSDUs.(M57)

NOTE 10—A PV1 MPDU cannot contain an SPP A-MSDU because the signaling of whether an A-MSDU is being carried is not part of the AAD (see Figure 12-19 (AAD construction for PV1 MPDUs)) and so is not protected.(#1555)

Reception and transmission of A-MSDUs using a non-RSNA(#4025) is unaffected by the value of the SPP A-MSDU Capable subfield.(M57)

An AP may transmit an SPP A-MSDU for a GCR group address if it has (#4201)negotiated RSNAs(#4025) with all associated STAs that have an active GCR agreement for this group address.

## 10.12 A-MPDU operation

### 10.12.1 A-MPDU contents

According to its context (defined in Table 9-660 (A-MPDU contexts)), an A-MPDU shall be constrained so that it contains only MPDUs as specified in the relevant table referenced from Table 9-660 (A-MPDU contexts).

The values of the Protocol Version field in the Frame Control field of the MPDUs contained in an A-MPDU shall be the same, except for a Control frame with the Protocol Version field equal to 0 in which case the Control frame can be aggregated with PV1 frame.

If an A-MPDU contains multiple QoS Control fields, then bit 4 of all the QoS Control fields shall have the same value, and bits 8–15 of the QoS Control fields that have the same value in bits 0–3 shall have the same value.(11ax)

When an A-MPDU contains multiple MPDUs whose Protocol Version field value is 1, the values of EOSP and Relayed Frame fields in the Frame Control field, and A3 Present, A4 Present subfields in the SID field shall be identical across MPDUs within the A-MPDU.

A DMG STA that transmits an A-MPDU shall do so only in the Data Enabled Immediate Response context or the Control Response context, with contents as specified in Table 9-661 (A-MPDU contents in the non-HE(11ax) data enabled immediate response context) and Table 9-663 (A-MPDU contents in the control response context), respectively.

### 10.12.2 A-MPDU length limit rules

A STA indicates in the Maximum A-MPDU Length Exponent field in its HT Capabilities element the maximum A-MPDU length that it can receive in an HT PPDU. A STA indicates in the Maximum A-MPDU Length Exponent field in its VHT Capabilities element the maximum length of the A-MPDU pre-EOF padding that it can receive in a VHT PPDU. A STA indicates in the Maximum A-MPDU Length Exponent field in its S1G Capabilities element the maximum length of the A-MPDU pre-EOF padding that it can receive in an S1G PPDU. A STA indicates in the Maximum A-MPDU Length Exponent field in its DMG Capabilities element the maximum A-MPDU length that it can receive in a DMG PPDU. A STA indicates the maximum length of the A-MPDU pre-EOF padding that it can receive in an HE PPDU in the Maximum A-MPDU Length Exponent field in its HT Capabilities, VHT Capabilities, and HE 6 GHz Band Capabilities elements (if present) and in the Maximum A-MPDU Length Exponent Extension field in its HE Capabilities element.(11ax) A STA indicates in the Maximum A-MPDU Length Exponent field in its EDMG Capabilities element the maximum length of the A-MPDU that it can receive in an EDMG PPDU.(11ay)

A VHT STA that sets the Maximum A-MPDU Length Exponent field in its VHT Capabilities element to a value in the range 0 to 3 shall set the Maximum A-MPDU Length Exponent in its HT Capabilities to the same value. A VHT STA that sets the Maximum A-MPDU Length Exponent field in the VHT Capabilities element to a value larger than 3 shall set the Maximum A-MPDU Length Exponent in its HT Capabilities element to 3.

Using the Maximum A-MPDU Length Exponent fields in the HT Capabilities, (11ax)VHT Capabilities, HE Capabilities, and HE 6 GHz Band Capabilities elements (if present), the STA establishes at association the maximum length of an A-MPDU pre-EOF padding that can be sent to it. An HT STA shall support(#546) receiving A-MPDUs of length up to the value indicated by the Maximum A-MPDU Length Exponent field in its HT Capabilities element. A VHT STA shall support(#546) receiving A-MPDUs where the A-MPDU pre-EOF padding length is up to the value indicated by the Maximum A-MPDU Length Exponent field in its VHT Capabilities element. An S1G STA that sets the A-MPDU Supported subfield in the S1G Capabilities element to 1 shall support(#546) receiving A-MPDUs where the A-MPDU pre-EOF padding length is up to the value indicated by the Maximum A-MPDU Length Exponent field in its S1G Capabilities element.

(11ax)An HE STA shall support(#546) receiving A-MPDUs where the A-MPDU pre-EOF padding length is up to the value indicated by the Maximum A-MPDU Length Exponent field in its HT Capabilities and VHT Capabilities elements and the Maximum A-MPDU Length Exponent Extension field in its HE Capabilities element in the 2.4 GHz or 5 GHz bands. An HE STA shall support(#546) receiving A-MPDUs where the A-MPDU pre-EOF padding length is up to the value indicated by the Maximum A-MPDU Length Exponent Extension field in the HE Capabilities element and the Maximum A-MPDU Length Exponent field in HE 6 GHz Band Capabilities element in the 6 GHz band.

A STA shall not transmit an A-MPDU in an HT PPDU that is longer than the value indicated by the Maximum A-MPDU Length Exponent field in the HT Capabilities element received from the intended receiver. MPDUs in an A-MPDU carried in an HT PPDU shall be limited to a maximum length of 4095 octets. A STA shall not transmit an A-MPDU in a VHT PPDU where the A-MPDU pre-EOF padding length is longer than the value indicated by the Maximum A-MPDU Length Exponent field in the VHT Capabilities element received from the intended receiver. An S1G STA shall not transmit an A-MPDU in an S1G PPDU where the A-MPDU pre-EOF padding length field is longer than the value indicated by the Maximum A-MPDU Length Exponent field in the S1G Capabilities element received from the intended receiver. A STA shall not transmit an A-MPDU in a DMG PPDU that is longer than the value indicated by the Maximum A-MPDU Length Exponent field in the DMG Capabilities element received from the intended receiver. (11ay)A STA shall not transmit an A-MPDU in an EDMG PPDU that is longer than the value indicated by the Maximum A-MPDU Length Exponent field in the EDMG Capabilities element received from the intended receiver.

(11ax)A STA shall not transmit an A-MPDU in an HE PPDU where the A-MPDU pre-EOF padding length is greater than the value indicated by the Maximum A-MPDU Length Exponent field in the HT Capabilities and VHT Capabilities elements and the Maximum A-MPDU Length Exponent Extension field in its HE

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Capabilities elements received from the intended receiver in the 2.4 GHz or 5 GHz bands. A STA shall not transmit an A-MPDU in an HE PPDU where the A-MPDU pre-EOF padding length is greater than the value indicated by the Maximum A-MPDU Length Exponent Extension field in the HE Capabilities element and the Maximum A-MPDU Length Exponent field in the HE 6 GHz Band Capabilities element received from the intended receiver in the 6 GHz band.

An S1G STA shall not transmit an A-MPDU, except for an S-MPDU, to an S1G STA from which it received a frame containing an S1G Capability element with the A-MPDU Supported subfield equal to 0.

(11bd)An NGV STA may transmit an A-MPDU without capability exchange as specified in 31.2.3 (A-MSDU operation, A-MPDU operation, and BA operation). An NGV STA shall support reception of an A-MPDU as specified in 31.2.3 (A-MSDU operation, A-MPDU operation, and BA operation).

NOTE—An NGV STA does not use the HT Capabilities element or the VHT Capabilities element to establish the maximum length of an A-MPDU, as an NGV STA only operates OCB and need not exchange these elements.(11bd)

### 10.12.3 Minimum MPDU start spacing rules

If the intended receiver is a non-HE STA, a STA shall not start the transmission of more than one MPDU within the time limit described in the Minimum MPDU Start Spacing field declared by the intended receiver. If the intended receiver is an HE STA, an HE STA shall not start the transmission of more than one QoS Data frame, QoS Null frame, or Management frame within the time limit described in the Minimum MPDU Start Spacing field declared by the intended receiver. To satisfy this requirement, the number of octets between the start of two consecutive MPDUs in an A-MPDU, *N*, measured at the PHY SAP, shall meet the condition defined by Equation (10-12).(11ax)

$$N \geq \begin{cases} t_{MMSS} \times r/8, \text{ if the A-MPDU is not carried in an HE TB PPDU} \\ t_{MMSS} \times 2^{MMSF} \times r/8, \text{ if the A-MPDU is carried in an HE TB PPDU} \end{cases} \quad (10\text{-}12)$$

where

$t_{MMSS}$ is the time (in microseconds) defined in the Encoding column of Table 9-225 (Subfields of the A-MPDU Parameters field) for an HT STA, of Table 9-351 (Subfields of the S1G Capabilities Information field) for an S1G STA for the value of the Minimum MPDU Start Spacing field, and of Table 9-291 (Subfields of the A-MPDU Parameters subfield) for a DMG STA for the value of the Minimum MPDU Start Spacing field

*MMSF* is the value of the MPDU MU Spacing Factor subfield of the User Info field addressed to the HE STA in the Trigger frame soliciting the HE TB PPDU (see 9.3.1.22 (Trigger frame format(11ax)))(11ax)

*r* is the value of the PHY Data Rate (in Mb/s(#4148)) defined in 19.5 (Parameters for HT-MCSs) for HT PPDUs, in 21.5 (Parameters for VHT-MCSs) for VHT PPDUs, in 23.5 (Parameters for S1G-MCSs) for S1G PPDUs, and in Clause 20 (Directional multi-gigabit (DMG) PHY specification) for a DMG STA

If necessary, in order to satisfy this requirement, a STA shall add padding between MPDUs in an A-MPDU. Any such padding shall be in the form of one or more MPDU delimiters with the MPDU Length field set to 0.

QoS Null frames transmitted by DMG STAs are not subject to this spacing, i.e., no MPDU delimiters with zero length need to be inserted after the MPDU immediately preceding the QoS Null frame in an A-MPDU.

(11az)For FTM procedure measurement exchange with an unassociated STA, the transmitting STA shall use one of the values specified in 9-225 (Subfields of the A-MPDU Parameters field), for the $t_{MMSS}$.

### 10.12.4 A-MPDU aggregation of group addressed Data frames

A STA that is not one of an AP, a mesh STA, or an NGV STA(11bd) shall not transmit an A-MPDU containing an MPDU with an RA that is a group address.

NOTE 1—An HT AP and an HT mesh STA can transmit an A-MPDU containing MPDUs with an RA that is a group address.

NOTE 2—As a VHT STA and an HE STA are HT STAs, NOTE 1 also applies to VHT APs, VHT mesh STAs, HE APs, and HE mesh STAs.(11ax)

NOTE 3—An AP providing GCR service can transmit an A-MPDU containing MPDUs with an RA that is a group address.

NOTE 4—An S1G AP can transmit an A-MPDU containing MPDUs with an RA that is a group address.

A STA that is an AP or a mesh STA shall not transmit an A-MPDU containing group addressed MPDUs if the HT Protection field is equal to non-HT mixed mode.

A DMG STA may transmit an A-MPDU containing MPDUs with an RA that is a group address.

When a STA transmits a PPDU containing at least one A-MPDU that contains MPDUs with an RA that is a group address, the following shall apply:

— If the PPDU is an HT PPDU(11ax), the maximum A-MPDU length exponent value is the minimum value in the Maximum A-MPDU Length Exponent subfield of the A-MPDU Parameters field of the HT Capabilities element across all HT STAs associated with the transmitting AP or (11ax)across all peer HT mesh STAs.(11ax)

— If the PPDU is a VHT PPDU, the maximum A-MPDU length exponent (11ax)value is the minimum value in the Maximum A-MPDU Length Exponent subfields of the VHT Capabilities elements across all VHT STAs associated with the transmitting AP or across all peer VHT mesh STAs.

— (11ax)If the PPDU is an HE PPDU sent in the 2.4 GHz or 5 GHz band, the maximum A-MPDU length exponent value is the minimum value in the Maximum A-MPDU Length Exponent subfield of the VHT Capabilities elements across all HE STAs associated with the transmitting AP or across all peer HE mesh STAs.

— (11ax)If the PPDU is an HE PPDU sent in the 6 GHz band, the maximum A-MPDU length exponent value is the minimum value in the Maximum A-MPDU Length Exponent subfield of the HE 6 GHz Band Capabilities elements across all HE STAs associated with the transmitting AP or across all peer HE mesh STAs.

— If the PPDU is a VHT PPDU, the minimum MPDU start spacing (11ax)value is the maximum value in the Minimum MPDU Start Spacing subfields of the A-MPDU Parameters field of the HT Capabilities elements across all VHT STAs associated with the transmitting AP or across all peer VHT mesh STAs.

— If the PPDU is an HT PPDU transmitted by an AP(11ax), the minimum MPDU start spacing value (11ax)is the maximum value in the Minimum MPDU Start Spacing subfield of the A-MPDU Parameters field of the HT Capabilities elements across all HT STAs associated with the transmitting AP or across all peer HT mesh STAs.(11ax)

— (11ax)If the PPDU is an HE PPDU sent in the 2.4 GHz or 5 GHz band, the minimum MPDU start spacing value is the maximum value in the Minimum MPDU Start Spacing subfield of the A-MPDU Parameters field of the HT Capabilities elements across all HE STAs associated with the transmitting AP or across all peer HE mesh STAs.

— (11ax)If the PPDU is an HE PPDU sent in the 6 GHz band, the minimum MPDU start spacing value is the maximum value in the Minimum MPDU Start Spacing subfield of the HE 6 GHz Band

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Capabilities elements across all HE STAs associated with the transmitting AP or across all peer HE mesh STAs.

— If the PPDU is a DMG PPDU, the maximum A-MPDU length exponent value (11ax)is the minimum value in the Maximum A-MPDU Length Exponent subfield of the A-MPDU Parameters field of the DMG Capabilities element of all DMG STAs associated with the AP or PCP.

— If the PPDU is a DMG PPDU, the minimum MPDU start spacing value (11ax)is the maximum value in the Minimum MPDU Start Spacing subfield of the A-MPDU Parameters field of the DMG Capabilities element of all DMG STAs associated with the AP or PCP.

— If the PPDU is an S1G PPDU, the maximum A-MPDU length exponent value(11ax) is the minimum value in the Maximum A-MPDU Length Exponent subfields of the S1G Capabilities Information field of the S1G Capabilities elements across all S1G STAs associated with the transmitting AP.

— If the PPDU is an S1G PPDU, the minimum MPDU start spacing value(11ax) is the maximum value in the Minimum MPDU Start Spacing subfields of the S1G Capabilities Information field of the S1G Capabilities elements across all S1G STAs associated with the transmitting AP.

— (11ay)If the PPDU is an EDMG PPDU, the maximum A-MPDU length exponent value that applies is the minimum value in the Maximum A-MPDU Length Exponent subfield of the A-MPDU Parameters field of the EDMG Capabilities element of all EDMG STAs associated with the AP or PCP.

— (11ay)If the PPDU is an EDMG PPDU, the minimum MPDU start spacing value that applies is the maximum value in the Minimum MPDU Start Spacing subfield of the A-MPDU Parameters field of the EDMG Capabilities element of all EDMG STAs associated with the AP or PCP.

### 10.12.5 Transport of A-MPDU by the PHY data service

An A-MPDU shall be transmitted in a PSDU associated with a PHY-TXSTART.request primitive with the TXVECTOR parameter AGGREGATION set to 1 or the TXVECTOR parameter FORMAT set to VHT. A received PSDU is determined to be an A-MPDU when the associated PHY-RXSTART.indication primitive RXVECTOR parameter AGGREGATION is equal to 1 or the RXVECTOR parameter FORMAT is equal to VHT.

A STA shall not transmit an MPDU in an S1G PPDU that exceeds the maximum MPDU length capability indicated in the S1G Capabilities element received from the recipient STA.

An S1G STA shall set the TXVECTOR parameter AGGREGATION to 1 when the length of the PSDU to be carried in the S1G PPDU is greater than aPSDUMaxLengthWithNoAggregation.

### 10.12.6 A-MPDU padding for VHT, HE(11ax) or S1G PPDU

A VHT STA that transmits a VHT PPDU or an S1G STA that transmits an S1G PPDU that contains one or more PSDUs, each of which contains an A-MPDU, shall construct the A-MPDU(s) as described in this subclause.

An A-MPDU pre-EOF padding (see 10.12.2 (A-MPDU length limit rules)) is constructed for each user from any of the following:

— A-MPDU subframes constructed from the MPDUs available for transmission that have a TID value that maps to the primary AC

— A-MPDU subframes with 0 in the MPDU Length field and 0 in the EOF/Tag(#4367) field

provided that each added subframe and the A-MPDU pre-EOF padding meet all of the following:

— A-MPDU content constraints (see 10.12.1 (A-MPDU contents)) for the intended recipient

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

- Format and length limit constraints (see 9.7.1 (A-MPDU format) and 10.12.2 (A-MPDU length limit rules)) for the intended recipient
- Minimum MPDU start spacing constraints (see 10.12.3 (Minimum MPDU start spacing rules)) for the intended recipient
- TXOP duration limits (see 10.23.2.9 (TXOP limits)) for the primary AC

The A-MPDU_Length[*n*] for user *n* is initialized as the length of the resulting A-MPDU pre-EOF padding.

This initial value of A-MPDU_Length[*n*] for user *n* is used as the APEP_LENGTH[*n*] parameter value for the PLME-TXTIME.request primitive (see 6.7.5 (PLME-TXTIME.request)). The PLME-TXTIME.request primitive is then invoked once for the VHT PPDU or the S1G PPDU. The PLME-TXTIME.confirm primitive (see 6.7.6 (PLME-TXTIME.confirm)) provides the TXTIME parameter and PSDU_LENGTH[] parameters for all of the users for the transmission.

Subsequently, for each user *n*, as permitted by the rules for EDCA TXOP Sharing (see 10.23.2.7 (Sharing an EDCA TXOP)), a VHT STA or S1G STA may add A-MPDU subframes to the A-MPDU for that user that meets either of the following conditions:

- Have a TID that maps to an AC that is not the primary AC
- Have 0 in the MPDU Length field and 0 in the EOF/Tag(#4367) field

provided that each added subframe and the resulting A-MPDU meet all of the following:

- A-MPDU content constraints (see 10.12.1 (A-MPDU contents)) for the intended recipient
- Length limit constraints (see 9.7.1 (A-MPDU format) and 10.12.2 (A-MPDU length limit rules)) for the intended recipient
- MPDU start spacing constraints (see 10.12.3 (Minimum MPDU start spacing rules)) for the intended recipient

and provided that, after incrementing the A-MPDU_Length[*n*] with the length of each such added A-MPDU subframe, the relationship A-MPDU_Length[*n*] ≤ PSDU_LENGTH[*n*] is true.

Subsequently, for each user n, a VHT STA or S1G STA may add A-MPDU subframes to the A-MPDU for that user that meet the following condition:

- Have 0 in the MPDU Length field

provided that each added subframe and the resulting A-MPDU meet the following condition:

- Length limit constraints (see 9.7.1 (A-MPDU format) and 10.12.2 (A-MPDU length limit rules)) for the intended recipient

and provided that, after incrementing the A-MPDU_Length[n] with the length of each such added A-MPDU subframe, the relationship A-MPDU_Length[*n*] ≤ PSDU_LENGTH[*n*] is true.

An implementation may reduce the A-MPDU_Length[*n*] by the amount of padding for user *n* that was added subsequent to the addition of a subframe for user *n* that contains 1 in the EOF/Tag(#4367) field.

The final value of A-MPDU_Length[] shall be used as APEP_LENGTH[] in the PHY-TXSTART.request primitive for the VHT PPDU or S1G PPDU.

Padding is then added for each user such that the resulting A-MPDU contains exactly PSDU_LENGTH octets for that user as follows:

- First, while A-MPDU_Length[*n*] < PSDU_LENGTH[*n*] and A-MPDU_Length[*n*] mod 4 ≠ 0, add an octet to the final A-MPDU subframe's Padding subfield and increment A-MPDU_Length[*n*] by 1.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

— Then, while A-MPDU_Length[*n*] + 4 ≤ PSDU_LENGTH[*n*], add an EOF padding subframe to the EOF Padding Subframes field and increment A-MPDU_Length[*n*] by 4.
— Finally, while A-MPDU_Length[*n*] < PSDU_LENGTH[*n*], add an octet to the EOF Padding Octets subfield and increment A-MPDU_Length[*n*] by 1.

An A-MPDU subframe with EOF set to 0 shall not be added after any A-MPDU subframe with EOF set to 1, except if the A-MPDU subframe is in an ack-enabled single-TID A-MPDU or ack-enabled multi-TID A-MPDU (see 9.7.3 (A-MPDU contents)).(11ax)

An A-MPDU subframe with EOF set to 1 and with MPDU Length field set to 0 shall not be added before an A-MPDU subframe that contains an S-MPDU (see 10.12.7 (Setting the EOF/Tag(11ax) field of the MPDU delimiter)).

### 10.12.7 Setting the EOF/Tag(11ax) field of the MPDU delimiter

The (11ax)EOF/Tag field may be set to 1 in an A-MPDU subframe carried in a VHT PPDU, HE PPDU, or S1G PPDU if the subframe's MPDU Length field is nonzero and the subframe is the only subframe that has a nonzero MPDU Length field. The (11ax)EOF/Tag field of each A-MPDU subframe with an MPDU Length field with a nonzero value that is not the only A-MPDU subframe with MPDU Length field with a nonzero value in the A-MPDU carried in a VHT PPDU or S1G PPDU shall be set to 0. The (11ax)EOF/Tag field shall be set to 0 in all A-MPDU subframes that are carried in an HT PPDU.

An MPDU that is the only MPDU in an A-MPDU and that is carried in an A-MPDU subframe with 1 in the (11ax)EOF/Tag field is called an S-MPDU.

(11ay)In an EDMG PPDU, the EOF padding can be used to indicate that no more MPDUs are present at end of the A-MPDU in the case the PSDU length exceeds the accumulated size of A-MPDU subframes plus the number of octets(#8150) used for MPDU start spacing.

(11ay)In the sequence of A-MPDU subframes transmitted in an EDMG PPDU, the EOF/Tag(#4367) field is set as follows:

— Shall be set to 0 in all A-MPDU subframes if the subframe's MPDU Length field is nonzero.
— (#2211)May be set to 1 in all A-MPDU subframes if the subframe's MPDU Length field is 0 and no A-MPDU subframe with nonzero value in the subframe's MPDU Length field is set for transmission in the A-MPDU subframes sequence after the subframe with MPDU Length field equal to 0 is transmitted.

(11ax)An MPDU that is carried in an A-MPDU subframe with the EOF/Tag field in the MPDU delimiter set to 1 is called a *tagged* MPDU. An S-MPDU is a tagged MPDU, but a tagged MPDU is not necessarily an S-MPDU.

(11ax)An MPDU that is carried in an A-MPDU subframe with the EOF/Tag field in the MPDU delimiter set to 0 is called an untagged MPDU.

### 10.12.8 Transport of S-MPDUs

The rules for S-MPDU operation are the same as the rules for non-A-MPDU frame operation with other types of non-A-MPDU.

NOTE—This affects the following behavior:
a) The frame could carry a fragment of an MSDU or MMPDU (see 10.2.7 (Fragmentation/defragmentation overview)).
b) Rate selection of control responses (see 10.6 (Multirate support)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

c) A QoS Data frame cannot have Implicit BAR ack policy, and does not generate a BlockAck frame response (see 9.2.4.5.4 (Ack Policy Indicator subfield)).
d) A QoS Data frame could have Normal Ack ack policy, which solicits an Ack frame immediate response. No block ack agreement is needed in this case (see 9.2.4.5.4 (Ack Policy Indicator subfield)).
e) The frame could be a Management frame that solicits an Ack frame response (see 9.7.3 (A-MPDU contents)).

## 10.13 PPDU duration constraint

A STA shall not transmit an HT PPDU that has a duration (as determined by the (#7074)PLME-TXTIME.confirm primitive defined in 6.7.6 (PLME-TXTIME.confirm)) that is greater than aPPDUMaxTime defined in Table 19-25 (HT PHY characteristics).

A STA shall not transmit a DMG PPDU that has a duration (as determined by the (#7074)PLME-TXTIME.confirm primitive defined in 6.7.6 (PLME-TXTIME.confirm)) that is greater than aPPDUMaxTime defined in Table 20-30 (DMG PHY characteristics).

A CMMG STA shall not transmit a PPDU that has a duration (as determined by the (#7074)PLME-TXTIME.confirm primitive defined in 6.7.6 (PLME-TXTIME.confirm)) that is greater than aPPDUMaxTime.

A STA shall not transmit a VHT PPDU that has a duration (as determined by the (#7074)PLME-TXTIME.confirm primitive defined in 6.7.6 (PLME-TXTIME.confirm)) that is greater than aPPDUMaxTime defined in Table 21-28 (VHT PHY characteristics).

A STA shall not transmit a VHT MU PPDU with the TXVECTOR parameter APEP_LENGTH for any of the users greater than aAPEPMaxLengthVHTMU20, aAPEPMaxLengthVHTMU40 or aAPEPMaxLengthVHTMU80orMore when TXVECTOR parameter CH_BANDWIDTH is CBW20, CBW40, or other values, respectively.

NOTE—In the case of using aPEPMaxLengthVHTMU80orMore, the constraint from Maximum A-MPDU Length Exponent of 7 is smaller and becomes the actual limiting factor (see 10.12.2 (A-MPDU length limit rules)).

A STA shall not transmit a VHT PPDU in TVWS bands that has a duration (as determined by the (#7074)PLME-TXTIME.confirm primitive defined in 6.7.6 (PLME-TXTIME.confirm)) that is greater than aPPDUMaxTime defined in Table 22-25 (TVHT PHY characteristics).

A STA shall not transmit an S1G PPDU that has a duration (as determined by the (#7074)PLME-TXTIME.confirm primitive defined in 6.7.6 (PLME-TXTIME.confirm)) that is greater than aPPDUMaxTime defined in Table 23-41 (S1G PHY characteristics).

An HE STA shall not transmit an HE PPDU that has a duration (as determined by the (#7074)PLME-TXTIME.confirm primitive defined in 6.7.6 (PLME-TXTIME.confirm)) that is greater than *aPPDUMaxTime* defined in Table 27-61 (HE PHY characteristics(11ax)).(11ax)

(11ay)A STA shall not transmit an EDMG PPDU that has a duration (as determined by the PLME-TXTIME.confirm primitive defined in 6.7.6 (PLME-TXTIME.confirm)) that is greater than aPPDUMaxTime defined in Table 20-30 (DMG PHY characteristics).

(11bd)A STA shall not transmit an NGV PPDU that has a duration (as determined by the (#7074)PLME-TXTIME.confirm primitive defined in 6.7.6 (PLME-TXTIME.confirm)(#7074)) that is greater than aPPDUMaxTime defined in Table 32-20 (NGV PHY characteristics).

## 10.14 DMG A-PPDU and EDMG A-PPDU(11ay) operation

(#3613)A DMG STA is a QoS STA and shall set dot11QosOptionImplemented to true.

A DMG STA is (11ay)DMG aggregate PPDU (A-PPDU) capable if the A-PPDU supported field within the STA's DMG Capabilities element is 1. Otherwise, the STA is not (11ay)DMG A-PPDU capable.

(11ay)An EDMG STA is EDMG A-PPDU capable if the EDMG A-PPDU subfield within the STA's EDMG Capabilities element is 1. Otherwise, the STA is not EDMG A-PPDU capable.

A DMG STA shall not transmit (11ay)a DMG A-PPDU to a STA that is not DMG A-PPDU capable.

(11ay)An EDMG STA shall not transmit an EDMG A-PPDU to a STA that is not EDMG A-PPDU capable.

(11ay)All PPDUs within a DMG A-PPDU shall have the ADD-PPDU parameter of the TXVECTOR set to ADD-PPDU, except for the last PPDU in the DMG A-PPDU that shall have this parameter set to NO-ADD-PPDU. (11ay)An EDMG PPDU shall have the ADD-PPDU parameter of the TXVECTOR set to NO-ADD-PPDU. All PPDUs within an EDMG A-PPDU shall have the EDMG_ADD_PPDU parameter of the TXVECTOR set to ADD-PPDU, except for the last PPDU in the EDMG A-PPDU that shall have this parameter set to NO-ADD-PPDU. A DMG PPDU and an EDMG PPDU shall not be included in the same A-PPDU.

The value of a TXVECTOR parameter of a PPDU belonging to (11ay)a DMG A-PPDU or an EDMG A-PPDU might differ from the value of the same TXVECTOR parameter of another PPDU in the same A-PPDU, including the MCS parameter.

A PPDU within an A-PPDU shall contain an A-MPDU. All MPDUs within A-MPDUs within an A-PPDU shall have the same values for the TA and RA fields. All QoS Data frames within A-MPDUs within an A-PPDU shall have the same ack policy. If a frame that requires an immediate response is present within an A-PPDU, it shall be transmitted in the last A-MPDU of the A-PPDU.

The transmission duration of an A-PPDU shall be no greater than aPPDUMaxTime (see Table 20-30 (DMG PHY characteristics)).

## 10.15 Low-density parity check code (LDPC) operation

An HT STA shall not transmit a frame in a PSDU with the TXVECTOR parameter FORMAT set to HT_MF or HT_GF and TXVECTOR parameter FEC_CODING set to LDPC_CODING unless the RA of the frame corresponds to an HT STA for which the LDPC Coding Capability subfield of the HT Capabilities element received from that STA contained a value of 1 and dot11LDPCCodingOptionActivated is true (if there is more than one intended receiver, then this requirement applies for each intended receiver).

A VHT STA shall not transmit a frame in a PSDU with the TXVECTOR parameter FORMAT set to VHT and TXVECTOR parameter FEC_CODING set to LDPC_CODING unless the RA of the frame corresponds to a VHT STA for which the Rx LDPC subfield of the VHT Capabilities element received from that STA contained a value of 1 and dot11VHTLDPCCodingOptionActivated is true (if there is more than one intended receiver, then this requirement applies for each intended receiver).

An S1G STA shall not transmit a frame in a PSDU with the TXVECTOR parameter FEC_CODING set to LDPC_CODING unless the RA of the frame corresponds to a STA for which the Rx LDPC subfield of the S1G Capabilities element from that STA contained a value of 1 and dot11S1GLDPCCodingOptionActivated is true (if there is more than one intended receiver, then this requirement applies for each intended receiver).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

A STA should not transmit a frame in a PSDU with the TXVECTOR parameter FORMAT set to HT_MF, HT_GF or VHT and TXVECTOR parameter FEC_CODING set to LDPC_CODING if the RA of the frame corresponds to a STA from which it has received a frame containing an Operating Mode field and the most recent Operating Mode field it has received from that STA had the No LDPC subfield equal to 1 (if there is more than one intended receiver, then this requirement applies for each intended receiver).

Further restrictions on TXVECTOR parameter values may apply due to rules found in 10.27 (Protection mechanisms) and 10.6 (Multirate support).

An HE STA shall not transmit a frame in an HE PPDU with the TXVECTOR parameter FEC_CODING set to LDPC_CODING, unless the frame is addressed to an HE STA for which the LDPC Coding In Payload subfield in the HE Capabilities element received from that STA contained a value of 1 and dot11HELDPCCodingInPayloadImplemented is true.(11ax)

## 10.16 STBC operation

A STA that has not set the Tx STBC subfield to 1 in the HT Capabilities element shall not transmit HT PPDUs with a TXVECTOR parameter STBC set to a nonzero value. A STA that has not set the Tx STBC subfield to 1 in the VHT Capabilities element shall not transmit VHT SU PPDUs with a TXVECTOR parameter STBC set to a nonzero value. A STA that has not set the Tx STBC subfield to 1 in the S1G Capabilities element shall not transmit S1G SU PPDUs with the TXVECTOR parameter STBC set to a nonzero value.

A STA shall not send an HT PPDU with the TXVECTOR parameter STBC set to a nonzero value to a recipient STA unless the recipient STA has indicated in the Rx STBC field of its HT Capabilities element that it supports the reception of PPDUs using STBC with a number of spatial streams greater than or equal to the number of spatial streams in the HT PPDU (if there is more than one intended receiver, then this requirement applies for each intended receiver). A STA shall not send a VHT PPDU with the TXVECTOR parameter STBC set to a nonzero value to a recipient STA unless the recipient STA has indicated in the Rx STBC field of its VHT Capabilities element that it supports the reception of PPDUs using STBC with a number of spatial streams greater than or equal to the number of spatial streams in the VHT PPDU (if there is more than one intended receiver, then this requirement applies for each intended receiver). A STA shall not send an S1G PPDU with the TXVECTOR parameter STBC set to a nonzero value to a recipient STA unless the recipient STA has indicated in the Rx STBC field of its S1G Capabilities element that it supports the reception of PPDUs using STBC with a number of spatial streams greater than or equal to the number of spatial streams in the S1G PPDU (if there is more than one intended receiver, then this requirement applies for each intended receiver).

A STA that has not set the Tx STBC subfield to 1 in the CMMG Capabilities element shall not transmit CMMG PPDUs with a TXVECTOR parameter STBC set to a nonzero value.

A STA shall not send a CMMG PPDU with the TXVECTOR parameter STBC set to a nonzero value to a recipient STA unless the recipient STA has indicated in the Rx STBC field of its CMMG Capabilities element that it supports the reception of PPDUs using STBC with a number of spatial streams equal to or greater than the number of spatial streams in the CMMG PPDU (if there is more than one intended receiver, then this requirement applies for each intended receiver).

## 10.17 Short GI operation

A STA may transmit a frame in a PSDU with TXVECTOR parameters CH_BANDWIDTH set to HT_CBW20 and GI_TYPE set to SHORT_GI only if all of the following conditions are met (if there is more than one intended receiver, then this requirement applies for each intended receiver):

— The STA is an HT STA.

— The TXVECTOR parameter FORMAT is equal to HT_MF or HT_GF.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

- The RA of the frame corresponds to a STA for which the Short GI for 20 MHz subfield of the HT Capabilities element contained a value of 1.
- dot11ShortGIOptionInTwentyActivated is present and is true.

A STA may transmit a frame in a PSDU with TXVECTOR parameters CH_BANDWIDTH set to CBW20 and GI_TYPE set to SHORT_GI only if all of the following conditions are met (if there is more than one intended receiver, then this requirement applies for each intended receiver):

- The STA is a VHT STA.
- The TXVECTOR parameter FORMAT is equal to VHT.
- The RA of the frame corresponds to a STA for which the Short GI for 20 MHz subfield of the HT Capabilities element contained a value of 1.
- dot11ShortGIOptionInTwentyActivated is present and is true.

A STA may transmit a frame in a PSDU with TXVECTOR parameters CH_BANDWIDTH set to HT_CBW40 and GI_TYPE set to SHORT_GI only if all of the following conditions are met (if there is more than one intended receiver, then this requirement applies for each intended receiver):

- The STA is an HT STA.
- The TXVECTOR parameter FORMAT is equal to HT_MF or HT_GF.
- The RA of the frame corresponds to a STA for which the Short GI for 40 MHz subfield of the HT Capabilities element contained a value of 1.
- dot11ShortGIOptionInFortyActivated is present and is true.

A STA may transmit a frame in a PSDU with TXVECTOR parameters CH_BANDWIDTH set to CBW40 and GI_TYPE set to SHORT_GI only if all of the following conditions are met (if there is more than one intended receiver, then this requirement applies for each intended receiver):

- The STA is a VHT STA.
- The TXVECTOR parameter FORMAT is equal to VHT.
- The RA of the frame corresponds to a STA for which the Short GI for 40 MHz subfield of the HT Capabilities element contained a value of 1.
- dot11ShortGIOptionInFortyActivated is present and is true.

A STA shall not transmit a frame in a PSDU with TXVECTOR parameters CH_BANDWIDTH set to CBW80 and GI_TYPE set to SHORT_GI unless all of the following conditions are met (if there is more than one intended receiver, then this requirement applies for each intended receiver):

- The STA is a VHT STA.
- The TXVECTOR parameter FORMAT is equal to VHT.
- The RA of the frame corresponds to a STA for which the Short GI for 80 MHz/TVHT_MODE_4C subfield of the VHT Capabilities element contained a value of 1.
- dot11VHTShortGIOptionIn80Activated is present and is true.

A STA may transmit a frame in a PSDU with TXVECTOR parameters CH_BANDWIDTH set to CBW160 or CBW80+80 and GI_TYPE set to SHORT_GI only if all of the following conditions are met (if there is more than one intended receiver, then this requirement applies for each intended receiver):

- The STA is a VHT STA.
- The TXVECTOR parameter FORMAT is equal to VHT.
- The RA of the frame corresponds to a STA for which the Short GI for 160 and 80+80 MHz subfield of the VHT Capabilities element contained a value of 1.
- dot11VHTShortGIOptionIn160and80p80Activated is present and is true.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

A STA may transmit a frame in a PSDU with TXVECTOR parameters FORMAT set to VHT, NUM_USERS set to greater than 1, and GI_TYPE set to SHORT_GI only if all of the following conditions are met:

- The STA is a VHT STA.
- The TXVECTOR parameter FORMAT is equal to VHT.
- The RAs of all MPDUs in the VHT MU PPDU correspond to STAs for which the Short GI subfield of the following conditions are satisfied:
  - If the TXVECTOR parameter CH_BANDWIDTH is(M118) CBW20, the Short GI for 20 MHz subfields of the HT Capabilities element contained a value of 1, and dot11ShortGIOptionInTwentyActivated is present and is true.
  - If the TXVECTOR parameter CH_BANDWIDTH is(M118) CBW40, the Short GI for 40 MHz subfields of the HT Capabilities element contained a value of 1, and dot11ShortGIOptionInFortyActivated is present and is true.
  - If the TXVECTOR parameter CH_BANDWIDTH is(M118) CBW80, the Short GI for 80 MHz/TVHT_MODE_4C subfields of the VHT Capabilities element contained a value of 1, and dot11VHTShortGIOptionIn80Activated is present and is true.
  - If the TXVECTOR parameter CH_BANDWIDTH is(M118) CBW160 or CBW80+80, the Short GI for 160 MHz and 80+80 MHz subfields of the VHT Capabilities element contained a value of 1, and dot11VHTShortGIOptionIn160and80p80Activated is present and is true.

An S1G STA may transmit a frame in a PSDU with TXVECTOR parameters CH_BANDWIDTH set to CBW1 and GI_TYPE set to SHORT_GI only if all of the following conditions are met (if there is more than one intended receiver, then this requirement applies for each intended receiver):

- The RA of the frame corresponds to a STA for which the Short GI for 1 MHz subfield of the S1G Capabilities element is 1.
- dot11ShortGIOptionIn1MActivated is present and is true.

An S1G STA may transmit a frame in a PSDU with TXVECTOR parameters CH_BANDWIDTH set to CBW2 and GI_TYPE set to SHORT_GI only if all of the following conditions are met (if there is more than one intended receiver, then this requirement applies for each intended receiver):

- The RA of the frame corresponds to a STA for which the Short GI for 2 MHz subfield of the S1G Capabilities element is 1.
- dot11ShortGIOptionIn2MActivated is present and is true.

An S1G STA may transmit a frame in a PSDU with TXVECTOR parameters CH_BANDWIDTH set to CBW4 and GI_TYPE set to SHORT_GI only if all of the following conditions are met (if there is more than one intended receiver, then this requirement applies for each intended receiver):

- The RA of the frame corresponds to a STA for which the Short GI for 4 MHz subfield of the S1G Capabilities element is 1.
- dot11ShortGIOptionIn4MActivated is present and is true.

An S1G STA may transmit a frame in a PSDU with TXVECTOR parameters CH_BANDWIDTH set to CBW8 and GI_TYPE set to SHORT_GI only if all of the following conditions are met (if there is more than one intended receiver, then this requirement applies for each intended receiver):

- The RA of the frame corresponds to a STA for which the Short GI for 8 MHz subfield of the S1G Capabilities element is 1.
- dot11ShortGIOptionIn8MActivated is present and is true.

An S1G STA may transmit a frame in a PSDU with TXVECTOR parameters CH_BANDWIDTH set to CBW16 and GI_TYPE set to SHORT_GI only if all of the following conditions are met (if there is more than one intended receiver, then this requirement applies for each intended receiver):

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

- The RA of the frame corresponds to a STA for which the Short GI for 16 MHz subfield of the S1G Capabilities element is 1.
- dot11ShortGIOptionIn16MActivated is present and is true.

An S1G STA may transmit a frame in a PSDU with TXVECTOR parameters NUM_USERS set to greater than 1, and GI_TYPE set to SHORT_GI only if all of the following conditions are met:

- The RAs of all MPDUs in the S1G MU PPDU correspond to STAs for which the Short GI subfield of the following conditions are satisfied:
  - If the TXVECTOR parameter CH_BANDWIDTH is (M118)equal to CBW2, the Short GI for 2 MHz subfield of the S1G Capabilities element is equal to 1, and dot11ShortGIOptionIn2MActivated is present and is true.
  - If the TXVECTOR parameter CH_BANDWIDTH is (M118)equal to CBW4, the Short GI for 4 MHz subfield of the S1G Capabilities element is equal to 1, and dot11ShortGIOptionIn4MActivated is present and is true.
  - If the TXVECTOR parameter CH_BANDWIDTH is (M118)equal to CBW8, the Short GI for 8 MHz subfield of the S1G Capabilities element is equal to 1, and dot11ShortGIOptionIn8MActivated is present and is true.
  - If the TXVECTOR parameter CH_BANDWIDTH is (M118)equal to CBW16, the Short GI for 16 MHz subfield of the S1G Capabilities element is equal to 1, and dot11ShortGIOptionIn16MActivated is present and is true.

An HT STA shall not transmit a frame with TXVECTOR parameter FORMAT set to HT_GF and the GI_TYPE parameter set to SHORT_GI when the MCS parameter indicates a single spatial stream.

Further restrictions on TXVECTOR parameter values may apply due to rules found in 10.27 (Protection mechanisms) and 10.6 (Multirate support).

## 10.18 Greenfield operation

An HT STA shall not transmit a frame in a PSDU with the TXVECTOR parameter FORMAT set to HT_GF unless the RA of the frame corresponds to a STA for which the HT-Greenfield subfield of the HT Capabilities element contained a value of 1 and dot11HTGreenfieldOptionActivated is true (if there is more than one intended receiver, then this requirement applies for each intended receiver). Further restrictions may apply due to rules found in 10.27 (Protection mechanisms), 10.6 (Multirate support), and 11.8.8.5 (HT-greenfield transmissions in operating classes that include a behavior limit of DFS_50_100_Behavior).

## 10.19 Group ID and partial AID in VHT and CMMG PPDUs

The partial AID is a nonunique STA identifier defined in Table 10-13 (Settings for the TXVECTOR parameters GROUP_ID and PARTIAL_AID for VHT STAs) and Table 10-14 (Settings for the TXVECTOR parameter PARTIAL_AID for CMMG STAs). The partial AID is carried in the TXVECTOR parameter PARTIAL_AID of a VHT SU PPDU or a CMMG PPDU and is limited to 9 bits.

A STA transmitting a VHT SU PPDU carrying one or more group addressed MPDUs or transmitting a VHT NDP intended for multiple recipients shall set the TXVECTOR parameters GROUP_ID to 63 and PARTIAL_AID to 0. The intended recipient of a VHT NDP is defined in 10.35.6 (Transmission of a VHT NDP).

A STA transmitting a CMMG PPDU carrying one or more group addressed MPDUs shall set the TXVECTOR parameters PARTIAL_AID to 0.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

A STA transmitting a VHT SU PPDU carrying one or more individually addressed MPDUs or a VHT NDP intended for a single recipient shall set the TXVECTOR parameters GROUP_ID and PARTIAL_AID as shown in Table 10-13 (Settings for the TXVECTOR parameters GROUP_ID and PARTIAL_AID for VHT STAs).

**Table 10-13—Settings for the TXVECTOR parameters GROUP_ID and PARTIAL_AID for VHT STAs**

| Condition | GROUP_ID | PARTIAL_AID |
|---|---|---|
| Addressed to AP | 0 | *int(*BSSID[39:47]) |
| Addressed to Mesh STA | 0 | *int(*RA[39:47]) |
| Sent by an AP and addressed to a STA associated with that AP or sent by a TDLS STA in a direct path to a TDLS peer STA | 63 | STA_Partial_AID_VHT (see Equation (10-13)) (#6096) |
| Otherwise (see NOTE) | 63 | 0 |
| NOTE—The last row covers the following cases:<br>a) A PPDU sent to an IBSS STA<br>b) A PPDU sent by an AP to a non associated STA<br>c) Any other condition not explicitly listed elsewhere in the table | | |

A STA transmitting a CMMG PPDU carrying one or more individually addressed MPDUs shall set the TXVECTOR parameter PARTIAL_AID as shown in Table 10-14 (Settings for the TXVECTOR parameter PARTIAL_AID for CMMG STAs).

**Table 10-14—Settings for the TXVECTOR parameter PARTIAL_AID for CMMG STAs**

| Condition | PARTIAL_AID |
|---|---|
| A frame that is not a Control frame that is addressed to an AP. | $(dec(\text{BSSID}[39:47]) \bmod (2^9 - 1)) + 1$ |
| A frame that is not a Control frame that is addressed to an AP. | $(dec(\text{RA}[39:47]) \bmod (2^9 - 1)) + 1$ |
| A frame that is not a Control frame that is sent by an AP and addressed to a STA associated with that AP or sent by a TDLS STA in a direct path to a TDLS peer STA. | STA_Partial_AID_CMMG (see Equation (10-14)) (#6096) |
| Otherwise (see NOTE) | 0 |
| NOTE—The last row covers the following cases:<br>a) A PPDU sent to an IBSS STA<br>b) A PPDU sent by an AP to a non associated STA<br>c) Any other condition not explicitly listed elsewhere in the table | |

A STA shall include the values computed in Table 10-13 (Settings for the TXVECTOR parameters GROUP_ID and PARTIAL_AID for VHT STAs) in the PHYCONFIG_VECTOR parameters PARTIAL_AID_LIST_GID00 and PARTIAL_AID_LIST_GID63.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

A STA that transmits a VHT or CMMG PPDU to a TDLS peer STA obtains the AID for the peer STA from the TDLS Setup Request or TDLS Setup Response frame.

(#6096)An AP should not assign to a STA an AID that results in a 0 value STA_Partial_AID_VHT as computed using Equation (10-13):

$$\text{STA\_Partial\_AID\_VHT} = (\text{AID}[0:8] + int(\text{BSSID}[44:47] \oplus \text{BSSID}[40:43]) \times 2^5) \bmod 2^9 \quad (10\text{-}13)$$

A CMMG AP should not assign to a CMMG STA an AID that results in the STA_Partial_AID_CMMG as computed using Equation (10-14):

$$\text{STA\_Partial\_AID\_CMMG} = (dec(\text{AID}[0:8]) + dec(\text{BSSID}[44:47] \oplus \text{BSSID}[40:43]) \times 2^5) \bmod 2^6 \quad (10\text{-}14)$$

being equal to one of the following:

$$0 \text{ or } (dec(\text{BSSID}[39:47]) \bmod (2^9 - 1)) + 1 \text{ or } (dec(\text{OBSSID}[39:47]) \bmod (2^9 - 1)) + 1$$

where OBSSID is the BSSID of a BSS that is not the BSS of which the AP is a member and for which the AP might be heard by the STA being assigned the AID.

A STA transmitting a VHT MU PPDU sets the TXVECTOR parameter GROUP_ID as described in 21.3.11.4 (Group ID).

As an example of the GROUP_ID and PARTIAL_AID setting, consider the case of a BSS with BSSID 00-21-6A-AC-53-52 that has as a member a non-AP STA assigned AID 5.[28] In VHT PPDUs sent to an AP, the GROUP_ID is set to 0 and the PARTIAL_AID is set to 164. In VHT PPDUs sent by the AP to the non-AP STA associated with that AP, the GROUP_ID is set to 63 and PARTIAL_AID is set to 229.

As an example of the PARTIAL_AID setting, consider the case of a BSS with BSSID 00-21-6A-AC-53-52 that has as a member a non-AP CMMG STA assigned AID 5. In CMMG PPDUs sent to an AP, the PARTIAL_AID is set to 165. In CMMG PPDUs sent by the AP to the non-AP STA associated with that AP, the PARTIAL_AID is set to 37.

A STA transmitting a CMMG PPDU that is addressed to an AP shall set the TXVECTOR parameter UPLINK_INDICATION to 1. The UPLINK_INDICATION parameter shall be set to 0 for all other cases.

The TXVECTOR parameter COLOR is used to assist a receiving STA in identifying the BSS from which a reception originates so that the receiving STA might increase spatial reuse and reduce power consumption by terminating the reception process in the case when the reception is not from the BSS of which the STA is a member. A STA transmitting a CMMG PPDU that is addressed to an AP need not include the TXVECTOR parameter COLOR in the TXVECTOR. A STA transmitting a CMMG PPDU that is not an NDP and that is sent by a TDLS STA in a direct path to a TDLS peer STA shall set the TXVECTOR parameter COLOR to the value of the COLOR parameter, if present, from the RXVECTOR of the most recently received frame from its associated AP or from the DO of the IBSS of which it is a member that contained a COLOR parameter. An AP transmitting a CMMG PPDU shall set the TXVECTOR parameter COLOR to a value of its choosing and shall maintain that value for the duration of the existence of the BSS. The AP which is a member of a Multiple BSSID Set shall set the TXVECTOR parameter COLOR for each different BSSID(*i*) to a same value.

[28] As described in IEEE Std 802, the use of hyphens for the BSSID indicates hexadecimal representation rather than bit-reversed representation.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

An AP shall include the value that it is using for the TXVECTOR parameter COLOR in the COLOR field of the CMMG Capabilities Info field of the CMMG Capabilities element in all frames that contain that element. The COLOR field of the CMMG Capabilities Info field of the CMMG Capabilities element in all frames transmitted from a non-AP STA is reserved.

## 10.20 S1G dynamic AID assignment operation

An S1G STA may support dynamic AID assignment. A STA with dot11DynamicAIDActivated equal to true is defined as a D-AID STA. A D-AID STA shall set the Dynamic AID field of the S1G Capabilities Information field in the S1G Capabilities element to 1. Otherwise it shall set the Dynamic AID field to 0.

(#1276)When performing the S1G dynamic AID operations described in this subclause(Ed1), if management frame protection is negotiated and both STAs set the Extended S1G Action Protection field in the RSNXE that they transmit to 1, the STAs shall:

— use individually addressed Protected AID Switch Request, Protected AID Switch Response and Protected Information Announcement frames instead of AID Switch Request, AID Switch Response and STA Information Announcement frames, respectively and

— discard any individually addressed AID Switch Request, AID Switch Response or STA Information Announcement frame received from the peer STA, with which management frame protection is negotiated.

(#1276)STAs that exchange individually addressed Protected AID Switch Request, Protected AID Switch Response or Protected STA Information Announcement frames shall follow the rules defined in 12.6.17 (Protection of robust Management frames.).

(#1276)When management frame protection is not negotiated or the Extended S1G Action Protection field in the RSNXE transmitted by either STA is set to 0, the STAs shall not use the Protected AID Switch Request, Protected AID Switch Response nor the Protected STA Information Announcement frame.

A D-AID STA may transmit AID Switch Request or AID Switch Response frames to a D-AID STA. A STA shall not transmit an AID Switch Request frame or AID Switch Response frame to a STA from which it has received an S1G Capabilities element with the Dynamic AID field equal to 0.

When the traffic pattern or the service characteristic or the remaining battery life of a D-AID STA is changed, the D-AID STA may change its listen interval. If the listen interval of the STA is changed, the AID of the STA should be updated so that the STA belong to the STA group consisting of the STAs having the same listen interval. A D-AID STA requesting a new listen interval may transmit an AID Switch Request frame containing an AID Request element with the AID Request Interval Present subfield of an AID Request Mode field equal to 1 and the AID Request Interval field equal to the requested new listen interval to the AP. The Service Characteristic field may be included in the AID Request element with the Service Characteristic Present subfield of the AID Request Mode field equal to 1 to inform the AP of the service characteristic of the STA if it has been changed. After receiving the AID Switch Request frame, the AP with dot11DynamicAIDActivated equal to true shall respond with an AID Switch Response frame containing an AID Response element with the AID/Group AID field equal to a new AID and the AID Response Interval field equal to a new listen interval. The AP may assign a particular AID to the D-AID STA taking into account the received service characteristic information from the STA if it is included in the AID Switch Request frame.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

An illustration of the dynamic AID assignment is shown in Figure 10-26 (Illustration of dynamic AID assignment(#220)).

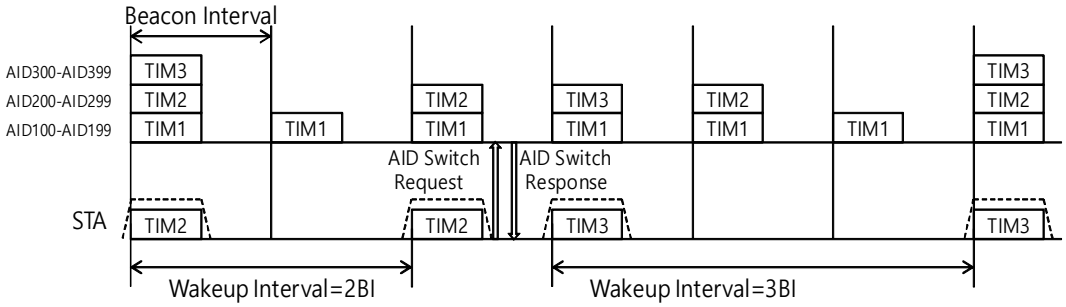

**Figure 10-26—Illustration of dynamic AID assignment(#220)**

A D-AID STA may switch between TIM mode and non-TIM mode during operation.

The mode switching is initiated by a non-AP D-AID STA. When the D-AID STA switches from TIM mode to non-TIM mode, the STA should inform the AP of its switching through the AID Switch Request frame with the Non-TIM Mode Switch subfield of the AID Request element set to 1 and the TIM Mode Switch subfield set to 0, the STA otherwise should inform the AP of its switching through the AID Switch Request frame with the TIM Mode Switch subfield of AID Request element equal to 1 and Non-TIM Mode Switch subfield set to 0 when the STA switches from non-TIM mode to TIM mode. A D-AID STA that switches between TIM mode and non-TIM mode, which also wants to update its listen interval may request a listen interval change by including a listen interval value in the AID Request Interval field in the AID Request element. The Service Characteristic field may be included in the AID Request element if the service characteristic has been changed.

Upon receiving AID Switch Request frame with the Non-TIM Mode Switch subfield or TIM Mode Switch subfield of AID Request element equal to 1, the AP may reassign a new AID to the STA. The new AID is transmitted to the D-AID STA by including it in the AID Response element of the AID Switch Response frame. The AP may reassign a new value for the listen interval and include it in the AID Response Interval field of the AID Response element. The STA shall update its listen interval to the value indicated in the AID Response.

If the AID included in the AID Response element of the AID Switch Response frame is not the same as the STA's current AID, the STA shall use the AID included in the AID Response element as its new AID. The non-AP STA shall switch to the new AID after the duration specified by the AID Switch Count field in the received AID Response element.

An AP can change the group of a STA for load/traffic distribution of each group. An AP with dot11UnsolicitedDynamicAIDActivated equal to true may transmit an unsolicited AID Switch Response frame containing an AID Response element with the AID/Group AID field equal to a new AID and an the AID Response Interval field equal to a new listen interval to the STA that has the Unsolicited Dynamic AID bit equal to 1 in its S1G Capabilities element. The STA for which dot11UnsolicitedDynamicAIDActivated is true shall set the Unsolicited Dynamic AID field of the S1G Capabilities Information field in the S1G Capabilities element to 1.

When a D-AID STA has buffered frames for a peer non-AP STA, it may request to belong to the group of AIDs having the same listen interval with a the peer non-AP STA. A D-AID STA requesting the same listen interval with a the peer non-AP STA may transmit an AID Switch Request frame containing an AID Request element with the Peer STA Address Present subfield of an AID Request Mode field equal to 1 and a the Peer STA Address field equal to the MAC address of the peer non-AP STA to an the AP. After receiving

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

the AID Switch Request frame, the AP with dot11DynamicAIDActivated equal to true shall respond with an AID Switch Response frame containing an AID Response element with an the AID/Group AID field equal to a new AID and the AID Response Interval field equal to the same listen interval with the peer non-AP STA.

When the AID of a non-AP D-AID STA has changed and that STA has direct connections with other peer STAs (e.g., TDLS), the AP shall transmit a STA Information Announcement frame (see 9.6.24.5 (STA Information Announcement frame format)) that contains the updated AID of the non-AP STA to each peer STA. A D-AID STA with direct connections with non-AP D-AID STAs that receives a STA Information Announcement frame shall update the AIDs of these STAs with the information contained in the received frame.

If a non-AP STA with direct connections receives a STA Information Announcement frame including an AID Announcement element from a peer STA, the non-AP STA updates the peer STA's AID to the received AID and sends the Ack frame after a SIFS.(#6587)

An S1G STA may indicate to the AP its service characteristic information by including the Service Characteristic field in the AID Request element in (Re)Association Request frames as described in 11.3.5.11 (Service characteristic indication during association) in which case the AID Request Interval field of the element is equal to the value of the Listen Interval field of the (Re)Association Request frame. Otherwise the AID Request element is not present in the (Re)Association Request frame.

## 10.21 Group ID, partial AID, Uplink Indication, and COLOR in S1G PPDUs

The S1G partial AID is a nonunique identifier of an S1G STA as defined in Table 10-15 (Settings for the TXVECTOR parameter PARTIAL_AID for an NDP) and Table 10-16 (Settings for the TXVECTOR parameter PARTIAL_AID for non-1 MHz PPDUs and non-NDPs). The partial AID is carried in the TXVECTOR parameter PARTIAL_AID of an S1G SU PPDU with the TXVECTOR parameter CH_BANDWIDTH set to CBW2, CBW4, CBW8, or CBW16 and is limited to 9 bits.

A STA transmitting an S1G PPDU carrying one or more group addressed MPDUs that share a single, common group AID value shall set the TXVECTOR parameter PARTIAL_AID according to (#4280)Table 10-16 (Settings for the TXVECTOR parameter PARTIAL_AID for non-1 MHz PPDUs and non-NDPs). A STA transmitting an S1G PPDU carrying one or more group addressed MPDUs that do not share a common group AID and a common BSSID or that is transmitting an S1G NDP intended for multiple recipients shall set the TXVECTOR parameter PARTIAL_AID to 0. The intended recipient of an S1G NDP is defined in 10.35.7 (Transmission of an S1G NDP).

A STA transmitting an S1G SU PPDU carrying one or more individually addressed MPDUs or an S1G NDP intended for a single recipient shall select any one of the AIDs assigned to the recipient and then set the TXVECTOR parameter PARTIAL_AID as shown in Table 10-15 (Settings for the TXVECTOR parameter PARTIAL_AID for an NDP) and Table 10-16 (Settings for the TXVECTOR parameter PARTIAL_AID for non-1 MHz PPDUs and non-NDPs).

NOTE—In Table 10-15 (Settings for the TXVECTOR parameter PARTIAL_AID for an NDP) and Table 10-16 (Settings for the TXVECTOR parameter PARTIAL_AID for non-1 MHz PPDUs and non-NDPs), the last row includes the cases of a PPDU carrying MPDUs:

a) Sent by an IBSS STA to one or more IBSS STAs
b) Sent by an AP to a non associated STA
c) Any other condition not explicitly listed elsewhere in the table.

An S1G STA shall include the values computed in Table 10-15 (Settings for the TXVECTOR parameter PARTIAL_AID for an NDP) in the PHYCONFIG_VECTOR parameter PARTIAL_AID_LIST_GID00 and PARTIAL_AID_LIST_GID63.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 10-15—Settings for the TXVECTOR parameter PARTIAL_AID for an NDP**

| Condition | PARTIAL_AID |
|---|---|
| An NDP that is intended for an AP or sent by an AP and intended for all STAs associated with that AP.(#3454) | (*int*(BSSID[39:47])) mod ($2^9 - 1$) + 1 |
| An NDP that is sent by an AP and intended for a STA associated with that AP or for a group of non-AP STAs with a common group AID and a common BSSID, or sent by a TDLS STA and intended for a TDLS peer STA.(#3454) | STA_Partial_AID_NDP (see Equation (10-15))(#6096) |
| Otherwise | 0 |

**Table 10-16—Settings for the TXVECTOR parameter PARTIAL_AID for non-1 MHz PPDUs and non-NDPs**

| Condition | PARTIAL_AID |
|---|---|
| A PPDU containing one or more frames addressed to an AP; except for a PPDU that just contains a single frame, and that frame is a Control frame.(#3454) | *int*(BSSID[39:47]) mod ($2^9$–1)) + 1 |
| A PPDU containing one or more frames sent by an AP and addressed to a STA associated with that AP or to a group of STAs with a common group AID and a common BSSID, or sent by a TDLS STA in a direct path to a TDLS peer STA; except for a PPDU that just contains a single frame, and that frame is a Control frame.(#3454) | STA_Partial_AID (see Equation (10-16))(#6096) |
| Otherwise | 0 |

An S1G STA that transmits an S1G PPDU to a TDLS peer STA obtains the AID for the peer STA from TDLS Setup Request, or TDLS Setup Response frame.

(#371)(#6096)An S1G AP should not assign an AID that results in the STA_Partial_AID_NDP value as computed using Equation (10-15):

$$\text{STA\_Partial\_AID\_NDP} = (\text{AID}[0{:}8] + int(\text{BSSID}[44{:}47] \oplus \text{BSSID}[40{:}43]) \times 2^5) \bmod 2^9 \quad (10\text{-}15)$$

being equal to one of the following:

$$0 \quad \text{or} \quad (int(\text{BSSID}[39{:}47]) \bmod (2^9 - 1)) + 1 \quad \text{or} \quad (int(\text{OBSSID}[39{:}47]) \bmod (2^9 - 1) + 1$$

where OBSSID is the BSSID of a BSS that is not the BSS of which the AP is a member and for which the AP might be heard by the STA being assigned the AID.

(#6096)An SIG AP should not assign an AID that results in the STA_Partial_AID value as computed using Equation (10-16):

$$\text{STA\_Partial\_AID} = (\text{AID}[0{:}8] + int(\text{BSSID}[44{:}47] \oplus \text{BSSID}[40{:}43]) \times 2^5) \bmod 2^6 \quad (10\text{-}16)$$

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

being equal to one of the following:

0 or (*int*(BSSID[39:47]) mod ($2^9$ – 1)) + 1 or (*int*(OBSSID[39:47]) mod ($2^9$ – 1) + 1

where OBSSID is the BSSID of a BSS that is not the BSS of which the AP is a member and for which the AP might be heard by the STA being assigned the AID.

An S1G STA transmitting an S1G MU PPDU sets the TXVECTOR parameter GROUP_ID as described in 23.3.10.4 (Group ID).

As an example of the PARTIAL_AID setting, consider the case of a BSS with BSSID 00-21-6A-AC-53-52 that has as a member a non-AP S1G STA assigned AID 5. In an NDP sent by the non-AP S1G STA to (#371)the AP, the PARTIAL_AID is equal to 165. In an NDP sent by the S1G AP to the non-AP STA, the PARTIAL_AID is equal to 229. In a non-1 MHz S1G PPDU that is not an NDP(#371), that does not contain a Control frame and that is sent by the non-AP S1G STA to the AP, the PARTIAL_AID is set to 165. In a non-1 MHz S1G PPDU that is not an NDP(#371), that does not contain a Control frame and that is sent by the S1G AP to the non-AP STA, the PARTIAL_AID is set to 37.

A STA transmitting a non-1 MHz S1G PPDU that is not an NDP and that is addressed to an AP shall set the TXVECTOR parameter UPLINK_INDICATION to 1. The UPLINK_INDICATION parameter shall be set to 0 for all other cases. The TXVECTOR parameter UPLINK_INDICATION is not present for 1 MHz PPDUs or NDPs.

The TXVECTOR parameter COLOR is used to assist a receiving STA in identifying the BSS from which a received PPDU originates so that the receiving STA reduces intra-BSS collisions by reporting a busy medium regardless of the received power when COLOR indicates that the current PPDU might be intra-BSS and might reduce power consumption by terminating the reception process when the received PPDU could not be from the BSS of which the STA is a member. A STA transmitting a non-1 MHz S1G PPDU that is not an NDP and that is addressed to an AP need not include the TXVECTOR parameter COLOR in the TXVECTOR. A STA transmitting a non-1 MHz S1G PPDU that is not an NDP and that is sent by a TDLS STA in a direct path to a TDLS peer STA shall set the TXVECTOR parameter COLOR to the value of the COLOR parameter, if present, from the RXVECTOR of the most recently received frame from its associated AP or from the STA transmitting a beacon of the IBSS of which it is a member that contained a COLOR parameter. An AP transmitting a non-1 MHz S1G PPDU that is not an NDP shall set the TXVECTOR parameter COLOR to a value of its choosing and shall maintain that value for the duration of the existence of the BSS. The AP which is a member of a Multiple BSSID Set shall set the TXVECTOR parameter COLOR for each different BSSID(*i*) to a same value.

When an S1G AP transmits a non-1 MHz S1G PPDU that is not an NDP, the AP shall set the TXVECTOR parameter COLOR to the value of the COLOR field of the S1G Capabilities Information field of the S1G Capabilities element transmitted by the AP. The COLOR field of the S1G Capabilities Information field of the S1G Capabilities element in all frames transmitted from a non-AP STA is reserved.

The partial BSSID is defined to be the PARTIAL_AID of the address of the STA contained in the AP and is equal to

(*int*(BSSID[39:47]) mod ($2^9$– 1)) + 1

## 10.22 Operation across regulatory domains

### 10.22.1 General

The PHY of a WLAN is subject to regulations that might vary significantly from one regulatory domain to another. This subclause provides the framework for operation across regulatory domains and describes the mechanism that supports cross-domain mobility and operation in multiple regulatory domains. When this mechanism is active, dot11MultiDomainCapabilityActivated attribute be true.

NOTE—This subclause does not eliminate the need to obtain type acceptance, regulatory approval, equipment authorization, or equipment certification in each of the regulatory domains in which the equipment operates. The mechanisms described in this subclause provide the information to the STA to identify the regulatory domain in which it is located and to cease operation while in those domains for which it does not have type approval. It is incumbent upon the implementer to provide proof of compliance to the requirements of individual regulatory agencies.

The method for configuring individual STAs is outside the scope of this standard. A STA needs to be properly configured for operation in a particular regulatory domain prior to beginning normal operation. Particular care needs to be taken when operating in an IBSS configuration.

### 10.22.2 Operation upon entering a regulatory domain

A STA that is enabled for operation across regulatory domains uses passive scanning when it has lost connectivity with its ESS. Passive scanning is performed using only the receive capabilities of the STA and is, thus, compatible with regulatory requirements. The timeout for determining the loss of connectivity is system dependent and beyond the scope of this standard.

When a STA with dot11MultiDomainCapabilityActivated true enters a regulatory domain, before transmitting, it shall passively scan to learn at least one valid channel, i.e., a channel upon which it detects IEEE 802.11 frames. The Beacon frame transmitted by non-DMG STAs and the DMG Beacon or Announce frame transmitted by DMG STAs contains information on the country code, the maximum allowable transmit power, and the channels that may be used for the regulatory domain. Optionally, these frames may also include in the Country element, on a periodic basis, the regulatory information that would be returned in a Probe Response frame. When DSE dependent STA operation is required in a regulatory domain, a dependent STA may be required to receive a Beacon, DMG Beacon, or an Announce frame signaling dependent enablement (11.11.5 (Dependent STA operation with DSE)), and until one of these frames is received, the STA may continue passive scanning to receive one such frame directly from an enabling STA. Once the STA has acquired the information so that it is able to meet the transmit requirements of the regulatory domain, it shall transmit a Probe Request frame to an AP or PCP to gain the additional necessary regulatory domain information contained in the Probe Response frame, unless the information was previously received in a Beacon, DMG Beacon, or Announce frame. The STA then has sufficient information available to configure its PHY for operation in the regulatory domain.

### 10.22.3 Operation with operating classes

The following, and only the following, are extended spectrum management capable: a VHT STA, (11ax)an HE STA, and a STA that has dot11ExtendedSpectrumManagementImplemented true. A non-VHT STA that has dot11ExtendedSpectrumManagementImplemented true shall indicate that it is extended spectrum management capable using the Extended Spectrum Management Capable field of the Extended Capabilities element.

When communicating with a STA that supports global operating classes, all requests and Action and Action No Ack frames that convey elements containing operating classes shall use global operating class values.

When dot11OperatingClassesImplemented is true, the following statements apply:

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

- When dot11OperatingClassesRequired is false, or where operating classes domain information is not present in a STA, that STA is not required to change its operation in response to an element that contains an operating class.
- When dot11OperatingClassesRequired is true, or where operating classes domain information is present in a STA, the STA shall indicate current operating class information in the Country element and Supported Operating Classes element, except for the following cases:(11ax)
  - (11ax)A VHT STA may omit from the Country element any Operating Triplet field for an Operating Class for which the Channel spacing (MHz) column indicates 80 MHz or wider and for which the Behavior limits set column in the applicable table in Annex E contains only a blank entry or either or both of "80+" and "UseEirpForVHTTxPowEnv."
  - (11ax)An HE STA may omit from the Country element any Operating Triplet field for an Operating Class for which the (#4177)Channel starting frequency column in Table E-4 (Global operating classes) is greater than or equal to 5.925 and less than or equal to 7.125.
- When dot11OperatingClassesRequired and dot11ExtendedChannelSwitchActivated are true and a STA is capable of operating as specified in more than one operating class, the STA shall include the Supported Operating Classes element in (Re)Association Request and Response frames.
- When dot11OperatingClassesRequired is true, or where operating classes domain information is present and the STA parsing a Country element finds an invalid First Channel Number field or Operating Class field with a value that is reserved, the STA shall ignore the remainder of the Country element and shall parse any remaining management frame body for additional elements.
- When dot11OperatingClassesRequired is true and the STA supports one or more global operating classes, or where global operating classes domain information is present in a STA, the STA shall indicate current operating class information in the Country element and Supported Operating Classes element using the country string for the global operating classes, except for the following cases:(11ax)
  - (11ax)A VHT STA may omit from the Country element any Operating Triplet field for an Operating Class for which the Channel spacing (MHz) column indicates 80 MHz or wider and for which the Behavior limits set column in the applicable table in Annex E contains only a blank entry or either or both of "80+" and "UseEirpForVHTTxPowEnv."
  - (11ax)An HE STA may omit from the Country element any Operating Triplet field for an Operating Class for which the (#4177)Channel starting frequency column in Table E-4 (Global operating classes) is greater than or equal to 5.925 and less than or equal to 7.125.

### 10.22.4 Operation with the Transmit Power Envelope element

A STA that (11ax)is not operating in the 6 GHz band, is extended spectrum management capable, and(11ax) has dot11SpectrumManagementRequired or dot11RadioMeasurementActivated equal to true shall determine a local maximum transmit power from a Transmit Power Envelope element for which (11ax)the Maximum Transmit Power Interpretation subfield indicates EIRP.

(11ax)A STA that is operating in the 6 GHz band shall determine local and regulatory client maximum transmit powers from Transmit Power Envelope element(s) (#6077)and other sources known to the STA, according to local regulations known at the STA (see 11.7.5 (Specification of regulatory and local maximum transmit power levels) and E.2.7 (6 GHz band(11ax)(#600))). A STA shall ignore Transmit Power Envelope element(s) indicating transmit power category values that the STA is unable to interpret for the current country.

NOTE 1—The Default category value (0) is applicable to, and so can be interpreted for, all countries (see 11.7.5 (Specification of regulatory and local maximum transmit power levels)). An AP in the 6 GHz band has dot11SpectrumManagementRequired equal to true and therefore transmits a Country element in Beacon and Probe Response frames.(11ax)

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

A STA that sends two or more Transmit Power Envelope elements in a frame shall order the elements by increasing values of their(11ax) Maximum Transmit Power Interpretation subfields.

(11ax)A STA that is operating in the 6 GHz band that sends two or more Transmit Power Envelope elements in a frame with the same value in the Maximum Transmit Power Interpretation subfield shall order the elements by increasing values of their Maximum Transmit Power Category subfields.

NOTE 2—The Maximum Transmit Power Category subfield is reserved, except in the 6 GHz band.(11ax)

If a STA that is extended spectrum management capable finds an unknown value in the(11ax) Maximum Transmit Power Interpretation subfield in a Transmit Power Envelope element, then the STA shall ignore that and subsequent Transmit Power Envelope elements.

A STA that receives two or more Transmit Power Envelope elements in the same frame with known values in their (11ax)Maximum Transmit Power Interpretation subfields shall process all of the elements according to the local regulations known at the STA.

NOTE 3—If a STA receives two Transmit Power Envelope elements, each with a known value in the(11ax) Maximum Transmit Power Interpretation subfield(11ax), then the expected possibilities are as follows:

a) The STA complies with either element (shared spectrum),
b) The STA complies with both elements (tightened regulations), or
c) The STA complies with the second element (changed regulations).

If a STA receives a Transmit Power Envelope element with the Maximum Transmit Power Interpretation subfield equal to 1 or 3 (EIRP PSD) and the Maximum Transmit Power Count subfield indicating a value of *N* greater than 1, 2, 4, or 8 from an AP that the STA identifies to have BSS bandwidth of 20, 40, 80, or 160/80+80 MHz, respectively, then the STA shall use the Maximum Transmit PSD 1–*M* subfields (*M* equal to 1, 2, 4, or 8 for BSS bandwidth of 20, 40, 80, or 160/80+80 MHz, respectively) to determine the maximum transmit PSD for each 20 MHz channel within the BSS bandwidth. The STA shall ignore the Maximum Transmit PSD *X* subfields with $X > M$.

NOTE 4—This might occur when the AP supports PHY mode(s) unknown to the STA and the actual BSS bandwidth is wider than the BSS bandwidth recognized by the STA.(11ax)

### 10.22.5 Operation with coverage classes

The attribute aSlotTime and other MAC timings are based on the PHY timing parameters, as specified in 10.3.2.3 (IFS), 10.3.7 (DCF timing relations), and 10.23.2.5 (EDCA channel access in a VHT or TVHT BSS), and in particular on aAirPropagationTime. If dot11OperatingClassesRequired is true, it is possible to manage the MAC timings of STAs to increase fairness in contending for the medium. Radio waves propagate at ~300 m/μs in free space, and, for example, 3 μs would be the maximum round-trip delay for a BSS with maximum coverage distance of ~450 m (~900 m round trip). The Coverage Class field of the Country element indicates a value of aAirPropagationTime (see Table 9-133 (Coverage Class field parameters)), and the MAC can use the value to calculate aSlotTime (as specified in the relevant PHY clause) and other timings.

If dot11OperatingClassesRequired is true and a Country element containing a Coverage Class field has been received from the AP of the BSS of which a STA is a member, from the DO of the IBSS of which a STA is a member, or from another mesh STA in the same MBSS, an associated STA, dependent STA, IBSS STA, or member of an MBSS shall, if the relevant PHY clause specifies that aAirPropagationTime is indicated by the coverage class, use MAC timings that correspond to the value of aAirPropagationTime indicated (as specified in the relevant PHY clause).

NOTE 1—Some PHYs do not specify a dependency of aSlotTime on aAirPropagationTime.

NOTE 2—Operation over larger BSS diameters is facilitated by relaxing some PHY timing parameters, while maintaining compatibility with existing implementations in small BSS diameters.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

NOTE 3—An AP using coverage classes that determines that an associating or associated STA does not support coverage classes may deny association to or disassociate that STA. The mechanism by which the AP makes that determination is outside the scope of the standard.

aAirPropagationTime is 0 μs if

- The relevant PHY clause specifies that aAirPropagationTime is indicated by the coverage class, and
- At least one of the following applies:
  - dot11OperatingClassesRequired is false.
  - No Country element containing a Coverage Class field has been received from the AP of the BSS of which a STA is a member, from the DO of the IBSS of which a STA is a member, or from another mesh STA in the same MBSS.

## 10.23 HCF

### 10.23.1 General

Under HCF, the basic unit of allocation of the right to transmit onto the WM is the TXOP. Each TXOP is defined by a starting time and a defined maximum length. In a non-DMG BSS, the TXOP may be obtained by a STA winning an instance of EDCA contention (see 10.23.2 (HCF contention based channel access (EDCA))) or by a STA receiving a QoS (+)CF-Poll frame (see 10.23.3 (HCF controlled channel access (HCCA))). The former is called *EDCA TXOP*, while the latter is called *HCCA TXOP* or *polled TXOP*.

In a DMG BSS, the EDCAF operates only during CBAPs. Operation of the EDCAF is suspended at the end of a CBAP and is resumed at the beginning of the following CBAP. See 10.38.5 (Contention based access period (CBAP) transmission rules) and 10.38.5 (Contention based access period (CBAP) transmission rules) for additional rules regarding contention based access in DMG BSSs.

HCCA is not used by DMG, S1G, and HE STAs.(11ax)

### 10.23.2 HCF contention based channel access (EDCA)

#### 10.23.2.1 Reference model

The EDCA channel access protocol is derived from the DCF procedures described in 10.3 (DCF) by adding four independent enhanced distributed channel access functions (EDCAFs) to provide differentiated priorities to transmitted traffic, through the use of four different access categories (ACs).

For the case in which dot11AlternateEDCAActivated is false or not present, a model of the reference implementation is shown in Figure 10-27 (Reference implementation model when dot11AlternateEDCAActivated is false or not present) and for the case in which dot11AlternateEDCAActivated is true, a model is shown in Figure 10-28 (Reference implementation model when dot11AlternateEDCAActivated is true). These figures illustrate a mapping from frame type or UP to the transmit queues and the four independent EDCAFs. The mapping of UP to the transmit queue and the mapping to AC are described in 10.2.3.2 (HCF contention based channel access (EDCA)) and Table 10-1 (UP-to-AC mappings(#68)). The mapping of frame types to ACs is also described in 10.2.3.2 (HCF contention based channel access (EDCA)).

An S1G STA shall be a QoS STA.

A DMG STA or an S1G STA that is a sensor STA may implement a single AC. If the DMG or S1G STA implements a single AC, all UP and frame types shall be mapped to AC_BE.

This is an unapproved IEEE Standards Draft, subject to change.

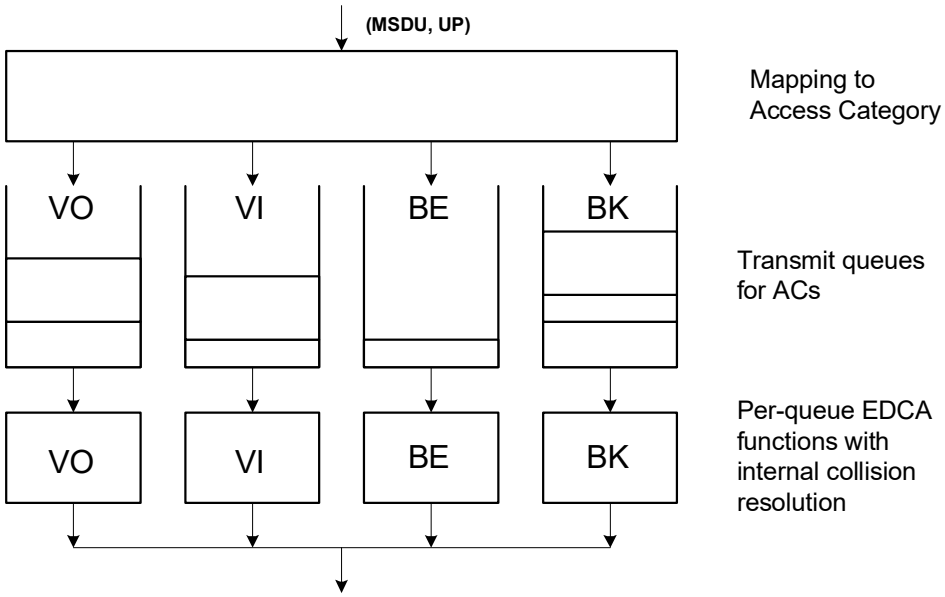

**Figure 10-27—Reference implementation model when dot11AlternateEDCAActivated is false or not present**

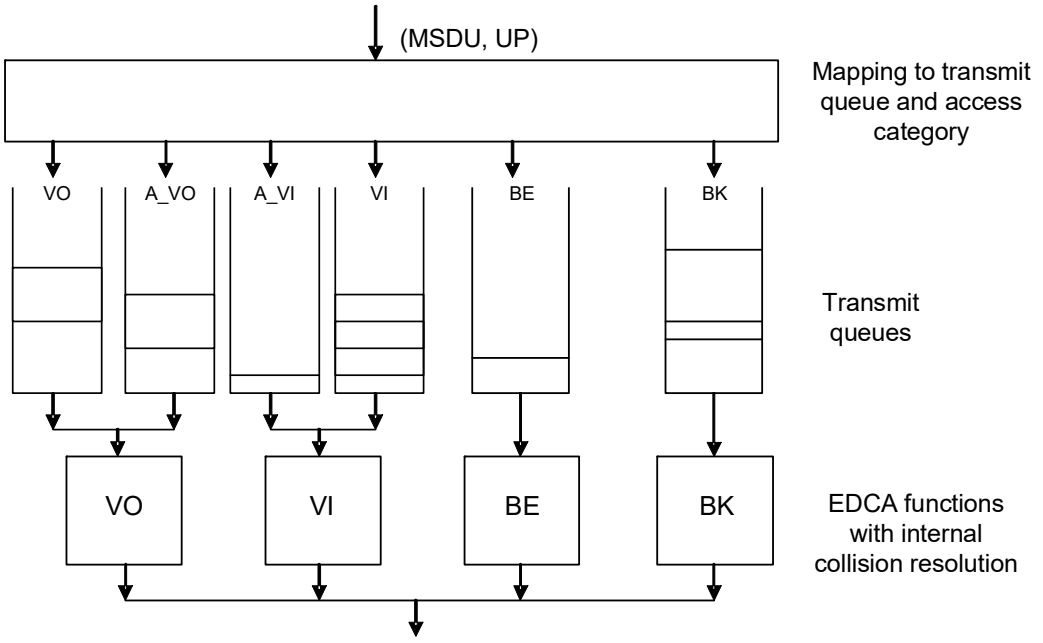

**Figure 10-28—Reference implementation model when dot11AlternateEDCAActivated is true**

NOTE—A DMG or S1G STA that implements a single AC has only one queue in Figure 10-27 (Reference implementation model when dot11AlternateEDCAActivated is false or not present).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 10.23.2.2 EDCA backoff procedure

Each EDCAF shall maintain a MAC variable CW[AC], which shall be initialized to the value of the parameter CWmin[AC], for that EDCAF's AC.

For the purposes of this subclause, (#159)transmission success or failure of an MPDU is defined as follows:

- After transmitting an MPDU (even if it is carried in an A-MPDU, (11ax)as part of a VHT or S1G MU PPDU, (11ax)or as part of an HE MU PPDU that is sent using TXVECTOR parameter NUM_USERS > 1) that requires an immediate response:
  - The STA shall wait for a timeout interval of duration aSIFSTime + aSlotTime + aRxPHYStartDelay, starting when the MAC receives a PHY-TXEND.confirm primitive. If a (#3038)PHY-RXEARLYSIG.indication or PHY-RXSTART.indication primitive does not occur during the timeout interval, the transmission of the MPDU has failed.
  - If a (#3038)PHY-RXEARLYSIG.indication or PHY-RXSTART.indication primitive does occur during the timeout interval, the STA shall wait for the corresponding PHY-RXEND.indication primitive to (#4179)receive a response MPDU(#109) that either does not have a TA field or is sent by the recipient of the MPDU requiring a response. (#4179)Anything else, including the reception of any other frame, is defined to be a failure.
- The nonfinal (re)transmission of an MPDU that is delivered using the GCR unsolicited retry retransmission policy (10.23.2.12.2 (Unsolicited retry procedure)) is defined to be a failure.
- In all other cases, the transmission of the MPDU is considered to be a successful transmission.(#159)

The TXNAV timer is a single timer, shared by the EDCAFs within a STA, that is initialized with the duration from the Duration/ID field in the frame most recently successfully transmitted by the TXOP holder, except for PS-Poll frames. The TXNAV timer begins counting down from the end of the transmission of the PPDU containing that frame. The Reservation Allocation Vector (RAV) timer for a mesh STA that has dot11MCCAActivated true is initialized with the MCCAOP Duration in the MCCAOP Reservation field at the start of an MCCAOP reservation. The RAV timer begins counting down from the start of an MCCAOP reservation (see 10.24.3.9.2 (Access during an MCCAOP by mesh STAs that are not the MCCAOP owner)).

The backoff procedure shall be invoked by an EDCAF (11ax)if any of the following events occurs:

a) An MA-UNITDATA.request primitive is received that causes an MPDU corresponding to the EDCAF's AC to be queued for transmission such that all of the following are true:
   1) One of the transmit queues associated with that AC has now become nonempty(#2222)
   2) Any other transmit queues associated with that AC are empty
   3) The backoff counter has a value of 0 for that AC
   4) The medium is busy on the primary channel as indicated by any of the following:
      - Physical CS
      - Virtual CS
      - A nonzero TXNAV timer value
      - For a mesh STA that has dot11MCCAActivated true, a nonzero RAV timer value

b) For the EDCAF that is the TXOP holder, the transmission of the final PPDU transmitted by the TXOP holder during the TXOP has completed, the final PPDU does not solicit an HE TB PPDU, and the TXNAV timer has expired.(11ax)

c) For the EDCAF that is the TXOP holder, the transmission of an MPDU in the initial PPDU of a TXOP fails, as defined in this subclause, and the initial PPDU does not solicit an HE TB PPDU.(11ax)

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

d) A transmission attempt by the EDCAF collides internally with another EDCAF of an AC that has higher priority, that is, two or more EDCAFs in the same STA are granted a TXOP at the same time.

e) The transmission of at least one MPDU in the final PPDU transmitted by the TXOP holder during the TXOP for that AC has completed, the PPDU contains an MPDU that solicits an HE TB PPDU and the TXNAV timer has expired.(11ax)

f) The transmission of all MPDUs in the initial PPDU of a TXOP fails, as defined in this subclause, and the PPDU contains an MPDU that solicits an HE TB PPDU.(11ax)

g) If explicitly indicated, such as in 26.17.2.3.3 (Non-AP STA scanning behavior).(11ax)

h) The EDCAF is permitted to initiate a TXOP (see 10.23.2.4 (Obtaining an EDCA TXOP)) but chooses not to.(#3653)

In addition, the backoff procedure may be invoked by an EDCAF if:

i) For the EDCAF that is the TXOP holder, the transmission by the TXOP holder of an MPDU in a non-initial PPDU of a TXOP fails, as defined in this subclause and an MPDU in the non-initial PPDU does not solicit an HE TB PPDU.(11ax)

j) For the EDCAF that is the TXOP holder, the transmission by the TXOP holder of all MPDUs in a non-initial PPDU of a TXOP fails, as defined in this subclause, and the PPDU contains an MPDU that solicits an HE TB PPDU.(11ax)

NOTE 1—If the transmission by the TXOP holder of an MPDU in a non-initial PPDU of a TXOP failed, the STA can perform either a PIFS recovery, as described in 10.23.2.8 (Multiple frame exchange sequences in an EDCA TXOP(#109)), perform a backoff as described in item i) (#1107)above, or wait for the TXNAV timer to expire and invoke the backoff procedure per item b) above. How it chooses among these options is implementation dependent.

A STA that performs a backoff within its existing TXOP per item i) (#1108)above shall not extend the TXNAV timer value (see 10.23.2.8 (Multiple frame exchange sequences in an EDCA TXOP(#109))).

NOTE 2—In other words, the backoff is a continuation of the TXOP, not the start of a new TXOP.

If the backoff procedure is invoked for (M133)reason a), g) or h) above, CW[AC] and QSRC[AC] shall be left unchanged.(#3653)

If the backoff procedure is invoked for (M133)reason b) or e)(11ax) above, CW[AC] shall be set to CWmin[AC], and QSRC[AC] shall be set to 0.(#3653)

If the backoff procedure is invoked for (M133)reason c), d), f), i), or j)(11ax) above, CW[AC] and QSRC[AC] shall be updated as follows:(#3653)

- If QSRC[AC] is less than dot11ShortRetryLimit,
  - QSRC[AC] shall be incremented by 1.
  - CW[AC] shall be set to the lesser of CWmax[AC] and $2^{QSRC[AC]} \times (CWmin[AC] + 1) - 1$.
- Else
  - QSRC[AC] shall be set to 0.
  - CW[AC] shall be set to CWmin[AC].

NOTE 3—An HE STA updates its local MIB variables related to CWmin and CWmax as defined in 26.2.7 (EDCA operation using MU EDCA parameters).(11ax)

(11ax)After transmission of an MPDU in an HE TB PPDU, an HE STA resumes the EDCA backoff procedure without modifying CW or the backoff counter for the associated EDCAF regardless of whether the STA has received the corresponding acknowledgment frame in response to the MPDU sent in the HE TB PPDU.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 10.23.2.3 EDCA TXOPs

There are three modes of EDCA TXOP defined: initiation of an EDCA TXOP, sharing an EDCA TXOP, and multiple frame exchange sequence(s)(#109) within an EDCA TXOP. Initiation of the TXOP occurs when the EDCA rules permit access to the medium. Sharing of the EDCA TXOP occurs when an EDCAF within an AP that supports DL MU-MIMO(#3367) has obtained access to the medium, making the corresponding AC the primary AC, and includes traffic from queues associated with (#1109)other ACs, in MU PPDUs transmitted during the TXOP. (#1110)In addition, sharing of the EDCA TXOP also occurs when an EDCAF within an HE STA that intends to transmit a Multi-TID A-MPDU has obtained access to the medium following rules defined in 26.6.3 (Multi-TID A-MPDU and ack-enabled single-TID A-MPDU). Multiple frame exchange sequence(s)(#109) within the TXOP occurs when an EDCAF retains the right to access the medium.

### 10.23.2.4 Obtaining an EDCA TXOP

Each EDCAF shall maintain a backoff counter, which has a value measured in backoff slots as described below.

When the backoff procedure is invoked, the backoff counter is set to an integer value chosen randomly with a uniform distribution taking values in the range 0 to CW[AC].

The duration AIFS[AC] is a duration derived from the value AIFSN[AC] by the relation

AIFS[AC] = AIFSN[AC] × aSlotTime + aSIFSTime.

In an infrastructure BSS, AIFSN[AC] is advertised by an EDCA AP in the EDCA Parameter Set element in Beacon and Probe Response frames transmitted by the AP. The value of AIFSN[AC] shall be greater than or equal to 2 for non-AP STAs. The value of AIFSN[AC] shall be greater than or equal to 1 for APs. An EDCA TXOP is granted to an EDCAF when the EDCAF determines that it shall initiate (#109)a frame exchange sequence according to the following rules:

EDCAF operations shall be performed at slot boundaries, defined as follows on the primary channel, for each EDCAF:

a) Following AIFSN[AC] × aSlotTime – aRxTxTurnaroundTime of idle medium after a SIFS(#6587) (not necessarily idle medium during the SIFS) after the last busy medium on the antenna that was the result of a reception of a frame with a correct FCS or of an S1G frame. Note that upon reception of an S1G frame, an S1G STA updates its RID counter based on information obtained from the RXVECTOR as described in 10.3.2.5 (Setting and resetting the RID) and this update does not depend on the outcome of the FCS check.

b) Following EIFS – DIFS + AIFSN[AC] × aSlotTime + aSIFSTime – aRxTxTurnaroundTime of idle medium after the last indicated busy medium as determined by the physical CS mechanism that was the result of a non-S1G frame reception that has resulted in FCS error, or of a frame reception that has resulted in PHY-RXEND.indication (RXERROR) primitive where the value of RXERROR is not NoError.

c) When any other EDCAF at this STA transmitted a frame requiring immediate acknowledgment, the earlier of

   1) The end of the AckTimeout interval timed from the PHY-TXEND.confirm primitive, followed by AIFSN[AC] × aSlotTime + aSIFSTime – aRxTxTurnaroundTime of idle medium, and

   2) The end of the first AIFSN[AC] × aSlotTime – aRxTxTurnaroundTime of idle medium after a SIFS(#6587) (not necessarily medium idle during the SIFS, the start of the SIFS implied by the length in the PHY header of the previous frame) when a PHY-RXEND.indication primitive occurs as specified in 10.3.2.11 (Acknowledgment procedure).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

d) Following AIFSN[AC] × aSlotTime – aRxTxTurnaroundTime of idle medium after a SIFS(#6587) (not necessarily medium idle during the SIFS) after the last busy medium on the antenna that was the result of a transmission of a frame for any EDCAF and which did not require an acknowledgment and after the expiration of the TXNAV timer if nonzero, and, if dot11MCCAActivated is true, the expiration of the RAV timer if nonzero.

e) Following AIFSN[AC] × aSlotTime + aSIFSTime – aRxTxTurnaroundTime of idle medium after the last indicated busy medium as indicated by the CS mechanism that is not covered by condition a) to condition d).

f) Following aSlotTime of idle medium, which occurs immediately after any of these conditions, a) to f), is met for the EDCAF.

On these specific slot boundaries, each EDCAF shall make a determination to perform one and only one of the following functions:

— Decrement the backoff counter.
— (#109)(#3653)Initiate a TXOP.
— Invoke the backoff procedure due to choosing not to transmit.
— Invoke the backoff procedure due to an internal collision.(#3653)
— Do nothing.

At each of the above-described specific slot boundaries, each EDCAF shall decrement the backoff counter if the backoff counter for that EDCAF has a nonzero value.

At each of the above-described specific slot boundaries, if(#3653)

— There is a frame available for transmission at an EDCAF, and
— The backoff counter for that EDCAF has a value of 0, and
— Initiation of a transmission sequence is not allowed to commence at this time for an EDCAF of higher UP, that EDCAF shall either choose not to transmit (which results in invocation of the backoff procedure as specified in 10.23.2.2 (EDCA backoff procedure)) or initiate a TXOP.

NOTE 1—An EDCAF might choose not to transmit if the available bandwidth (based on the state of the secondary channel(s)) is insufficient for its purposes, or for other reasons.(#3653)

(#3653)At each of the above-described specific slot boundaries, each EDCAF shall report an internal collision (which results in invocation of the backoff procedure as specified in (#1361) 10.23.2.2 (EDCA backoff procedure) (see item d)) if

— There is a frame available for transmission at that EDCAF, and
— The backoff counter for that EDCAF has a value of 0, and
— (#109)Initiation of a frame exchange sequence is allowed to commence at this time for an EDCAF of higher UP.

(#3653)At each of the above-described specific slot boundaries, each EDCAF shall do nothing if

— There is no frame available for transmission at that EDCAF, and
— The backoff counter for that EDCAF has a value of 0.

(#1536)NOTE 2—An EDCAF does nothing at each of the above-described specific slot boundaries if there is not a frame available for transmission at that EDCAF and the backoff counter for that EDCAF has a value of 0.

NOTE 3—If an EDCAF gains access to the channel and transmits MSDUs, A-MSDUs, or MMPDUs from a secondary AC, the EDCAF of the secondary AC is not affected by this operation. If the EDCAF of a secondary AC experiences an internal collision with the EDCAF that gained access to the channel, it performs the backoff procedure regardless of the transmission of any of its MSDUs, A-MSDUs, or MMPDUs (see 10.23.2.7 (Sharing an EDCA TXOP)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

An example showing the relationship between AIFS, AIFSN, DIFS, and slot times immediately following a medium busy condition (and assuming that medium busy condition was not caused by a frame in error) is shown in Figure 10-29 (EDCA mechanism timing relationships(#14)(#1058)). In this case, with AIFSN = 2, the EDCAF may decrement the backoff counter for the first time at 2 × aSlotTime following the TxSIFS (where TxSIFS is the time at which the MAC responds to the end of the medium busy condition if it is going to respond "after a SIFS")(#6587). If, in this example, the backoff counter contained a value of 1 at the time the medium became idle, transmission would start as a result of an EDCA TXOP on-air at a time

aSIFSTime + 3 × aSlotTime

following the end of the medium busy condition.

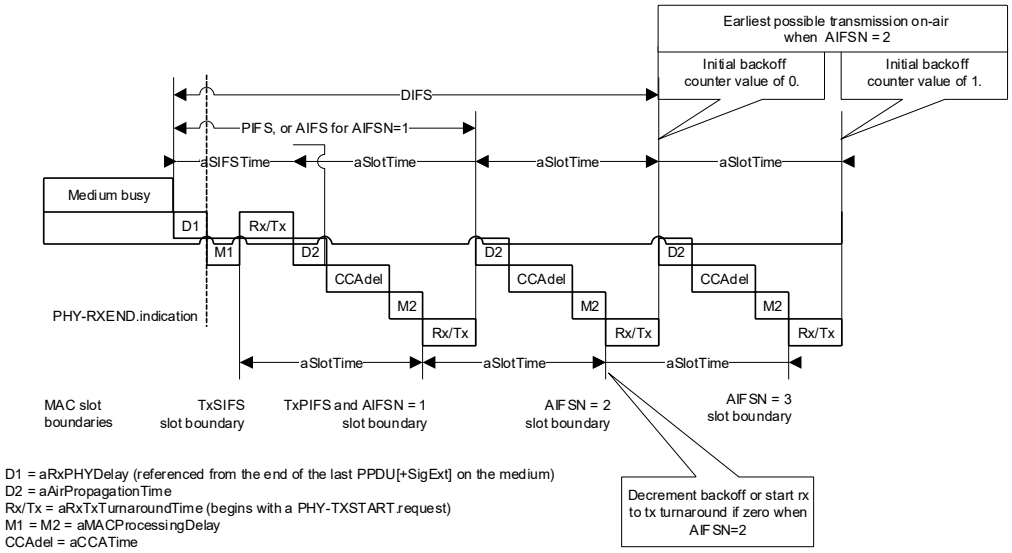

**Figure 10-29—EDCA mechanism timing relationships(#14)(#1058)**

A STA shall save the TXOP holder address for the BSS in which it is associated. (11ax)The TXOP holder address is the MAC address from the Address 2 field of the frame that initiated a frame exchange sequence except (11ax)if this is a CTS frame, in which case the TXOP holder address is the Address 1 field. If the TXOP holder address is obtained from a Control frame, a VHT STA (11ax)or HE STA shall save the nonbandwidth signaling TA(#3522) obtained from the Address 2 field. If a non-VHT non-HE STA(11ax) receives an RTS frame with the RA matching the MAC address of the STA and the MAC address in the TA field in the RTS frame matches the saved TXOP holder address, then the STA shall send the CTS frame after a SIFS(#6587), without regard for, and without resetting, its NAV. If a VHT STA (11ax)or HE STA receives an RTS frame with the RA matching the MAC address of the STA and the nonbandwidth signaling TA(#3522) obtained from the Address 2 field in the RTS frame matches the saved TXOP holder address, then the STA shall send the CTS frame after a SIFS(#6587), without regard for, and without resetting, its NAV. If a CMMG STA receives an RTS frame with the RA matching the MAC address of the STA and the TA value obtained from the Address 2 field in the RTS frame matches the saved TXOP holder address, then the STA shall send the CTS frame after a SIFS(#6587), without regarding for, and without resetting its NAV. When a STA receives a frame addressed to it that requires an immediate response, except for RTS (11ax)and Trigger frames (see 26.5.2.5 (UL MU CS mechanism)), it shall transmit the response independent of its NAV. The saved TXOP holder address shall be cleared when the NAV is reset or when the NAV counts down to 0.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

(11ax)During an EDCA TXOP, the Address 2 field excluding the Individual/Group bit of all Control frames sent by an HE STA that is a TXOP holder and carried in a PPDU that is not an HE MU PPDU shall be set to the same address value.

### 10.23.2.5 EDCA channel access in a VHT or TVHT BSS

If the MAC receives a PHY-CCA.indication primitive with the channel-list parameter present, the channels considered idle are defined in Table 10-17 (Channels indicated idle by the channel-list parameter for VHT or TVHT BSSs).

**Table 10-17—Channels indicated idle by the channel-list parameter for VHT or TVHT BSSs**

| PHY-CCA.indication primitive channel-list parameter entry | Idle channels |
|---|---|
| primary | None |
| secondary | Primary 20 MHz channel |
| secondary40 | Primary 20 MHz channel and secondary 20 MHz channel |
| secondary80 | Primary 20 MHz channel, secondary 20 MHz channel, and secondary 40 MHz channel |

(11ax)If the MAC receives a PHY-CCA.indication primitive with the per20bitmap parameter present, the parameter indicates the busy/idle status of each of the 20 MHz subchannels that comprise the operating channel width.

When a STA and the BSS, of which the STA is a member, both support multiple channel widths, an EDCA TXOP is obtained based solely on activity of the primary channel ((#311)see 10.23.2.4 (Obtaining an EDCA TXOP)). “Idle medium” in this subclause means “idle primary channel.” Likewise “busy medium” means “busy primary channel.” Once an EDCA TXOP has been obtained according to this subclause, further constraints defined in 11.15.9 (STA CCA sensing in a 20/40 MHz BSS) and 10.23.3 (HCF controlled channel access (HCCA)) might limit the width of transmission during the TXOP or deny the channel access, based on the state of CCA on secondary channel, secondary 40 MHz channel, or secondary 80 MHz channel.

In the following description, the CCA is sampled according to the timing relationships defined in 10.3.7 (DCF timing relations). Slot boundaries are determined solely by activity on the primary channel. “Channel idle for an interval of PIFS” means that the STATE parameter of the most recent PHY-CCA.indication primitive was IDLE, and no PHY-CCA.indication(BUSY) occurred during the period of PIFS that ends at the start of transmission, the CCA for that channel was determined to be idle.

(#3653)If one of a STA’s EDCAFs is permitted to initiate a TXOP (as specified in 10.23.2.4 (Obtaining an EDCA TXOP)), the STA shall perform exactly one of the following actions:

a) Transmit a 160 MHz or 80+80 MHz mask PPDU if the secondary channel, the secondary 40 MHz channel, and the secondary 80 MHz channel were idle during an interval of PIFS immediately preceding the start of the TXOP.

b) Transmit an 80 MHz mask PPDU on the primary 80 MHz channel if both the secondary channel and the secondary 40 MHz channel were idle during an interval of PIFS immediately preceding the start of the TXOP.

c) Transmit a 40 MHz mask PPDU on the primary 40 MHz channel if the secondary channel was idle during an interval of (11ax)duration 1) DIFS if the PPDU is transmitted in the 2.4 GHz band or 2) PIFS otherwise, immediately preceding the start of the TXOP.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

d) Transmit a 20 MHz mask PPDU on the primary 20 MHz channel.

e) (#3653)Transmit nothing and invoke the backoff procedure for the EDCAF as specified in 10.23.2.2 (EDCA backoff procedure).

f) Transmit a TVHT_4W or TVHT_2W+2W mask PPDU if the secondary TVHT_W channel and the secondary TVHT_2W channel were idle during an interval of PIFS immediately preceding the start of the TXOP.

g) Transmit a TVHT_2W or TVHT_W+W mask PPDU if the secondary TVHT_W channel was idle during an interval of PIFS immediately preceding the start of the TXOP.

h) Transmit a TVHT_W mask PPDU on the primary TVHT_W channel.

i) Transmit an 80 MHz HE MU PPDU where in the preamble the only punctured subchannel is the secondary 20 MHz channel, if all of the 20 MHz subchannels (other than the primary 20 MHz channel) that are not punctured were idle during an interval of PIFS immediately preceding the start of the TXOP.(11ax)

j) Transmit an 80 MHz HE MU PPDU where in the preamble the only punctured subchannel is one of the two 20 MHz subchannels in the secondary 40 MHz channel, if all of the 20 MHz subchannels that are not punctured were idle during an interval of PIFS immediately preceding the start of the TXOP.(11ax)

k) Transmit a 160 MHz or 80+80 MHz HE MU PPDU where in the preamble the only punctured subchannels are the secondary 20 MHz channel and zero to two of the 20 MHz subchannels in the secondary 80 MHz channel, if all of the 20 MHz subchannels that are not punctured were idle during an interval of PIFS immediately preceding the start of the TXOP. If two of the 20 MHz subchannels in the secondary 80 MHz channel are punctured, these are either the lower two or the higher two. No more than two adjacent 20 MHz subchannels are punctured across the preamble, for a 160 MHz preamble.(11ax)

l) Transmit a 160 MHz or 80+80 MHz HE MU PPDU where in the preamble the only punctured subchannels are zero, one, or both of the 20 MHz subchannels in the secondary 40 MHz channel and zero to two of the 20 MHz subchannels in the secondary 80 MHz channel, if all of the 20 MHz subchannels that are not punctured were idle during an interval of PIFS immediately preceding the start of the TXOP. At least one 20 MHz subchannel is punctured. If two of the 20 MHz subchannels in the secondary 80 MHz channel are punctured, these are either the lower two or the higher two. No more than two adjacent 20 MHz subchannels are punctured across the preamble, for a 160 MHz preamble.(11ax)

NOTE 1—An EDCAF that initiates a TXOP has a frame available for transmission (see 10.23.2.4 (Obtaining an EDCA TXOP)). There might be another EDCAF of lower priority that invokes the backoff procedure due to an internal collision (see 10.23.2.4 (Obtaining an EDCA TXOP).(#3653)

NOTE 2—In the case of rule e), the STA selects a new random number using the current value of CW[AC], and the retry count is(#2188) not updated [as described in 10.23.2.2 (EDCA backoff procedure)(#1478); backoff procedure invoked for event a)].

NOTE 3—An HT, VHT, or HE STA obtains an EDCA TXOP based on activity on the primary channel (see 10.23.2.4 (Obtaining an EDCA TXOP)). The width of transmission is determined by the CCA status of the nonprimary channels during an interval of duration 1) DIFS if transmitting in the 2.4 GHz band or 2) PIFS otherwise, before transmission (see in 10.3.2 (Procedures common to the DCF and EDCAF)).(11ax)

NOTE 4—In the case of rule j), there was(#1477) only one idle 20 MHz subchannel in the secondary 40 MHz channel, and the other 20 MHz subchannel in the secondary 40 MHz channel is preamble punctured.(11ax)

### 10.23.2.6 EDCA channel access in an S1G BSS

If the MAC receives a PHY-CCA.indication primitive with the channel-list parameter present, the channels considered idle are defined in Table 10-18 (Channels indicated idle by the channel-list parameter for S1G BSSs).

**Table 10-18—Channels indicated idle by the channel-list parameter for S1G BSSs**

| PHY-CCA.indication primitive channel-list parameter entry | Idle channels |
|---|---|
| primary1 | None |
| primary2 | primary 1 MHz channel |
| secondary2 | primary 1 MHz channel, primary 2 MHz channel |
| secondary4 | primary 1 MHz channel, primary 2 MHz channel and secondary 2 MHz channel |
| secondary8 | primary 1 MHz channel, primary 2 MHz channel, secondary 2 MHz channel and secondary 4 MHz channel |

When a STA and the BSS, of which the STA is a member, both support multiple channel widths, an EDCA TXOP is obtained based solely on activity of the primary channel ((#311)see 10.23.2.4 (Obtaining an EDCA TXOP)). "Idle medium" in this subclause means "idle primary channel." Likewise "busy medium" means "busy primary channel."

In the following description, the CCA is sampled according to the timing relationships defined in 10.3.7 (DCF timing relations). Slot boundaries are determined solely by activity on the primary channel. "Channel idle for an interval of PIFS" means that whenever CCA is sampled during the period of PIFS that ends at the start of transmission, the CCA for that channel was determined to be idle.

a) If an S1G STA invokes a backoff procedure at the primary 2 MHz channel for ≥ 2 MHz mask PPDU transmission using the CCA conditions defined in 23.3.18.5.3 (CCA sensitivity for signals occupying the primary 2 MHz and/or primary 1 MHz channel) and one of the STA's EDCAFs is permitted to initiate a TXOP (as specified in 10.23.2.4 (Obtaining an EDCA TXOP)), the STA shall perform exactly one of the following actions:(#3653)
   1) Transmit a 16 MHz mask PPDU if the secondary 2 MHz channel, the secondary 4 MHz channel and the secondary 8 MHz channel were idle during an interval of PIFS immediately preceding the start of the TXOP.
   2) Transmit an 8 MHz mask PPDU on the primary 8 MHz channel if both the secondary 2 MHz channel and the secondary 4 MHz channel were idle during an interval of PIFS immediately preceding the start of the TXOP.
   3) Transmit a 4 MHz mask PPDU on the primary 4 MHz channel if the secondary 2 MHz channel was idle during an interval of PIFS immediately preceding the start of the TXOP.
   4) Transmit a 2 MHz mask PPDU on the primary 2 MHz channel.
   5) Transmit nothing and invoke the backoff procedure for the EDCAF as specified in 10.23.2.3 (EDCA TXOPs).(#3653)

b) (#111)Prior to transmitting an 8 or 16 MHz PPDU, an S1G STA may also invoke a backoff procedure at the primary 2 MHz channel using the CCA conditions defined in 23.3.18.5.3.2 (CCA sensitivity for devices in type 2 channels implementing intended 8 or 16 MHz transmit channel width channel access procedure), if one of the STA's EDCAFs is permitted to initiate a TXOP (as in

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

10.23.2.4 (Obtaining an EDCA TXOP)). In this case the S1G STA shall perform exactly one of the following actions:(#3653)

1) Transmit a 16 MHz PPDU if the secondary 2 MHz channel, the secondary 4 MHz channel and the secondary 8 MHz channel were idle during an interval of PIFS immediately preceding the start of the TXOP.
2) Transmit an 8 MHz PPDU on the primary 8 MHz channel if both the secondary 2 MHz channel and the secondary 4 MHz channel were idle during an interval of PIFS immediately preceding the start of the TXOP.
3) Transmit nothing and invoke the backoff procedure for the EDCAF as specified in 10.23.2.2 (EDCA backoff procedure).(#3653)

c) If an S1G STA invokes a backoff procedure at the primary 1 MHz channel for 1 MHz PPDU transmission and one of the STA's EDCAFs is permitted to initiate a TXOP (as specified in 10.23.2.4 (Obtaining an EDCA TXOP)), the S1G STA shall transmit a 1 MHz mask PPDU on the primary 1 MHz channel.(#3653)

NOTE —An EDCAF that initiates a TXOP has a frame available for transmission (see 10.23.2.4 (Obtaining an EDCA TXOP)). There might be another EDCAF of lower priority that invokes the backoff procedure due to an internal collision (see 10.23.2.4 (Obtaining an EDCA TXOP)).(#3653)

### 10.23.2.7 Sharing an EDCA TXOP

The AC associated with the EDCAF that gains an EDCA TXOP is referred to as the primary AC. Frames from ACs other than the primary AC shall not be included in the TXOP, with the following exceptions (TXOP sharing):

— (11ax)For a multi-TID A-MPDU in an HE MU PPDU transmitted by an AP, frames from any AC may be included as defined in 26.6.3 (Multi-TID A-MPDU and ack-enabled single-TID A-MPDU). Otherwise, frames from a higher priority AC may be included when at least one frame from the primary AC has been transmitted and all frames from the primary AC have been transmitted.

NOTE 1—The frames from a higher priority AC might be included in successive PPDUs in the TXOP and/or in one or more MU PPDUs.

— When (11ax)(11ay)VHT AP, EDMG AP, or PCP supports DL MU-MIMO(#3367), frames from a lower priority AC may be included in (11ax)(11ay)VHT or EDMG MU PPDU with the TXVECTOR parameter NUM_USERS > 1 when these frames do not increase the duration of the (11ax)(11ay)VHT or EDMG MU PPDU beyond that required for the transmissions of the frames of the primary AC and any frames from a high priority AC. For a given user, any frames from the primary AC shall be transmitted first and then any frames from a higher priority AC immediately next.

— When an HE AP transmits an HE MU PPDU, frames from higher or lower priority AC may be included in the HE MU PPDU when these frames do not increase the duration of the HE MU PPDU beyond that required for the transmissions of the frames of the primary AC and any frames from a high priority AC. For a given user, any frames from the primary AC shall be transmitted first, and then any frames from a higher priority AC immediately next.(11ax)

NOTE 1—TXOP sharing is an operation performed by a single EDCAF, using frames belonging to another EDCAF's queues.(#2069)

The EDCAF remains bound by the TXOP limit for its AC (i.e., the primary AC), irrespective of the AC(s) of the frames transmitted during the TXOP.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

(#253)With respect to admission control (see 10.23.4.2 (Contention based admission control procedures)), all frames transmitted under TXOP sharing shall be treated as if they were from the primary AC.

NOTE 2—An AP (11ay)or PCP can protect an immediate response by preceding the DL MU-MIMO(#3367) PPDU (which might have TXVECTOR parameter NUM_USERS > 1) with an RTS/CTS, MU-RTS Trigger/CTS (#109)frame exchange sequence or a CTS-to-self transmission.(11ax)

An illustration of TXOP sharing is shown in Figure 10-30 (Illustration of TXOP sharing and PPDU construction (DL MU-MIMO)) and Figure 10-31 (Illustration of TXOP sharing and PPDU construction (non-A-MPDUs)). The AP has frames in queues of three of its ACs. The TXOP was obtained by AC_VI or AC_BE, as shown, and is shared by the other two ACs. The frames target three STAs, STA-1 to STA-3.

### 10.23.2.8 Multiple frame exchange sequences in an EDCA TXOP(#109)

(#109)Frame exchange sequences of the primary AC may be transmitted in an EDCA TXOP that was acquired following the rules in 10.23.2.4 (Obtaining an EDCA TXOP). Frames that are pending in other ACs shall not be transmitted in this EDCA TXOP except when permitted by the rules in 10.23.2.7 (Sharing an EDCA TXOP). If a TXOP holder has in its transmit queue an additional frame exchange sequence(#109) of the primary AC (or, where permitted, a secondary AC) and the duration of that frame exchange sequence(#109) is less than the remaining TXNAV timer value and, if dot11MCCAActivated is true, the remaining RAV timer value, (#1987)then the TXOP holder may initiate that frame exchange sequence(#109) a SIFS (or RIFS, if the conditions defined in 10.3.2.3.2 (RIFS) are met, or PIFS, if the frame contains a bandwidth signaling TA) after the completion of the immediately preceding frame exchange sequence, subject to the TXOP limit restriction as described in 10.23.2.9 (TXOP limits). A STA shall not commence the transmission of an RTS with a bandwidth signaling TA until at least a PIFS after the immediately preceding frame exchange sequence. A CMMG STA shall not commence the transmission of an RTS frame until at least PIFS time after the immediately preceding frame exchange sequence. An HT STA that is a TXOP holder may transmit multiple MPDUs of the same AC within an A-MPDU as long as the duration of transmission of the A-MPDU plus any expected BlockAck frame response is less than the remaining TXNAV timer value and, if dot11MCCAActivated is true, the remaining RAV timer value. An S1G STA that is a TXOP holder may transmit multiple MPDUs of the same AC within an A-MPDU as long as the duration of transmission of the A-MPDU plus any expected (NDP) BlockAck frame response is less than the remaining TXNAV timer value.

NOTE 1—PIFS is used by a VHT STA to perform CCA in the secondary 20 MHz, 40 MHz, and 80 MHz channels before receiving RTS (see 10.3.2 (Procedures common to the DCF and EDCAF)).

NOTE 2—An RD responder can transmit multiple MPDUs as described in 10.29.4 (Rules for RD responder).

(11ay)NOTE 3—PIFS is used by an EDMG STA to perform CCA in the secondary, secondary1, and secondary2 channels before receiving RTS (see 10.3.2 (Procedures common to the DCF and EDCAF)).

NOTE 4(11ay)—Within a BDT, STAs can transmit multiple MPDUs as described in 10.49 (Bidirectional TXOP).

NOTE 5(11ay)—A PIFS is required to be present preceding an RTS transmission by a CMMG STA in order to allow a recipient of the RTS to perform CCA in the secondary 540 MHz channels to determine the appropriate response to the RTS.

After a valid response(#109) to the initial frame of a TXOP, if the Duration/ID field is set for multiple frame exchange sequences(#109) and there is a subsequent transmission failure, the corresponding channel access function may transmit after the CS mechanism (see 10.3.2.1 (CS mechanism)) indicates that the medium is idle at the TxPIFS slot boundary (see Figure 10-29 (EDCA mechanism timing relationships(#14)(#1058))) provided that the duration of that transmission plus the duration of any expected acknowledgment and applicable IFS is less than the remaining TXNAV timer value and, if dot11MCCAActivated is true, the RAV timer. At the expiration of the TXNAV timer and if dot11MCCAActivated is true, the RAV timer, if the channel access function has not regained access to the medium, then the EDCAF shall invoke the backoff procedure that is described in 10.23.2.4 (Obtaining an EDCA TXOP). Transmission failure is defined in 10.23.2.12 (Retransmit procedures).

All other channel access functions at the STA shall treat the medium as busy until the expiration of the TXNAV timer.

NOTE 6(11ay)—(#109)Frame exchange sequence(s) are granted to an EDCAF, not to a STA, so that multiple frame exchange sequences are permitted only for the transmission of frames of the same AC as the frame that was granted the EDCA TXOP, except as specified in 10.23.2.7 (Sharing an EDCA TXOP).(#3263)

If a TXOP is protected by an RTS or CTS frame carried in a non-HT or a non-HT duplicate PPDU, the TXOP holder shall set the TXVECTOR parameter CH_BANDWIDTH of a PPDU as follows:

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

— To be the same or narrower than (11ax)the RXVECTOR parameter CH_BANDWIDTH_IN_NON_HT of the last received CTS frame in the same TXOP, if the RTS frame with a bandwidth signaling TA and TXVECTOR parameter DYN_BANDWIDTH_IN_NON_HT set to Dynamic has been sent by the TXOP holder in the last RTS/CTS exchange.

— Otherwise, to be the same or narrower than the TXVECTOR parameter CH_BANDWIDTH of the RTS frame that has been sent by the TXOP holder in the last RTS/CTS exchange in the same TXOP.

(11ax)If a TXOP is protected by an MU-RTS Trigger frame or CTS frame carried in a non-HT or a non-HT duplicate PPDU, the TXOP holder shall set the TXVECTOR parameter CH_BANDWIDTH of a PPDU as follows:

— To be the same or narrower than the TXVECTOR parameter CH_BANDWIDTH of the MU-RTS Trigger frame that has been sent by the TXOP holder in the last MU-RTS Trigger/CTS (#109)frame exchange sequence in the same TXOP, if the RU Allocation subfields of the MU-RTS Trigger frame for all intended receivers are equal to a value that corresponds to the channel bandwidth that is indicated in the UL BW subfield in the Common Info field of the MU-RTS Trigger frame.

— Otherwise, to be the same or narrower than the TXVECTOR parameter CH_BANDWIDTH of the preceding PPDU that it has transmitted in the same TXOP.

If there is no RTS/CTS (11ax)or MU-RTS Trigger/CTS (#109)frame exchange sequence in non-HT duplicate format in a TXOP, and the TXOP includes at least one non-HT duplicate frame that does not include a PS-Poll, then the TXOP holder shall set the TXVECTOR parameter CH_BANDWIDTH of a PPDU sent after the first non-HT duplicate frame that is not a PS-Poll to be the same or narrower than the TXVECTOR parameter CH_BANDWIDTH of the initial frame in the first non-HT duplicate frame in the same TXOP.

If there is no non-HT duplicate frame in a TXOP, the TXOP holder shall set the TXVECTOR parameter CH_BANDWIDTH of a non-initial PPDU to be the same or narrower than the TXVECTOR parameter CH_BANDWIDTH of the preceding PPDU that it has transmitted in the same TXOP, subject to the following constraints:(11ax)

— If the preceding PPDU is a DL HE MU PPDU with preamble puncture, the TXOP holder shall set the TXVECTOR parameter CH_BANDWIDTH of the non-initial PPDU to a value whose corresponding 20 MHz channels are within a set of 20 MHz channels where pre-HE modulated fields of the preceding PPDU are located.(11ax)

— If the non-initial PPDU is a DL HE MU PPDU with preamble puncture, the TXOP holder shall set the TXVECTOR parameter RU_ALLOCATION of the non-initial PPDU to a value whose corresponding RU is within a set of 20 MHz channels where pre-HE modulated fields of the preceding PPDU are located.(11ax)

If a TXOP is protected by a CTS-to-self frame carried in a non-HT or non-HT duplicate PPDU, the TXOP holder shall set the TXVECTOR parameter CH_BANDWIDTH of a PPDU to be the same or narrower than the TXVECTOR parameter CH_BANDWIDTH of the CTS-to-self frame in the same TXOP.

(#109)Note that multiple frame exchange sequences in a TXOP that use acknowledgment mechanisms other than immediate acknowledgment should use a protective mechanism (such as RTS/CTS or the protection mechanism described in 10.27 (Protection mechanisms)). A QoS AP or a mesh STA may send group addressed frames without using any protection mechanism. In a QoS IBSS, group addressed frames shall be sent one at a time, and backoff shall be performed after the transmission of each of the group addressed frames. In an MBSS, a mesh STA may send multiple group addressed frames in a TXOP, bounded by the TXOP limit, without performing backoff after the TXOP is obtained.

(#111)In the course of transmitting transmit an 8 MHz or 16 MHz PPDU invoking a backoff procedure in the primary 2 MHz channel using the channel busy conditions defined in 23.3.18.5.3.2 (CCA sensitivity for

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

devices in type 2 channels implementing intended 8 or 16 MHz transmit channel width channel access procedure) an S1G STA shall not set the Dynamic Indication field to 1 in any RTS frame that is scheduled for transmission at the expiration of this backoff.

### 10.23.2.9 TXOP limits

The duration of a TXOP is the time a STA obtaining a TXOP (the TXOP holder) maintains uninterrupted control of the medium, and it includes the time required to transmit frames sent as an immediate response to TXOP holder transmissions. The TXOP holder shall, subject to the exceptions below, ensure that the duration of a TXOP does not exceed the TXOP limit, when nonzero.

The TXOP limits are advertised by the AP in the EDCA Parameter Set element in Beacon and Probe Response frames transmitted by the AP.

A TXOP limit of 0 indicates that the TXOP holder may transmit or cause to be transmitted (as responses) the following within the current TXOP:

a) One of the following at any rate, subject to the rules in 10.6 (Multirate support)
   1) One or more SU PPDUs carrying fragments of a single MSDU or MMPDU
   2) An SU or MU PPDU, where the PPDU carries a single MSDU, single MMPDU, single A-MSDU, or single A-MPDU(#446)
   3) An MU PPDU carrying A-MPDUs to different users (a single A-MPDU to each user)(#446)
   4) A QoS Null frame or PS-Poll frame that is not an PS-Poll+BDT frame
   5) A Basic Trigger frame, BSRP Trigger frame, or BQRP Trigger frame(11ax)
   6) An HE TB PPDU carrying A-MPDUs from different users (a single A-MPDU from each user)(11ax)
b) Any required acknowledgments
c) Any frames required for protection, including one of the following:
   1) An RTS/CTS or MU-RTS Trigger/CTS frame(11ax) exchange
   2) CTS-to-self
   3) Dual CTS as specified in 10.3.2.10 (Dual CTS protection)
d) Any frames required for beamforming as specified in 10.30 (Sounding PPDUs), 10.35.5 (VHT sounding protocol), (11ax)26.7 (HE sounding operation(#2388)), and 10.41 (DMG beamforming)
e) Any frames required for link adaptation as specified in 10.31 (Link adaptation) and 26.13 (Link adaptation using the HLA Control subfield)(11ax)
f) Any number of BlockAckReq, MU-BAR Trigger, Multi-TID BlockAckReq, or GCR MU-BAR Trigger frames(11ax)

NOTE 1—This is a rule for the TXOP holder. A TXOP responder need not be aware of the TXOP limit nor of when the TXOP was started.

NOTE 2—This rule prevents the use of RD, BDT, and TXOP sharing when the TXOP limit is 0.

When dot11OCBActivated is true, (11bd)dot11NGVOptionImplemented is false or not present, and dot11DMGOCBActivated is false or not present, the TXOP limit shall be 0 for each AC.

The TXOP holder may exceed the TXOP limit only if it does not transmit more than one Data or Management frame in the TXOP, only if it does not transmit a (#3367)DL MU-MIMO PPDU in the TXOP, and only for the following situations:

— Retransmission of an MPDU, not in an A-MPDU consisting of more than one MPDU, where the size of the retransmitted MPDU is the same as the initially transmitted MPDU.(11ax)

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

- Transmission of an MSDU or MMPDU less than 600 octets by an S1G non-sensor STA.
- Transmission of a fragment of an MSDU or MMPDU, the fragment being less than 256 octets, by an S1G non-sensor STA.
- Initial transmission of an MSDU under a block ack agreement, where the MSDU is not in an A-MPDU consisting of more than one MPDU and the MSDU is not in an A-MSDU.
- Transmission of a Control frame or a QoS Null frame , not in an A-MPDU consisting of more than one MPDU.
- Initial transmission of a (11ax)(M118)nondynamic fragment of an MSDU or MMPDU (11ax)(see 10.4 (MSDU, (11ax)A-MSDU, and MMPDU fragmentation)), if a previous fragment of that MSDU or MMPDU was retransmitted.
- Transmission of a (11ax)(M118)nondynamic fragment of an MSDU or MMPDU fragmented into 16 fragments.
- Transmission of the 16th dynamic fragment of an MSDU or MMPDU.(11ax)
- Initial transmission of the first dynamic fragment of an MSDU or MMPDU, where the size of the first fragment is equal to the minimum fragment size specified by the receiver STA and the MSDU or MMPDU is not in an A-MPDU consisting of more than one MPDU.(11ax)
- Transmission of an A-MPDU consisting of the initial transmission of a single MPDU not containing an MSDU and that is not an individually addressed Management frame.
- Transmission of a group addressed MPDU, not in an A-MPDU consisting of more than one MPDU.
- Transmission of a null data PPDU (NDP).
- Transmission of a VHT NDP Announcement frame and NDP or transmission of a Beamforming Report Poll frame, where these fit within the TXOP limit and (11ax)only the response and the immediately preceding SIFS (11ax)cause the TXOP limit to be exceeded.
- (11ax)Transmission of one of the following sequences, provided that the sequence fits within the TXOP limit and only the response and the immediately preceding SIFS cause the TXOP limit to be exceeded:
  - An HE NDP Announcement frame and HE sounding NDP
  - An HE NDP Announcement frame and HE sounding NDP and BFRP Trigger frame
  - A BFRP Trigger frame

Except as described above, a STA shall fragment an individually addressed MSDU or MMPDU so that the initial transmission of the first fragment does not cause the TXOP limit to be exceeded.

NOTE 3—The TXOP limit is not exceeded for the following situations:

a) Initial transmission of an MPDU containing an unfragmented though fragmentable (see 10.2.7 (Fragmentation/defragmentation overview) and 26.3 (Fragmentation and defragmentation)) MSDU/MMPDU.(11ax)
b) Initial transmission of the first fragment of a fragmented MSDU/MMPDU, except if the MSDU/MMPDU is fragmented into 16 fragments.
c) Initial transmission of an A-MSDU.
d) Initial transmission of a (M118)nondynamic fragment of a fragmented MSDU/MMPDU, if no previous fragment of that MSDU/MMPDU was retransmitted, except if the MSDU/MMPDU is fragmented into 16 fragments.(11ax)
e) Initial transmission of a dynamic fragment of a fragmented MSDU/MMPDU, except for either the first dynamic fragment of a fragmented MSDU/MMPDU using the minimum fragment size specified by the receiver STA, or the 16th dynamic fragment of a fragmented MSDU/MMPDU.(11ax)
f) Transmission of an A-MPDU consisting of a single MPDU containing an A MSDU or individually addressed Management frame, unless this is a retransmission of that MPDU.
g) Transmission of an A-MPDU consisting of more than one MPDU, even if some or all of the MPDUs are retransmissions.
h) Transmission of a Trigger frame, other than a BFRP Trigger frame, where either the Trigger frame or its response does not fit within the TXOP limit.(11ax)

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

If the TXOP holder exceeds the TXOP limit, it should use as high a PHY rate as possible to minimize the duration of the TXOP.

The duration of a TXOP for a mesh STA that has dot11MCCAActivated true shall not exceed the time between the start of the TXOP and the end of the current MCCAOP reservation.

NOTE 4—The rules in this subclause also apply to priority-downgraded MSDUs and A-MSDUs (see 10.23.4.2 (Contention based admission control procedures)).

If the Duration field in a frame carried in an HE TB PPDU is set to 0, the HE TB PPDU shall not include any frames that solicit a control response frame from the AP.(11ax)

### 10.23.2.10 Truncation of TXOP

When a STA gains access to the channel using EDCA and empties its transmission queue, it may transmit a CF-End frame provided that the remaining duration is long enough to transmit this frame. By transmitting the CF-End frame, the STA is explicitly indicating the completion of its TXOP. In a DMG BSS, the STA shall not send a CF-End frame with a nonzero value in the Duration/ID field if the remaining duration is shorter than $2\times T_{CF\text{-}End}$ + 2×SIFS, where $T_{CF\text{-}End}$ is the duration of a CF-End frame. A STA that is an S1G AP may transmit an NDP CF-End frame instead of a CF-End frame. A non-S1G STA shall not transmit an NDP CF-End frame.

An S1G STA that both

— Transmits either a PPDU with its TXVECTOR parameter RESPONSE_INDICATION value Long Response or an NDP (PS-Poll-)Ack frame with its Idle Indication field value 1 and Duration field value 0 and

— Does not receive (after a SIFS) a response with its RXVECTOR parameter RESPONSE_INDICATION value NDP Response or Normal Response

may, after a PIFS(#6587), transmit an NDP CF-End frame to truncate any active RID or NAV.

A TXOP holder that transmits a CF-End frame shall not initiate any further frame exchange sequences within the current TXOP.

An S1G STA that transmits an NDP CF-End frame shall set the frame's Duration field to 0 and shall initiate no other frame exchange sequences in the current TXOP.

A non-AP STA that is not the TXOP holder shall not transmit a CF-End frame.

In a non-DMG BSS, a non-S1G non-HE STA(11ax) shall interpret the reception of a CF-End frame as a NAV reset, i.e., it resets its NAV to 0 at the end of the PPDU containing this frame. After receiving a CF-End frame with a matching BSSID(TA) without comparing Individual/Group bit, an AP may respond by transmitting a CF-End frame after a SIFS(#6587). An HE STA interprets the reception of a CF-End frame as defined in 26.2.5 (Truncation of TXOP).(11ax)

NOTE 1—The transmission of a single CF-End frame by the TXOP holder resets the NAV of STAs hearing the TXOP holder. There may be STAs that could hear the TXOP responder that had set their NAV that do not hear this NAV reset. Those STAs are prevented from contending for the medium until the original NAV reservation expires.

NOTE 2—A CF-End sent by a non-AP VHT STA that is a member of a VHT BSS can include the TXVECTOR parameter CH_BANDWIDTH_IN_NON_HT as defined in 10.6.6.6 (Channel Width selection for Control frames) in case it elicits a CF-End response.

In a DMG BSS, a STA that is not in the listening mode (10.38.6.6 (DMG and CMMG protected period)) shall interpret the reception of a CF-End frame as a NAV reset, i.e., it resets its NAV to 0 at the end of the time

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

interval indicated in the value of the Duration/ID field of the received frame. The interval starts at PHY-RXEND.indication primitive of the frame reception. The STA shall not transmit during the interval if the RA field of the frame is not equal to the STA MAC address. The STA may transmit a CF-End frame if the RA field of the received frame is equal to the STA MAC address and the value of the Duration/ID field in the received frame is not equal to 0.

Figure 10-32 (Example of TXOP truncation) shows an example of TXOP truncation. In this example, the STA accesses the medium using EDCA channel access and then transmits a nav-set sequence (e.g., RTS/CTS for non-DMG STAs or RTS/DMG CTS for DMG STAs)(#109). After a SIFS, it then transmits an initiator-sequence, which may involve the exchange of multiple PPDUs between the TXOP holder and TXOP responders. At the end of the second sequence, the TXOP holder has no more data that it can send that fits within the TXOP limit; therefore, it truncates the TXOP by transmitting a CF-End frame.

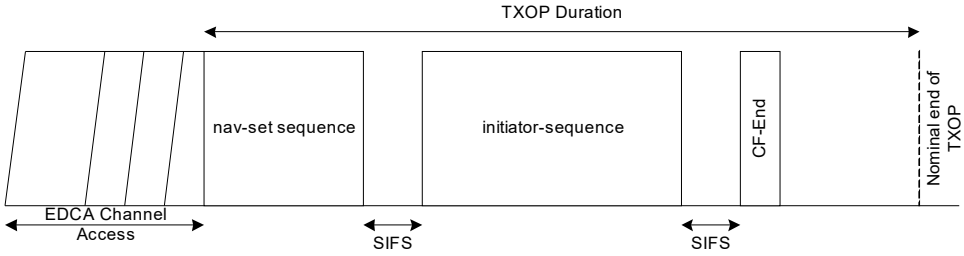

**Figure 10-32—Example of TXOP truncation**

(11ax)Non-DMG non-S1G non-HE STAs that receive a CF-End frame reset their NAV and can start contending for the medium without further delay. An HE STA that receives a CF-End frame may start contending for the medium without further delay as defined in 26.2.5 (Truncation of TXOP). A DMG STA that receives a CF-End frame can start contending for the medium at the end of the time interval equal to the value in the Duration/ID field of the frame if none of its NAVs has a nonzero value (10.38.10 (Updating multiple NAVs).

An S1G STA that receives an NDP CF-End frame should reset its NAV and may start contending for the medium without further delay.

An S1G STA may transmit a CF-End frame containing a value greater or equal to 0 in the Duration/ID field.

An S1G STA shall interpret the reception of a CF-End frame with the Duration/ID field equal to 0 as a NAV reset, i.e., it resets its NAV timer to 0 at the end of the PPDU containing this frame. After receiving a CF-End frame with the Duration/ID field equal to 0 and a matching BSSID, an AP may respond by transmitting a CF-End frame with the Duration/ID field equal to 0 after a SIFS.(#6587)

When an S1G STA receives a CF-End frame with the Duration/ID field not equal to 0 that falls (#6119)in the range [NAV value – 8, NAV value + 8] (microseconds) at the time of the reception of the PHY-RXEND.indication, it shall reset the NAV and may start contending for the medium without further delay. If the received duration value does not fall (#6119)in the range [NAV value – 8, NAV value + 8] microseconds at the time of the reception of the PHY-RXEND.indication, the STA shall discard the CF-End frame.

NOTE 3—A NAV value that varies within ±8 µs(#8087) (#7198)boundaries accommodates almost all inaccuracies (e.g., due to clock drifting) to the NAV counter at the receiving STA.

After receiving a CF-End frame with a matching BSSID, an S1G AP may respond by transmitting a CF-End frame after a SIFS(#6587) in which the value of the Duration field is equal to the value obtained from the

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Duration field of the received CF-End frame adjusted by subtracting the value of aSIFSTime and the time required to transmit the CF-End frame, in units of microseconds. If the adjusted value is a negative value, the Duration field of the CF-End frame is set to 0.

#### 10.23.2.11 Termination of TXOP

A TXOP holder that transmits a PPDU using one of the modulation classes in Table 10-19 (Modulation classes eligible for TXOP termination) should transmit a short Control frame as the final transmission in a TXOP, under the conditions specified in Table 10-20 (Rate and modulation class of a final transmission in a TXOP).

**Table 10-19—Modulation classes eligible for TXOP termination**

| Modulation classes eligible for TXOP termination (see Table 10-9 (Modulation classes)) |
|---|
| DSSS |
| HR/DSSS |
| ERP-OFDM |
| OFDM (20 MHz channel spacing) |
| HT |
| VHT |
| HE(11ax) |

**Table 10-20—Rate and modulation class of a final transmission in a TXOP**

| Modulation class and data rate of immediately preceding frame in TXOP | Rate and modulation class of final transmission |
|---|---|
| DSSS or HR/DSSS with long preamble, data rate > 1 Mb/s | 1 Mb/s DSSS |
| HR/DSSS with short preamble, data rate > 2 Mb/s | 2 Mb/s HR/DSSS short preamble |
| Other eligible modulation classes, except 6 Mb/s OFDM(11ax) | 6 Mb/s OFDM |

The final transmission can be a CF-End, or a CTS-to-self when no NAV needs to be truncated.

NOTE—The final transmission at the lowest data rate within the modulation class is needed because a final transmission at a higher rate can cause spurious EIFSs to occur, because the PHY header of such frames travels farther than the MPDU.

#### 10.23.2.12 Retransmit procedures

#### 10.23.2.12.1 General

A QoS STA shall maintain a frame retry count for each MSDU, A-MSDU, or MMPDU (#451)that requires acknowledgment. The initial value for the frame retry count shall be 0.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

QoS STAs shall also maintain a QoS STA retry count for each AC, QSRC[AC]. The initial value for the QSRC[AC] counters shall be 0.

When dot11RobustAVStreamingImplemented is true, a QoS STA shall maintain a drop-eligible frame retry count for each QoS Data frame with an HT variant HT Control field with the DEI field equal to 1. The initial value for the drop-eligible frame retry count shall be 0.

APs with dot11RobustAVStreamingImplemented equal to true and mesh STAs with dot11MeshGCRImplemented equal to true, shall maintain an unsolicited frame retry count. The initial value for the unsolicited frame retry count shall be 0.

After transmitting a frame that requires an immediate acknowledgment, the STA shall perform either of the acknowledgment procedures, as appropriate, that are defined in 10.3.2.11 (Acknowledgment procedure). The frame retry count for an MSDU or A-MSDU that is not part of a block ack agreement or for an MMPDU shall be incremented every time transmission fails for that MSDU, A-MSDU, or MMPDU, including of an associated RTS.

For APs with dot11RobustAVStreamingImplemented equal to true and mesh STAs with dot11MeshGCRImplemented equal to true, the unsolicited frame retry count shall be incremented after the transmission of every A-MSDU that is transmitted using the GCR unsolicited retry retransmission policy.

All retransmission attempts by a non-DMG STA for an MPDU with the Type subfield equal to Data or Management that is not sent under a block ack agreement and that has failed the acknowledgment procedure one or more times shall be made with the Retry subfield set to 1.

All retransmission attempts by a DMG STA for an MPDU with the Type subfield equal to Data or Management that has failed the acknowledgment procedure one or more times shall be made with the Retry subfield set to 1.

A QoS STA shall maintain a transmit MSDU/MMPDU timer for each MSDU passed to the MAC and for each MMPDU. (#3754)For a non-AP STA, dot11EDCATableMSDULifetime specifies the maximum amount of time allowed to transmit an MSDU/MMPDU for a given AC. (#3754)For an AP, dot11QAPEDCATableMSDULifetime specifies the maximum amount of time allowed to transmit an MSDU/MMPDU for a given AC. The transmit MSDU/MMPDU timer shall be started when the MSDU/MMPDU is passed to the MAC.

NOTE—(#3142)The timer is started at different times for DCF and EDCA.(#2054)

When A-MSDU aggregation is used, the HT STA maintains a single timer for the whole A-MSDU. The timer is restarted each time an MSDU is added to the A-MSDU. The result of this procedure is that no MSDU in the A-MSDU is discarded before a period of dot11EDCATableMSDULifetime (#3754)for a non-AP STA or dot11QAPEDCATableMSDULifetime for an AP has elapsed.

Retries for failed transmission attempts shall continue until one or more of the following conditions occur:

- The frame retry count for the MSDU, A-MSDU, or MMPDU is equal to dot11ShortRetryLimit.
- The drop-eligible frame retry count for the MSDU, A-MSDU, or MMPDU is equal to dot11ShortDEIRetryLimit.
- The unsolicited frame retry count for the A-MSDU is equal to dot11UnsolicitedRetryLimit.
- The transmit MSDU/MMPDU timer for the MSDU/MMPDU or any undelivered fragments of that MSDU/MMPDU exceeds dot11EDCATableMSDULifetime (#3754)for a non-AP STA or dot11QAPEDCATableMSDULifetime for an AP.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

When any of these limits is reached, retry attempts shall cease, and the associated MSDU, A-MSDU, or MMPDU shall be discarded.

For internal collisions, the frame retry counts associated with the MSDUs, A-MSDUs, or MMPDUs involved in the internal collision shall be incremented.

With the exception of a frame belonging to a TID for which block ack agreement is set up, (#1938)a QoS STA shall not initiate the transmission of any Management or Data frame to a specific RA while the transmission of another Management or Data frame with the same RA and having been assigned its sequence number from the same sequence number space has not yet completed to the point of success, retry fail, or other MAC discard (e.g., lifetime expiration).

If an HE STA transmits an HE TB PPDU, the QSRC[AC] for the associated EDCAF is not changed.(11ax)

### 10.23.2.12.2 Unsolicited retry procedure

When using the GCR unsolicited retry retransmission policy for a group address, an AP or mesh STA may retransmit an MPDU to increase the probability of correct reception at the STAs that are listening to this group address (i.e., the group address is in their dot11GroupAddressesTable). The set of MPDUs that may be retransmitted is dependent upon whether block ack agreements are active with the STAs that are listening to this group address and is defined in 11.21.16.3.6 (GCR unsolicited retry). How an AP or a mesh STA chooses which MPDUs to retransmit is an implementation decision and beyond the scope of this standard.

A protective mechanism (such as a mechanism described in 10.27 (Protection mechanisms)) should be used to reduce the probability of other STAs transmitting during the GCR TXOP. When using a protection mechanism that requires a response from another STA, the AP should select a STA that is a member of the GCR group.

The TXOP initiation rules defined in 10.23.2.2 (EDCA backoff procedure) and(#311) 10.23.2.3 (EDCA TXOPs) shall be used for initiating a GCR TXOP. The duration of a GCR TXOP shall be subject to the TXOP limits defined in 10.23.2.9 (TXOP limits).

When transmitting MPDUs using the GCR service with retransmission policy equal to GCR unsolicited retry, the following rules apply:

— Following a MAC protection exchange that includes a response frame, in all GCR unsolicited retry retransmissions, the STA shall either transmit the frames within a GCR TXOP separated by SIFS or invoke its backoff procedure as defined in 10.23.2.2 (EDCA backoff procedure). The STA shall not transmit an MPDU and a retransmission of the same MPDU within the same GCR TXOP. The final frame transmitted within a GCR TXOP shall follow the backoff procedure defined in 10.23.2.2 (EDCA backoff procedure).

— Without MAC protection or with MAC protection that lacks a response frame, in all transmissions, the STA shall invoke the backoff procedure defined in 10.23.2.2 (EDCA backoff procedure), using a value of CWmin[AC] for CW, at the PHY-TXEND.confirm primitive that follows the transmission of each unsolicited retry GCR MPDU.

— All retransmissions of an MPDU shall have the Retry subfield in their Frame Control fields set to 1.

— During a GCR TXOP, frames may be transmitted within the GCR TXOP that do not use the GCR unsolicited retry retransmission policy.

### 10.23.2.13 EDCA channel access in a CMMG BSS

If the MAC receives a PHY-CCA.indication primitive with the channel-list parameter present, the channels considered idle are defined in Table 10-21 (Channels indicated idle by the channel-list parameter for CMMG BSSs).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 10-21—Channels indicated idle by the channel-list parameter for CMMG BSSs**

| PHY-CCA.indication primitive channel-list parameter entry | Idle channel |
|---|---|
| primary | None |
| secondary | Primary 540 MHz |

In the following description, the CCA is sampled according to the timing relationships defined in 10.3.7 (DCF timing relations). Slot boundaries are determined solely by activity on the primary channel. "Channel idle for an interval of PIFS" means that whenever CCA is sampled during the period of PIFS that ends at the start of transmission, the CCA for that channel was determined to be idle.

If one of a STA's EDCAFs is permitted to initiate a TXOP (as specified in 10.23.2.4 (Obtaining an EDCA TXOP)), the STA shall perform exactly one of the following actions:(#3653)

a) Transmit a 1080 MHz mask PPDU if the secondary 540 MHz channel is idle during an interval of PIFS immediately preceding the start of the TXOP.

b) Transmit a 540 MHz mask PPDU on the primary 540 MHz channel.

c) Transmit nothing and invoke the backoff procedure for the EDCAF as specified in 10.23.2.2 (EDCA backoff procedure).(#3653)

NOTE 1—In the case of rule c), the STA selects a new random number using the current value of CW[AC], and the retry counts are not updated [as described in 10.23.2.2 (EDCA backoff procedure)(#1478); backoff procedure invoked for event a)].

NOTE 2—For CMMG STAs, an EDCA TXOP is obtained based on activity on the primary channel (see 10.23.2.4 (Obtaining an EDCA TXOP)(#311)). The width of transmission is determined by the CCA status of the nonprimary channels during the PIFS before transmission (see 10.23.2.4 (Obtaining an EDCA TXOP)).

NOTE 3—An EDCAF that initiates a TXOP has a frame available for transmission (see 10.23.2.4 (Obtaining an EDCA TXOP)). There might be another EDCAF of lower priority that invokes the backoff procedure due to an internal collision (see 10.23.2.4 (Obtaining an EDCA TXOP)).(#3653)

### 10.23.2.14 EDCA channel access in an EDMG BSS(11ay)

If the MAC receives a PHY-CCA.indication primitive with the channel-list parameter present, the channels considered busy are defined in Table 10-22 (Channels indicated busy by the channel-list parameter(11ay)). Channels not indicated as busy are considered idle.

When a STA and the BSS, of which the STA is a member, both support multiple channel widths, an EDCA TXOP is obtained based solely on activity of the primary channel ((#311)see 10.23.2.4 (Obtaining an EDCA TXOP)). "Idle medium" in this subclause means "idle primary channel." Likewise "busy medium" means "busy primary channel."

Once an EDCA TXOP has been obtained according to this subclause, further constraints defined in 10.38.12.2 (Channel access over multiple channels) and 10.23.2 (HCF contention based channel access

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

(EDCA)) might limit the width of transmission during the TXOP or deny the channel access, based on the state of CCA on secondary channels.

**Table 10-22—Channels indicated busy by the channel-list parameter(11ay)**

| PHY-CCA.indication primitive channel-list parameter | Busy channels |
|---|---|
| Primary | Primary |
| secondary | First secondary channel |
| secondary1 | Second secondary channel |
| secondary2 | Third secondary channel |

In the following description, the CCA is sampled according to the timing relationships defined in 10.3.7 (DCF timing relations). Slot boundaries are determined solely by activity on the primary channel. "Channel idle for an interval of PIFS" means that the STATE parameter of the most recent PHY-CCA.indication primitive was IDLE, and no PHY-CCA.indication(BUSY)(#4122) occurred during an interval of PIFS that ends at the start of transmission, the CCA for that channel was determined to be idle.

(#3653)If one of a STA's EDCAFs is permitted to initiate a TXOP (as specified in 10.23.2.4 (Obtaining an EDCA TXOP)), the STA shall perform exactly one of the following actions on the primary, secondary, seconday1, and secondary2 channels defined in Table 8-6 (Definition of EDMG secondary, secondary1, and secondary2 channels(11ay)), which is based on the BSS Operating Channels field and Primary Channel field within the EDMG Operation element transmitted by an EDMG AP or an EDMG PCP:

a) Transmit an 8.64 GHz mask PPDU if the secondary, secondary1 and secondary2 channels are contiguous and secondary, secondary1 and secondary2 were idle during an interval of PIFS immediately preceding the start of the TXOP.

b) Transmit a 4.32+4.32 GHz mask PPDU if the primary and secondary channels are contiguous, secondary1 and secondary2 channels are contiguous and secondary, secondary1 and secondary2 channels were idle during an interval of PIFS immediately preceding the start of the TXOP.

c) Transmit a 6.48 GHz mask PPDU if the primary, secondary and secondary1 channels are contiguous and the secondary and secondary1 channels were idle during an interval of PIFS immediately preceding the start of the TXOP or if the primary, secondary1 and secondary2 channels are contiguous and secondary1 and secondary2 channels were idle during an interval of PIFS immediately preceding the start of the TXOP.

d) Transmit a 4.32 GHz mask PPDU if the primary and secondary channels are contiguous and the secondary channel was idle during an interval of PIFS immediately preceding the start of the TXOP or if the primary and secondary1 channels are contiguous and the secondary1 channel was idle during an interval of PIFS immediately preceding the start of the TXOP.

e) Transmit a 2.16+2.16 GHz mask PPDU if the secondary, secondary1 or secondary2 channels were idle during an interval of PIFS immediately preceding the start of the TXOP.

f) Transmit a 2.16 GHz mask PPDU on the primary channel.

g) Transmit nothing and invoke the backoff procedure for the EDCAF as specified in 10.23.2.2 (EDCA backoff procedure).(#3653)

NOTE 1–In the case of rule g), the STA selects a new random number using the current value of CW[AC], and the retry counters are not updated [as described in 10.23.2.2 (EDCA backoff procedure)(#1478); backoff procedure invoked for event a)].

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

NOTE 2–For an EDMG STA, an EDCA TXOP is obtained based on activity on the primary channel (see 10.23.2.4 (Obtaining an EDCA TXOP)). The width of transmission is determined by the CCA status of the nonprimary channels during an interval of PIFS before transmission (see EDMG description in 10.3.2 (Procedures common to the DCF and EDCAF)).

NOTE 3—An EDCAF that initiates a TXOP has a frame available for transmission (see 10.23.2.4 (Obtaining an EDCA TXOP)). There might be another EDCAF of lower priority that invokes the backoff procedure due to an internal collision (see 10.23.2.4 (Obtaining an EDCA TXOP)).(#3653)

An EDMG STA that initiates a PPDU transmission to peer EDMG STA shall set the TXVECTOR parameters CH_BANDWIDTH and CHANNEL_AGGREGATION of the PPDU to a subset of the channels in which the CCA were idle according to Table 8-6 (Definition of EDMG secondary, secondary1, and secondary2 channels(11ay)), and shall set the TXVECTOR parameter SCRAMBLER_INIT_SETTING to a value that provides bandwidth information to the peer STA.

### 10.23.3 HCF controlled channel access (HCCA)

#### 10.23.3.1 General

The HCCA mechanism manages access to the WM using an HC that has higher medium access priority than non-AP STAs. This allows it to transfer MSDUs to STAs and to allocate TXOPs to STAs.

The HC grants a STA a polled TXOP with duration specified in a QoS (+)CF-Poll frame. A STA may transmit multiple frame exchange sequences within given polled TXOPs, subject to the limit on TXOP duration.

All STAs inherently obey the NAV rules of the HCF because each frame transmitted under HCF contains a duration value chosen to cause STAs in the BSS to set their NAVs to protect the expected subsequent frames.

A non-AP QoS STA that is (#181)a non-S1G STA shall respond to QoS (+)CF-Poll frames received from an HC with the Address 1 field matching their own addresses.

The HC shall perform delivery of buffered non-GCR-SP group addressed MSDUs/MMPDUs following DTIM beacons(#3309).

An HC may perform a backoff following an interruption of a frame exchange sequence due to lack of an expected response under the rules described in 10.23.3.2.3 (Recovery from the absence of an expected reception), using the parameters dot11HCCWmin, dot11HCCWmax, and dot11HCCAIFSN and the backoff rules in 10.2 (MAC architecture) and 10.23.2.2 (EDCA backoff procedure). The decision to perform a backoff by the HC is dependent on conditions such as interference from an overlapping BSS. The mechanism to detect the interference from an overlapping BSS and the decision to perform a backoff, DFS (such as in 11.6), or other techniques (such as inter-BSS scheduling) is beyond the scope of this standard.

#### 10.23.3.2 HCCA procedure

##### 10.23.3.2.1 General

To start an HCCA TXOP, the HC gains control of the WM by waiting a shorter time before initiating the first transmission of the TXOP than STAs using the EDCA procedures. The duration values used in QoS frame exchange sequences reserve the medium to permit completion of the current sequence.

##### 10.23.3.2.2 CAP generation

When the HC needs access to the WM to start a CAP, the HC shall sense the WM. When the WM is determined to be idle at the TxPIFS slot boundary as defined in 10.3.7 (DCF timing relations), the HC shall transmit either a QoS (+)CF-Poll with the duration value set to cover the polled TXOP, or the first frame of any

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

permitted frame exchange sequence with the duration value set to cover the HCCA TXOP. A CAP shall not extend across a TBTT. The occurrence of a TBTT implies the end of the CAP, after which the regular channel access procedure (EDCA or HCCA) is resumed. It is possible that no Data frame was transmitted during an HCCA TXOP. The shortened termination of the HCCA TXOP does not imply an error condition. CAPs are illustrated in Figure 10-33 (CAP periods).

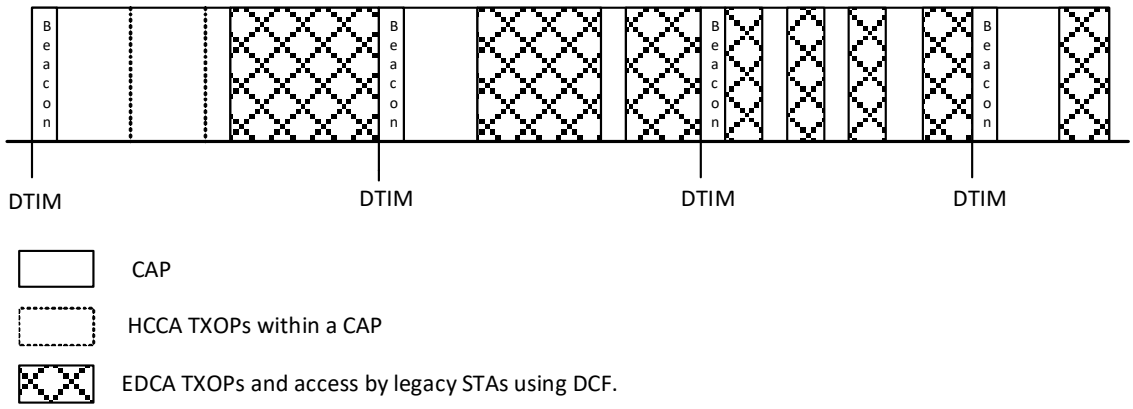

**Figure 10-33—CAP periods**

After the last frame of all other nonfinal frame exchange sequences (e.g., sequences that convey individually addressed QoS Data or Management frames) during an HCCA TXOP, the holder of the current HCCA TXOP shall wait for one SIFS before transmitting the first frame of the next frame exchange sequence. The HC may sense the channel and reclaim the channel if the WM is determined to be idle at the TxPIFS slot boundary after the HCCA TXOP (see Figure 10-29 (EDCA mechanism timing relationships(#14)(#1058))). A CAP ends when the HC does not reclaim the channel at the TxPIFS slot boundary after the end of an HCCA TXOP.

#### 10.23.3.2.3 Recovery from the absence of an expected reception

This subclause describes recovery from the absence of an expected reception in a CAP. Note that the recovery rules from the absence of an expected reception are different from EDCA because in this case the NAVs of all of the STAs in the BSS have already been set up by the transmissions by the HC. The recovery rules for the multiple frame exchange sequences in an EDCA TXOP(#109) are different because a STA may always be hidden and may have not set its NAV due to the transmission by another STA. Finally, since an HC is (#2210)colocated with the AP, the AP may recover using the rules described in this subclause even if the recovery is from the absence of an expected reception.

The beginning of reception of an expected response is detected by the occurrence of PHY-CCA.indication(BUSY,channel-list) primitive at the STA that is expecting the response where the channel-list parameter is absent or, if present, includes “primary.”

If the beginning of such reception does not occur during the first slot time following a SIFS, then:[29]

— If the transmitting STA is the HC, it may initiate recovery by transmitting at the TxPIFS slot boundary after the end of the HC’s last transmission only if the PHY-CCA state indicates IDLE during the CCAdel period preceding the TxPIFS slot boundary as shown in 10-25 (DCF timing relationships(#14)(#1058)(#3297)).

— If the transmitting STA is a non-AP QoS STA, and there is an MPDU for transmission, it shall initiate recovery by transmitting at a PIFS after the end of the last transmission if the PHY-CCA

[29] This restriction is intended to avoid collisions due to inconsistent CCA reports in different STAs, not to optimize the bandwidth usage efficiency.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

state indicates IDLE during the CCAdel period preceding the TxPIFS slot boundary, the polled TXOP limit is nonzero and at least one frame (re)transmissions can be completed within the remaining duration of a nonzero polled TXOP limit.

If the transmitted frame is not of type QoS (+)CF-Poll and the expected response frame is not received correctly, regardless of the occurrence of the PHY-RXSTART.indication primitive, the QoS STA may initiate recovery following the occurrence of PHY-CCA.indication(IDLE) primitive so that a SIFS occurs between the last energy on the WM and the transmission of the recovery frame.

When there is a transmission failure within a polled TXOP, the short retry count (as described in 10.23.2.12 (Retransmit procedures)) corresponding to the failed MSDU or MMPDU shall be incremented.(#4331)

An MPDU belonging to a TC is subject to the respective retry limit as well as the dot11EDCATableMSDULifetime (#3757)for a non-AP STA or dot11QAPEDCATableMSDULifetime for an AP and is discarded when either of them is exceeded.(#4331)

An MPDU belonging to a TS with a specified delay bound is subject to delay bound and is discarded if the MPDU could not be transmitted successfully since it has been delivered to the MAC. An MPDU belonging to a TS with an unspecified delay is subject to dot11MaxTransmitMSDULifetime and is discarded when it is exceeded.

Non-AP STAs that receive a QoS (+)CF-Poll frame shall respond within a SIFS, regardless of the NAV setting. If a response is not received but a PHY-CCA.indication(BUSY) primitive occurs during the slot following a SIFS and is followed by a PHY-RXSTART.indication or PHY-RXEND.indication primitive prior to a PHY-CCA.indication(IDLE) primitive, then the HC assumes that the transmitted QoS (+)CF-Poll frame was received by the polled STA. In the cases of QoS Data +CF-Poll, QoS Data +CF-Ack +CF-Poll, or QoS CF-Ack +CF-Poll, the PHY-CCA.indication(BUSY) primitive is used only to determine whether the transfer of control of the channel has been successful. The PHY-CCA.indication(BUSY) primitive is not used for determining the success or failure of the transmission. If the CF-Poll is piggybacked onto a QoS Data frame, the HC may have to retransmit that QoS Data frame subsequently.

If an HC receives a frame from a STA with a duration/ID covering only the response frame, the HC shall assume that the STA is terminating its TXOP, and the HC may initiate other transmissions, or send a CF-End frame (see 10.23.3.4 (NAV operation of a TXOP under HCCA)).

If a polled QoS STA has no queued traffic to send or if the MPDUs available to send are too long to be transmitted within the specified TXOP limit, the QoS STA shall send a QoS (+)Null frame. In the case of no queued traffic, this QoS (+)Null frame shall have a QoS Control field that reports a queue size of 0 for any TID with the duration/ID set to the time required for the transmission of one Ack frame, plus one SIFS. In the case of insufficient TXOP size, such as when the maximum MSDU size is not specified, this QoS (+)Null frame shall have a QoS Control field that contains the TID and TXOP duration or a nonzero queue size needed to send the MPDU that is ready for transmission. When a queue size is transmitted, the HC shall combine the queue size information with the rate of the received QoS (+)Null frame to determine the required size of the requested TXOP.

Within a polled TXOP, the unused portion of TXOPs shall not be used by the STA and may be reallocated by the HC as follows:

a) The recipient of the final frame, with Normal Ack ack policy, shall be the HC if there will be time remaining in the TXOP after the transmission of the final frame and its expected Ack frame. If there are no frames to be sent to the HC, then the QoS STA shall send to the HC a QoS Null with the Queue Size subfield in the QoS Control field set to 0.
    1) If a PHY-CCA.indication(BUSY) primitive occurs at the STA that is expecting the Ack frame during the first slot following a SIFS after the end of the transmission of the final frame, it shall

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

be interpreted as indicating that the channel control has been successfully transferred and no further frames shall be transmitted by the STA in the TXOP, even though the Ack frame from HC may be incorrectly received.[30]

2) If the beginning of the reception of an expected Ack frame to the final frame does not occur, detected as the nonoccurrence of the PHY-CCA.indication(BUSY) primitive at the QoS STA that is expecting the response during the first slot time following a SIFS, the QoS STA shall retransmit the frame or transmit a QoS Null frame, with Normal Ack ack policy and the Queue Size subfield set to 0, after a PIFS(#6587) from the end of last transmission, until such time that it receives an acknowledgment or when there is not enough time remaining in the TXOP for sending such a frame.[31]

b) If there is not enough time within the unused portion of the TXOP to transmit either the QoS Null frame or the frame with the Duration/ID field covering only the response frame, then the STA shall cease control of the channel.[32]

### 10.23.3.3 HCCA TXOP structure and timing

Any QoS Data frame of a subtype that includes CF-Poll contains a TXOP limit in its QoS Control field. The ensuing polled TXOP is protected by the NAV set by the Duration field of the frame that contained the QoS (+)CF-Poll function, as shown in Figure 10-34 (Polled TXOP). Within a polled TXOP, a STA may initiate the transmission of one or more frame exchange sequences, with all such sequences nominally separated by a SIFS. (#136)The STA shall not initiate transmission of a frame unless the transmission and any acknowledgment or other immediate response expected from the peer MAC entity are able to complete within the polled TXOP, and the HC shall account for these when setting the TXOP limit. If the TXOP Limit subfield in the QoS Control field of the QoS Data frame that includes CF-Poll is equal to 0, then the STA to which the frame is directed to shall respond with either one MPDU or one QoS Null frame.

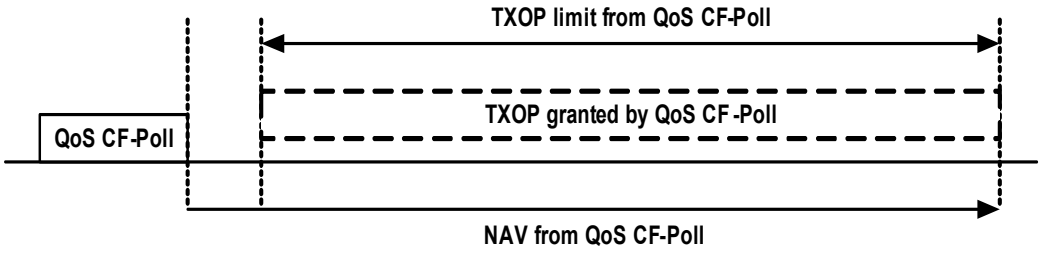

**Figure 10-34—Polled TXOP**

A TXOP or transmission within a TXOP shall not extend across TBTT, or dot11CAPLimit. The HC shall verify that the full duration of any granted TXOP meets these requirements so that a STA may use the time prior to the TXOP limit of a polled TXOP without checking for these constraints. Subject to these limitations, all decisions regarding what MSDUs, A-MSDUs, and/or MMPDUs are transmitted during any given TXOP are made by the STA that holds the TXOP.[33,34]

[30] Note that while the PHY-CCA.indication(BUSY) primitive is used in this instance to determine the control of the channel, it is not used for determining the success or failure of the transmission.

[31] This is to avoid the situation where the HC might not receive the frame and might result in an inefficient use of the channel.

[32] In this case the channel is not accessed until the NAVs expire at all of the STAs.

[33] In certain regulatory domains, channel sensing needs to be done at periodic intervals (for example, in Japan, this period is 4 ms). This means that the duration of a TXOP in these regulatory domains might not be more than this periodic interval. In order to extend the TXOP beyond the limit implied by this periodic interval, the TXOP holder needs to sense the channel at least once in the limit imposed in the regulatory domain, by waiting for at least for the duration of one PIFS during which it senses the channel. If it does not detect any energy, it may continue by sending the next frame. In other words, the total TXOP size assigned should include an extra time allocated (i.e., $n \times$ aSlotTime, where $n$ is the number of times the STA needs to sense the channel) and is given by $\lfloor$TXOP limit/limit imposed in the regulatory domain$\rfloor$.

#### 10.23.3.4 NAV operation of a TXOP under HCCA

An HC shall set its own NAV to prevent it from transmitting during a TXOP that it has granted to a STA through an HCCA poll. However, the HC may reclaim the TXOP if a STA is not using it or ends the TXOP early (see 10.23.3.2.3 (Recovery from the absence of an expected reception)).

If the HC has no more STAs to poll and it has no more Data, Management, BlockAckReq, or BlockAck frames to send, it may reset the NAVs of all QoS STAs in the BSS by sending a QoS CF-Poll frame with the RA matching (#3403)its MAC address and with the Duration/ID field set to 0.

A STA that receives a QoS (+)CF-Poll frame with a MAC address in the Address 1 field that matches the HC's MAC address and the Duration/ID field value equal to 0 shall reset the NAV value to 0.

When a STA receives a QoS (+)CF-Poll frame containing the BSSID of the BSS of which the STA is a member, that STA shall update the NAV if necessary and shall save the TXOP holder address for that BSS, which is the MAC address from the Address 1 field of the frame containing the QoS (+)CF-Poll. If an RTS frame is received with the RA matching the MAC address of the STA and the MAC address in the TA field in the RTS frame matches the saved TXOP holder address, then the STA shall send the CTS frame after a SIFS(#6587), without regard for, and without resetting, its NAV. The saved TXOP holder address shall be cleared when the NAV is reset or when the NAV counts down to 0.

When a STA receives a frame addressed to it and requires an acknowledgment, it shall respond with an Ack or QoS +CF-Ack frame independent of its NAV. A non-AP STA shall accept a polled TXOP by initiating a frame exchange sequence independent of its NAV.

#### 10.23.3.5 HCCA transfer rules

##### 10.23.3.5.1 General

A TXOP obtained by receiving a QoS (+)CF-Poll frame uses the specified TXOP limit consisting of one or more frame exchange sequences with the sole time-related restriction being that the final sequence shall end not later than the TXOP limit. In QoS CF-Poll and QoS CF-Ack +CF-Poll frames, the TID subfield in the QoS Control field indicates the TS for which the poll is intended. The requirement to respond to that TID is nonbinding, and a STA may respond with any frame. Upon receiving a QoS (+)CF-Poll frame, a STA may send any frames, i.e., QoS Data frames belonging to any TID as well as Management frames in the obtained TXOP. MSDUs may be fragmented in order to fit within TXOPs.

The QoS CF-Poll frames shall be sent only by an HC. Non-AP STAs are not allowed to send QoS (+)CF-Poll frames. A STA shall not send QoS (+)Data frames in response to any Data frame other than the QoS (+)CF-Poll frames.

The TXOP limit is inclusive of the PHY and IFS overhead, and an AP should account for the overhead when granting TXOPs.

If a STA has set up at least one TS for which the Aggregation subfield in the associated TSPEC is equal to 0, the AP shall use only QoS CF-Poll or QoS CF-Ack +CF-Poll frames to poll the STA and shall never use QoS (+)Data +CF-Poll to poll the STA. Note that although QoS (+)CF-Poll is a Data frame, (#151)it should be transmitted at one of the rates in the BSSBasicRateSet parameter in order to set the NAV of all STAs that are not being polled (see 10.6 (Multirate support)). If a CF-Poll is piggybacked with a QoS Data frame, then the

[34] The TID value in the QoS Control field of a QoS Data +CF-Poll frame pertains only to the MSDU or fragment thereof in the Frame Body field of that frame. This TID value does not pertain to the TXOP limit value and does not place any constraints on what frame(s) the addressed STA may send in the granted TXOP.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

frame containing all or part of an MSDU or A-MSDU may be transmitted at a rate that is below the negotiated minimum PHY rate in the TSPEC related to that data.

A QoS STA shall use QoS Data frames for all MSDU transfers to another QoS STA. The TID in the QoS Control fields of these frames shall indicate the TC or TS to which the MPDU belongs. Furthermore, either the Queue Size subfield shall indicate the amount of queued traffic present in the output queue that the STA uses for traffic belonging to this TC or TS, or the TXOP Duration Requested subfield shall indicate the duration that the STA requests for use in the next TXOP for traffic belonging to this TC or TS. The queue size value reflects the amount on the appropriate queue not including the present MPDU. The queue size value may remain constant in all QoS Data frames that carry fragments of the same MSDU even if the amount of queued traffic changes as successive fragments are transmitted. In order to inform the HC of queue status, a STA may use the QoS Null frame indicating the TID and the queue size or TXOP duration request (also see 10.23.3.5.2 (TXOP requests)).

(#181)A QoS STA shall support receiving QoS +CF-Ack frames. The HC may use QoS Data +CF-Ack frames to send frames to the same STA a SIFS after receiving the final transmission of the previous TXOP. The HC may also use QoS Data +CF-Ack frames to send frames to any other STA a SIFS after receiving the final transmission of the previous TXOP, if the STA that sent the final transmission of the previous TXOP has set the Q-Ack subfield in the QoS Capability element in the (Re)Association Request frame to 1. A STA shall respond to QoS Data frames having Normal Ack ack policy with an Ack frame, unless the acknowledgment is piggybacked in which case it shall use a QoS +CF-Ack frame. Piggybacked frames are allowed only within TXOPs initiated by the HC. The HC shall not send a QoS Data frame containing a +CF-Ack with an Address 1 that does not correspond to the address of the STA for which the +CF-Ack is intended, unless the STA to which the +CF-Ack is intended, sets the Q-Ack subfield in the QoS Capability element in the (Re)Association Request frame. STAs are not required to be able to transmit QoS Data frames with subtypes that include +CF-Ack.

An AP that has dot11QAckOptionImplemented true may allow associations with STAs advertising support for the Q-Ack option. Such associations do not require the AP to employ piggyback acknowledgments directed toward that associated STA in frames that are not directed to that associated STA. (#181)A QoS STA shall process received QoS Data frames with subtypes that include +CF-Ack when the STA to which the acknowledgment is directed is the same as the STA addressed by the Address 1 field of that Data frame. A STA that does not set the Q-Ack subfield to 1 in the QoS Capability element in the (Re)Association Request frame is not required to handle the received QoS (+)Data +CF-Ack frames that are addressed to other STAs. The net effect of these restrictions on the use of QoS +CF-Ack frames is that the principal QoS +CF-Ack subtype that is useful is the QoS Data +CF-Ack frame, which can be sent by a STA as the first frame in a polled TXOP when that TXOP was conveyed in a QoS Data +CF-Poll (+CF-Ack) frame and the outgoing frame is directed to the HC's STA address. QoS (Data +)CF-Poll +CF-Ack frames are useful to allow the HC to grant another TXOP to the same STA a SIFS after receiving the final transmission of that STA's previous TXOP. QoS (Data+)CF-Poll +CF-Ack frames are also useful to allow the HC to grant another TXOP to a different STA a SIFS after receiving the final transmission of a STA's previous TXOP, if the STA that sent the final transmission of the previous TXOP has set the Q-Ack subfield in the QoS Capability element in the (Re)Association Request frame to 1.

HCF contention based channel access shall not be used to transmit MSDUs belonging to an established TS (with the HC's acceptance of the associated TSPEC), unless the granted TSPEC indicates it is permitted to do so when the Access Policy subfield of the TS Info field is equal to "HCCA, EDCA mixed mode" (HEMM), the polled STA utilized the full TXOP provided by the HC, and it has more MPDUs to send. When this STA sends frames belonging to a TS using contention based channel access, it shall encode the TID subfield in the QoS Data frame with the TID associated with the TS. When the AP grants a TSPEC with the Access Policy subfield equal to HEMM and if the corresponding AC needs admission control, the AP shall include the medium time that specifies the granted time for EDCA access in the ADDTS Response frame.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

#### 10.23.3.5.2 TXOP requests

STAs may send TXOP requests during polled TXOPs or EDCA TXOPs using the QoS Control field in a QoS Data frame or a QoS Null frame directed to the HC, with the TXOP Duration Requested or Queue Size subfield value and TID subfield value indicated to the HC. APs indicate whether they process TXOP request or queue size in the QoS Info field in the Beacon, Probe Response, and (Re)Association Response frames. An AP shall process requests in at least one format. The AP may reallocate TXOPs if the request belongs to TS or update the EDCA parameter set if the above request belongs to TC. A STA shall use only the request format that the AP indicates it can process.

TXOP Duration Requested subfield values are not cumulative. A TXOP duration requested for a particular TID supersedes any prior TXOP duration requested for that TID. A value of 0 in the TXOP Duration Requested subfield may be used to cancel a pending unsatisfied TXOP request when its MSDU is no longer queued for transmission. The TXOP duration requested is inclusive of the PHY and IFS overhead, and a STA should account for this when attempting to determine whether a given transmission fits within a specified TXOP duration.

The AP may choose to assign a TXOP duration shorter than that requested in the TXOP Duration Requested subfield.

Even if the value of TXOP Duration Requested subfield or Queue Size subfield in a QoS Data frame is 0, the HC shall continue to poll according to the negotiated schedule.

#### 10.23.3.5.3 Use of RTS/CTS

In order to provide improved NAV protection, a STA may send an RTS frame as the first frame of any frame exchange sequence without regard for dot11RTSThreshold or dot11TXOPDurationRTSThreshold.(11ax)

If a QoS STA sends an RTS frame and does not receive an expected CTS frame, then the recovery rules are as specified in 10.23.3.2.3 (Recovery from the absence of an expected reception).

In order to provide NAV protection for a transmission to the AP in response to a QoS Data frame with a subtype that includes CF-Poll, the polled STA may send a CTS frame with the RA containing its own MAC.

NOTE 1—The CTS frame is shorter than a QoS Data frame and has a higher probability that it will be received by other STAs.

NOTE 2—The transmission of the CTS sets the NAV in its own vicinity without the extra time required to send an RTS frame.[35]

#### 10.23.3.5.4 HCCA transfer rules for a VHT STA

A VHT STA that is a member of a BSS that supports multiple channel widths is granted a TXOP for a specified duration and for a channel width that is equal to the channel width of the frame containing the QoS CF-Poll.

### 10.23.4 Admission control at the HC

#### 10.23.4.1 General

An IEEE 802.11 network may use admission control to administer policy or regulate the available bandwidth resources. Admission control is used to attempt to provide a guarantee of the amount of time that a STA has

[35] This is unnecessary because the NAVs in the vicinity of the QoS AP were set by the QoS (+)CF-Poll frame.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

available to access the channel. The HC, which is in the AP, is used to administer admission control in the network. As the QoS facility supports two access mechanisms, there are two distinct admission control mechanisms: one for contention based access and another for controlled access.

Admission control, in general, depends on vendors' implementation of the scheduler, available channel capacity, link conditions, retransmission limits, and the scheduling requirements of a given stream. All of these criteria affect the admissibility of a given stream. If the HC has admitted no streams that require polling, it might not find it necessary to perform the scheduler or related HC functions.

### 10.23.4.2 Contention based admission control procedures

#### 10.23.4.2.1 General

An AP shall support admission control procedures, at least to the minimal extent of advertising that admission is not mandatory on its ACs. The AP uses the ACM (admission control mandatory) subfields advertised in the EDCA Parameter Set element to indicate whether admission control is required for each of the ACs. All ACs with priority higher than that of an AC for which the ACM subfield is set to 1 should have the ACM subfield set to 1. While the CWmin, CWmax, AIFS, and TXOP limit parameters may be adjusted over time by the AP, the ACM subfield shall be static for the duration of the lifetime of the BSS.

A non-AP STA may send frames in an AC where admission control is not mandated.

A non-AP STA may support the admission control procedure in 10.23.4.2.3 (Procedure at non-AP STAs) to send frames in an AC where admission control is mandated. If it does not support that procedure or admission was denied, and both of the following apply:

— dot11RejectUnadmittedTraffic is false or not present
— there is a lower priority AC (see Table 10-1 (UP-to-AC mappings(#68))) that does not require admission control

then it may send such frames using the EDCA parameters of that lower priority AC for channel access; the contents of the frames are unaffected. Otherwise, it shall not send such frames.

A STA shall transmit an ADDTS Request frame to the HC in order to request admission of traffic in any direction (i.e., uplink, downlink, direct, or bidirectional) employing an AC that requires admission control. The ADDTS Request frame shall contain the UP associated with the traffic and shall indicate EDCA as the access policy. The AP shall associate the received UP of the ADDTS Request frame with the appropriate AC per the UP-to-AC mappings described in 10.2.3.2 (HCF contention based channel access (EDCA)).

The HC contained within an AP when dot11SSPNInterfaceActivated is true shall admit a non-AP STA's request based on dot11NonAPStationAuthAccessCategories stored in that non-AP STA's dot11InterworkingEntry, which is part of the dot11InterworkingTable. The dot11InterworkingEntry specifies the EDCA access classes and throughput limitations on each access class for which a non-AP STA is permitted to transmit.

#### 10.23.4.2.2 Procedures at the AP

Regardless of the AC's ACM setting, the AP shall respond to an ADDTS Request frame with an ADDTS Response frame that may be to accept or deny the request. On receipt of an ADDTS Request frame from a non-AP STA, the AP shall make a determination about whether to

a) Accept the request, or
b) Deny the request.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The algorithm used by the AP to make this determination is implementation dependent. An AP when dot11SSPNInterfaceActivated is true shall use the policies delivered by the SSPN that are stored in the dot11InterworkingEntry, which is part of the dot11InterworkingTable. If the AP decides to accept the request, the AP shall also derive the medium time from the information conveyed in the TSPEC element in the ADDTS Request frame. The AP may use any algorithm in deriving the medium time, but K.2.2 (Deriving medium time) provides a procedure that may be used. Having made such a determination, the AP shall transmit a TSPEC element to the requesting non-AP STA contained in an ADDTS Response frame. If the AP is accepting the request, the Medium Time field shall be specified. If the AP is accepting a request for a downlink TS, the Medium Time field shall be set to 0. If the AP is accepting a request corresponding to an AC for which ACM is 0 (e.g., the TSPEC is to change APSD behavior), the Medium Time field shall be set to 0.

#### 10.23.4.2.3 Procedure at non-AP STAs

Each EDCAF shall maintain two MAC variables: admitted_time and used_time.

The admitted_time and used_time shall be set to 0 at the time of (re)association. The STA may subsequently decide to explicitly request medium time for the AC that is associated with the specified priority.

In order to make such a request, the STA shall transmit a TSPEC element contained in an ADDTS Request frame with the following fields specified (i.e., nonzero): Nominal MSDU Size, Mean Data Rate, Minimum PHY Rate, Inactivity Interval, and Surplus Bandwidth Allowance. The Medium Time field is not used in the request frame and shall be set to 0.

On receipt of a TSPEC element contained in an ADDTS Response frame indicating that the request has been accepted, the STA shall recompute the admitted_time for the specified EDCAF as follows:

admitted_time = admitted_time + dot11EDCAAveragingPeriod × medium time of TSPEC.

The STA may choose to tear down the explicit request at any time. For the teardown of an explicit admission, the STA shall transmit a DELTS frame containing the TSID and direction that specify the TSPEC to the AP.

If the STA sends or receives a DELTS frame, it shall recompute the admitted_time for the specified EDCAF as follows:

admitted_time = admitted_time – dot11EDCAAveragingPeriod × medium time of TSPEC.

The MAC variable used_time is the amount of time used, in units of 32 μs, by the STA in dot11EDCAAveragingPeriod. The MAC variable admitted_time is the medium time allowed by the AP, in units of 32 μs, in dot11EDCAAveragingPeriod. The STA shall update the value of used_time:

a) At dot11EDCAAveragingPeriod second intervals
   used_time = max((used_time – admitted_time), 0)
b) After each successful or unsuccessful frame exchange sequence,
   used_time = used_time + MPDUExchangeTime

The MPDUExchangeTime is the duration of the frame exchange sequence. For the case of an MPDU transmitted with Normal Ack ack policy and without RTS/CTS protection, this equals the time required to transmit the MPDU plus the time required to transmit the expected response frame plus one SIFS. Frame exchange sequences that do not include any Data frames are excluded from the used_time update. Any RD transmission granted by the AP is excluded from the used_time update. If the used_time value reaches or exceeds the admitted_time value, the corresponding EDCAF shall no longer transmit QoS Data frames or QoS Null frames using the EDCA parameters for that AC as specified in the QoS Parameter Set element. However, a STA may choose to temporarily replace the EDCA parameters for that EDCAF with those specified for an AC of lower priority, if no admission control is required for those ACs.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

NOTE—When a frame is transmitted using temporary EDCA parameters, the TID field of that frame is not modified.

If, for example, a STA has made and had accepted an explicit admission for a TS and the channel conditions subsequently worsen, possibly including a change in PHY data rate so that it requires more time to send the same data, the STA may make a request for more admitted_time to the AP and at the same time downgrade the EDCA parameters for that AC for short intervals in order to send some of the traffic at the admitted priority and some at the unadmitted priority, while waiting for a response to the admission request.

### 10.23.4.3 Controlled-access admission control

This subclause describes the schedule management of the admitted HCCA streams by the HC. When the HC provides controlled channel access to STAs, it is responsible for granting or denying polling service to a TS based on the parameters in the associated TSPEC. If the TS is admitted, the HC is responsible for scheduling channel access to this TS based on the negotiated TSPEC fields. The HC should not initiate a modification of TSPEC fields of an admitted TS unless requested by the STA. The HC should not tear down a TS unless explicitly requested by the STA or at the expiration of the inactivity timer. The polling service based on admitted TS provides a "guaranteed channel access" from the scheduler in order to have its QoS requirements met. This is an achievable goal when the WM operates free of external interference (such as operation within the channel by other technologies and co-channel overlapping BSS interference). The nature of wireless communications may preclude absolute guarantees to satisfy QoS requirements.

The following are rules for the operation of the scheduler:

— The scheduler shall be implemented so that, under controlled operating conditions, all STAs with admitted TS are offered TXOPs that satisfy the service schedule.

— Specifically, if a TS is admitted by the HC, then the scheduler shall service the STA during an SP. An SP is a period of time during which a set of one or more downlink individually addressed frames and/or one or more polled TXOPs are granted to the STA. An SP starts at fixed intervals of time specified in Service Interval field. The first SP starts when the lower order 4 octets of the TSF timer equals the value specified in Service Start Time field.[36] Additionally, the minimum TXOP duration shall be at least the time to transmit one maximum MSDU size successfully at the minimum PHY rate specified in the TSPEC. If maximum MSDU size is not specified in the TSPEC, then the minimum TXOP duration shall be at least the time to transmit one nominal MSDU size successfully at the minimum PHY rate. The vendors are free to implement any optimized algorithms, such as reducing the polling overheads, increasing the TXOP duration, etc., within the parameters of the transmitted schedule.

— The HC shall admit its request based on Infrastructure Authorization Information in dot11InterworkingEntry, which is part of the dot11InterworkingTable. The dot11InterworkingEntry specifies whether a non-AP STA is permitted to use HCCA, its throughput limitation and its minimum delay bound.

When the HC aggregates the admitted TS, it shall set the Aggregation field in the granted TSPEC to 1. An AP shall schedule the transmissions in HCCA TXOPs and communicate the service schedule to the STA. The HC shall provide an aggregate service schedule if the STA sets the Aggregation field in its TSPEC request. If the AP establishes an aggregate service schedule for a STA, it shall aggregate all HCCA streams for the STA. The service schedule is communicated to the STA in a Schedule element contained in an ADDTS Response frame. In the ADDTS Response frame, the modified service start time shall not exceed the requested service start time, if specified in ADDTS Request frame, by more than one maximum service interval (SI). The HC uses the maximum SI for the initial scheduling only as there might be situations that HC is not be able to service the TS at the scheduled timing, due to an EDCA or DCF transmission or other interferences interrupting the schedule.

[36] The lower order 4 octets of the TSF timer cover a span of around 71 min. Due to TSF timer wrapover and due to the possibility of receiving the schedule frame after the indicated start time timer, ambiguity may occur. This ambiguity is resolved by using the nearest absolute TSF timer value in past or future when the lower order 4 octets match the Start Time field in the Schedule element.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Service Interval field value in the Schedule element shall be greater than the minimum SI. The service schedule could be subsequently updated by an AP as long as it meets TSPEC requirements.

The HC may update the service schedule at any time by sending a Schedule element in a Schedule frame. The updated schedule is in effect when the HC receives the Ack frame for the Schedule frame. The service start time in the Schedule element in the Schedule frame shall not exceed the beginning of the immediately previous SP by more than the maximum SI. The service start time shall not precede the beginning of the immediately previous SP by more than the minimum SI.

A STA may affect the service schedule by modifying or deleting its existing TS as specified in 11.4 (TS operation).

K.3.1 (Guidelines for deriving service schedule parameters) provides guidelines for deriving an aggregate service schedule for a single STA from the STA's admitted TS. The schedule shall meet the QoS requirements specified in the TSPEC.

During any time interval [$t1$, $t2$] including the interval that is greater than the specification interval, the cumulative TXOP duration shall be greater than the time required to transmit all MSDUs (of nominal MSDU size) arriving at the mean data rate for the stream, over the period [$t1$, $t2 - D$]. The parameter $D$ is set to the specified maximum SI in the TSPEC. If maximum SI is not specified, then $D$ is set to the delay bound in the TSPEC.

The HC shall use the minimum PHY rate in calculating TXOPs if the minimum PHY rate is present in the TSPEC field in the ADDTS response. Otherwise, the HC may use an observed PHY rate in calculating TXOPs. A STA may have an operational rate lower than the minimum PHY rate due to varying conditions on the channel for a short time and still may be able to sustain the TS without changing the minimum PHY rate in the TSPEC.

A minimum set of TSPEC fields shall be specified during the TSPEC negotiation. The specification of a minimum set of parameters is required so that the scheduler can determine a schedule for the stream that is to be admitted. These parameters are Mean Data Rate, Nominal MSDU Size, Minimum PHY Rate, Surplus Bandwidth Allowance, and at least one of Maximum Service Interval and Delay Bound in the ADDTS Request frame. In the ADDTS Response frame, these parameters are Mean Data Rate, Nominal MSDU Size, Minimum PHY Rate, Surplus Bandwidth Allowance, and Maximum Service Interval and shall be nonzero when a stream is admitted.

If any of the elements in the minimum set of parameters does not have the required nonzero value, as specified above in this subclause, in the ADDTS Request frame, the HC may replace the unspecified parameters with nonzero values and admit the stream, or it may reject the stream. If the HC admits the stream with the alternative set of TSPEC fields, these parameters are indicated to the STA through the ADDTS Response frame. If both maximum SI and delay bound are specified, the HC may use only the maximum SI. If any other parameter is specified in the TSPEC element, the scheduler may use it when calculating the schedule for the stream. The HC may also use the UP value in the TS Info field for admission control or scheduling purposes; however, this decision is outside the scope of this standard. The mandatory set of parameters might be set by any higher layer entity or may be generated autonomously by the MAC.

If a STA specifies a nonzero minimum SI and if the TS is admitted, the HC shall generate a schedule that conforms to the specified minimum SI.

A reference design for a sample scheduler and admission control unit is provided in Annex K. A sample use of the TSPEC for admission control is also described in Annex K.

### 10.23.5 Restricted access window (RAW) operation

#### 10.23.5.1 General

Restricting uplink channel access to a small number of STAs and spreading their uplink access attempts over a period of time might improve the medium utilization's efficiency by reducing collisions. When dot11RAWOperationActivated is true, an AP may allocate a medium access interval, called a restricted access window (RAW), for a group of STAs within a (short) beacon interval and broadcast this information using S1G Beacon frame.

An S1G STA with dot11RAWOperationImplemented equal to true shall set the RAW Operation Support field in the S1G Capabilities element it transmits to 1. An S1G STA with dot11RAWOperationImplemented equal to false shall set the RAW Operation Support field in the S1G Capabilities element it transmits to 0.

(#181)A non-AP STA with dot11RAWOperationImplemented equal to true shall follow the RAW procedure, as described in this subclause.

An AP shall not include a non-AP STA in any RAW Group from which it has received an S1G Capabilities element whose RAW Operation Support field value is 0.

An S1G STA in TIM mode with dot11RAWOperationImplemented equal to false that receives an RPS element from the AP it is associated shall not access the WM for the RAW duration indicated in the RPS element.

An S1G STA in TIM mode is in the RAW group indicated by the RAW Group subfield in the RAW Assignment subfield of the RPS element if the AID of the S1G STA in TIM mode ($n$) is greater than or equal to the lowest AID of the STA allocated in the RAW ($N_1$) and the AID of the STA is less than or equal to the highest AID of the S1G STA in TIM mode ($N_2$) allocated in the RAW (i.e., $N_1 \leq n \leq N_2$), where $N_1$ is constructed by (#3487concatenating the Page Index subfield and the RAW Start AID subfield in the RAW Group subfield of the RPS element and $N_2$ is constructed by (#3487)concatenating the Page Index subfield and the RAW End AID subfield in the RAW Group subfield of the RPS element.(#2047)

An S1G STA in TIM mode that receives an RPS element in an S1G Beacon frame transmitted by the AP with which it is associated determines the RAW timing as the RAW duration specified by RAW Slot Definition subfield in the RAW Assignment subfield of the received RPS element and the start time of the RAW specified by the RAW Start Time subfield in the RAW Assignment subfield of the received RPS element.

The RAW is divided into one or more RAW slots. The Slot Duration Count subfield of the RAW Slot Definition subfield in the RAW Assignment subfield of the RPS element defines the duration of a RAW slot in the RAW.

If the S1G STA in TIM mode belongs to the RAW group, it is allowed to contend for medium access at the start of its assigned RAW slot (see 10.23.5.3 (Slot assignment procedure in RAW)) and shall not contend for medium access within a RAW slot not assigned to it during that RAW.

An AP may allocate more than one RAW by including more than one RAW Assignment subfield in the RPS element within a (short) beacon interval with different RAW parameters. The AP may also assign periodic RAWs to a group of S1G STAs in TIM mode where the periodicity information is indicated in the RPS element (see 9.4.2.190 (RPS element)).

An AP may assign to each S1G STA in TIM mode or a group of S1G STAs in TIM mode a RAW slot inside the RAW at which the STA(s) is (are) allowed to contend for medium access. After determining its channel access RAW slot assigned by the AP, the S1G STA in TIM mode starts to access the channel not earlier than

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

its assigned RAW slot based on the S1G variant of EDCA (10.23.2.6 (EDCA channel access in an S1G BSS)). An S1G STA in TIM mode that is not a member of the RAW group indicated by the RAW Group subfield in the RAW Assignment subfield of the RPS element or is not allowed to access the RAW implicitly indicated by the values of RAW Type and RAW Type Options subfield for which the RAW Group subfield is not present, shall not access the WM in the indicated channels of the RPS element or in the BSS operating channel if there are no indicated channels for duration of the RAW, except for a non-AP STA that is allowed not to check the Beacon frame (e.g., S1G STA in non-TIM mode). Upon receipt of any frame (e.g., PS-Poll frame or trigger frame) for the RAW duration from an S1G STA in TIM mode not within the RAW group indicated by the RAW Group subfield in the RAW Assignment subfield of the RPS element, the AP shall respond with a Control frame (e.g., NDP PS-Poll ACK frame).

An AP may further indicate on which channel(s) the SST STA(s) that are granted access to the RAW are allowed to transmit for the RAW duration, through the Channel Indication subfield in the RAW Assignment subfield of the RPS element (see 9.4.2.190 (RPS element)). An SST STA is an S1G STA that is associated with an AP and that chooses a subset of the allowed operating channels for the SST on which to operate when SST operation is activated by the AP as indicated (#1776)in the SST element in the Beacon frame. A value of 1 in a bit position in the Channel Activity Bitmap in the Channel Indication subfield of the RPS element indicates that operation is allowed on the BSS operating channel for the RAW duration, with any allowed operating bandwidth that includes that channel, subject to the limitations described in 10.51 (Subchannel selective transmission (SST)). Access to the channel shall be performed according to the signaling of the procedure described in 10.51 (Subchannel selective transmission (SST)) followed by the Channel Indication signaling in RPS element, assuming the primary channel is a channel identified by a value of 1 in one of the Channel Activity bits in the Channel Indication subfield in the RAW Assignment subfield of the RPS element. The channels that are allowed for SST operation in the RPS element can be different from the channels allowed for SST operation in the SST element. An AP shall not include an S1G STA in TIM mode that is not supporting the SST Operation in the RAW Group of an RPS element that has a Channel Indication that does not include the primary BSS operating channel.

An S1G AP may protect the access of sensor STAs in some S1G Beacon frames by allocating the PRAW (10.23.5.8 (Periodic RAW (PRAW) operation)). During the allocated PRAW, only sensor STAs can access the wireless medium. An S1G AP may determine the duration of the PRAW based on the number of sensor STAs in its network, their expected uplink data amount and data rate and any other factors that the S1G AP chooses.

AP may designate a RAW for S1G STAs in non-TIM mode by setting the RAW Type to Simplex RAW and setting the RAW Type Options to Non-TIM RAW in the RPS element. In a non-TIM RAW, only S1G STAs in non-TIM mode that have been previously scheduled within the RAW such as TWT STAs or awake/doze(#6038) rescheduled STAs (as described in 10.47.2 (Rescheduling of awake/doze cycle)) are allowed to access the medium.

### 10.23.5.2 RAW structure and timing

An illustration of the RAW structure and timing diagram is shown in Figure 10-35 (Restricted Access Window (RAW)).

An AP indicates the RAW allocation and RAW slot assignment within the RAW by including the RPS element and the TIM element in an S1G Beacon frame.

An AP allows or prohibits transmission at the end of the assigned RAW slot by using the Cross Slot Boundary subfield in the RAW Slot Definition subfield within the RAW Assignment subfield of the RPS element (9.4.2.190 (RPS element)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

If the Cross Slot Boundary subfield in the RAW Slot Definition subfield within the RAW Assignment subfield of the RPS element is set to 1, a STA is allowed to cross its assigned RAW slot boundary to complete the ongoing frame exchange sequence.

If the Cross Slot Boundary subfield in the RAW Slot Definition subfield within the RAW Assignment subfield of the RPS element is(M118) 0, a STA shall not transmit or cause to be transmitted a frame exchange sequence that would exceed boundary of its allocated RAW slot.

As shown in Figure 10-35 (Restricted Access Window (RAW)), if the Cross Slot Boundary subfield in RAW Assignment subfield of the RPS element is equal to 0, a STA may initiate frame transmission only if the remaining time to the end of the assigned RAW slot duration is greater than or equal to the transmission time and reception of any immediate response expected from the peer MAC entity prior to the end of the allocated RAW slot boundary. Otherwise, it shall not initiate transmission of a frame even though the remaining RAW slot duration is nonzero.

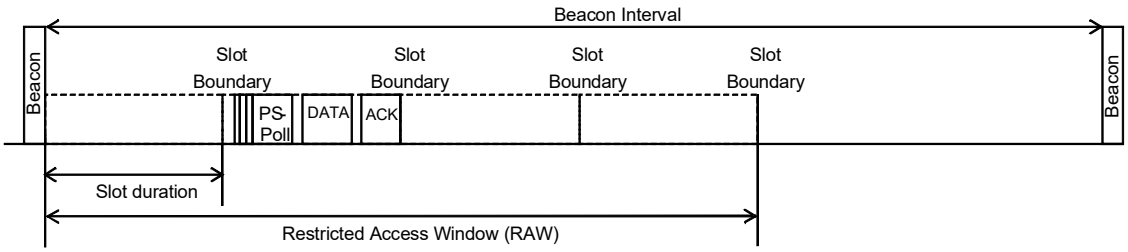

**Figure 10-35—Restricted Access Window (RAW)**

### 10.23.5.3 Slot assignment procedure in RAW

This subclause defines a RAW slot assignment procedure for STAs that are allowed to access the medium within a RAW based on the RPS element and the TIM element in a Beacon frame. Further restrictions apply to a RAW for which the RA Frame Indication field in the RPS element is 1 as described in 10.23.5.7 (RAW Operation with Resource Allocation frame).

A STA shall obtain the number of RAW slots in the RAW ($N_{RAW}$) from the Number of Slots subfield in the RAW Slot Definition subfield of RAW Assignment subfield of the RPS element. The RAW slots in the RAW are indexed from 0 to ($N_{RAW} - 1$) as shown in Figure 10-36 (Illustration of the RAW slot assignment procedure (RAW not restricted to STAs whose AID bits in the TIM element are equal to 1)).

The STA shall determine the index of the RAW slot, $i_{slot}$, in which the STA is allowed to start contending for the medium based on the following mapping function:

$$i_{slot} = (x + N_{offset}) \bmod N_{RAW}$$

where

| | |
|---|---|
| $x$ | is the position index of the AID of the STA or the AID of the STA |
| $N_{offset}$ | represents the offset value in the mapping function |
| $N_{RAW}$ | is the value of the Number of Slots subfield |

The value $x$ is the position index of the AID of the STA if the RAW is restricted to STAs whose AID bits in the TIM element are equal to 1 (the RAW Type field is equal to 0 and the Bit 0 of the RAW Type Options field is equal to 1 or the RAW Type field is equal to 3), and AIDs are arranged in ascending order and each AID is assigned with a position index, which starts from 0 (see Figure 10-37 (Illustration of the RAW slot assignment procedure (RAW restricted to STAs whose AID bits in the TIM element are equal to 1))). Otherwise, if the RAW is not restricted to STAs whose AID bits in the TIM element are equal to 1 (the

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

RAW Type field is equal to 0 and the Bit 0 of the Raw Type Options field is equal to 0), $x$ is the AID of the STA (see Figure 10-36 (Illustration of the RAW slot assignment procedure (RAW not restricted to STAs whose AID bits in the TIM element are equal to 1))); $N_{offset}$ represents the offset value in the mapping function, which improves the fairness among the STAs in the RAW, and the STA shall use the 2 least significant octets of the FCS field of the S1G Beacon frame for the $N_{offset}$.

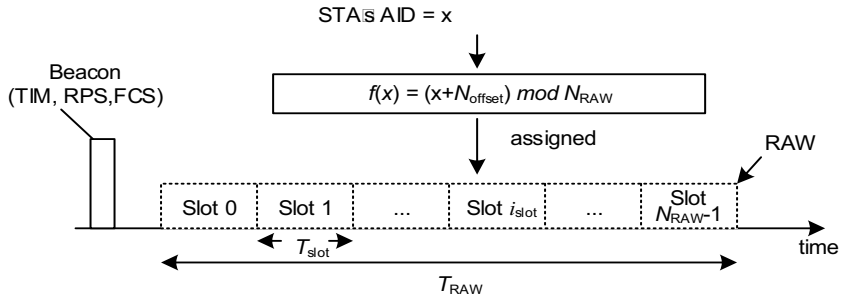

**Figure 10-36—Illustration of the RAW slot assignment procedure (RAW not restricted to STAs whose AID bits in the TIM element are equal to 1)**

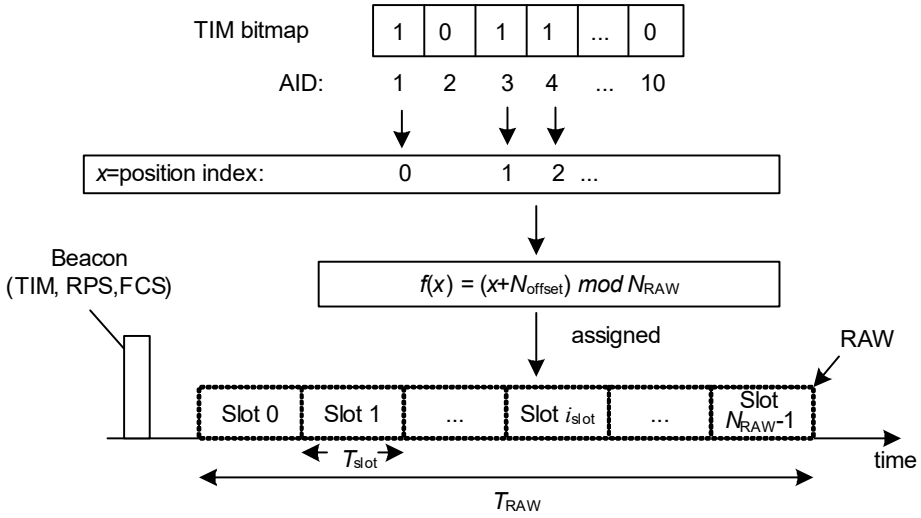

**Figure 10-37—Illustration of the RAW slot assignment procedure (RAW restricted to STAs whose AID bits in the TIM element are equal to 1)**

### 10.23.5.4 Slotted channel access procedure in RAW

When the RAW is not restricted to STAs with DL BU indication in the TIM element (the RAW is a generic RAW and the Paged STA indication is equal to 0), all STAs that belong to a RAW group are allowed to access the medium in the RAW of the RAW group, an AP assigns a RAW slot for each STA that belongs to the RAW group (10.23.5.3 (Slot assignment procedure in RAW)). Each STA that belongs to the RAW group shall start to contend for the WM not earlier than the start of the assigned RAW slot. The channel access is based on EDCA.

When the RAW is restricted to STAs with DL BU indication in the TIM element (the RAW is a generic RAW and the Paged STA indication is equal to 1 or the RAW is a triggering frame RAW), paged STAs only

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

are allowed to access the medium in the RAW, after receiving a TIM element, the paged STA starts to contend for the WM not earlier than the allocated RAW slot within the RAW defined as the function of STA position in the TIM element and the RAW group information in the RPS element (10.23.5.3 (Slot assignment procedure in RAW)), and non-paged STAs are not allowed to access the RAW.

An AP may designate a RAW for trigger frames by setting the RAW type to Triggering Frame RAW. When the RAW type is Triggering Frame RAW, each STA in the RAW Group is only allowed to send up to one trigger frame during its assigned RAW slot as described in 10.23.5.3 (Slot assignment procedure in RAW). In the Triggering Frame RAW, a trigger frame is limited to a QoS Null contained in a non-A-MPDU frame or a (NDP) PS-Poll frame. In the Triggering Frame RAW, the STA transmits a trigger frame to the AP not earlier than the start of its assigned RAW slot. The duration of the trigger frame exchange sequence shall not exceed a RAW slot duration calculated by the RAW Slot Definition subfield in the RAW Assignment subfield of the RPS element. And, in the Triggering Frame RAW, crossing RAW slot boundary is not allowed.

After receiving the trigger frame from the paged STA in the Triggering Frame RAW, the AP shall not respond with the downlink buffered BU during the Triggered Frame RAW and may deliver the downlink buffered BU for the corresponding paged STAs after the end of the current Triggering Frame RAW.

An AP may protect transmissions of PS-Poll or trigger frames by setting the NAV for the RAW immediately following the S1G Beacon frame as specified in at least one of the RPS elements (see 10.3.2.4 (Setting and resetting the NAV)). (#221)A STA with dot11RAWOperationImplemented equal to true that is allowed to access the medium during this RAW shall ignore the NAV set by the S1G Beacon frame as described in 10.3.2.4 (Setting and resetting the NAV).

### 10.23.5.5 EDCA backoff procedure in generic RAW or triggering frame RAW

An illustration of EDCA backoff procedure in RAW is shown in Figure 10-38 (Backoff procedure for restricted channel access control).

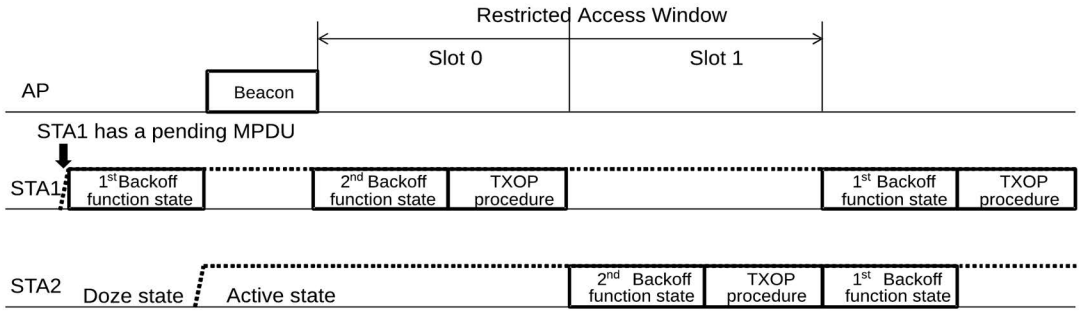

**Figure 10-38—Backoff procedure for restricted channel access control**

For supporting the restricted channel access control based on EDCA, a STA maintains two backoff function states. First backoff function state is used outside RAW and second backoff function state is used inside RAW.

Each STA performing EDCA access suspends an operation of its EDCAF at the start of each RAW and stores the value of the backoff counter, CW[AC], and QSRC[AC] as the first backoff state. At the end of the RAW, the stored first backoff function state is restored and an operation of the EDCAF is resumed. If the previously stored first backoff function state is empty, the EDCAF of a STA shall invoke a backoff procedure, even if no additional transmissions are currently queued.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

If the STA is participating in the RAW and has a pending MPDU, the EDCAF of the STA shall invoke a new backoff procedure for accessing the WM in the RAW using the access category indicated by the (#332)RAW ACI subfield in an EDCA Parameter Set element. At the beginning of the allocated RAW slot, the STA sets the CW[AC] of the secondary backoff procedure to CWmin[AC]. The values of the backoff and CW[AC] used in the RAW is called the second backoff function state.

If the Cross Slot Boundary subfield in RAW Assignment subfield of the RPS element is 0, the STA shall count down backoff only in its assigned RAW slots within the RAW. If the Cross Slot Boundary subfield in RAW Assignment subfield of the RPS element is 1, the STA shall continue to count down backoff after its assigned RAW slots within the RAW.

After the end of the RAW, STAs with the second backoff counter shall reset and disregard the second backoff function state.

#### 10.23.5.6 EDCA backoff procedure in RAWs other than generic or triggering frame RAW

When the S1G STA is performing EDCA in any RAW other than generic or triggering frame RAW, it shall follow the rules defined in 10.23.2 (HCF contention based channel access (EDCA)).

An S1G STA performing EDCA outside a RAW shall suspend an operation of its EDCA at the start of the RAW and may resume it at the end of the RAW if the STA is not included in that RAW.

An S1G STA performing EDCA outside a RAW shall continue its EDCA operation at the start of the RAW if it is included in that RAW.

#### 10.23.5.7 RAW Operation with Resource Allocation frame

An AP transmits a Resource Allocation (RA) frame if Bit 1 of the RAW Type Options subfield is equal to 1 in the RAW Control subfield of the RAW Assignment subfield of the RPS element.

The AP transmits the RA frame to non-AP STAs belonging to the RAW group allocated to access the RAW as specified in the previously transmitted RPS element. A non-AP STA that does not belong to the RAW group may (#3683)discard the RA frame.

An AP shall schedule the Resource Allocation frame as the first frame to be transmitted at the beginning of the RAW following the channel access rules. The beginning of the RAW is further defined in the RAW start time subfield of the RAW assignment subfield of the RPS element.

AP shall defer the transmission of the RA frame till the channel is free but since the preallocated RAW duration information in the RPS frame may be shortened by the delay of the transmission of the RA frame, the AP and STA shall check the transmission time of the allocated RAW slot against the end of RAW period. If the transmission of the RA frame is later than the end of RAW period, the AP and STA shall discard the information indicated in the RPS element and follow the channel access rules defined outside the RAW (10.23.5 (Restricted access window (RAW) operation)).

The AP assigns a RAW slot to either an individual STA indicated by the Partial AID subfield or a group of STAs indicated by the Group ID subfield within the Slot Assignment field of the RA frame when Slot Assignment Mode subfield in the Frame Control field of the RA frame is equal to 0. The AP assigns a RAW slot to an individual STA indicated by the Slot Assignment Indication field of the RA frame when Slot Assignment Mode subfield in the Frame Control field of the RA frame is equal to 1.

An intended STA identified by the RPS element should transition to awake state(#6038) before the RAW start time indicated in the RAW start time subfield of the RAW assignment subfield of the RPS element to receive the RA frame. The STA shall not access the medium during its assigned RAW with the RA

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

indication if it fails to receive the RA frame. The STA can resume medium access according to the channel access rule after the RAW.

An intended STA identified by the RPS element of a RAW learns its assigned RAW slots for both uplink and downlink service periods according to the Slot Assignment subfield or the Slot Assignment Bitmap subfield in Slot Assignment Indication field of the RA frame. The STA should be awake before the start of the RAW slot time assigned to it. The AP shall start the delivery of BUs addressed to the STA using the EDCA procedure at the beginning of the RAW slot assignment if the TIM bit for the STA in the TIM element is equal to 1 after receiving an (NDP) PS-Poll or trigger frame from the STA. The STA may transmit uplink data as listed below:

— When the AP explicitly signals permission for the non-AP STA to begin UL transmission using the explicit signaling provided by BDT (10.49 (Bidirectional TXOP)) or RD protocol (10.29 (Reverse direction protocol)).
— Using EDCA procedure when the AP transmits a frame to the STA with more data bit equal to 0.
— Using EDCA procedure at the beginning of its RAW slot assignment if the TIM bit for this STA is 0 and this STA has not negotiated with the AP to use the UL-Sync procedure (10.48 (Sync frame operation)).
— After receiving a frame sequence that contains a sync frame if the STA has negotiated with the AP to use the UL-Sync procedure.

#### 10.23.5.8 Periodic RAW (PRAW) operation

An AP may schedule a RAW in periodic manner by setting Periodic RAW Indication subfield to 1 for the RAW Assignment subfield of an RPS element, and this RAW is called a PRAW.

PRAW allocation may be indicated by an RPS element included in S1G Beacon frames and/or Probe Response frames. Once a PRAW is allocated, the allocation indication is broadcasted by the AP such that every S1G STA in TIM mode can identify the allocation of PRAW. However, it is not necessary for an AP to indicate the PRAW allocation in every S1G Beacon frame transmitted in the beacon interval or short beacon interval, for which PRAW is allocated. The parameters in the RAW Assignment subfield for PRAW shall not be changed until updated PRAW information is broadcasted. A non-AP STA updates the PRAW information and accesses the channel according to the parameters in the RAW Assignment subfield of the PRAW indicated by the Periodic Operation Parameters subfield of the most recently received RPS element.

If an AP allocates more than one PRAW assignments, all active PRAW assignments shall be included in one or more RPS elements in the same S1G Beacon frame.

The S1G Beacon frame after which the first window of the PRAW appears is indicated by the PRAW Start Offset subfield of Periodic Operation Parameters of RPS element, and the starting time of the first window of the PRAW with respect to the S1G Beacon frame is equal to the RAW start time indicated by the same RAW Assignment subfield.

The periodicity of RAW assignment for a group of STAs indicated in the RAW Group subfield of the RAW Assignment subfield of RPS element is valid for a fixed number of periods indicated in the PRAW Validity subfield of the Periodic Operation Parameters subfield in the RAW Assignment subfield of RPS element. An AP may extend current PRAW assignment by indicating the PRAW assignment with the PRAW Validity subfield value extended before it expires.

At each RPS element with one or more PRAW assignments included, an AP indicates next scheduled PRAW indication time at which the AP will send another RPS element with PRAW assignments. The next scheduled PRAW indication time is the closest DTIM beacon(#3309) before any of PRAW Validity subfield value of PRAW assignments included in current RPS element expires.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

An AP may send another RPS element with PRAW assignments before next scheduled PRAW indication time. However, an AP shall not modify currently active PRAW assignment until next scheduled PRAW indication time. If an AP intends to add a new PRAW assignment, the new PRAW assignment shall be indicated from the next scheduled PRAW indication time.

## 10.24 Mesh coordination function (MCF)

### 10.24.1 General

Under MCF, the basic unit of allocation of the right to transmit onto the WM is the TXOP. Each TXOP is defined by a starting time and a defined maximum length.

There are two types of TXOP in MCF: EDCA TXOPs and MCCA TXOPs. The EDCA TXOP is obtained by a mesh STA winning an instance of EDCA contention (see 10.23.2 (HCF contention based channel access (EDCA))). The MCCA TXOP is obtained by a mesh STA gaining control of the WM during an MCCAOP. The MCCAOP is an interval of time for frame transmissions that has been reserved by means of the exchange of MCCA frames (see 10.24.3 (MCF controlled channel access (MCCA))).

EDCA TXOPs of a mesh STA that has dot11MCCAActivated true shall not overlap with the time periods of any of its tracked MCCAOP reservations.

The process of tracking MCCAOP reservations involves the recording of the MCCAOP reservations and the data that structure the MCCAOP advertisements of these reservations, namely the advertisement set sequence number, advertisement elements bitmap, and the advertisement element (#4136)indices, in a local database, and the updating of this database on the basis of received advertisements as described in 10.24.3.7.5 (Receipt of an MCCAOP advertisement).

### 10.24.2 MCF contention based channel access

MCF implements the same EDCA (see 10.23.2 (HCF contention based channel access (EDCA))) as does HCF.

### 10.24.3 MCF controlled channel access (MCCA)

#### 10.24.3.1 General

MCF controlled channel access (MCCA) is an optional access method that allows mesh STAs to access the WM at selected times with lower contention than would otherwise be possible. This standard does not require all mesh STAs to use MCCA. MCCA might be used by a subset of mesh STAs in an MBSS. However, MCCAOP reservations may be set up among mesh STAs that have dot11MCCAActivated true and that operate on the same channel; MCCAOP reservations shall not be set up otherwise. The performance of MCCA might be impacted by STAs that do not respect MCCAOP reservations.

MCCA enabled mesh STAs use Management frames to make reservations for transmissions. The mesh STA transmitting an MCCA Setup Request frame to initiate a reservation becomes the MCCAOP owner of the MCCAOP reservation. The receivers of the MCCA Setup Request frame are the MCCAOP responders. The MCCAOP owner and the MCCAOP responders advertise this MCCAOP reservation to their neighbors via an MCCAOP advertisement. An MCCA enabled neighbor mesh STA shall not transmit during these reserved MCCAOP time periods. During its MCCAOP, the MCCAOP owner obtains a TXOP by winning an instance of EDCA contention. Because of its reservation, the MCCAOP owner experiences no competition from other MCCA enabled neighbor mesh STAs. At the start of an MCCAOP, the EDCAF of the MCCAOP owner replaces the AIFSN, CWmin, and CWmax value of its dot11EDCATable with MCCA access parameters.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

In order to use MCCA, a mesh STA maintains synchronization with its neighboring mesh STAs. Mesh STAs that use MCCA shall use a DTIM interval with a duration of $2^n \times 100$ TU with $n$ being a non-negative integer less than or equal to 17. Additionally, a mesh STA shall track the reservations of its neighboring mesh STAs.

NOTE 1—The DTIM interval of this form was chosen so that the starting times of the reservations do not change relative to each other between consecutive DTIM intervals. The restriction that $n$ be less than or equal to 17 was chosen for compatibility with the maximum DTIM interval as well as the compatibility of the reservation's MCCAOP offset range (see 9.4.2.104.2 (MCCAOP Reservation field)) with the maximal DTIM interval length.

NOTE 2—It is allowed that a different value for the DTIM interval is used for mesh STAs that use MCCA in an MBSS that is centrally controlled and the central authority provides a coordination of the DTIM interval of the mesh STAs that use MCCA in the MBSS.

#### 10.24.3.2 MCCA activation

When it receives an MLME-ACTIVATEMCCA.request primitive from its SME, a mesh STA shall set the MCCA Enabled subfield of the Mesh Capability field in the Mesh Configuration element to 1 in Beacon and Probe Response frames it transmits. It shall not initiate or accept MCCA Setup Request frames for dot11MCCAScanDuration TUs after the receipt of the MLME-ACTIVATEMCCA.request primitive.

During the dot11MCCAScanDuration waiting period, the mesh STA learns its neighborhood MCCAOP periods by receiving Beacon, Probe Response, or MCCA Advertisement frames from neighboring mesh STAs.

After this period, the mesh STA may initiate and accept MCCA Setup Request frames as per 10.24.3.6 (MCCAOP setup procedure).

#### 10.24.3.3 MCCAOP reservations

An MCCAOP reservation specifies a schedule for frame transmissions. The time periods scheduled for frame transmissions in the reservation are called *MCCAOPs*. The schedule is set up between an MCCAOP owner and one (for individually addressed frames) or more (for group addressed frames) MCCAOP responders. MCCAOPs are set up by means of the procedure defined in 10.24.3.6 (MCCAOP setup procedure). Once an MCCAOP reservation is set:

— Access to the channel by MCCA enabled mesh STAs is governed by the procedures in 10.24.3.9 (Access during MCCAOPs).

— The MCCAOP reservation is advertised according to the procedures in 10.24.3.7 (MCCAOP advertisement).

The schedule is defined by means of the MCCAOP Reservation field defined in 9.4.2.104.2 (MCCAOP Reservation field). An MCCAOP reservation schedules a series of MCCAOPs with a common duration given in the MCCAOP Duration subfield of the MCCAOP Reservation field. This series is started after the first DTIM (#1000)beacon following the successful completion of the MCCAOP setup procedure and terminated when the MCCAOP reservation is torn down.

The reservation defines a regular schedule of MCCAOPs in the DTIM interval of the MCCAOP owner. The number of MCCAOPs in the DTIM interval is given by the value of the MCCAOP Periodicity subfield of the MCCAOP Reservation field. The MCCAOP Offset subfield specifies the offset of the first scheduled MCCAOP of the transmission schedule relative to the beginning of the DTIM interval of the MCCAOP owner. The following MCCAOPs are separated by a time interval with a duration equal to the length of the DTIM period divided by the value in the MCCAOP Periodicity subfield.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

An example of an MCCAOP reservation schedule is shown in Figure 10-39 (Example MCCAOP reservation with MCCAOP Periodicity equal to 2). In this example, the MCCAOP Periodicity equals two, so that there are two MCCAOPs in each DTIM interval. As further illustrated in the figure, the MCCAOP Offset value indicates the beginning of the first MCCAOP in each DTIM interval.

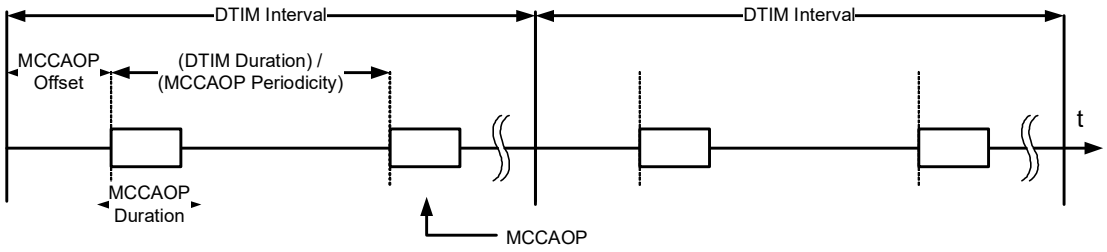

**Figure 10-39—Example MCCAOP reservation with MCCAOP Periodicity equal to 2**

If a mesh STA adjusts its TBTT, e.g., in response to a TBTT adjustment request, it shall adjust the MCCAOP reservations by modifying the MCCAOP Offset of each MCCAOP reservation.

An MCCAOP reservation is identified by an MCCAOP reservation ID. The MCCAOP owner shall select an MCCAOP reservation ID that is unique among all of its MCCAOP reservations. The MCCAOP reservation ID and MAC address of the MCCAOP owner uniquely identify the MCCAOP reservation in the mesh BSS. The MCCAOP reservation ID is an 8-bit unsigned integer and included in the MCCAOP Reservation ID field of an MCCAOP Setup Request element. If this MCCAOP setup request is for an individually addressed transmission, the MCCAOP Reservation ID is between 0 and 127. If this MCCAOP setup request is for a group addressed transmission, the MCCAOP Reservation ID is between 128 and 254. The value 255 is not used to identify a specific MCCAOP reservation but is reserved for usage in the MCCAOP teardown procedure as described in 10.24.3.8 (MCCAOP teardown).

(#181)(#1466)A mesh STA with dot11MCCAActivated equal to true shall support tracking of dot11MCCATrackStatesCapable MCCAOP reservations, including its own reservations. A mesh STA shall record the number of MCCAOP reservations that the mesh STA is currently tracking as dot11MCCATrackStatesActive.

(#181)(#1466)If dot11MCCATrackStatesActive is less than dot11MCCATrackStatesCapable, the mesh STA shall support tracking, setting up, and accepting additional MCCAOP reservations. In this case, the mesh STA shall set the Accept Reservations subfield in the Flags field to 1 in the MCCAOP Advertisement Overview elements it transmits.

(#1466)If dot11MCCATrackStatesActive is equal to dot11MCCATrackStatesCapable, the mesh STA shall not track, set up, or accept additional reservations. In this case, the mesh STA shall set the Accept Reservations subfield in the Flags field to 0 in the MCCAOP Advertisement Overview elements it transmits. Moreover, it shall reply to MCCA Setup Request frames with an MCCA Setup Reply frame with the MCCA Reply Code field in the MCCAOP Setup Reply element equal to 3: Reject: MCCAOP track limit exceeded.

The tracked MCCAOP reservations are advertised as described in 10.24.3.7 (MCCAOP advertisement). How to access the medium during the tracked MCCAOP reservations is specified in 10.24.3.9 (Access during MCCAOPs).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

#### 10.24.3.4 Neighborhood MCCAOP periods at a mesh STA

The set of MCCAOP reservations in which a mesh STA is involved as an MCCAOP owner or an MCCAOP responder and that are used for individually addressed transmissions are referred to as the *TX-RX periods of this mesh STA*.

The set of MCCAOP reservations in which a mesh STA is involved as an MCCAOP owner or an MCCAOP responder and that are used for group addressed transmissions are referred to as the *broadcast periods of this mesh STA*. Optionally, the broadcast periods of a mesh STA includes known target beacon transmission times of Beacon frames for which this mesh STA is either the transmitter or the receiver, and transmission or reception periods of a STA that is (#2210)colocated with the reporting mesh STA, for example, beacon or HCCA times of a (#2210)colocated AP.

The interference periods of a mesh STA comprise the TX-RX periods and the broadcast periods of its neighbor mesh STAs in which the mesh STA is not involved as the owner or as a responder. The TX-RX periods, the broadcast periods, and the interference periods of a mesh STA shall not be used for a new MCCAOP reservation with the mesh STA as transmissions in these periods might experience interference from the transmissions in the new MCCAOPs or might cause interference to them.

The interference periods are directly derived from the TX-RX Periods Report field and Broadcast Periods Report field of the MCCAOP Advertisement elements transmitted by the neighbor mesh STAs. The Interference Periods Report field reflects the latest TX-RX Periods Report and Broadcast Periods Report fields received from the neighbor mesh STAs.

The MCCAOP reservations of a mesh STA and its neighbors define a set of MCCAOPs that are already reserved for frame transmissions in the mesh neighborhood of a mesh STA. This set of MCCAOPs is referred to as the *neighborhood MCCAOP periods for the mesh STA*. Thus, neighborhood MCCAOP periods at a mesh STA include all MCCAOPs for which the mesh STA or one of its neighbors, including neighbors from other MBSSs, is either transmitter or receiver.

#### 10.24.3.5 MCCA access fraction (MAF)

The MCCA access fraction at a mesh STA is the ratio of the time reserved for MCCAOPs in the DTIM interval of this mesh STA to the duration of the DTIM interval. This parameter is reported in the MCCA Access Fraction field of the MCCAOP Advertisement Overview elements. The maximum value for the MAF that is allowed at a mesh STA is specified by dot11MAFlimit. The dot11MAFlimit is copied into the MAF Limit field of the MCCAOP Advertisement Overview element as described in 9.4.2.106 (MCCAOP Advertisement Overview element).

The MAF and the MAF Limit may be used to limit the use of MCCA in the mesh neighborhood of a mesh STA, as specified in 10.24.3.6 (MCCAOP setup procedure). Before attempting to set up an MCCAOP reservation with a neighbor peer mesh STA, a mesh STA shall verify that the new MCCAOP reservation does not cause its MAF to exceed its MAF Limit and that the new MCCAOP reservation does not cause the MAF of any of its neighbor peer mesh STAs to exceed their MAF Limit. An MCCAOP setup request shall be refused by the intended MCCAOP responder if the MAF limit of one of its neighbors is exceeded due to the new setup.

#### 10.24.3.6 MCCAOP setup procedure

The setup of an MCCAOP reservation is initiated by the MCCAOP owner and is accepted or rejected by the MCCAOP responder. The setup procedure for an MCCAOP reservation is as follows:

a) The MCCAOP owner shall build a map of the neighborhood MCCAOP periods in the DTIM interval after hearing advertisements from all of its neighbor mesh STAs with the MCCA Enabled

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

subfield of the Mesh Capability field in the Mesh Configuration element equal to 1. It shall request an MCCAOP advertisement, as described in 10.24.3.7.8 (MCCAOP advertisement request procedure), from each neighbor mesh STA from which no advertisement was heard in the last dot11MCCAAdvertPeriodMax DTIM intervals.

b) The MCCAOP owner shall determine the MCCAOP reservation. The MCCAOP parameters shall be chosen in such a way that they satisfy the following conditions:
   1) The reservation shall not overlap with the neighborhood MCCAOP periods of the MCCAOP owner.
   2) The reservation shall not overlap with the interference periods of the intended MCCAOP responder or responders.
   3) The reservation shall not cause the MAF limit to be exceeded for either itself or its neighbor mesh STAs.
   4) The Accept Reservations subfield of the Flags field equals 1 in the most recent MCCAOP Advertisement Overview element received from all intended MCCAOP responders.

c) If the conditions in item b) are satisfied, the MCCAOP owner shall transmit an MCCAOP Setup Request element to the intended MCCAOP responder with the chosen MCCAOP parameters.

d) The MCCAOP responder shall verify the following conditions:
   1) The reservation does not overlap with its neighborhood MCCAOP periods.
   2) The reservation does not cause the MAF limit to be exceeded for itself or its neighbor mesh STAs.
   3) The reservation does not cause dot11MCCATrackStatesActive to exceed dot11MCCATrackStatesCapable.(#1466)

e) If the conditions in item d) are satisfied, the responder shall send an MCCA Setup Reply frame to the MCCAOP owner with the MCCA Reply Code field in the MCCAOP Setup Reply element equal to 0: Accept, as defined in Table 9-285 (MCCA Reply Code field values).

f) If the conditions in item d) are satisfied and the MCCAOP request has been intended for group addressed transmissions, the responder shall include the reservation in its MCCAOP advertisement only after the MCCAOP advertisement from the MCCAOP owner is received.

g) If not all of the conditions in item d) are satisfied and the MCCAOP request is intended for individually addressed transmissions, the responder shall transmit to the MCCAOP owner an MCCA Setup Reply frame that is constructed as follows:
   1) If the condition in item d)1) is not satisfied and both conditions in item d)2) and item d)3) are satisfied, the responder may calculate an alternative MCCAOP reservation and include it in the MCCAOP Reservation field of the MCCAOP Setup Reply element. It shall set the MCCA Reply Code field of the MCCAOP Setup Reply element to 1: Reject: MCCAOP reservation conflict, as defined in Table 9-285 (MCCA Reply Code field values).
   2) If the condition in item d)2) is not satisfied, it shall set the MCCA Reply Code field of the MCCAOP Setup Reply element to 2: Reject: MAF limit exceeded, as defined in Table 9-285 (MCCA Reply Code field values).
   3) If the condition in item d)2) is satisfied and the condition in item d)3) is not satisfied, it shall set the MCCA Reply Code field of the MCCAOP Setup Reply element to 3: Reject: MCCAOP track limit exceeded, as defined in Table 9-285 (MCCA Reply Code field values).

h) If not all of the conditions in item d) are satisfied and the MCCAOP request is intended for group addressed transmissions, the responder shall send an MCCA Setup Reply frame to the MCCAOP owner with the MCCA Reply Code field in the MCCAOP Setup Reply element equal to 1: Reject: MCCAOP reservation conflict.

i) If the MCCAOP owner receives an MCCA Setup Reply frame with MCCA Reply Code equal to Accept, the MCCAOP reservation is established. Otherwise, the mesh STA may repeat the MCCAOP setup procedure using a modified MCCAOP Setup Request. If an alternative MCCAOP

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

reservation is included in the MCCAOP Setup Reply element, the mesh STA may consider this alternative in its modified MCCAOP Setup Request.

### 10.24.3.7 MCCAOP advertisement

#### 10.24.3.7.1 General

A mesh STA with dot11MCCAActivated equal to true tracks MCCAOP reservations. The tracked MCCAOP reservations contain the neighborhood MCCAOP periods and optionally other periodic transmission of itself or of neighboring STAs.

The MCCAOP advertisement set contains all MCCAOP reservations tracked by the mesh STA. The MCCAOP advertisement set is represented by an MCCAOP Advertisement Overview element and zero (if the MCCAOP advertisement set is empty) or more (if the MCCAOP advertisement set is nonempty) MCCAOP Advertisement elements. An MCCAOP Advertisement element contains one or more tracked MCCAOP reservations.

The mesh STA advertises its MCCAOP advertisement set to its neighbor mesh STAs.

This subclause describes how the mesh STA constructs the MCCAOP Advertisement Overview element and the MCCAOP Advertisement elements. Further, this subclause describes the procedure to advertise an MCCAOP advertisement set, the procedure to request an MCCAOP advertisement from a neighboring mesh STA, and the procedure to process a received MCCAOP advertisement.

#### 10.24.3.7.2 Construction of an MCCAOP advertisement set

The following terminology is used in this subclause:

- TX-RX report: an MCCAOP Reservation field contained in the TX-RX Periods Report field of an MCCAOP Advertisement element
- Broadcast report: an MCCAOP Reservation field contained in the Broadcast Periods Report field of an MCCAOP Advertisement element
- Interference report: an MCCAOP Reservation field contained in the Interference Periods Report field of an MCCAOP Advertisement element

Each MCCAOP reservation tracked by a mesh STA is one of the following types:

- TX-RX period:
  - An MCCAOP reservation for individually addressed frames for which the mesh STA is the MCCAOP owner or the MCCAOP responder.
- Broadcast period:
  - An MCCAOP reservation for group addressed frames for which the mesh STA is the MCCAOP owner or the MCCAOP responder.
  - Optionally, known target beacon transmission times of Beacon frames for which the mesh STA is either the transmitter or the receiver.
  - Optionally, a transmission or reception period of a STA that is (#2210)colocated with the mesh STA, for example, beacon or HCCA times of a (#2210)colocated AP.
- Interference period:
  - A TX-RX or a broadcast period reported by a neighbor peer mesh STAs of the mesh STA excluding those periods for which this mesh STA is either the MCCAOP owner or the MCCAOP responder.
  - Optionally, a TX-RX or a broadcast period reported by neighbor nonpeer mesh STAs of the mesh STA.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The MCCAOP reservations are grouped into the following sets:

— MCCAOP TX-RX advertisement set, which includes all TX-RX periods
— MCCAOP broadcast advertisement set, which includes all broadcast periods
— MCCAOP interference advertisement set, which includes all interference periods

These three sets constitute the MCCAOP advertisement set. The mesh STA uses the MCCAOP Overview element and MCCAOP Advertisement elements to advertise its MCCAOP advertisement set to its neighbor mesh STAs.

The mesh STA acts as follows to construct the MCCAOP Overview elements and the MCCAOP Advertisement elements:

a) If the MCCAOP advertisement set is nonempty, the mesh STA constructs one or more MCCAOP reports according to the format described in 9.4.2.107.3 (MCCAOP Reservation Report field) as follows:
    1) If the MCCAOP TX-RX advertisement set is nonempty, the mesh STA constructs one or more TX-RX reports according to the format described in 9.4.2.107.3 (MCCAOP Reservation Report field) such that each reservation in the MCCAOP TX-RX advertisement set occurs exactly in one TX-RX report.
    2) If the MCCAOP broadcast advertisement set is nonempty, the mesh STA constructs one or more broadcast reports according to the format described in 9.4.2.107.3 (MCCAOP Reservation Report field) such that each reservation in the MCCAOP broadcast advertisement set occurs exactly in one broadcast report.
    3) If the MCCAOP interference advertisement set is nonempty, the mesh STA constructs one or more interference reports according to the format described in 9.4.2.107.3 (MCCAOP Reservation Report field) such that each reservation in the MCCAOP interference advertisement set occurs exactly in one interference report.
b) If the MCCAOP advertisement set is nonempty, the mesh STA constructs one or more MCCAOP Advertisement elements as follows:
    1) The MCCAOP Advertisement Set Sequence Number field is set to the MCCAOP advertisement set sequence number as explained in 10.24.3.7.3 (Setting the MCCAOP advertisement set sequence number).
    2) The MCCAOP Advertisement Element Index subfield is set to an identifier that uniquely identifies the MCCAOP Advertisement element in the MCCAOP advertisement set.
    3) Each MCCAOP Advertisement element includes at least one of the TX-RX reports, broadcast reports, or interference reports. Moreover, it includes at most one of the TX-RX reports, at most one of the broadcast reports, and at most one of the interference reports. In case the MCCAOP Advertisement element contains a TX-RX report, the TX-RX Report Present subfield of the MCCAOP Advertisement Element Information field is set to 1; otherwise this subfield is set to 0. In case the MCCAOP Advertisement element contains a broadcast report, the Broadcast Report Present subfield of the MCCAOP Advertisement Element Information field is set to 1; otherwise this subfield is set to 0. In case the MCCAOP Advertisement element contains an interference report, the Interference Report Present subfield of the MCCAOP Advertisement Element Information field is set to 1; otherwise, this subfield is set to 0.
    4) Each report as constructed in step a) is present in exactly one MCCAOP Advertisement element.
c) The mesh STA constructs one MCCAOP Advertisement Overview element such that
    1) The MCCAOP Advertisement Set Sequence Number field is set to the advertisement set sequence number as explained in 10.24.3.7.3 (Setting the MCCAOP advertisement set sequence number).
    2) The Medium Access Fraction field is set to the medium access fraction.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

3) The MAF limit field is set to dot11MAFlimit.
4) The Accept Reservations field is set to 1 if dot11MCCATrackStatesActive is less than dot11MCCATrackStatesCapable, and set to 0 otherwise.(#1466)
5) Bit *i* of the Advertisement Elements Bitmap field is set to 1 if an MCCAOP Advertisement element with the MCCAOP Advertisement Element Index subfield equal to *i* is part of the representation of this MCCAOP advertisement set, and set to 0 otherwise.

#### 10.24.3.7.3 Setting the MCCAOP advertisement set sequence number

The MCCAOP advertisement set sequence number identifies an MCCAOP advertisement set. Mesh STAs with dot11MCCAActivated equal to true assign MCCAOP advertisement set sequence numbers from a single modulo 256 counter. The MCCAOP advertisement set sequence number is initialized to 0. The MCCAOP advertisement set sequence number shall be incremented by 1 if one of the following conditions holds:

a) The mesh STA sets the bit for an MCCAOP Advertisement element in the Advertisement Elements Bitmap from 0 to 1 and this bit has been set to 1 under the same MCCAOP Advertisement Sequence Number before.
b) The bit of the Advertisement Elements Bitmap corresponding to an MCCAOP Advertisement element is equal to 1 and the content of this MCCAOP Advertisement element changes.

However, the MCCAOP advertisement set sequence number may remain unchanged if

— The mesh STA changes a bit in the Advertisement Element Bitmap from 0 to 1 and this bit has not been set to 1 under the same MCCAOP Advertisement Sequence Number before, or
— The mesh STA changes a bit in the Advertisement Elements Bitmap from 1 to 0.

NOTE—The Advertisement Set Sequence Number identifies the current distribution of the MCCAOP advertisement set over the MCCAOP Advertisement elements. Using a new MCCAOP advertisement set sequence number signals a new, (possibly) completely different distribution of the MCCAOP advertisement set over the MCCAOP Advertisement elements, and requires an advertisement of all reservations of the MCCAOP advertisement set. Leaving the MCCAOP advertisement set sequence number unchanged as in the previous MCCAOP Advertisement Overview element indicates MCCAOP Advertisement elements that have previously been advertised are not changed and remain current. This enables a limited advertisement procedure in which only new MCCAOP Advertisement elements are advertised. Additionally, this enables mesh STAs that operate in light or deep sleep mode to request a limited update of the MCCAOP advertisement set of a neighboring mesh STA in which only new MCCAOP Advertisement elements are included.

#### 10.24.3.7.4 Advertisement procedure

To advertise its MCCAOP advertisement set, the mesh STA constructs a representation of the MCCAOP advertisement set as described in 10.24.3.7.2 (Construction of an MCCAOP advertisement set). The MCCAOP advertisement set is advertised by transmitting an MCCAOP Advertisement Overview element and zero or more MCCAOP Advertisement elements (see 10.24.3.7.2 (Construction of an MCCAOP advertisement set)) to neighbor peer mesh STAs. The MCCAOP Advertisement Overview element and the MCCAOP Advertisement elements are transmitted in Beacon frames, Probe Response frames, or MCCA Advertisement frames.

The mesh STA shall advertise its MCCAOP advertisement set according to the following rules:

a) The mesh STA shall advertise at least one MCCAOP Advertisement Overview element in every dot11MCCAAdvertPeriodMax DTIM intervals.
b) The mesh STA shall advertise its MCCAOP Advertisement Overview element and any new MCCAOP Advertisement elements at the latest with the transmission of its next Beacon frame after its MCCAOP advertisement set has changed.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

c) The mesh STA shall advertise the requested MCCAOP Advertisement elements as described in 10.24.3.7.8 (MCCAOP advertisement request procedure) if the mesh STA receives an MCCA Advertisement Request frame.

#### 10.24.3.7.5 Receipt of an MCCAOP advertisement

Upon receipt of an MCCAOP advertisement a mesh STA with dot11MCCAActivated shall compare the Advertisement Set Sequence Number contained in the MCCAOP Advertisement Overview element of the received MCCAOP advertisement with the last advertisement set sequence number that this mesh STA tracked for the sender of the received MCCAOP advertisement.

If the tracked advertisement set sequence number does not equal the Advertisement Set Sequence Number of the received MCCAOP advertisement, the mesh STA shall perform the procedure described in 10.24.3.7.6 (Complete update of the tracked MCCAOP reservations of a neighbor mesh STA).

If the tracked advertisement set sequence number equals the Advertisement Set Sequence Number of the received MCCAOP advertisement, the mesh STA shall compare the Advertisement Elements Bitmap contained in the received MCCAOP Advertisement Overview element with the last Advertisement Elements Bitmap that this mesh STA tracked for the sender of the received MCCAOP advertisement. If the tracked Advertisement Elements Bitmap does not equal the Advertisement Elements Bitmap of the received MCCAOP advertisement, the mesh STA shall perform the procedure described in 10.24.3.7.7 (Partial update of the tracked MCCAOP reservations of a neighbor mesh STA).

NOTE—If both the tracked advertisement set sequence number equals the Advertisement Set Sequence Number of the received MCCAOP advertisement and the tracked Advertisement Elements Bitmap equals the Advertisement Elements Bitmap of the received MCCAOP advertisement, the MCCAOP advertisement set of the sender of the MCCAOP advertisement tracked by the mesh STA is current, and no update of the MCCAOP advertisement set is needed.

#### 10.24.3.7.6 Complete update of the tracked MCCAOP reservations of a neighbor mesh STA

The mesh STA performed the steps in 10.24.3.7.5 (Receipt of an MCCAOP advertisement) and detected that the MCCAOP advertisement set sequence number has been updated. Consequently, the mesh STA shall operate as follows.

The mesh STA shall discard all MCCAOP reservations that it tracked for the sender of the received MCCAOP advertisement. The mesh STA shall record the Advertisement Set Sequence Number and the source address (SA) of the received MCCAOP advertisement. The mesh STA shall record all reservations in the MCCAOP Advertisement elements of the received MCCAOP advertisement.

If the mesh STA does not receive all MCCAOP Advertisement elements of the sender of the MCCAOP advertisement before a frame exchange sequence on the wireless medium causes the mesh STA to set its NAV, the mesh STA shall perform the MCCAOP advertisement request procedure as described in 10.24.3.7.8 (MCCAOP advertisement request procedure).

#### 10.24.3.7.7 Partial update of the tracked MCCAOP reservations of a neighbor mesh STA

The mesh STA performed the steps in 10.24.3.7.5 (Receipt of an MCCAOP advertisement) and detected that part of the MCCAOP advertisement set of the sender of the MCCAOP advertisement has been updated. Consequently, the mesh STA shall operate as follows for each bit in the Advertisement Elements Bitmap contained in the MCCAOP Advertisement Overview element of the received MCCAOP advertisement.

If the bit in position n of the Advertisement Elements Bitmap in the received MCCAOP Advertisement is equal to 0 and if the bit in position n of the Advertisement Elements Bitmap tracked for the sender of the received MCCAOP advertisement is equal to 1, the mesh STA shall delete the reservations with the same

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Advertisement Sequence Number and the same MCCAOP Advertisement Element Index received from the same sender from its tracked reservations.

If the bit in position n of the Advertisement Elements Bitmap in the received MCCAOP Advertisement is equal to 1 and if the bit in position n of the Advertisement Elements Bitmap tracked for the sender of the received MCCAOP advertisement is equal to 0, the mesh STA shall add the reservations of the received MCCAOP Advertisement element with the MCCAOP Advertisement Element Index set to n to its tracked reservations. If the mesh STA does not receive this MCCAOP Advertisement element of the sender of the MCCAOP Advertisement before a frame exchange sequence on the wireless medium causes the mesh STA to set its NAV, the mesh STA shall perform the MCCAOP Advertisement request procedure as described in 10.24.3.7.8 (MCCAOP advertisement request procedure).

NOTE—If the bit in position n of the received Advertisement Elements Bitmap contained in the received MCCAOP Advertisement is equal to the bit in position n of the Advertisement Elements Bitmap tracked for the sender of the received MCCAOP advertisement, then the Advertisement element with the MCCAOP Advertisement Element Index equal to n is current, and no update of this Advertisement element is needed.

#### 10.24.3.7.8 MCCAOP advertisement request procedure

To request all MCCAOP Advertisement elements from a neighbor peer mesh STA, the mesh STA transmits an MCCA Advertisement Request frame without an MCCAOP Advertisement Overview element.

To request a subset of the MCCAOP Advertisement elements of a neighbor peer mesh STA, the mesh STA transmits an MCCA Advertisement Request frame including an MCCAOP Advertisement Overview element. The mesh STA shall set the contents of the MCCAOP Advertisement Overview element as follows. The mesh STA sets

a) The Advertisement Set Sequence Number field to the Advertisement Sequence Number that it tracks for the recipient of this frame
b) In the Advertisement Element Bitmap, the bit to 1 for each MCCAOP Advertisement element that the mesh STA requests from the recipient of this frame
c) The Flags field, the MCCA Access Fraction field, and the MAF Limit field to 0

The mesh STA shall discard the MCCA Advertisement Request frame from its frame queue if it receives all of the MCCAOP Advertisement elements that it requests in the MCCAOP Advertisement Request.

### 10.24.3.8 MCCAOP teardown

#### 10.24.3.8.1 Conditions that trigger an MCCAOP teardown

The MCCAOP owner and the MCCAOP responder may initiate a teardown of an MCCAOP reservation, e.g., when the reservation is no longer needed. A mesh STA shall act as follows to resolve conflicts between MCCAOP reservations in its neighborhood MCCAOP periods. If the conflict is caused by overlapping reservations from its TX-RX periods and broadcast periods, it shall select one of these reservations and initiate a teardown for it. If the conflict is caused by an overlap between a reservation from its TX-RX periods or broadcast periods, and another reservation from its interference periods, it shall act as follows. It creates a first unsigned integer by inverting the bit order of its MAC address and a second unsigned integer by inverting the bit order of the lowest of the known MAC addresses of the owner and responder(s) of the reservation in the interference periods. If the first unsigned integer is smaller than the second unsigned integer, it shall initiate a teardown of the reservation in its TX-RX or broadcast periods. Otherwise, it may initiate a teardown of the reservation in its TX-RX or broadcast periods.

There are also other conditions that trigger the MCCAOP owner and responder to delete a reservation, without an explicit tear down. An MCCAOP owner shall delete a reservation for an individually addressed transmission when it has not received an acknowledgment for any frame transmission in the MCCAOPs

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

corresponding to the reservation for greater than dot11MCCAOPtimeout time. An MCCAOP responder shall delete a reservation for individually addressed transmission or group addressed transmissions when it has not received a frame transmission in any of the MCCAOPs corresponding to the reservation for greater than dot11MCCAOPtimeout time.

#### 10.24.3.8.2 MCCAOP teardown procedure

The teardown is initiated by transmitting an MCCA Teardown frame. The MCCAOP Reservation ID field in the MCCAOP Teardown element is set to the MCCAOP Reservation ID of the reservation that is to be torn down. In case the tear down is initiated by an MCCAOP responder, the MCCAOP Owner field of the MCCAOP Teardown element is set to the MAC address of the MCCAOP owner.

The transmitter of the MCCA Teardown frame deletes the reservation after the MCCA Teardown frame has been successfully transmitted. The receiver of the MCCA Teardown frame acts as follows. In case the MCCAOP Reservation ID field corresponds to a reservation for individually addressed transmissions, it deletes the reservation. If the reservation is for group addressed transmissions for which it is the MCCAOP owner, it deletes the reservation if there are no other MCCAOP responders for this reservation.

The MCCAOP owner acts as follows when deleting a reservation:

— It stops executing the access procedure described in 10.24.3.9.1 (Access by MCCAOP owners) at the start of the MCCAOPs corresponding to the reservation that was deleted.
— In case the reservation was for individually addressed frames, it stops advertising the MCCAOP reservation in its TX-RX Periods Report field.
— In case the reservation was for group addressed frames, it stops advertising the MCCAOP reservation in its Broadcast Periods Report field.

The MCCAOP responder acts as follows when deleting a reservation:

— It stops executing the procedure described in 10.24.3.9.2 (Access during an MCCAOP by mesh STAs that are not the MCCAOP owner) during the MCCAOPs corresponding to the reservation that was deleted.
— In case the reservation was for individually addressed frames, it stops advertising the MCCAOP reservation in its TX-RX Periods Report field.
— In case the reservation was for group addressed frames, it stops advertising the MCCAOP reservation in its Broadcast Periods Report field.

### 10.24.3.9 Access during MCCAOPs

#### 10.24.3.9.1 Access by MCCAOP owners

At the start of the MCCAOP, the EDCAF of the MCCAOP owner shall set AIFSN[AC] equal to dot11MCCAAIFSN, CWmax[AC] equal to dot11MCCACWmax, CW[AC] equal to dot11MCCACWmin, and QSRC[AC] to 0 for all ACs. The TXOP limit shall specify a duration value no larger than the MCCAOP Duration.

During the MCCAOP, the EDCAFs of the ACs operates as specified in 10.23.2 (HCF contention based channel access (EDCA)), with the following modifications.

— During the MCCAOP, the EDCAF of each AC shall consider only those frame whose RA matches the MAC address of the MCCAOP responder.
— When the access to the medium is delayed, the TXOP limit shall specify a duration to end no later than the MCCAOP start time plus the MCCAOP Duration.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

— As specified in 10.24.3.9.2 (Access during an MCCAOP by mesh STAs that are not the MCCAOP owner), a neighboring STA shall not access the WM during an MCCAOP, until it receives a frame from either the MCCAOP owner or the MCCAOP responder. With the exception of truncation of an MCCA TXOP by means of a CF-End, standard EDCA TXOP rules apply for the remainder of the MCCAOP. For HT mesh STAs, these include the reverse direction protocol as specified in 10.29 (Reverse direction protocol).

— At the end of the MCCAOP, the parameters used by the EDCAF of the MCCAOP owner shall be set to dot11EDCATable, and QSRC[AC] shall be set to 0 for all ACs.

The MCCAOP owner may adjust the duration of an MCCAOP by setting the Duration/ID field in the frames it transmits. In particular, if an MCCAOP owner has no data to transmit in an MCCAOP corresponding to an MCCAOP reservation that is intended for individually addressed frames, it may transmit an individually addressed QoS Null frame during the MCCAOP to end the MCCAOP.

NOTE—(#161)An MCCAOP owner ought to send a QoS Null frame to end the MCCAOP although there might be situations in which the transmission of a QoS Null is not needed or undesirable.

If an MCCAOP owner has no data to transmit in an MCCAOP reservation that is intended for group addressed frames, it may transmit a group addressed QoS Null frame during the MCCAOP to end the MCCAOP.

### 10.24.3.9.2 Access during an MCCAOP by mesh STAs that are not the MCCAOP owner

The MAC of a mesh STA with dot11MCCAActivated is true shall provide a Reservation Allocation Vector (RAV) mechanism to indicate a busy medium from the start of an MCCAOP corresponding to a reservation in its interference periods until the receipt of a frame transmitted by either the MCCAOP owner or the MCCAOP responder. The RAV mechanism is provided in addition to the PHY and virtual CS mechanisms described in 10.3.2.1 (CS mechanism). It is different from the virtual CS mechanism in two aspects. Firstly, a mesh STA might be neighbor to multiple ongoing MCCAOPs corresponding to different reservations and the regular NAV setting and updating rules do not suffice to prevent interference during these reservations. Secondly, the virtual CS mechanism is set immediately upon receipt of a frame, whereas the RAV mechanism is based on reservation frames received at some earlier time instant. When either the CS function provided by the PHY, the virtual CS function provided by the MAC via the NAV, or the RAV mechanism indicate a busy medium during an MCCAOP for which the mesh STA is neither the MCCAOP owner nor the MCCAOP responder, the medium shall be considered busy; otherwise, it shall be considered idle.

The RAV mechanism maintains an index of future MCCAOPs based on the reservation information that is available in the interference periods of a mesh STA. At the start of each MCCAOP corresponding to a reservation in the interference periods, a RAV is set to indicate a busy medium for the duration of the MCCAOP given in the MCCAOP Duration subfield of the MCCAOP reservation. At the start of each MCCAOP corresponding to a reservation in the TX-RX or broadcast periods for which the mesh STA is an MCCAOP responder, a RAV is set to indicate a busy medium for the duration of the MCCAOP given in the MCCAOP Duration subfield of the MCCAOP reservation. The RAV may be thought of as a counter, corresponding to an MCCAOP corresponding to a reservation in the interference periods. The RAV counts down to zero at a uniform rate. When the counter is zero, the RAV indication is that the medium is idle; when nonzero, the indication is busy.

The mesh STA clears the RAV timer, i.e., sets it to 0, upon receipt of a frame from either the MCCAOP owner or responder. If a mesh STA receives an RTS frame during an MCCAOP for which it is an MCCAOP responder, with the RA matching its MAC address and with the MAC address in the TA field in the RTS frame matching the MAC address of the MCCAOP owner, then the STA shall send the CTS frame after a SIFS(#6587), without regard for the NAV and the RAV, and without resetting its NAV. The RAV for an MCCAOP is not cleared upon receipt of a frame originating from stations that are not the MCCAOP owner or responder. Since the NAV is set upon receipt of frames with a Duration/ID field, the MCCAOP owner

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

and responder adjust the reservation period of an MCCAOP to their actual traffic needs by the Duration/ID field in the transmitted frame and obtain protection of the frame transmission via the NAV setting.

The RAV mechanism might be represented by a number of counters, where each counter corresponds to one MCCAOP. The number of counters needed at any instant is equal to the number of MCCAOPs at this instant corresponding to reservations in the interference periods of the mesh STA.

#### 10.24.3.10 Interaction with time synchronization

If a mesh STA adjusts its TBTT, e.g., in response to a TBTT Adjustment Request, it shall adjust the reservations by modifying the MCCAOP Offset of each of the tracked MCCAOP reservations. If a mesh STA adjusts its timing offset value with respect to a neighbor mesh STA, as specified in 14.14.2.2 (Neighbor offset synchronization method), it shall adjust the reservations by modifying the MCCAOP Offset of each of the tracked MCCAOP reservations for which this neighbor mesh STA is the owner. In either case, an MCCAOP advertisement of a mesh STA shall always contain the most recent MCCAOP Offsets.

## 10.25 Block acknowledgment (block ack)

### 10.25.1 Introduction

The block ack mechanism improves channel efficiency by aggregating several acknowledgments into one frame. In this subclause, the STA with data to send using the block ack mechanism is referred to as the *originator*, and the receiver of that data as the *recipient*.

The block ack mechanism is initialized by an exchange of ADDBA Request/Response frames except for GLK-GCR block ack (11bd)and block ack between two NGV STAs, or by using the unsolicited block ack extension mechanism(11ay). After initialization, blocks of QoS Data frames may be transmitted from the originator to the recipient. A block may be started within a polled TXOP, within an SP, or by winning EDCA contention. The number of frames in the block is limited, and the amount of state that is to be kept by the recipient is bounded. The MPDUs within the block of frames are acknowledged by a BlockAck frame, which is requested by a BlockAckReq frame.

For GLK-GCR block ack, the block ack mechanism is initialized when the GLK STA associates with the GLK AP. The MPDUs within a block of SYNRA addressed Data frames are acknowledged by a BlockAck frame, which is requested by a BlockAckReq frame.

The block ack mechanism does not require the setting up of a TS; however, QoS STAs using the TS facility may choose to signal their intention to use block ack mechanism for the scheduler's consideration in assigning TXOPs. The block ack mechanism is also used by the GCR service. Acknowledgments of frames belonging to the same TID, but transmitted during multiple TXOPs/SPs, may also be combined into a single BlockAck frame. This mechanism allows the originator to have flexibility regarding the transmission of Data frames. The originator may split the block of frames across TXOPs/SPs, separate the data transfer and the block ack exchange, and interleave blocks of MPDUs carrying all or part of MSDUs or A-MSDUs for different TIDs or RAs.

(#306)A non-AP S1G STA may negotiate an asymmetric BA with an S1G AP as described in 10.25.2 (Setup and modification of the block ack parameters). A non-S1G STA shall not transmit NDP BlockAck frames and shall not initiate an asymmetric BA. An S1G AP with dot11AsymmetricBlockAckActivated equal to false shall not support asymmetric BA. Under asymmetric BA operation, the responding S1G STA may use a lower MCS for transmitting the immediate BlockAck frame as described in 10.6.6.5.2 (Selection of a rate or MCS). The intended recipient STA maintains a measure of the degree of asymmetry between the AP and the STA and implicitly indicates the value to the originator AP during the block ack setup phase. This degree of asymmetry is represented as the difference in MCS values between AP and STA, and referred to as MCSDifference (see 10.25.2 (Setup and modification of the block ack parameters)). After an asymmetric

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

BA agreement is established, the originator AP uses the MCSDifference to calculate the Duration field of PV0 frames carried in the A-MPDU that elicits the BlockAck frame.

An S1G STA that sets the STA Type Support subfield in a transmitted S1G Capabilities element to 0 or 2, as described in 10.62 (S1G BSS type and STA type), shall support the HT-immediate block ack extension. An S1G STA that sets the A-MPDU Supported field in the S1G Capabilities element to 1 shall support the HT-immediate block ack extension.

All arithmetic and equations (including inequalities) in 10.25 (Block acknowledgment (block ack)) are to be understood as being modulo the size of the relevant counter space (typically 4096).

(11ay)Under a block ack agreement using segmentation and reassembly, operations on MSDU Sequence Number and MPDU Sequence Number are performed modulo $2^{\text{MSDU Modulo}}$ and modulo $2^{\text{MPDU Modulo}}$ respectively (see 10.69 (DMG segmentation and reassembly operation(11ay))), where MSDU Modulo and MPDU Modulo correspond to the values of the MSDU Modulo and MPDU Modulo subfields, respectively, defined in the SAR Configuration element. Comparisons between MPDU sequence number and MSDU sequence number are circular modulo $2^{\text{MPDU Modulo}}$ and $2^{\text{MSDU Modulo}}$, respectively, i.e., the sequence number space is considered divided into two parts, one of which is "old" and one of which is "new," by means of a boundary created by adding half the sequence number range to the current start of receive window (modulo $2^{\text{MPDU Modulo}}$ and $2^{\text{MSDU Modulo}}$, respectively). The Block Ack Starting Sequence Control subfield within the BlockAckReq frame represents the MPDU starting sequence number.

(11ay)The EDMG flow control is an amendment to the block ack mechanism to prevent overloading of the recipient's memory space, which may happen in case the link speed is higher than STA's capability to process or consume incoming data. The EDMG flow control adjusts to the recipient's capabilities to optimize network utilization.

### 10.25.2 Setup and modification of the block ack parameters

Where the generic terms ADDBA Request frame, ADDBA Response frame, and DELBA frame are used throughout 10.25 (Block acknowledgment (block ack)) in reference to a block ack agreement between S1G STAs, the appropriate variant according to this subclause (e.g., NDP ADDBA Request, BAT ADDBA Request, and ADDBA Request) is referenced by the generic term.

(#6286)To establish a block ack agreement, an originator sends an ADDBA Request frame indicating the TID for which the block ack agreement is being established. (#6172)The Buffer Size and Block Ack Timeout Value fields in the ADDBA Request frame are advisory. (#6286)A block ack agreement shall not be established between a non-HT non-DMG non-S1G STA and another STA.

If the intended S1G recipient is capable of participating in an HT-immediate block ack agreement, the S1G originator shall send an NDP ADDBA Request to indicate that it expects only NDP BlockAck frames during the block ack agreement with the following exceptions:

a) If the S1G originator has the dot11BATImplemented equal to true and the BAT Support subfield in the S1G Capabilities element received from the S1G recipient is 1 and (#6286)a TWT has been established with the S1G recipient as described in 10.46 (Target wake time (TWT)), then the S1G originator shall send a BAT ADDBA Request to indicate that it expects only BAT frames during the block ack agreement.

b) When any of the conditions below is satisfied then the S1G originator may send an ADDBA Request to indicate that it expects only BlockAck frames during the block ack agreement:

   1) The value of the Buffer Size field in the ADDBA Request, carried in an S1G_LONG or S1G_SHORT PPDU, is greater than 16.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

2) The value of the Buffer Size field of the ADDBA Request, carried in an S1G_1M PPDU, is greater than 8.
3) The dot11AsymmetricBlockAckActivated is true and Asymmetric BA Supported field in the S1G Capabilities element received from the S1G recipient is 1.

The recipient STA shall respond by an ADDBA Response frame. The recipient STA has the option of accepting or rejecting the request. When the recipient STA accepts, then a block ack agreement exists between the originator and recipient.

When the S1G recipient STA rejects the request it may indicate a status code of 109 (REJECTED_NDP_BLOCK_ACK_SUGGESTED) to indicate to the S1G originator that it prefers to generate only NDP BlockAck frames.

When the recipient STA accepts, it indicates the type of block ack agreement, the type of BlockAck frames, and the number of buffers that it shall allocate for the support of this block ack agreement within the ADDBA Response frame and (#6172)the block ack agreement inactivity timeout that is used. Each block ack agreement that is established by a STA may have a different buffer allocation. If the intended recipient STA rejects the request, then the originator shall not use the block ack mechanism.

An S1G recipient STA that accepts an HT-immediate block ack agreement shall respond with the following:

— An NDP ADDBA Response if the value of the Buffer Size field of the NDP ADDBA Response is not greater than the value of the maximum number of MSDUs and A-MSDUs that can be acknowledged with the selected NDP BlockAck frame and (#6286)no TWT has already been established with the S1G originator as described in 10.46 (Target wake time (TWT)).
  — This value is 8 for NDP_1M BlockAck frames and 16 for NDP_2M BlockAck frames as described in 23.3.12.2.6 (NDP BlockAck). The NDP ADDBA Response frame shall be carried in an S1G_1M PPDU to indicate the use of NDP_1M BlockAck frames and shall be carried in an S1G_SHORT or S1G_LONG PPDU to indicate the use of NDP_2M BlockAck frames.
— Otherwise, a BAT ADDBA Response as a response to a BAT ADDBA Request (#6286)if a TWT has already been established with the S1G originator as described in 10.46 (Target wake time (TWT)).
  — The value of the Buffer Size field in the BAT ADDBA Response shall not be greater than 32.
— Otherwise, a ADDBA Response to indicate the use of BlockAck frames.

The MCS subfield in the Originator Preferred MCS field shall be set to 15 unless the dot11AsymmetricBlockAckActivated is true and the Asymmetric BA Supported field in the S1G Capabilities element received from the S1G originator is 1 in which case the MCS subfield may indicate the value of the preferred MCS if asymmetric BA operation is used. The preferred MCS implicitly indicates the MCSDifference value, which is the difference between the preferred MCS and the MCS at which the ADDBA Response is sent.

When the Block Ack Policy subfield value is 1 in an ADDBA Request frame, the responding HT STA shall set the Block Ack Policy subfield to 1 in the ADDBA Response frame accepting the ADDBA Request frame.(M118)

For each accepted block ack agreement, the originator shall set the sequence number of the first frame transmitted under the agreement to the value of the Block Ack Starting Sequence Control field of the ADDBA Request frame of the accepted block ack agreement.

When a block ack agreement is established between two HT STAs, two DMG STAs, or two S1G STAs, the originator may change the size of its transmission window(#1818):(11ax)

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

- The transmission window is not greater than the value in the Buffer Size field of the ADDBA Response frame.(11ax)
- The transmission window is not greater than 64 if the sender or receiver of the ADDBA Response frame is a non-HE STA.(11ax)
- The transmission window is not greater than 256 if the sender and receiver of the ADDBA Response frame are HE STAs.(11ax)

If the value in the Buffer Size field of the ADDBA Response frame is smaller than the value in the ADDBA Request frame, the originator shall change the size of its transmission window ($WinSize_O$) so that it meets the following conditions:(11ax)

- Is not greater than the value in the Buffer Size field of the ADDBA Response frame.(11ax)
- Is not greater than 64 if the sender or receiver of the ADDBA Response frame is a non-HE STA or if the STAs that establish the block ack agreement are HT STAs or DMG STAs that are not EDMG STAs.(11ax)(11ay)
- Is not greater than 256 if the sender and receiver of the ADDBA Response frame are HE STAs.(11ax)
- Is not greater than 1024 if the STAs that establish the block ack agreement are EDMG STAs.(11ay)

(11ay)When a block ack agreement is established between two EDMG STAs, the size of the Block Ack bitmap the recipient shall use depends on the established size of the transmission window (#6310)($WinSize_O$). The size of the Block Ack bitmap for an EDMG STA shall be one of 64, 128, 256, 512, or 1024 bits. The size of the Block Ack bitmap shall be the smallest size that is greater than $WinSize_O$ for the established block ack agreement(#1807).

NOTE 1—A block ack associated with a GCR group address does not use an inactivity timer because the GCR originator might switch between the DMS delivery method, the GCR unsolicited retry retransmission policy, and the GCR block ack retransmission policy during the lifetime of a GCR agreement.

NOTE 2—(#6286)A GLK-GCR block ack is established at the time the general link is established and might be used by the general link originator whenever the GCR block ack retransmission policy is active. Therefore, an explicit block ack setup or modification procedure is not defined for GLK-GCR block ack. The GLK-GCR block ack is deleted when the corresponding general link gets reassociated or disassociated.

The A-MSDU Supported field indicates whether an A-MSDU may be sent under the particular block ack agreement. The originator sets this field to 1 to indicate that it might transmit A-MSDUs with this TID. The recipient sets this field to 1 to indicate that it is capable of receiving an A-MSDU with this TID.

NOTE 3—The recipient is free to respond with any setting of the A-MSDU Supported field, irrespective of the originator's setting of the A-MSDU Supported field(#7148). If the value in the ADDBA Response frame is not acceptable to the originator, it can delete the block ack agreement and transmit data using normal acknowledgment.

If the block ack mechanism is being (#6286)established for a TS, bandwidth negotiation (using ADDTS Request and Response frames) should precede the establishment of the block ack mechanism. If the block ack mechanism is being (#6286)established for the GCR service, then the following steps apply:

- One or more GCR request/response frame exchanges(#4173) precede the (#6286)establishment of the block ack mechanism.
- The ADDBA Request and Response frames exchanged to (#6286)establish the block ack agreement(#6171) shall include the GCR Group Address element indicating the group address of the GCR service.

Once the block ack agreement(#6171) has been (#6286)established, QoS Data frames are transferred in A-MPDUs and acknowledged using the procedure described in 10.25.3 (Data and acknowledgment transfer using immediate block ack policy).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

(11ay)An originator may include the SAR Configuration element in the ADDBA Request frame if the recipient supports segmentation and reassembly as indicated by the Segmentation and Reassembly Support subfield within the recipient's DMG Capabilities element. If the SAR Enabled field is(M118) 1 in a SAR Configuration element transmitted within an ADDBA Request frame, the value of the MPDU Modulo subfield shall be more than or equal to 7 and less than or equal to 12, and the sum of the MPDU Modulo and MSDU Modulo subfields shall be equal to 14. If the recipient accepts the SAR configuration within a received ADDBA Request frame, the recipient shall transmit an ADDBA Response frame that includes the SAR Configuration element with the SAR Enabled subfield set to 1, and the MSDU Modulo and MPDU Modulo subfields set to the same value of the MSDU Modulo and MPDU Modulo subfields received in the ADDBA Request frame. A recipient may reject the SAR configuration by setting the SAR Enabled field within the SAR Configuration element in the ADDBA Response to zero or by not including the SAR Configuration element in the ADDBA Response frame. The size of the originator's transmission window shall not be greater than value in the Buffer Size subfield of the Block Ack Parameter Set field of the ADDBA Response frame in the case that the recipient rejects the SAR configuration, but responds with a status code of SUCCESS in the ADDBA Response frame. The originator shall set the Sequence Number field to zero in the first MPDU it transmits under an established block ack agreement in case the recipient rejects the SAR configuration, but responds with a status code of SUCCESS in the ADDBA Response frame.

(11ay)When a block ack agreement with segmentation and reassembly is established, a DMG originator may change the size of its transmission window if the value in the MPDU Buffer Size or MSDU Buffer Size fields within the SAR Configuration element contained in an ADDBA Response frame are larger than the corresponding field values transmitted in the ADDBA Request frame. If the value in the MSDU Buffer Size or the MPDU Buffer Size fields in the ADDBA Response frame is smaller than the corresponding value in the ADDBA Request frame, the originator shall change the size of its transmission window (#6310)($WinSize_O$ or $WinSize_{OI}$) so that it is not larger than the value of the field in the ADDBA Response frame and not larger than 1024. In addition, the MPDU Buffer Size subfield shall not exceed the value of $2^{(\text{MPDU Modulo-2})}$ and shall be equal or larger than the value of the resulting maximum segmented MSDU size as indicated by the Maximum Segmented MSDU Exponent subfield in the recipient's SAR Configuration element divided by the maximum MPDU size as defined in 9.4.2.279 (SAR Configuration element(11ay)). The originator may set the MSDU Buffer Size subfield to a value greater than $2^{\text{MSDU Modulo}-2}$ if the MPDU Modulo subfield is(M118) greater than 9; in this case, the recipient may receive multiple MSDUs or A-MSDUs with identical SNs that are not detected.

(11ay)An EDMG originator STA may insert an EDMG Flow Control Extension Configuration element in an ADDBA Request frame. In this case, no subelements shall be present in the EDMG Flow Control Extension Configuration element.

(11ay)An EDMG recipient STA that responds to an ADDBA Request frame that contains an EDMG Flow Control Extension Configuration element should insert an EDMG Flow Control Extension Configuration element in the ADDBA Response frame sent as response. A Recipient Memory Configuration subelement shall be included in the EDMG Flow Control Extension Configuration element sent by the recipient if at least one subfield, except for the Advanced Recipient Memory Length Capable subfield, in the Recipient Memory Capabilities field of the EDMG Flow Control Extension Configuration element is nonzero.

(11ay)EDMG STAs that established a block ack agreement with or without exchange of an EDMG Flow Control Extension Configuration element shall follow the flow control operation rules defined in 10.25.6.5 (Generation and transmission of BlockAck frames by an HT STA, DMG STA, or S1G STA), 10.25.6.6 (Receive reordering buffer control operation), and 10.25.6.7 (Originator's behavior).

(11ay)The following negotiation rules apply to EDMG STAs (EDMG originator and EDMG recipient) that exchange ADDBA Request and ADDBA Response frames.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

(11ay)An EDMG originator or EDMG recipient support those recipient memory capabilities for which the corresponding subfields in the Recipient Memory Capabilities field of the EDMG originator or EDMG recipient, respectively, are set to 1 in ADDBA Request and ADDBA Response frames of the block ack agreement established between the EDMG originator and EDMG recipient, and do not support otherwise.

(11ay)An EDMG recipient shall not respond with Status Code = SUCCESS in an ADDBA Response frame if the EDMG recipient sets to one at least one of the subfields within the recipient's Recipient Memory Capabilities field and:

— The same subfield is set to 0 in the Recipient Memory Capabilities field in the corresponding ADDBA Request frame received from EDMG originator; or

— No EDMG Flow Control Extension Configuration element is present in the corresponding ADDBA Request frame.

(11ay)NOTE 4—Status Code values (#1780)REFUSED_REASON_UNSPECIFIED, REQUEST_DECLINED, or INVALID_PARAMETERS can be used in the aforementioned case.

(11ay)The recipient memory multiple buffer units capability is supported in a successfully established block ack agreement if both the originator and recipient set the RBUFCAP Quantity Capable and Recipient Memory Multiple Buffer Units Capable subfields to 1 in their respective EDMG Flow Control Extension Configuration elements transmitted in the ADDBA Request and ADDBA Response frames. Otherwise, the recipient memory multiple buffer units capability is not supported.

(11ay)The memory config tag capability is supported in a successfully established block ack agreements if both the originator and recipient set the RBUFCAP Quantity Capable and Two Memory Config Tag Capable subfields to 1 in their respective EDMG Flow Control Extension Configuration elements transmitted in the ADDBA Request and ADDBA Response frames. Otherwise, the memory config tag capability is not supported.

(11ay)The advanced recipient memory length capability is supported in a successfully established block ack agreement if the recipient set the Advanced Recipient Memory Length Capable subfield to 1 in its EDMG Flow Control Extension Configuration element transmitted in the ADDBA Response. Otherwise, the advanced recipient memory length capability is not supported.

(11ay)The TID grouping capability is supported in a successfully established block ack agreements if both the originator and recipient set the TID Grouping Capable and the RBUFCAP Quantity Capable subfields to 1 in their respective EDMG Flow Control Extension Configuration elements transmitted in the ADDBA Request and ADDBA Response frames. The Recipient Memory Capabilities field and fields within the Recipient Memory Configuration subelement for TIDs that were set to 1 in the TID Grouping subfield shall be identical in the ADDBA Response frame.

(11ay)An EDMG STA that has (#4201)negotiated a block ack agreement shall obey the following rules as a recipient in addition to the rules specified in 10.25.6 (HT-immediate block ack extensions). The recipient may transmit an unsolicited ADDBA Response frame that is not a response to an ADDBA Request frame to update the RBUFCAP subfield and Advanced Recipient Memory Length field values. The unsolicited ADDBA Response frame is sent by the recipient that is a TXOP holder or source of an SP. The Dialog Token field of an unsolicited ADDBA Response frame shall be set to 0 and the Status Code field shall be set to SUCCESS. An EDMG Flow Control Extension Configuration element shall be included in the ADDBA Response frame, and the element shall not contain a Recipient Memory Configuration subelement. The RBUFCAP subfield and Advanced Recipient Memory Length Exponent field values shall comply, respectively, with the RBUFCAP quantity and advanced recipient memory length capabilities that established the block ack agreement. After transmitting an unsolicited ADDBA Response frame, the recipient may

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

— Transmit a Grant frame to the TXOP responder or SP destination (see 10.38.7.3 (Grant period (GP))) to relinquish the remainder of the TXOP or SP, respectively; or
— Grant a reverse direction (see 10.29 (Reverse direction protocol)) to the TXOP responder or SP destination.

(11ay)An EDMG STA that has (#4201)negotiated a block ack agreement shall obey the following rules as an originator in addition to rules specified in 10.25.6 (HT-immediate block ack extensions). The originator that receives an ADDBA Response frame with the Dialog Token field equal to 0 shall ignore the Block Ack Parameter Set and Block Ack Timeout Value fields of the frame. In addition, the originator shall update the local values of the RBUFCAP and Advanced Recipient Memory Length Exponent field values to the values received in the ADDBA Response frame, provided it is in compliance with RBUFCAP quantity and advanced recipient memory length capabilities.

(11ay)Support for the unsolicited block ack extension is a capability of a recipient. Support for the unsolicited block ack extension by the recipient is advertised by insertion of the Unsolicited Block Ack Extension element in all transmitted Probe Request, Probe Response, Association Request, Association Response, Reassociation Request, Reassociation Response, Information Request and Information Response frames. An originator shall not use the unsolicited block ack extension mechanism with a recipient that does not support the mechanism.

(11ay)An unsolicited block ack extension agreement is established per <TA, RA, TID> tuple. The unsolicited block ack extension agreement is (#6286)established if the following conditions apply:

— The recipient transmits and the originator receives a BlockAck frame in response to an MPDU with the Ack Policy field set to Implicit Block Ack Request sent by the originator; and
— Prior to the reception of the BlockAck frame, the originator does not receive an ADDBA Response frame with Status Code equal to SUCCESS with the same <TA, RA, TID> tuple as the BlockAck frame <TA, RA, TID> tuple.

(11ay)Parameters of the established unsolicited block ack extension agreement are equal to those advertised by the recipient in the recipient's Unsolicited Block Ack Extension element.

(11ay)A pair of EDMG STAs that have an established unsolicited block ack agreement shall follow the RBUFCAP operation rules defined in 10.25.6.5 (Generation and transmission of BlockAck frames by an HT STA, DMG STA, or S1G STA) and 10.25.6.7 (Originator's behavior).

(11ay)An unsolicited block ack extension agreement may be torn down by transmitting a DELBA frame as defined in 10.25.3 (Data and acknowledgment transfer using immediate block ack policy).

(#1807)A block ack agreement may be modified by the originator by sending an ADDBA Request frame ((#3174)(see 11.5.2 (Setup and modification of the block ack parameters), except that MLME-ADDBA primitives are not used by the originator(#4352)). All parameters of the agreement may be modified except for the TID. If the request is not successful, the existing agreement is not modified. (#6171)If the request is successful, the behavior is as if a DELBA frame for the block ack agreement had been transmitted by the originator and received by the recipient immediately prior to the ADDBA Request frame.

(11bd)An NGV STA does not initialize the block ack mechanism as defined in this subclause; a block ack agreement with parameters defined in 31.2.3 (A-MSDU operation, A-MPDU operation, and BA operation) is always in place.

### 10.25.3 Data and acknowledgment transfer using immediate block ack policy

After (#6286)establishing an immediate block ack agreement following the procedure in 10.25.2 (Setup and modification of the block ack parameters), and having gained access to the medium and established protection,

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

if necessary, the originator may transmit an A-MPDU. The RA field of the frames that are not delivered using the GCR block ack retransmission policy shall be the recipient's individual address. The RA field in GCR frames delivered using the GCR block ack retransmission policy shall be set to the GCR concealment address. The RA field in Data frames delivered using the GLK-GCR block ack retransmission policy shall be set to a SYNRA. The originator requests acknowledgment of outstanding QoS Data frames by sending a BlockAckReq frame.

### 10.25.4 Teardown of the block ack agreement(#6171)

When the originator has no data to send and the final block ack exchange has completed, it shall signal the end of its use of the block ack mechanism by sending the DELBA frame to its recipient. The DELBA frame sent by the S1G originator shall be a BAT DELBA if a BAT ADDBA Request was sent (#6286)during block ack establishment or NDP DELBA if an NDP ADDBA Request was sent during block ack establishment or DELBA if ADDBA Request was sent during block ack setup. The recipient does not generate a Management frame in response to the DELBA frame.[37] The recipient of the DELBA frame shall release all resources allocated for the block ack transfer.

The block ack agreement shall(#6173) be torn down if there are no BlockAck, BlockAckReq, or (#7155)Data frames received from the peer under the block ack agreement, for the block ack agreement's(#6171) TID, (#6172)within the block ack agreement inactivity timeout (see 11.5.4 (Error recovery upon a peer failure)).

The DELBA frame transmitted to release the block ack (#6286)establishment of a GCR service shall include the GCR Group Address element to indicate the group address of the GCR service. For general links using a GLK-GCR block ack retransmission policy, there is no explicit teardown of the block ack agreement(#6171). The GLK-GCR block ack agreement terminates when the general link is reassociated/ disassociated.

### 10.25.5 Selection of BlockAck and BlockAckReq variants

(#4179)For non-HE STAs, the Multi-TID BlockAckReq variant shall not be used(#3263). The Multi-TID BlockAckReq variant can be used between HE STAs to solicit a Multi-STA BlockAck frame for Multi-TID A-MPDUs. (11ax)

In a DMG BSS, if the Compressed BlockAckReq variant is used related to an HT-immediate agreement, then all of the following BlockAck and BlockAckReq frames transmitted as part of the HT-immediate agreement shall use the Compressed BlockAck and Compressed BlockAckReq variants.(11ax)

In a DMG BSS, if the Extended Compressed BlockAckReq variant is used related to an HT-immediate agreement, then all of the following BlockAck and BlockAckReq frames transmitted as part of the HT-immediate agreement shall use the Extended Compressed BlockAck and Extended Compressed BlockAckReq variants.(11ax)

(11ay)In a DMG BSS, when transmitted between EDMG STAs as part of the HT-immediate agreement, BlockAck frames shall be of EDMG Compressed BlockAck frame variant or of EDMG Multi-TID BlockAck variant, and BlockAckReq frames shall be of Compressed BlockAckReq variant or of Multi-TID BlockAckReq variant.(#4244)

Where the terms BlockAck and BlockAckReq are used (11ax)in 10.25.6 (HT-immediate block ack extensions), the appropriate variant according to this subclause (e.g., Compressed, Multi-TID) is referenced by the generic term. The term BlockAck as used in 10.25.6 (HT-immediate block ack extensions) includes the additional NDP_1M BlockAck, NDP_2M BlockAck, BAT, and BlockAck frame variants.

[37] Normal Ack rules apply.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

(11ax)GCR BlockAck and GCR BlockAckReq variants shall be used in a GCR block ack agreement. GLK-GCR BlockAck and GLK-GCR BlockAckReq variants shall be used in a GLK-GCR block ack agreement.

The S1G recipient of an accepted block ack agreement that was negotiated with NDP ADDBA shall use NDP BlockAck frames instead of BlockAck frames to acknowledge MPDUs within A-MPDUs during an HT-immediate block ack agreement.

The S1G recipient of an accepted block ack agreement that was negotiated with BAT ADDBA shall use BAT frames instead of BlockAck frames to acknowledge MPDUs within A-MPDUs during an HT-immediate block ack agreement. Otherwise, the S1G recipient of an accepted block ack agreement shall not use BAT frames.

The S1G recipient of an accepted block ack agreement that was negotiated with ADDBA shall use BlockAck frames to acknowledge MPDUs within A-MPDUs during an HT-immediate block ack agreement.

The S1G recipient of an accepted block ack agreement that was negotiated with either ADDBA Request/ NDP ADDBA Response or NDP ADDBA Request/ADDBA Response shall use either NDP BlockAck or BlockAck frames depending on the type of response frame elicited by the S1G originator. The type of response shall be:

— An NDP BlockAck frame if the RXVECTOR parameter RESPONSE_INDICATION of the eliciting PPDU that contains a BlockAckReq or an A-MPDU is equal to NDP Response
— A BlockAck frame if the RXVECTOR parameter RESPONSE_INDICATION of the eliciting PPDU that contains a BlockAckReq or an A-MPDU is equal to Normal Response
— A PPDU that contains a BlockAck frame if the RXVECTOR parameter RESPONSE_INDICATION of the eliciting PPDU is equal to Long Response

(11ay)An EDMG STA that has a value of 0 in the EDMG Multi-TID Aggregation Support subfield of the STA's EDMG Capabilities element shall not initiate transmission of Multi-TID BlockAckReq variant frames.

(11ay)An EDMG STA shall not transmit a Multi-TID BlockAckReq variant frame to a peer STA that has a value of 0 in the EDMG Multi-TID Aggregation Support subfield within the peer STA's EDMG Capabilities element.

(11ay)An EDMG STA that indicates a nonzero value in the EDMG Multi-TID Aggregation Support subfield of the STA's EDMG Capabilities element shall respond with an EDMG Multi-TID BlockAck variant frame to a received Multi-TID BlockAckReq variant frame.

(11ay)An EDMG STA that indicates a nonzero value in the EDMG Multi-TID Aggregation Support subfield of the STA's EDMG Capabilities element shall respond with an EDMG Multi-TID BlockAck variant frame to an A-MPDU that contains MPDUs of different TIDs and Ack policy equal to Normal Ack or Scheduled Ack. The STA shall set to 1 the Management Ack subfield in the BA Control field of the EDMG Multi-TID BlockAck variant frame to acknowledge an Action Ack or Management frame received within the multi-TID A-MPDU.

(11ay)An EDMG Multi-TID BlockAck frame shall not include more than one BA Information field for a specific TID.

(11ay)An EDMG STA shall respond with (#4251)an EDMG Multi-TID BlockAck frame to an A-MPDU conveyed in an EDMG MU-MIMO PPDU that contains an MPDU with a TID without a block ack agreement.

### 10.25.6 HT-immediate block ack extensions

#### 10.25.6.1 Introduction to HT-immediate block ack extensions

An HT extension to the block ack feature (defined in 10.25.1 (Introduction) to 10.25.4 (Teardown of the block ack agreement(#6171))), called *HT-immediate block ack,* is defined in 10.25.6.2 (HT-immediate block ack architecture) to 10.25.6.9 (Originator's support of recipient's partial state).

The HT-immediate extensions simplify immediate block ack use with A-MPDUs and reduce recipient resource requirements.

An HT STA shall support HT-immediate block ack in the role of recipient.

A DMG STA shall support HT-immediate block ack.

(11ax)If the B0 of Fragment Number subfield of a Compressed BlockAck frame or Multi-STA BlockAck frame is equal to 0, then *BitmapLength* represents the maximum length, in bits, of the Block Ack Bitmap subfield in the Compressed BlockAck frame and Multi-STA BlockAck frame for a particular TID; otherwise, *BitmapLength* is derived by dividing by 4 the length represented in the Block Ack Bitmap subfield in the Compressed BlockAck frame and Multi-STA BlockAck frame for a particular TID. For a non-HE STA, *BitmapLength* is 64. For an HE STA, *BitmapLength* is negotiated when the block ack agreement is established as defined in 26.4.3 (Negotiation of block ack bitmap lengths).

(11ay)An EDMG STA shall support HT-immediate block ack with EDMG flow control extension.

(11ay)An HT-immediate block ack agreement in which the SAR Configuration element was included in the both the ADDBA Request and ADDBA Response frames and that had the SAR Enabled subfield set to 1 in both frames is considered as a block ack agreement with segmentation and reassembly.

(11ay)After setting up an immediate block ack (#6286)establishment following the procedure in 10.25.2 (Setup and modification of the block ack parameters), and having gained access to the medium and established protection, if necessary, an originator that is a DMG STA may transmit a block of QoS Data frames separated by SIFS as follows:

— The total number of frames shall not exceed the Buffer Size subfield value in the associated ADDBA Response frame and subject to any additional duration limitations based on the channel access mechanism; and

— If the block ack agreement is between a pair of EDMG STAs, the memory occupied by the frames shall not exceed the values computed in Table 10-24 (FlowControlByteCountLimit computation at the start of a data transfer sequence(11ay)) and in Table 10-25 (FlowControlByteCountLimit computation during a data transfer sequence(11ay)). The actual RBUFCAP value is delivered by the EDMG Compressed BlockAck, EDMG Multi-TID BlockAck, EDMG Flow Control Extension Configuration element in the ADDBA Response frame or the RBUFCAP update of other TIDs as indicated in TID Grouping field of the Recipient Memory Configuration subelement, whichever comes later. If the ADDBA Response frame does not contain an EDMG Flow Control Extension Configuration element, the relevant originator parameters shall be considered as receiving an RBUFCAP with value Receiver Buffer Empty (9.3.1.8.7 (EDMG Compressed BlockAck variant(11ay))).

(11ay)Each of the frames shall have the Ack Policy Indicator subfield in the QoS Control field set to Block Ack. The RA field of the frames shall be the recipient's individual address. The originator requests acknowledgment of outstanding QoS Data frames by sending a BlockAckReq frame. The recipient shall maintain a block ack record for the block. An EDMG recipient shall maintain free memory space for the

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

established block ack agreement(s) (10.25.6.5 (Generation and transmission of BlockAck frames by an HT STA, DMG STA, or S1G STA)).

(11ay)An EDMG recipient that is TXOP holder or source of an SP may transmit ADDBA Response frames to the originator as defined in 10.25.2 (Setup and modification of the block ack parameters).

### 10.25.6.2 HT-immediate block ack architecture

The HT-immediate block acknowledgment rules(#553) are explained in terms of the architecture shown in Figure 10-40 (HT-immediate block ack architecture)(11ay) and in Figure 10-41 (HT-immediate block ack architecture with EDMG flow control(#6310)(11ay)) for non-EDMG and EDMG STAs, respectively.

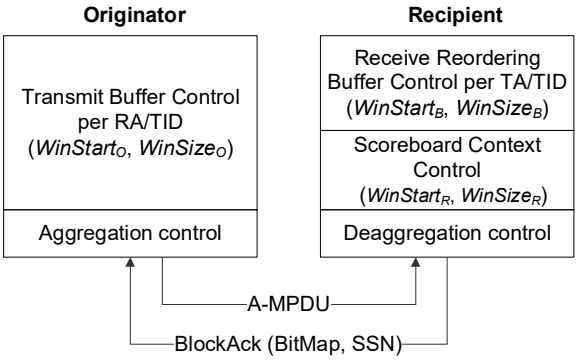

**Figure 10-40—HT-immediate block ack architecture**

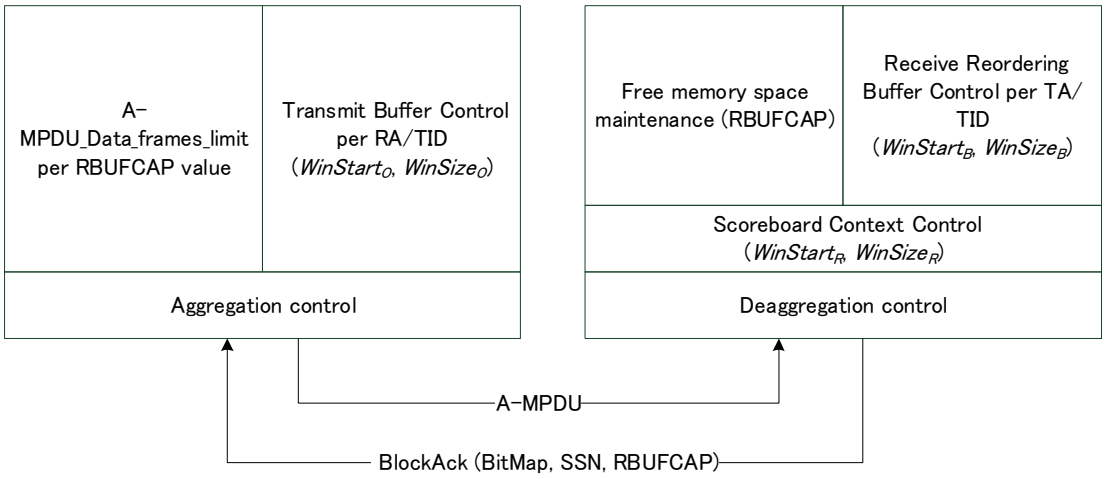

**Figure 10-41—HT-immediate block ack architecture with EDMG flow control(#6310)(11ay)**

The originator contains a transmit buffer control that uses $WinStart_O$ and $WinSize_O$ to submit MPDUs for transmission and releases transmit buffers upon receiving BlockAck frames from the recipient.

$WinStart_O$ is the starting sequence number of the transmit window, and $WinSize_O$ is the number of buffers negotiated in the block ack agreement.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

(11ay)In a block ack agreement with segmentation and reassembly, the originator maintains a transmit buffer control that uses $WinStart_{OJ}$ and $WinSize_{OJ}$ to submit MPDUs for transmission and releases transmit buffers upon reception of BlockAck frames from the recipient. $WinStart_{OJ}$ is the(#4200) starting sequence number of the transmit window and $WinSize_{OJ}$ is the value of the MSDU Buffer Size field in the recipient's SAR Configuration element that established the block ack agreement.

(11ay)An EDMG originator uses RBUFCAP to limit the number of transmitted MPDUs to not exceed the available free memory space at an EDMG recipient.

The Aggregation control creates A-MPDUs. It may adjust the ack policy of transmitted QoS Data frames according to the rules defined in 10.25.6.7 (Originator's behavior) in order to solicit BlockAck frame responses.

The recipient contains a receive reordering buffer control per TA/TID, which contains a related control state. The receive reordering buffer is responsible for reordering MSDUs or A-MSDUs so that MSDUs or A-MSDUs are eventually passed up to the next MAC process in order of received sequence number. It is also responsible for identifying and discarding duplicate frames (i.e., frames that have the same sequence number as a currently buffered frame) that are part of this block ack agreement. It maintains its own state independent of the scoreboard context control to perform this reordering as specified in 10.25.6.6 (Receive reordering buffer control operation).

For each HT-immediate block ack agreement, the recipient chooses either full-state or partial-state operation (this choice is known only to the recipient). A STA may simultaneously use full-state operation for some agreements and partial-state operation for other agreements. The scoreboard context control stores an acknowledgment bitmap containing the current reception status of MSDUs or A-MSDUs for HT-immediate block ack agreements. (11ay)Under a block ack agreement with segmentation and reassembly, the scoreboard context control stores an acknowledgment bitmap containing the current reception status of MPDUs. Under full-state operation, status is maintained in statically assigned memory. Under partial-state operation, status is maintained in a cache memory; therefore, the status information is subject to cache replacement. This entity provides the bitmap and the value for the Starting Sequence Number subfield to be sent in BlockAck frame responses to the originator.

(11ay)An EDMG recipient contains a free memory space maintenance entity. This entity is responsible to compute the RBUFCAP value. This entity provides the RBUFCAP value subfield to be sent in BlockAck and in ADDBA Response frames to an EDMG originator.

The deaggregation control entity separates frames contained in an A-MPDU.

Each received MPDU is analyzed by the scoreboard context control as well as by the receive reordering buffer control.

Each HT-immediate block ack agreement is uniquely identified by a tuple of Address 1, Address 2, and TID from the ADDBA Response frame that successfully established the HT-immediate block ack agreement. The STA that corresponds to Address 1 of the ADDBA Response frame is the originator. The STA that corresponds to Address 2 of the ADDBA Response frame is the recipient. Data frames that contain the same values for Address 1, Address 2, and TID as a successful ADDBA Response frame are (#407)related to the HT-immediate block ack agreement that was established by the receipt of that ADDBA Response frame provided that the HT-immediate block ack agreement is still active.

### 10.25.6.3 Scoreboard context control during full-state operation

For each HT-immediate block ack agreement that uses full-state operation, a recipient shall maintain a block acknowledgment record. This record includes a bitmap, indexed by sequence number; a 12-bit unsigned integer starting sequence number, $WinStart_R$, representing the lowest sequence number position in the bitmap;

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$WinEnd_R$, representing the highest sequence number in the current transmission window; and the maximum transmission window size, $WinSize_R$, which is set to the smaller of *BitmapLength*(11ax) and the value of the Buffer Size field of the associated ADDBA Response frame that established the block ack agreement. A STA implementing full-state operation for an HT-immediate block ack agreement shall maintain the block acknowledgment record for that agreement according to the following rules:

a) At HT-immediate block ack agreement establishment:

   1) (11ay)(#4200)$WinStart_R$ = Starting Sequence Number subfield in the ADDBA Request frame that elicited the ADDBA Response frame that established the HT-immediate block ack agreement or from an MPDU that synchronized an unsolicited block ack agreement.

   2) $WinEnd_R = WinStart_R + WinSize_R - 1$.

b) For each received Data frame that is (#407)related to a specific full-state operation HT-immediate block ack agreement, the block acknowledgment record for that agreement is modified as follows, where *SN* is the value of the Sequence Number subfield of the received Data frame(#6049):

   1) If $WinStart_R \le SN \le WinEnd_R$, set to 1 the bit in position *SN* within the bitmap.(#6049)

   2) If $WinEnd_R < SN < WinStart_R + 2^{11}$,

      i) Set to 0 the bits corresponding to MPDUs with Sequence Number subfield values from $WinEnd_R + 1$ to $SN - 1$.(#6049)

      ii) Set $WinStart_R = SN - WinSize_R + 1$.(#6049)

      iii) Set $WinEnd_R = SN$.(#6049)

      iv) Set to 1 the bit at position *SN* in the bitmap.

   3) If $WinStart_R + 2^{11} \le SN < WinStart_R$, make no changes to the record.

      NOTE —A later-arriving Data frame might validly contain a sequence number that is lower than an earlier-arriving one. This might happen because the transmitter may choose to send Data frames in a nonsequential sequence number order or because a previous Data frame transmission with lower sequence number is not successful and is being retransmitted. (#6049)

c) For each received BlockAckReq frame that is (#407)related to a specific full-state operation HT-immediate block ack agreement that is not a protected block ack agreement, the block acknowledgment record for that agreement is modified as follows, where *SSN* is (#4200)the Starting Sequence Number subfield of the received BlockAckReq frame(#4200):

   1) If $WinStart_R < SSN \le WinEnd_R$,

      i) Set $WinStart_R = SSN$.

      ii) Set to 0 the bits corresponding to MPDUs with Sequence Number subfield values from $WinEnd_R + 1$ to $WinStart_R + WinSize_R - 1$.

      iii) Set $WinEnd_R = WinStart_R + WinSize_R - 1$.

   2) If $WinEnd_R < SSN < WinStart_R + 2^{11}$,

      i) Set $WinStart_R = SSN$.

      ii) Set $WinEnd_R = WinStart_R + WinSize_R - 1$.

      iii) Set to 0 bits the corresponding to MPDU with Sequence Number subfield values from $WinStart_R$ to $WinEnd_R$.

   3) If $WinStart_R + 2^{11} \le SSN \le WinStart_R$, make no changes to the record.

#### 10.25.6.4 Scoreboard context control during partial-state operation

In an HT-immediate block ack agreement that uses partial-state operation, a recipient shall maintain a temporary block acknowledgment record. This temporary record includes a bitmap, indexed by sequence number; a 12-bit unsigned integer $WinStart_R$ (the lowest sequence number represented in the bitmap); a 12-bit unsigned integer $WinEnd_R$ (the highest sequence number in the bitmap); the originator address; TID; and the

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

maximum transmission window size, $WinSize_R$, which is set to the smaller of 64 and the value of the Buffer Size field of the associated ADDBA Response frame that established the block ack agreement.

During partial-state operation of scoreboard context control, the recipient retains the current record for an HT-immediate block ack agreement at least as long as it receives data from the same originator. If a frame for an HT-immediate block ack agreement from a different originator is received, the temporary record may be discarded if the resources it uses are needed to store the temporary record corresponding to the newly arriving frame.

A STA implementing partial-state operation for an HT-immediate block ack agreement shall maintain the temporary block acknowledgment record for that agreement according to the following rules:

a) During partial-state operation(#4200), $WinStart_R$ is determined by the Sequence Number subfield value of received Data frames and by the Starting Sequence Number subfield value of received BlockAckReq frames as described below.(#4200)

b) For each received Data frame that is (#407)related to a specific partial-state operation HT-immediate block ack agreement, when no temporary record for the agreement (#407)related to the received Data frame exists at the time of receipt of the Data frame, a temporary block acknowledgment record is created as follows, where *SN* is the value of the Sequence Number subfield of the received Data frame (11ay)if segmentation and reassembly is not used and is the value of the MPDU Sequence Number subfield of the received Data frame when segmentation and reassembly is used(#6049):

   1) $WinEnd_R = SN$.(#6049)
   2) $WinStart_R = WinEnd_R - WinSize_R + 1$.
   3) Create a bitmap of size $WinSize_R$, with the first bit corresponding to sequence number $WinStart_R$ and the last bit corresponding to sequence number $WinEnd_R$, and set all bits in the bitmap to 0.
   4) Set to 1 the bit in the position in the bitmap that corresponds to *SN*.

c) For each received Data frame that is (#407)related to a specific partial-state operation HT-immediate block ack agreement, when a temporary record for the agreement (#407)related to the received Data frame exists at the time of receipt of the Data frame, the temporary block acknowledgment record for that agreement is modified in the same manner as the acknowledgment record for a full-state agreement described in 10.25.6.3 (Scoreboard context control during full-state operation).

d) For each received BlockAckReq frame that is (#407)related to a specific partial-state operation HT-immediate block ack agreement that is not a protected block ack agreement, when no temporary record for the agreement (#407)related to the received frame exists at the time of receipt of the frame, a temporary block acknowledgment record is created as follows, where *SSN* is (#4200)the Starting Sequence Number subfield of the received BlockAckReq frame(#4200):

   1) $WinStart_R = SSN$.
   2) $WinEnd_R = WinStart_R + WinSize_R - 1$.
   3) Create a bitmap of size $WinSize_R$, and set all bits in the bitmap to 0.

e) For each received BlockAckReq frame that is (#407)related to a specific partial-state operation HT-immediate block ack agreement that is not a protected block ack agreement, when a temporary record for the agreement (#407)related to the received frame exists at the time of receipt of the frame, the temporary block acknowledgment record for that agreement is modified in the same manner as the acknowledgment record for a full-state agreement described in 10.25.6.3 (Scoreboard context control during full-state operation).

### 10.25.6.5 Generation and transmission of BlockAck frames by an HT STA, DMG STA, or S1G STA

(#3263)A STA that receives a PPDU that contains a BlockAckReq frame in which the Address 1 field matches its MAC address during either full-state operation or partial-state operation shall transmit a PPDU containing a

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

BlockAck frame that is separated on the WM by a SIFS from the PPDU that elicited the BlockAck frame as a response. A STA that receives an A-MPDU that contains one or more QoS Data frames with Implicit BAR ack policy during either full-state operation or partial-state operation shall transmit a PPDU containing a BlockAck frame that is separated on the WM by a SIFS from the PPDU that elicited the BlockAck frame as a response.

(11ay)A STA operating in an SP with TDD channel access (see 10.38.6.2.2 (SP with TDD channel access(11ay))) that receives a PPDU that contains a BlockAckReq frame in which the Address 1 field matches its MAC address during either full-state or partial-state operation shall transmit a PPDU containing a BlockAck frame starting at the earliest occurring TDD slot the STA is assigned to, with the Bitmap and Access Type Schedule field of the TDD slot set to TX, and with slot category of the TDD slot set to Basic TDD slot, as indicated in the TDD Slot Schedule element.

(11ay)A STA operating in an SP with TDD channel access (see 10.38.6.2.2 (SP with TDD channel access(11ay))) that receives an A-MPDU that contains one or more MPDUs in which the Address 1 field matches its MAC address with the Ack Policy field equal to Normal Ack (i.e., implicit block ack request) during either full-state operation or partial-state operation shall transmit a PPDU containing a BlockAck frame starting at the earliest occurring TDD slot the STA is assigned to, with the Bitmap and Access Type Schedule field of the TDD slot set to TX, and with slot category of the TDD slot set to Basic TDD slot, as indicated in the TDD Slot Schedule element.

When responding with a BlockAck frame to either a received BlockAckReq frame or a received QoS Data frame with Implicit BAR ack policy during either full-state operation or partial-state operation, any adjustment to the value of $WinStart_R$ according to the procedures defined within 10.25.6.3 (Scoreboard context control during full-state operation) and 10.25.6.4 (Scoreboard context control during partial-state operation) shall be performed before the generation and transmission of the response BlockAck frame. The Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield of the BlockAck frame shall be set to any value in the range ($WinEnd_R$ – $BitmapLength$ + 1))(11ax) to $WinStart_R$. The Starting Sequence Number subfield stored in the Starting Sequence Control field of NDP BlockAck and BAT frames shall be set to $WinStart_R$. The values in the recipient's record of status of MPDUs beginning with the MPDU for which the Sequence Number subfield value is equal to $WinStart_R$ and ending with the MPDU for which the Sequence Number subfield value is equal to $WinEnd_R$ shall be included in the bitmap of the BlockAck frame. The bitmap of the NDP BlockAck frame is protected using the encoding procedure described in 10.56 (Bitmap protection for NDP BlockAck frames).

When responding with a BlockAck frame to either a received BlockAckReq frame or a received QoS Data frame with Implicit BAR ack policy during either full-state or partial-state operation, if the adjusted value of $WinStart_R$ is greater than the value of the starting sequence number of the BlockAck frame, within the bitmap of the BlockAck frame, the status of MPDUs with sequence numbers that are less than the adjusted value of $WinStart_R$ may be set to any value.

When responding with a BlockAck frame to either a received BlockAckReq frame or a received QoS Data frame with Implicit BAR ack policy during either full-state or partial-state operation, if the adjusted value of $WinEnd_R$ is less than the value of the starting sequence number of the BlockAck frame plus(11ax) $BitmapLength$ − 1, within the bitmap of the BlockAck frame, the status of MPDUs with sequence numbers that are greater than the adjusted value of $WinEnd_R$ shall be reported as not received (i.e., the corresponding bit in the bitmap shall be set to 0).

If a BlockAckReq frame is received and no matching partial state is available, the recipient shall send a null BlockAck frame in which the bitmap is set to all 0s.

(11ay)If an EDMG STA transmits a BlockAck frame in response to a BlockAckReq frame or an A-MPDU with Ack Policy equal to Normal Ack (i.e., implicit block ack request) during either full-state or partial-state operation, the EDMG STA shall calculate the free memory space value at the generation and transmission of the BlockAck frame. The RBUFCAP subfield value in the transmitted BlockAck frame shall be computed

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

as defined in Table 10-23 (RBUFCAP value calculation(11ay)). The free memory space is an estimation of the amount of free memory available at the recipient to collect MPDUs at the time of and during reception of a forthcoming A-MPDU.

(11ay)Within an unsolicited block ack agreement, the RBUFCAP value used by an EDMG STA for the RBUFCAP calculation in (11ay)Table 10-23 (RBUFCAP value calculation(11ay)) shall assume that the RBUFCAP Quantity Capable subfield value is "Not Supported" and shall not use a value between 1 and 254, inclusive.

**Table 10-23—RBUFCAP value calculation(11ay)**

| Free memory space comparison | RBUFCAP Quantity Capable subfield value (10.25.2 (Setup and modification of the block ack parameters)) | RBUFCAP subfield value |
|---|---|---|
| Free memory space ≥ $(2^{(13 + \text{Maximum A-MPDU Length Exponent})} - 1)$ | Supported | Receiver Buffer Empty |
| Free memory space ≥ $(2^{(13 + \text{Maximum A-MPDU Length Exponent})} - 1)$ | Not supported | Receiver Buffer Empty |
| Free memory space < $(2^{(13 + \text{Maximum A-MPDU Length Exponent})} - 1)$ | Supported | Int [Free memory space/ Buffer Unit Size] |
| Free memory space < $(2^{(13 + \text{Maximum A-MPDU Length Exponent})} - 1)$ | Not supported | Receiver Buffer Full |

### 10.25.6.6 Receive reordering buffer control operation

#### 10.25.6.6.1 General

The behavior described in this subclause, 10.25.6.6.2 (Operation for each received Data frame), and 10.25.6.6.3 (Operation for each received BlockAckReq) applies to a STA that uses either partial-state operation or full-state operation for an HT-immediate block ack agreement.

(11ay)For each HT-immediate block ack agreement that does not use segmentation and reassembly, a receive reordering buffer shall be maintained for each HT-immediate block ack agreement. Each receive reordering buffer includes a record comprising the following:

— Buffered MSDUs or A-MSDUs that have been received, but not yet passed up to the next MAC process

— A $WinStart_B$ parameter, indicating the value of the Sequence Number subfield of the first (in order of ascending sequence number) MSDU or A-MSDU that has not yet been received

— A $WinEnd_B$ parameter, indicating the highest sequence number expected to be received in the current reception window

— A $WinSize_B$ parameter, indicating the size of the reception window

(11ay)For each HT-immediate block ack agreement that does not use segmentation and reassembly and is not part of an unsolicited block ack agreement, (#6305)the variables shall be initialized as follows:

— $WinStart_B$ is initialized to the Starting Sequence Number subfield value of the ADDBA Request frame that elicited the ADDBA Response frame that established the HT-immediate block ack agreement.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

— $WinEnd_B$ is initialized to $WinStart_B + WinSize_B - 1$, where $WinSize_B$ is set to the smaller of(11ax) *BitmapLength* and the value of the Buffer Size field of the ADDBA Response frame that established the block ack agreement.

(11ay)For each HT-immediate block ack agreement that does not use segmentation and reassembly, the recipient shall always pass MSDUs or A-MSDUs up to the next MAC process in order of increasing Sequence Number subfield value.

(11ay)For each HT-immediate block ack agreement that uses segmentation and reassembly, a receive reordering buffer shall be maintained. Each receive reordering buffer includes a record comprising the following:

— Buffered MPDUs belonging to MSDUs or A-MSDUs that have been received, but not yet passed up to the next MAC process.

— A $WinStart_B$ parameter, indicating the value of the MPDU Sequence Number subfield of the first (in order of ascending sequence number) MPDU that has not yet been received.

— A $WinEnd_B$ parameter, indicating the highest MPDU sequence number expected to be received in the current reception window.

— A $WinSize_B$ parameter, indicating the size of the reception window.

(11ay)For each HT-immediate block ack agreement that uses segmentation and reassembly, (#4200)$WinStart_B$ and (#4200)$WinEnd_B$ variables shall be initialized as follows:

— $WinStart_B$ is initialized to the (#4200)Starting Sequence Number subfield value of the ADDBA Request frame that elicited the ADDBA Response frame that established the block ack agreement.

— $WinEnd_B$ is initialized to $WinStart_B + WinSize_B - 1$, where $WinSize_B$ is set to the smaller of 1024 and the value of the MPDU Buffer Size field of the ADDBA Response frame that established the block ack agreement.

(11ay)For each HT-immediate block ack agreement that uses segmentation and reassembly, the recipient shall always pass MSDUs or A-MSDUs up to the next MAC process in order of increasing MSDU Sequence Number subfield value.

(11ay)Any MSDU or A-MSDU that has been passed up to the next MAC process shall be deleted from the receive reordering buffer.

#### 10.25.6.6.2 Operation for each received Data frame

##### 10.25.6.6.2.1 Block ack agreements not using segmentation and reassembly(11ay)

For each received Data frame that is related to a specific HT-immediate block ack agreement(11ay) that does not use segmentation and reassembly, the receive reordering buffer record shall be modified as follows, where *SN* is the value of the Sequence Number subfield of the received MPDU:

a) If $WinStart_B \le SN \le WinEnd_B$,

1) Store the received MPDU in the buffer, (#270)if no MSDU or A-MSDU with the same sequence number is already present; otherwise discard the MPDU.

2) Pass MSDUs or A-MSDUs up to the next MAC process if they are stored in the buffer in order of increasing value of the Sequence Number subfield starting with the MSDU or A-MSDU that has $SN=WinStart_B$ or if $SN>WinStart_B$, the STA is a (11ay)non-EDMG STA, and one of the following conditions is met:

i) The MPDU is received as non-first frame in the A-MPDU; the bit at position $SN=WinStart_R - 1$ is set to 1; and all delimiters between the received MPDU and the preceding MPDU ($SN=WinStart_R - 1$) are valid.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

ii) The MPDU is received as first frame in the A-MPDU; the A-MPDU is received in SIFS or RIFS after an A-MPDU or in SIFS after transmission of a BlockAck frame; the bit at position $SN=WinStart_R - 1$ is set to 1; and all delimiters after the MPDU ($SN=WinStart_R - 1$) in the preceding A-MPDU are valid.

iii) The MPDU is received in SIFS or RIFS after an A-MPDU or in SIFS after transmission of a BlockAck frame; the bit at position $SN=WinStart_R - 1$ is set to 1; and all delimiters after the MPDU ($SN=WinStart_R - 1$) in the preceding A-MPDU are valid.

iv) The MPDU is received as first frame in the A-MPDU; the A-MPDU is received in SIFS or RIFS after an MPDU or in SIFS after transmission of an Ack frame; and the bit at position $SN=WinStart_R - 1$ is set to 1.

v) The MPDU is received in SIFS or RIFS after the preceding MPDU or in SIFS after transmission of an Ack frame; and the bit at position $SN=WinStart_R - 1$ is set to 1.

This process is continued sequentially until there is no buffered MSDU or A-MSDU for the next sequential value of the Sequence Number subfield.

3) Set $WinStart_B$ to the value of the Sequence Number subfield of the last MSDU or A-MSDU that was passed up to the next MAC process plus one.

4) Set $WinEnd_B = WinStart_B + WinSize_B - 1$.

b) If $WinEnd_B < SN < WinStart_B + 2^{11}$,

1) Store the received MPDU in the buffer, (#270)if no MSDU or A-MSDU with the same sequence number is already present; otherwise discard the MPDU.

2) Set $WinEnd_B = SN$.

3) Set $WinStart_B = WinEnd_B - WinSize_B + 1$.

4) Pass any complete MSDUs or A-MSDUs stored in the buffer with Sequence Number subfield values that are lower than the new value of $WinStart_B$ up to the next MAC process in order of increasing Sequence Number subfield value. Gaps may exist in the Sequence Number subfield values of the MSDUs or A-MSDUs that are passed up to the next MAC process.

5) In a non-DMG STA, pass MSDUs or A-MSDUs stored in the buffer up to the next MAC process in order of increasing value of the Sequence Number subfield starting with $WinStart_B$ and proceeding sequentially until there is no buffered MSDU or A-MSDU for the next sequential Sequence Number subfield value. For a DMG STA, follow rules defined in item a)2) above.

6) Set $WinStart_B$ to the Sequence Number subfield value of the last MSDU or A-MSDU that was passed up to the next MAC process plus one.

7) Set $WinEnd_B = WinStart_B + WinSize_B - 1$.

c) If $WinStart_B + 2^{11} \leq SN < WinStart_B$, discard the MPDU (do not store the MPDU in the buffer, and do not pass the MSDU or A-MSDU up to the next MAC process).

#### 10.25.6.6.2.2 Block ack agreements using segmentation and reassembly(11ay)

For each received data MPDU that is related to a specific block ack agreement using segmentation and reassembly, the receive reordering buffer record shall be modified as follows, where MPDU_SN is the value of the Sequence Number subfield of the received MPDU:

a) If $WinStart_B \leq MPDU\_SN \leq WinEnd_B$,

1) Store the received MPDU in the buffer if no MPDU with the same sequence number is already present; otherwise, discard the MPDU.

2) Pass to the next MAC process any complete MSDUs or A-MSDUs in the buffer, which includes all MPDUs with the same value of *MSDU_SN* in increasing order of MPDU_SN, from the *MPDU_SN* with Start of MSDU subfield equal to 1 until the MPDU with End of MSDU subfield equal to 1 and which their MPDU_SN starts with $MPDU\_SN = WinStart_B$ and

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

proceeds sequentially until there is no buffered MPDUs for the next *MPDU_SN*. An MSDU or A-MSDU is complete if all MPDUs identified with the same MSDU_SN from the *MPDU_SN* with Start of MSDU subfield equal to 1 until the MPDU with End of MSDU subfield equal to 1 are present in the receive reordering buffer.

3) Set $WinStart_B$ to the value of the MPDU_SN subfield of the last MPDU of the MSDU or A-MSDU that was passed up to the next MAC process plus one.

4) Set $WinEnd_B = WinStart_B + WinSize_B - 1$.

b) If $WinEnd_B < MPDU\_SN < WinStart_B + 2^{\text{MPDU Modulo-1}}$,

1) Store the received MPDU in the buffer if no MPDU with the same sequence number is already present; otherwise, discard the MPDU.

2) Set $WinEnd_B = MPDU\_SN$.

3) Set $WinStart_B = WinEnd_B - WinSize_B + 1$.

4) Pass to the next MAC process any complete MSDUs or A-MSDUs in the buffer, which include all MPDUs with the same value of *MSDU_SN* in increasing order of *MPDU_SN*, from the *MPDU_SN* with Start of MSDU subfield equal to 1 until the MPDU with End of MSDU subfield equal to 1 and which their *MPDU_SN* is lower than $WinStart_B$. Gaps may exist in the MPDU_SN subfield, in this case the recipient shall discard the MSDUs or A-MSDUs with missing *MPDU_SN* and may inform the next MAC process of the incomplete or missing *MSDU_SN*.

5) Set $WinStart_B$ to the value of the *MPDU_SN* of the last MSDU or A-MSDU that was passed up to the next MAC process plus one.

6) Set $WinEnd_B = WinStart_B + WinSize_B - 1$.

c) If $WinStart_B + 2^{\text{MPDU Modulo-1}} \leq MPDU\_SN < WinStart_B$, discard the MPDU.

An originator shall not transmit a segmented MSDU if the size of the segmented MSDU is greater than the value defined by the Maximum Segmented MSDU Exponent subfield of the recipient's SAR Configuration element.

#### 10.25.6.6.3 Operation for each received BlockAckReq

##### 10.25.6.6.3.1 Block ack agreements not using segmentation and reassembly(11ay)

For each received BlockAckReq frame that is (#407)related to a specific HT-immediate block ack agreement(11ay) that does not use segmentation and reassembly, the receive reordering buffer record is modified as follows, where *SSN* is the Starting Sequence Number subfield value of the received BlockAckReq frame:

a) If $WinStart_B < SSN < WinStart_B + 2^{11}$,

1) In a block ack agreement that is not a protected block ack agreement, set $WinStart_B = SSN$. See 10.25.7 (Protected block ack agreement) for a protected block ack agreement.

2) Set $WinEnd_B = WinStart_B + WinSize_B - 1$.

3) Pass any complete MSDUs or A-MSDUs stored in the buffer with Sequence Number subfield values that are lower than the new value of $WinStart_B$ up to the next MAC process in order of increasing Sequence Number subfield value. Gaps may exist in the Sequence Number subfield values of the MSDUs or A-MSDUs that are passed up to the next MAC process.

4) Pass MSDUs or A-MSDUs stored in the buffer up to the next MAC process in order of increasing Sequence Number subfield value starting with $SN=WinStart_B$ and proceeding sequentially until there is no buffered MSDU or A-MSDU for the next sequential Sequence Number subfield value.

5) Set $WinStart_B$ to the Sequence Number subfield value of the last MSDU or A-MSDU that was passed up to the next MAC process plus one.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

6) Set $WinEnd_B = WinStart_B + WinSize_B - 1$.

b) If $WinStart_B + 2^{11} \leq SSN \leq WinStart_B$, do not make any changes to the receive reordering buffer record.

#### 10.25.6.6.3.2 Block ack agreements using segmentation and reassembly(11ay)

For each received BlockAckReq frame that is (#407)related to a specific block ack agreement that uses segmentation and reassembly, the receive reordering buffer record is modified as follows, where *MPDU_SSN* is the (#4200)Starting Sequence Number subfield value of the received BlockAckReq frame:

a) If $WinStart_B < MPDU\_SSN < WinStart_B + 2^{\text{MPDU Modulo-1}}$,

1) In a block ack agreement that is not a protected block ack agreement, set $WinStart_B = MPDU\_SSN$. See 10.25.7 (Protected block ack agreement) for a protected block ack agreement.

2) Set $WinEnd_B = WinStart_B + WinSize_B - 1$.

3) Pass to the next MAC process any complete MSDUs or A-MSDUs in the buffer, which include all MPDUs with the same value of *MSDU_SN* in increasing order of MPDU_SN, from the *MPDU_SN* with Start of MSDU subfield equal to 1 until the MPDU with End of MSDU subfield equal to 1 and which their *MPDU_SN* is lower than $WinStart_B$. Gaps may exist in the MPDU_SN subfield, in this case the recipient shall discard the MSDUs or A-MSDUs with missing *MPDU_SN* and may inform the next MAC process of the incomplete or missing MSDUs or A-MSDUs.

4) Pass to the next MAC process any complete MSDUs or A-MSDUs in the buffer, which include all MPDUs with the same value of *MSDU_SN* in increasing order of *MPDU_SN*, from the *MPDU_SN* set with the Start of MSDU subfield equal to 1 until the MPDU with End of MSDU subfield equal to 1 and which their MPDU_SN starts with $MPDU\_SN = WinStart_B$ and proceeds sequentially until there is no buffered MPDUs for the next *MPDU_SN*.

5) Set $WinStart_B$ to the *MPDU_SN* value of the last MSDU or A-MSDU that was passed up to the next MAC process plus one.

6) Set $WinEnd_B = WinStart_B + WinSize_B - 1$.

b) If $WinStart_B + 2^{\text{MPDU Modulo-1}} \leq MPDU\_SSN < WinStart_B$, do not make any changes to the receive reordering buffer record.

### 10.25.6.7 Originator's behavior

#### 10.25.6.7.1 General(11ay)

A STA may send a block of data in a single A-MPDU where each QoS Data frame has Normal Ack ack policy. The originator expects to receive a BlockAck frame response immediately following the A-MPDU if at least one Data frame is received without error.

(11ay)A DMG STA originator operating in an SP with TDD channel access (see 10.38.6.2.2 (SP with TDD channel access(11ay))) expects to receive a BlockAck frame response in the earliest occurring TDD slot with slot category of the TDD slot set to Basic TDD slot as defined in 10.25.6.5 (Generation and transmission of BlockAck frames by an HT STA, DMG STA, or S1G STA) if at least one Data frame is received without error.

(11ay)A DMG STA originator operating in an SP with TDD channel access (see 10.38.6.2.2 (SP with TDD channel access(11ay))) shall not transmit to a peer STA more than one MPDU or A-MPDU that has an Ack Policy of Normal Ack per each occurrence of a TDD slot the peer STA is assigned to, with the Bitmap and Access Type Schedule field of the TDD slot set to TX, and with slot category of the TDD slot set to Basic TDD slot or Data TDD slot, as indicated in the TDD Slot Schedule element.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

If the received BlockAck response is of an expected NDP_1M BlockAck frame (or an NDP_2M BlockAck frame), the S1G originator shall accept it as correctly received if the value obtained from the BlockAck ID field equals the 2 LSBs (or the 6 LSBs) of the (#8126)scrambler initialization value of the immediately previously transmitted A-MPDU that is not an S-MPDU, or BlockAckReq frame,(#4200) and the Starting Sequence Number obtained from the Starting Sequence Control field equals $WinStart_O$. The S1G originator shall otherwise consider the NDP BlockAck frame to be lost.(#6277)

NOTE—(#6277)(#8126)The scrambler initialization value is obtained from the PHY-TXEND.confirm parameter SCRAMBLER_OR_CRC. The values of the BlockAck ID and Starting Sequence Number fields are obtained after decoding the NDP BlockAck frame as described in 10.56 (Bitmap protection for NDP BlockAck frames).

Alternatively, the originator may send an A-MPDU where each QoS Data frame has Block Ack ack policy under an HT-immediate block ack agreement if it does not require a BlockAck frame response immediately following the A-MPDU.

If the BlockAck frame is lost, the originator may transmit a BlockAckReq frame to solicit an immediate BlockAck frame or it may retransmit the Data frames.

During an accepted HT-immediate block ack agreement, the S1G originator shall set the TXVECTOR parameter RESPONSE_INDICATION of a PPDU transmitted to the S1G recipient that elicits a block acknowledgment frame to

— NDP Response if the block ack agreement was negotiated with NDP ADDBA Request/NDP ADDBA Response exchange

— Normal Response if the block ack agreement was negotiated with either BAT ADDBA Request/ BAT ADDBA Response or ADDBA Request/ADDBA Response exchange

During an accepted HT-immediate block ack agreement, the S1G originator is allowed to elicit an NDP BlockAck or a BlockAck frame on a per-PPDU basis only if the block ack agreement was negotiated with either ADDBA Request/NDP ADDBA Response or NDP ADDBA Request/ADDBA Response exchanges. In this case the S1G originator may set the TXVECTOR parameter RESPONSE_INDICATION of a PPDU transmitted to the S1G recipient that elicits a block acknowledgment frame to either NDP Response or Normal Response.

The S1G originator shall not set the TXVECTOR parameter RESPONSE_INDICATION to Long Response for a PPDU transmitted to the S1G recipient that elicits a block acknowledgment frame, if neither BlockAck frame nor BAT frames have been negotiated with the S1G recipient. The S1G originator may set the TXVECTOR parameter RESPONSE_INDICATION to Long Response if either BlockAck frame or BAT frames have been negotiated with the S1G recipient.

The originator may transmit QoS Data frames with a TID matching a block ack agreement in any order provided that their sequence numbers lie within the current transmission window. The originator may transmit an MPDU with a sequence number that is beyond the current transmission window ($SN > WinStart_O + WinSize_O - 1$), in which case the originator's transmission window (and the recipient's window) is moved forward. The originator should not transmit an MPDU with a sequence number that is before the current transmission window (i.e., $SN < WinStart_O$). (11ay)Under a block ack agreement with segmentation and reassembly, the originator may transmit QoS Data frames with a TID matching an established block ack agreement in any order provided that their *MPDU_SN* and MSDU_SN are within the current transmission window. The originator may transmit an MPDU with an *MSDU_SN* that is beyond the current transmission window ($MSDU\_SN > WinStart_{OJ} + WinSize_{OJ} - 1$), in which case the originator's transmission window (and the recipient's window) is moved forward. The originator shall not transmit MSDUs or A-MSDUs that are lower than the current transmission window (i.e., $SN < WinStart_{OJ}$) in case the MSDU Modulo subfield was set to a value smaller than 5.(#6049)

The originator shall not retransmit an MPDU after that MPDU's appropriate lifetime limit.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

When a QoS Data frame that was previously transmitted within an A-MPDU that had Normal Ack ack policy is discarded due to exhausted MSDU lifetime, the originator may send a BlockAckReq frame for a block ack agreement that is not a protected block ack agreement or a PBAC WinStart Update frame for a protected block ack agreement to shift the recipient's $WinStart_B$ and $WinStart_R$ past the hole in the sequence number space that is created by the discarded Data frame and thereby to allow the earliest possible passing of buffered frames up to the next MAC process. (11ay)(#4200)Under a block ack agreement with segmentation and reassembly, the BlockAckReq and PBAC WinStart Update frames shall have a Starting Sequence Number field that corresponds to an MPDU that has the Start of MSDU subfield equal to 1. (#3169)(#3014)

An originator that is a DMG STA shall transmit MPDUs sent under a block ack agreement such that:

- (11ay)If the originator or the recipient are a non-EDMG STA,
  - MPDUs that need to be retransmitted are transmitted first, in sequential order of sequence number, starting from the oldest MPDU that needs to be retransmitted
  - MPDUs that are being transmitted for the first time are sent after any MPDUs that need to be retransmitted, in sequential order of sequence number, starting from the oldest MPDU that has not been transmitted
- QoS Data MPDUs are transmitted with Block Ack ack policy if the A-MPDU that contains them is followed after a SIFS(#6587) or RIFS by another A-MPDU

An originator that is a DMG STA shall not start a new TXOP or SP with a PPDU containing a QoS Data MPDU that has an ack policy other than Normal Ack or Implicit BAR if at least one frame transmitted by the originator to the recipient in the last PPDU did not require an immediate response.

(11ay)At the start of a data transfer sequence that has an established Block Ack agreement, an originator that is an EDMG STA shall not transmit a frame with a PSDU size greater than *FlowControlByteCountLimit*, where *FlowControlByteCountLimit* is defined per the configuration obtained during the Block Ack agreement establishment for the respective TID or group of TIDs described in Table 10-24 (FlowControlByteCountLimit computation at the start of a data transfer sequence(11ay)) and per the computation described in 10.25.6.7.2 (Number of MPDUs per FlowControlByteCountLimit computation(11ay)).

**Table 10-24—FlowControlByteCountLimit computation at the start of a data transfer sequence(11ay)**

| According to Block Ack agreement | | As received via BlockAck or ADDBA Response frame | | FlowControlByteCount Limit |
|---|---|---|---|---|
| Advanced recipient memory length capable | Recipient buffer quantity capable | Updated RBUFCAP | No Memory Kept | |
| 0 | N/A | Receiver Buffer Full | N/A | Zero (see NOTE) |
| N/A | N/A | Receiver Buffer Empty | 0 | $2^{(13 + \text{Maximum A-MPDU Length Exponent})} - 1$ |
| 1 | N/A | N/A | 1 | $2^{(13 + \text{Advanced Recipient Memory Length Exponent})} - 1$ |
| 0 | N/A | Receiver Buffer Empty or Receiver Buffer Available | 1 | Zero (see NOTE) |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 10-24—FlowControlByteCountLimit computation at the start of a data transfer sequence(11ay) *(continued)***

| According to Block Ack agreement | | As received via BlockAck or ADDBA Response frame | | FlowControlByteCount Limit |
|---|---|---|---|---|
| Advanced recipient memory length capable | Recipient buffer quantity capable | Updated RBUFCAP | No Memory Kept | |
| N/A | 1 | Receiver Buffer Available | 0 | Receiver Buffer Available × Buffer Unit Size |
| NOTE—An originator can poll a responder's RBUFCAP value. | | | | |

(11ay)During a data transfer sequence that has an established Block Ack agreement, an originator that is an EDMG STA shall not transmit a frame with a PSDU size greater than *FlowControlByteCountLimit*, where *FlowControlByteCountLimit* is defined per the configuration obtained during the Block Ack agreement establishment for the respective TID or group of TIDs described in Table 10-25 (FlowControlByteCountLimit computation during a data transfer sequence(11ay)) and per the computation described in 10.25.6.7.2 (Number of MPDUs per FlowControlByteCountLimit computation(11ay)).

**Table 10-25—FlowControlByteCountLimit computation during a data transfer sequence(11ay)**

| According to Block Ack agreement | As received via BlockAck or ADDBA Response frame | FlowControlByteCountLimit |
|---|---|---|
| Recipient buffer quantity capable | Updated RBUFCAP | |
| N/A | Receiver Buffer Full | Zero (see NOTE) |
| N/A | Receiver Buffer Empty | $2^{(13 + \text{Maximum A-MPDU Length Exponent})} - 1$) |
| 1 | Receiver Buffer Available | Receiver Buffer Available × Buffer Unit Size |
| NOTE—An originator can poll a responder's RBUFCAP value. | | |

### 10.25.6.7.2 Number of MPDUs per FlowControlByteCountLimit computation(11ay)

Figure 10-42 (Algorithm for computation of FlowControlByteCountLimit(11ay) (continued on next page)) specifies the algorithm used to compute the number of MPDUs satisfying a given *FlowControlByteCountLimit* based on Table 10-24 (FlowControlByteCountLimit computation at the start of a data transfer sequence(11ay)) and Table 10-25 (FlowControlByteCountLimit computation during a data transfer sequence(11ay)). In this algorithm, the following apply:

— *numOfMpdusForTx* indicates the number of pending MPDUs in the transmit queue that are within the transmission window.

— If the recipient memory multiple buffer units capability is not supported, then the parameters *maxMpduInMem* and *mpduSplitInBuffer* are assigned with values 255 and 1, respectively.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

— Parameters *unitBufferSize*, *rbufcap*, *memoryUnitSize*, *maxMpduInMem*, and *mpduSplitInBuffer* correspond to the last EDMG flow control parameters as received from a TID within a group of TIDs and with the respective memory configuration tag.

— *mpduForTx[k]* contains the size of the MPDU at location *k* in the transmit queue with the padding for minimum A-MPDU spacing and A-MPDU delimiter alignment, if required.

— For a multi-TID A-MPDU containing TIDs not included in a TID group, the algorithm computes the number of MPDUs for each TID using the *FlowControlByteCountLimit* of that TID. For a multi-TID A-MPDU containing TIDs included in a TID group, the algorithm computes the number of MPDUs for all the TIDs using the recent calculated *FlowControlByteCountLimit* for any TID within the TID group.

#### 10.25.6.8 Maintaining block ack state at the originator

If an originator receives a BlockAck frame, the originator updates the status of MPDUs in its transmit buffer that have the same TID as the BlockAck frame, RA equal to the TA of the BlockAck frame and TA equal to the RA of the BlockAck frame. Status update is performed as follows:

— The originator shall not update the status of MPDUs with Sequence Number subfield values between $WinStart_O$ and $SSN - 1$ of the received BlockAck frame, where *SSN* is the Starting Sequence Number subfield in the received BlockAck frame.(#4200)

NOTE 1—It is possible for (#4200)*SSN* to be greater than $WinStart_O$ because of the lack of reception of a nonzero number of MPDUs beginning with the MPDU with Sequence Number subfield value equal to $WinStart_O$ at a recipient that is using partial-state operation.

— For each MPDU for which the status is not acknowledged, and for which the corresponding bit of the received bitmap contains a value of 1, and for which the Sequence Number subfield value is between *SSN* and $WinStart_O + WinSize_O - 1$, the originator shall change its status to acknowledged.(#4200)

NOTE 2—This second rule means that if an originator successfully delivered an MPDU and received the BlockAck frame in one TXOP and then receives a BlockAck frame in a later TXOP in which the MPDU is not indicated as received (i.e., the corresponding bit of the received bitmap is 0 because the partial state has been reset), the originator knows not to retry the MPDU.

(11ay)Under a block ack agreement with segmentation and reassembly, the originator shall update $WinStart_{OJ}$ and $WinEnd_{OJ}$ at the arrival of a BlockAck frame. At each subsequent MPDU sent with End of MSDU subfield set to 1 in the Sequence Control field, $WinStart_{OJ}$ shall be set to *MSDU_SN*+1 and $WinEnd_{OJ}$ shall be set to $WinStart_{OJ} + WinSize_{OJ} - 1$ if following conditions are met:

— The MPDU is indicated as acknowledged in the Block Ack bitmap.

(11ay)All preceding MPDUs starting from MPDU_SN with Start of MSDU subfield set to 1 in the Sequence Control field are indicated as successfully delivered.

#### 10.25.6.9 Originator's support of recipient's partial state

A recipient may choose to employ either full-state operation or partial-state operation for each individual block ack agreement. An originator is unaware of the recipient's choice of full-state or partial-state operation.

NOTE—The originator might solicit a BlockAck frame as the last activity associated with that block ack agreement in the current TXOP to reduce the probability that data are unnecessarily retransmitted due to loss of partial state.

### 10.25.7 Protected block ack agreement

(#1002)A STA indicates support for protected block ack by setting the MFPC subfield in the RSN Capabilities field to 1 (see 9.4.2.23.4 (RSN capabilities)) and the PBAC subfield in the Extended RSN Capabilities field to

*(continued from previous page)*

1 (see 9.4.2.240 (RSNXE(#1776))). Such a STA is a PBAC STA; otherwise, the STA is a non-PBAC STA. A block ack agreement that is (#4201)negotiated between two PBAC STAs is a protected block ack agreement. A block ack agreement that is (#4201)negotiated between two STAs when either or both of the STAs is not a PBAC STA is a block ack agreement that is not a protected block ack agreement.

A PBAC STA may choose to negotiate a block ack agreement with a non-PBAC STA if dot11RSNAPBACRequired is false(#1817); otherwise, it shall negotiate a block ack agreement only with other PBAC STAs. If a PBAC STA is communicating with a non-PBAC STA, it shall follow the rules for a nonprotected block ack agreement.

A STA that has (#4201)negotiated a protected block ack agreement shall obey the following rule as a block ack originator in addition to rules specified in 10.25.6.7 (Originator's behavior) and 10.25.6.8 (Maintaining block ack state at the originator):

— To update $WinStart_B$ and $WinStart_R$ at the receiver, the STA shall use a PBAC WinStart Update frame.(#3169)(#3014)

A STA that has successfully negotiated a protected block ack agreement shall obey the following rules for that agreement(#1014) as a block ack recipient in addition to rules specified from(#1014) 10.25.6.3 (Scoreboard context control during full-state operation) to 10.25.6.6 (Receive reordering buffer control operation):

— (#1014)(#1017)The STA shall not use the Starting Sequence Number subfield of the Block Ack Starting Sequence Control field in a BlockAckReq, MU-BAR Trigger or GCR-MU BAR Trigger frame(#3015) to update $WinStart_B$ and $WinStart_R$. If the Starting Sequence Number subfield is greater than $WinEnd_B$ or less than $WinStart_B$, dot11PBACErrors shall be incremented by 1.(#4200)

— Upon receipt of a PBAC WinStart Update frame whose TID and transmitter address are the same as those of the protected block ack agreement, the STA shall update its $WinStart_R$ and $WinStart_B$ values based on the starting sequence number in the PBAC WinStart Update frame according to the procedures outlined for reception of BlockAckReq frames in 10.25.6.3 (Scoreboard context control during full-state operation), 10.25.6.4 (Scoreboard context control during partial-state operation), 10.25.6.6.1 (General), and 10.25.6.6.3 (Operation for each received BlockAckReq), while treating the starting sequence number as though it were the Starting Sequence Number field of a received BlockAckReq frame.(#4200)

### 10.25.8 GCR and GLK-GCR block ack

#### 10.25.8.1 General(11ax)

Subclause 10.25.8 (GCR and GLK-GCR block ack) extends the block ack mechanism to group addressed frames that are transmitted using the GCR block ack and GLK-GCR retransmission policies. Other than the exceptions noted in 10.25.8.2 (Scoreboard context control during GCR block ack) to 10.25.8.4 (GCR block

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

ack BlockAckReq and BlockAck frame exchange sequences(#109)), the operation of GCR block ack is the same as is described in 10.25.6 (HT-immediate block ack extensions).

An HE AP shall not send a GCR MU-BAR Trigger frame to a non-AP HE STA if the most recently received Extended Capabilities element from the STA does not indicate support for Robust AV Streaming or Advanced GCR.

### 10.25.8.2 Scoreboard context control during GCR block ack

For each GCR block ack agreement, each recipient shall maintain a block acknowledgment record. This record includes the following information:

— A bitmap, indexed by sequence number
— A 12-bit unsigned integer starting sequence number
— $WinStart_R$, representing the lowest sequence number position in the bitmap
— $WinEnd_R$, representing the highest sequence number in the current transmission window
— The maximum transmission window size, $WinSize_R$

$WinSize_R$ is set to the smaller of 64 and the value of the Buffer Size field of the associated ADDBA Response frame that established the block ack agreement. $WinEnd_R$ is defined as the highest sequence number in the current transmission window. A STA implementing a GCR block ack agreement shall maintain the block acknowledgment record for that agreement according to the following rules:

a) At GCR block ack agreement establishment:
   1) $WinStart_R$ = the Starting Sequence Number subfield value (#4200)in the ADDBA Request frame that elicited the ADDBA Response frame that established the GCR block ack agreement.
   2) $WinEnd_R = WinStart_R + WinSize_R - 1$.
b) For each received Data frame that is (#407)related to a specific GCR block ack agreement, the block acknowledgment record for that agreement is modified as follows, where *SN* is the value of the Sequence Number subfield of the received Data frame:
   1) If $WinStart_R \le SN \le WinEnd_R$, set to 1 the bit in position *SN* within the bitmap.
   2) If $WinEnd_R < SN < WinStart_R + 2^{11}$,
      i) Set to 0 the bits corresponding to MPDUs with Sequence Number subfield values from $WinEnd_R + 1$ to $SN - 1$.
      ii) Set $WinStart_R = SN - WinSize_R + 1$.
      iii) Set $WinEnd_R = SN$.
      iv) Set to 1 the bit at position *SN* in the bitmap.
   3) If $WinStart_R + 2^{11} \le SN \le WinStart_R$, make no changes to the record.
c) For each received BlockAckReq frame that is (#407)related to a specific GCR block ack agreement, the block acknowledgment record for that agreement is modified as follows, where *SSN* is the value from the Starting Sequence Number subfield of the received BlockAckReq frame:
   1) If $WinStart_R < SSN \le WinEnd_R$,
      i) Set $WinStart_R = SSN$.
      ii) Set to 0 the bits corresponding to MPDUs with Sequence Number subfield values from $WinEnd_R + 1$ to $WinStart_R + WinSize_R - 1$.
      iii) Set $WinEnd_R = WinStart_R + WinSize_R - 1$.
   2) If $WinEnd_R < SSN < WinStart_R + 2^{11}$,
      i) Set $WinStart_R = SSN$.
      ii) Set $WinEnd_R = WinStart_R + WinSize_R - 1$.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

iii) Set to 0 bits the corresponding to MPDU with Sequence Number subfield values from $WinStart_R$ to $WinEnd_R$.

3) If $WinStart_R + 2^{11} \leq SSN \leq WinStart_R$, make no changes to the record.

### 10.25.8.3 Scoreboard context control during GLK-GCR block ack

GLK-GCR scoreboarding accounts for all GLK-GCR frames received under the GLK-GCR block ack agreement. The received frame may be discarded after SYNRA filtering (see 10.64 (Addressing of GLK Data frame transmission)) but still accounted for in the scoreboarding.

A GLK AP may (#6286)establish a GLK-GCR block ack agreement with each GLK STA that has indicated support for GLK-GCR in the Association/Reassociation Request frame when the GLK STA associated/ reassociated with the GLK AP. Each of those GLK STAs with GLK-GCR block ack agreement shall maintain a block acknowledgment record for full state operation as defined in 10.25.3 (Data and acknowledgment transfer using immediate block ack policy). This record includes the following information:

— A bitmap, indexed by sequence number
— A 12-bit unsigned integer starting sequence number
— $WinStart_R$, representing the lowest sequence number position in the bitmap
— $WinEnd_R$, representing the highest sequence number in the current transmission window
— The maximum transmission window size, $WinSize_R$

$WinSize_R$ is set to the smaller of 64 and the value of the Buffer Size subfield in the GLK-GCR Parameter Set element in the most recently received Association Response or the Reassociation Response frame that established the GLK-GCR block ack agreement, or the GLK Groupcast Mode Change Notification frame. $WinEnd_R$ is defined as the highest sequence number in the current transmission window. A STA implementing a GLK-GCR block ack agreement shall maintain the block acknowledgment record for that agreement according to the following rules:

a) At GCR block ack agreement establishment (either during general link establishment or when GLK-GCR groupcast mode changes):
   1) $WinStart_R$ = the Starting Sequence Number subfield value (#4200)in the GLK-GCR Parameter Set element included in the Association Response frame, Reassociation Response frame or in the GLK-GCR Groupcast Mode Change Notification frame.
   2) $WinEnd_R = WinStart_R + WinSize_R - 1$.
b) For each Data frame that is received under the GLK-GCR block ack agreement, the block acknowledgment record for that agreement is modified as follows, where SN is the value of the Sequence Number subfield in the received Data frame:
   1) If $WinStart_R \leq SN \leq WinEnd_R$, set to 1 the bit in position SN within the bitmap.
   2) If $WinEnd_R < SN < WinStart_R + 2^{11}$,
      i) Set to 0 the bits corresponding to MPDUs with Sequence Number subfield values from $WinEnd_R + 1$ to SN – 1.
      ii) Set $WinStart_R = SN - WinSize_R + 1$.
      iii) Set $WinEnd_R$ = SN.
      iv) Set to 1 the bit at position SN in the bitmap.
   3) If $WinStart_R + 2^{11} \leq SN \leq WinStart_R$, make no changes to the record.
c) For each BlockAckReq frame received under the GLK-GCR block ack agreement, the block acknowledgment record for that agreement is modified as follows, where SSN is the value from the Starting Sequence Number subfield in the received BlockAckReq frame:
   1) If $WinStart_R < SSN \leq WinEnd_R$,

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

i) Set $WinStart_R$ = SSN.

ii) Set to 0 the bits corresponding to MPDUs with Sequence Number subfield values from $WinEnd_R + 1$ to $WinStart_R + WinSize_R - 1$.

iii) Set $WinEnd_R = WinStart_R + WinSize_R - 1$.

2) If $WinEnd_R$ < SSN < $WinStart_R + 2^{11}$,

i) Set $WinStart_R$ = SSN.

ii) Set $WinEnd_R = WinStart_R + WinSize_R - 1$.

iii) Set to 0 bits the corresponding to MPDU with Sequence Number subfield values from $WinStart_R$ to $WinEnd_R$.

3) If $WinStart_R + 2^{11} \leq$ SSN $\leq WinStart_R$, make no changes to the record.

### 10.25.8.4 GCR block ack BlockAckReq and BlockAck frame exchange sequences(#109)

A protective mechanism (such as transmitting an HCCA CAP, MCCA, or RTS/CTS; setting the Duration field in the first frame and response frames to update the NAVs of STAs in the BSS and OBSS(s); or using another mechanism described in 10.27 (Protection mechanisms) and 10.3.2.10 (Dual CTS protection)) should be used to reduce the probability of other STAs transmitting during the GCR TXOP.

If the retransmission policy for a group address is GCR Block Ack, an originator shall not transmit more than the GCR buffer size number of A-MSDUs with the RA field set to the GCR concealment address and the DA field of the A-MSDU subframe set to the GCR group address before sending a BlockAckReq frame to one of the STAs that has a GCR block ack agreement for this group address. The RA field of the BlockAckReq frame shall be set to the MAC address of the destination STA. Upon reception of the BlockAck frame, an originator may send a BlockAckReq frame to another STA that has a block ack agreement for this group address, and this process may be repeated multiple times. If the originator has a GCR block ack agreement with one or more of the HE STAs for this group address, the originator may send a GCR MU-BAR Trigger frame to one or more of the HE STAs that are in the awake state. Upon reception of the BlockAck frame from one or more HE STAs, the originator may send a GCR MU-BAR Trigger frame to one or more other HE STAs that have a GCR block ack agreement, and this process may be repeated multiple times.(11ax)

NOTE 1—If the originator sends a BlockAckReq frame to a STA with a MAC address that matches the SA in any of the A-MSDUs transmitted during the GCR TXOP, the Block Ack Bitmap subfield does not indicate the MSDUs sourced from this STA. This is because the STA will have discarded all group addressed MPDUs transmitted by the AP that have the source address equal to their MAC address (see 10.3.6 (Group addressed MPDU transfer procedure)).

If a recipient receives a BlockAckReq frame with the GCR Group Address subfield equal to a GCR group address, the recipient shall transmit a BlockAck frame at a delay of SIFS after the BlockAckReq frame. The BlockAck frame acknowledges the STA's reception status of the block of group addressed frames requested by the BlockAckReq frame. If an HE STA receives a GCR MU-BAR Trigger frame with the AID12 subfield set to the 12 LSBs of the AID of the HE STA, the HE STA shall include the BlockAck frame in the HE TB PPDU sent in response to the Trigger frame. The BlockAck frame acknowledges the HE STA's reception status of the block of group addressed frames requested by the GCR MU-BAR Trigger frame.(11ax)

Figure 10-43 (Example of frame exchange sequence(#109) with GCR block ack retransmission policy) shows an example of a frame exchange sequence(#109) when the GCR block ack retransmission policy is used. The AP sends several A-MSDUs using the GCR block ack retransmission policy. The AP then sends a BlockAckReq frame to group member 1 of the GCR group, waits for the BlockAck frame, and then sends a BlockAckReq frame to group member 2. After receiving the BlockAck frame from GCR group member 2, the AP determines whether any A-MSDUs need to be retransmitted and sends additional A-MSDUs (some of which might be retransmissions of previous A-MSDUs) using the GCR block ack retransmission policy.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

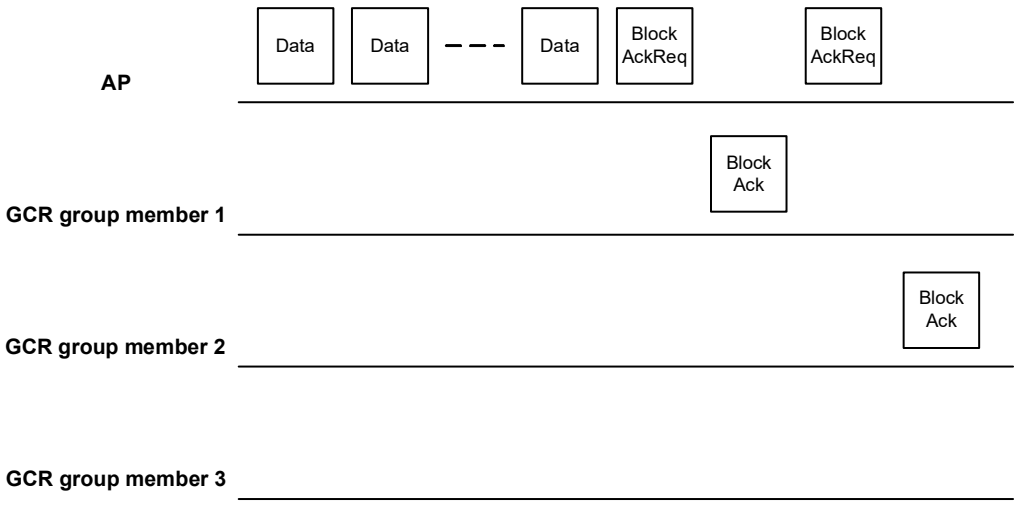

**Figure 10-43—Example of frame exchange sequence(#109) with GCR block ack**

(11ax)Figure 10-43 (Example of frame exchange sequence(#109) with GCR block ack retransmission policy) shows another example of a frame exchange sequence(#109) when the GCR block ack retransmission policy is used. The HE AP sends several A-MSDUs using the GCR block ack retransmission policy. The HE AP then sends a GCR MU-BAR Trigger frame to group members 1 and 2 of the GCR group, waits for the BlockAck frames, then sends a GCR MU-BAR Trigger frame to group members 3 and 4, and waits for the BlockAck frames. The HE AP then sends a BlockAckReq frame to group member 5, which is a non-HE STA, and waits for the BlockAck frame. After receiving the BlockAck frames, the HE AP determines whether any A-MSDUs need to be retransmitted and sends additional A-MSDUs (some of which might be retransmissions of previous A-MSDUs) using the GCR block ack retransmission policy.

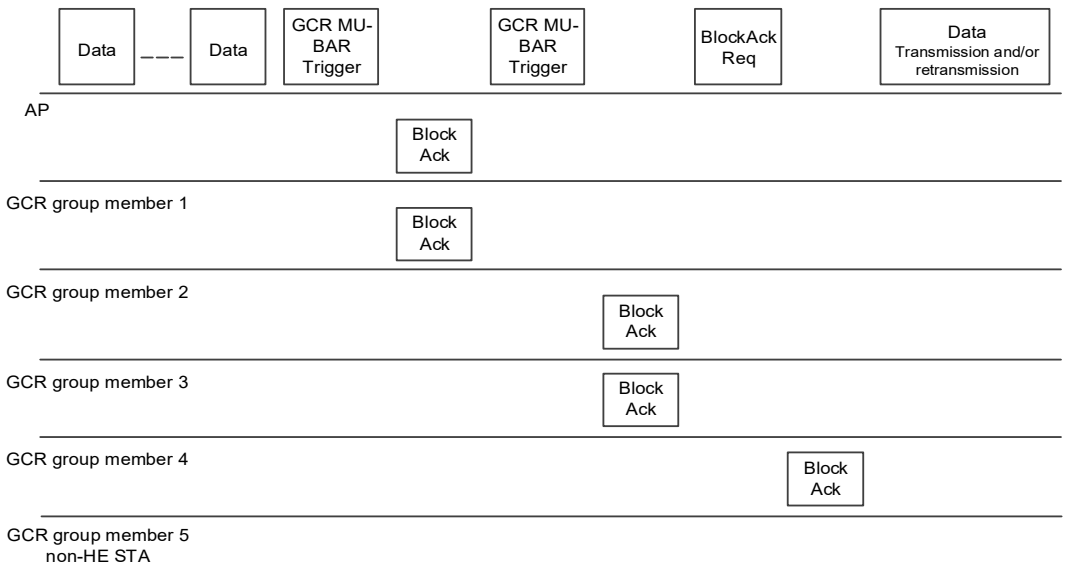

**Figure 10-44—Example of a frame exchange sequence(#109) with GCR MU-BAR**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

After completing the BlockAckReq or GCR MU-BAR Trigger frame and BlockAck (#109)frame exchange sequences, the originator determines, from the information provided in the BlockAck bitmap and from the missing BlockAck frame, the A-MSDUs, if any, that need to be retransmitted.(11ax)

An originator adopting the GCR block ack retransmission policy for a GCR group address chooses a lifetime limit for the group address. The originator may vary the lifetime limit for the group address at any time and may use different lifetime limits for different GCR group addresses. The originator transmits and retries each A-MSDU until the appropriate lifetime limit is reached or until each one has been received by all group members to which a BlockAckReq frame (11ax)or a GCR MU-BAR Trigger frame has been sent, whichever occurs first.

For GCR streams with retransmission policy equal to GCR Block Ack, an originator may regularly send a BlockAckReq frame with the GCR Group Address subfield in the BAR Information field set to the GCR group address and the (#270)Block Ack Starting Sequence Control subfield set to the Sequence Number field in the MPDU containing the earliest A-MSDU that has not been acknowledged by all group members and has not expired due to lifetime limits, in order to minimize buffering latency at receivers in the GCR group. An originator may also send a GCR MU-BAR Trigger frame with the AID12 fields set to the 12 LSBs of the AIDs of HE STAs that transmit the BlockAck frames and the Block Ack Starting Sequence Control subfield set to the Sequence Number field of the earliest A-MSDU of the GCR stream that has not been acknowledged by all group members and has not expired due to lifetime limits, in order to minimize buffering latency at receivers in the GCR group.(11ax)

NOTE 2—This is because an originator might transmit Management frames, QoS Data frames with a group address in the Address 1 field (including different GCR streams), and non-QoS Data frames intermingled. (#1938)Since these are transmitted using a single sequence number space, missing frames or frames sent to group addresses absent from a receiving STA's dot11GroupAddresses table complicate receiver processing for GCR streams with a GCR block ack retransmission policy since the cause of a hole in a receiver's block ack bitmap is ambiguous: it is due either to an MPDU being lost from the GCR stream or to transmissions of MPDUs not related to the GCR service using the same sequence number counter.

For GLK-GCR transmissions with retransmission policy equal to GLK-GCR block ack, an originator may send a BlockAckReq frame with the Block Ack Starting Sequence Control subfield set to the Sequence Number field in the MPDU containing the earliest MSDU that has not been acknowledged and has not expired due to lifetime limits, in order to minimize buffering latency at the receivers of the GLK-GCR transmission.

If an originator accepts two or more GCR agreements with multiple STAs where the GCR agreements have the same Ethernet classifiers, but different additional classifiers, then each STA receives multiple GCR flows from the originator and sends them to upper layers where the MSDUs irrelevant to the STA are discarded, in the same manner that non-GCR MSDUs irrelevant to the STA are discarded. In the Block Ack Bitmap field sent to the originator, each STA sets bits corresponding to MPDUs received from any of the multiple GCR streams. The originator should not retry MPDUs to the STA for the bit positions that are irrelevant to that STA.

The beginning of reception of an expected response to a BlockAckReq frame is detected by the occurrence of a PHY-CCA.indication(BUSY, channel-list) primitive at the STA that is expecting the response where the channel-list parameter is absent or, if present, includes "primary."

If the beginning of such reception does not occur during the first slot time following a SIFS, then the originator may perform error recovery by retransmitting a BlockAckReq frame (11ax)or a GCR MU-BAR Trigger frame PIFS after the previous BlockAckReq frame (11ax)or GCR MU-BAR Trigger frame if both of the following conditions are met:

— The carrier sense mechanism (see 10.3.2.1 (CS mechanism)) indicates that the medium is idle at the TxPIFS slot boundary (see Figure 10-29 (EDCA mechanism timing relationships(#14)(#1058))) after the expected start of a BlockAck frame, and

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

— The remaining duration of the GCR TXOP is longer than the total time required to retransmit the GCR BlockAckReq frame (11ax)or GCR MU-BAR Trigger frame plus one slot time.

NOTE 3—If an originator fails to receive a BlockAck frame in response to a BlockAckReq frame and there is insufficient time to transmit a recovery frame, the AP retransmits the BlockAckReq frame in a new TXOP.

### 10.25.9 DMG block ack with flow control

#### 10.25.9.1 General

A DMG STA indicates that it is capable of supporting DMG block ack with flow control by (#6286)establishing the block ack with Flow Control field to 1 within the STA's DMG Capabilities element. A DMG block ack agreement with flow control can be established only when both originator and recipient support this capability.

#### 10.25.9.2 DMG block ack architecture with flow control

The DMG block acknowledgment(#553) rules are explained in terms of the architecture shown in Figure 10-45 (DMG block ack architecture) and explained in this subclause.

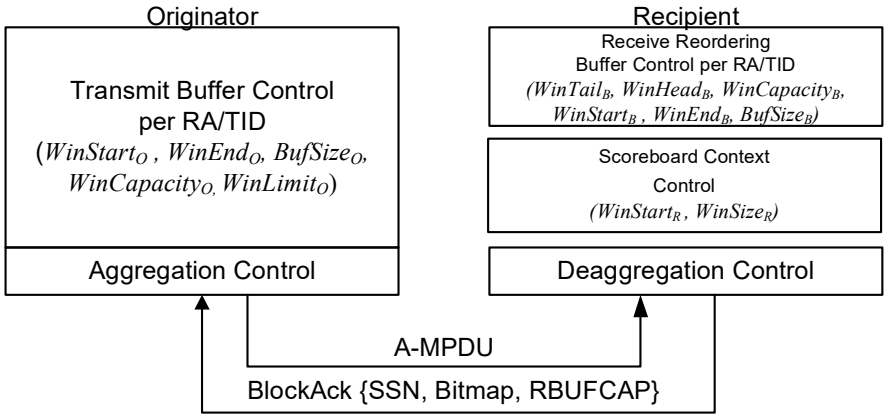

**Figure 10-45—DMG block ack architecture**

The originator contains a transmit buffer control that uses $WinStart_O$, $BufSize_O$, and $WinLimit_O$ to submit MPDUs for transmission, and releases transmit buffers upon receiving BlockAck frames from the recipient or when it advances the transmit control buffer window.

$WinStart_O$ is the starting sequence number of the transmit range, $WinLimit_O$ is the last sequence number expected to exhaust the receiver buffer capacity, and $BufSize_O$ is the number of buffers negotiated in the block ack agreement.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Figure 10-46 (Flow control and its associated parameters as a function of receiver buffer size) shows the DMG block ack with flow control and its associated parameters from the originator perspective.

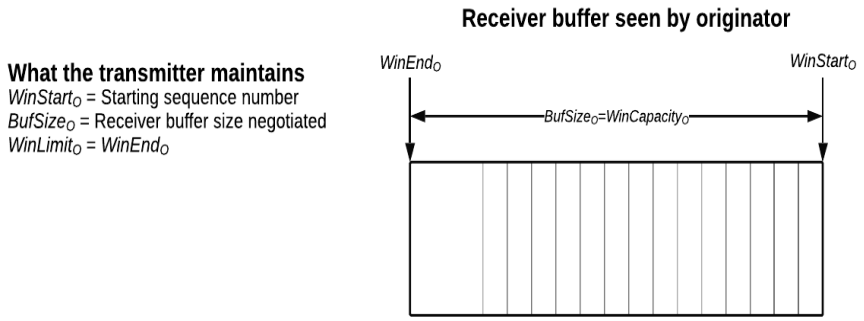

**Figure 10-46—Flow control and its associated parameters as a function of receiver buffer size**

The Aggregation control creates A-MPDUs. It can adjust the ack policy of transmitted QoS Data frames according to the rules defined in 10.25.6.7 (Originator's behavior) in order to solicit block ack responses.

The recipient contains a Receive Reordering Buffer Control per TA/TID, which contains related control state.

The receive reordering buffer is responsible for reordering MSDUs or A-MSDUs so that MSDUs or A-MSDUs are eventually passed up to the next MAC process in order of received sequence number (SN). It maintains its own state independent of the scoreboard context control to perform this reordering as specified in 10.25.6.6 (Receive reordering buffer control operation). The delivery of in order MSDUs or A-MSDUs to the next MAC process is implementation dependent. In some cases, the receiver reordering buffer might be forced to hold on to MSDUs ready for in order delivery due to deferred reception at the next MAC process. This behavior can impose additional buffering requirements on the receiver, causing the actual available buffer capacity to vary dynamically. The reordering buffer is required to manage its lowest and highest (in order) SN, which are marked as $WinTail_B$ and $WinHead_B$, respectively.

The scoreboard context control provides the $WinCapacity_B$, actually controlled by the Reordering buffer in addition to the bitmap field and the Starting Sequence Number field value(#6279)(#4200) to be sent in BlockAck frame responses to the originator.

### 10.25.9.3 Scoreboard context control with flow control

The scoreboard context control with flow control is defined in 10.25.6.3 (Scoreboard context control during full-state operation) and 10.25.6.4 (Scoreboard context control during partial-state operation).

### 10.25.9.4 Receive Reordering Buffer with flow control operation

#### 10.25.9.4.1 General

A recipient shall maintain a receive reordering buffer for each DMG block ack agreement. Each receive reordering buffer includes a record comprising the following:

— Buffered MSDUs or A-MSDUs that have been received, but not yet passed up to the next MAC process

— A $WinStart_B$ parameter, indicating the value of the Sequence Number field (SN) of the first (in order of ascending sequence number) MSDU or A-MSDU that has not yet been received

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

- A $WinEnd_B$ parameter, indicating the highest SN expected to be received in the current reception range
- A $BufSize_B$ parameter, indicating the size of the reception window
- A $WinTail_B$ parameter, indicating the value of the Sequence Number field (SN) of the first (in order of ascending sequence number) MSDU or A-MSDU that has not yet been delivered to the next MAC process
- A $WinHead_B$ parameter, indicating the highest SN received in the current reception range

$WinStart_B$ is initialized to the Starting Sequence Number field value(#6279) of the ADDBA Request frame that elicited the ADDBA Response frame that established the DMG block ack agreement.

$WinEnd_B$ is initialized to $WinStart_B + BufSize_B - 1$, where $BufSize_B$ is set to the value of the Buffer Size field of the ADDBA Response frame that established the block ack agreement. (#6279)Both $WinTail_B$ and $WinHead_B$ are initialized to the preceding Starting Sequence Number field value(#6279), to indicate no MPDU was received, within the current reception window.

Any MSDU or A-MSDU that has been passed up to the next MAC process shall be deleted from the receive reordering buffer, advancing the $WinTail_B$.

The recipient shall pass MSDUs or A-MSDUs up to the next MAC process in order of increasing Sequence Number field value.

#### 10.25.9.4.2 Operation for DMG block ack agreement initialization

At DMG block ack agreement establishment:

a) $WinStart_B = SSN$,(#4200) where $SSN$ is the Starting Sequence Number field in the ADDBA Request frame that elicited the ADDBA Response frame that established the DMG block ack agreement
b) $WinEnd_B = WinStart_B + BufSize_B - 1$
c) $WinCapacity_B = BufSize_B$
d) $WinHead_B = SSN - 1$, where SSN is taken from the ADDBA Request, similar to $WinStart_B$
e) $WinTail_B = SSN - 1$

#### 10.25.9.4.3 Operation for each received Data frame

For each received Data frame that is related to a specific DMG block ack agreement, the receive reordering buffer record is modified as follows, where SN is the value of the Sequence Number field of the received MPDU:

a) If $WinStart_B \le SN \le WinEnd_B$
    1) Store the received MPDU in the buffer.
        i) If $SN > WinHead_B$, Set $WinHead_B = SN$.
        ii) If $SN > (WinTail_B + BufSize_B)$,
            1) (#270)All MSDUs and A-MSDUs buffered with sequence numbers from $WinTail_B$ to $SN - BufSize_B$ that were received correctly are passed to the next MAC process.
            2) Set $WinTail_B = SN - BufSize_B$.
        iii) Set $WinCapacity_B = WinTail_B + BufSize_B - WinHead_B$.
    2) Set $WinStart_B$ to the value of the Sequence Number field of the first MSDU or A-MSDU that is missing to allow in-order delivery to the next MAC process.
    3) Set $WinEnd_B = WinStart_B + BufSize_B - 1$.
b) If $WinEnd_B < SN < WinStart_B + 2^{11}$

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

1) Store the received MPDU in the buffer.
2) Set $WinEnd_B = SN$.
3) Set $WinStart_B = WinEnd_B - BufSize_B + 1$.
4) (#270)All MSDUs and A-MSDUs buffered with sequence numbers from $WinTail_B$ to $SN - BufSize_B$ that were received correctly are passed to the next MAC process.
5) Set $WinTail_B = SN - BufSize_B$.
6) Set $WinHead_B = SN$.
7) Set $WinCapacity_B = WinTail_B + BufSize_B - WinHead_B$.

c) If $WinStart_B + 2^{11} \leq SN < WinStart_B$, discard the MPDU (do not store the MPDU in the buffer, do not pass the MSDU or A-MSDU up to the next MAC process).

d) For each received BlockAckReq frame the block acknowledgment record for that agreement is modified as follows, where SSN is the value from the Starting Sequence Number field of the received BlockAckReq frame:

1) If $WinStart_B < SSN \leq WinEnd_B$
   i) Set $WinStart_B = SSN$.
   ii) Set $WinEnd_B = WinStart_B + BufSize_B - 1$.
   iii) If $SSN > WinHead_B$, set $WinHead_B = SSN - 1$.
   iv) If $SSN > (WinTail_B + BufSize_B)$,
      1) (#270)All MSDUs and A-MSDUs buffered with sequence numbers from $WinTail_B$ to $SSN - BufSize_B$, are discarded from the buffer.
      2) Set $WinTail_B = SSN - BufSize_B$.
   v) Set $WinCapacity_B = WinTail_B + BufSize_B - WinHead_B$.
2) If $WinEnd_B < SSN < WinStart_B + 2^{11}$
   i) Set $WinStart_B = SSN$.
   ii) Set $WinEnd_B = WinStart_B + BufSize_B - 1$.
   iii) Set $WinHead_B = SSN - 1$.
   iv) If $SSN > (WinTail_B + BufSize_B)$,
      1) (#270)All MSDUs and A-MSDUs buffered with sequence numbers from $WinTail_B$ to $SSN - BufSize_B$, are discarded from the buffer.
      2) Set $WinTail_B = SSN - BufSize_B$.
   v) Set $WinCapacity_B = WinTail_B + BufSize_B - WinHead_B$.
3) If $WinStart_B + 2^{11} \leq SSN \leq WinStart_B$, make no changes to the record.

#### 10.25.9.4.4 Operation for ongoing release of received MPDUs

The reordering buffer shall continue to pass MSDUs or A-MSDUs up to the next MAC process that are stored in the buffer in order of increasing value of the Sequence Number field, starting with the MSDU or A-MSDU that has $SN = WinTail_B$ and proceeding sequentially until there is no ready in-order MSDU or A-MSDU buffered for the next sequential value of the Sequence Number field.

a) Set $WinTail_B$ to the value of the Sequence Number field of the last MSDU or A-MSDU that was passed up to the next MAC process plus one.

### 10.25.9.5 Generation and transmission of BlockAck frame by a STA with flow control

In addition to the behavior specified in 10.25.6.5 (Generation and transmission of BlockAck frames by an HT STA, DMG STA, or S1G STA) when responding with a BlockAck frame, the RBUFCAP field shall be updated with the value of $WinCapacity_B$.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

#### 10.25.9.6 Originator's behavior with flow control support

If the BA with Flow Control field within a recipient's DMG Capabilities element is equal to 1, the originator shall not transmit an MPDU with a SN that is beyond the current recipient's buffer capacity ($WinLimit_O$).

The BlockAck frame indicates the number of free buffer slots available at the recipient for reception of additional MPDUs.

The originator shall update $WinLimit_O$ upon reception of a valid BlockAck:

— Set $WinCapacity_O$ to the received value of the RBUFCAP field in the BlockAck frame.
— Set *MostSuccSN* to the highest *SN* of positively acknowledged MPDUs
— Set $WinLimit_O = MostSuccSN + WinCapacity_O$

NOTE—Updating $WinLimit_O$ limits the transmission of the following MPDUs.

Originator's support of recipient's partial state is defined in 10.25.6.9 (Originator's support of recipient's partial state).

### 10.25.10 Unsolicited block ack extension(11ay)

#### 10.25.10.1 Introduction

The unsolicited block ack is an extension to the HT-Immediate block ack mechanism that allows transmission of A-MPDUs without the need for a prior exchange of ADDBA Request and ADDBA Response frames (#6286)to establish the agreement. The unsolicited block ack extension also enables optimizing the buffering requirements needed at the recipient side with the ability to share the recipient resources among all originators.

A recipient that supports the unsolicited block ack extension is ready to use this mechanism with an originator following the exchange of frames as specified in 10.25.2 (Setup and modification of the block ack parameters).

#### 10.25.10.2 Unsolicited block ack extension agreement architecture

The unsolicited block ack extension to the HT-immediate block ack architecture is identical to the HT-immediate block ack extension architecture described in 10.25.6.2 (HT-immediate block ack architecture) with the following rules:

— (#6310)$WinSize_O$ is the value of the Buffer Size field advertised in the recipient's Unsolicited Block Ack Extension element.
— (#6310)$WinStart_O$ is equal to the sequence number of the first MPDU inside the first A-MPDU sent with a specific tuple <TA, RA, TID>.
— The recipient shall only use full-state operation of the scoreboard context control.

#### 10.25.10.3 Scoreboard context control during full-state operation

The scoreboard context control for the unsolicited block ack extension mechanism shall follow the rules of full-state operation defined in 10.25.6.3 (Scoreboard context control during full-state operation) with the following additional rule. When the recipient flushes buffers in the reordering buffer control, the bits in the bitmap position in the block acknowledgment record for the SNs that are higher than the lowest SN of all unsuccessful MPDUs and lower than the highest SN of all successful MPDUs are set to 0. $WinStart_R$, $WinSize_R$, and $WinEnd_R$ remain unchanged.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

#### 10.25.10.4 Generation and transmission of BlockAck frames

The recipient shall follow the same rules defined in 10.25.6.5 (Generation and transmission of BlockAck frames by an HT STA, DMG STA, or S1G STA).

#### 10.25.10.5 Receive reordering buffer control operation

The receive reordering buffer control behaves the same as in the HT-Immediate block ack agreement defined in 10.25.6.6 (Receive reordering buffer control operation), with the ability of the recipient to flush the buffers when it starts receiving from a different originator or TID.

Under the unsolicited block ack extension mechanism, the parameters are initialized as follows:

- $WinSize_B$ is set to the value of the Buffer Size field advertised in the Unsolicited Block Ack Extension element.
- When the unsolicited block ack extension agreement is established, $WinEnd_B$ is initialized to the sequence number of the first MPDU inside the first A-MPDU sent with a specific tuple <TA, RA, TID>, and (#6310)$WinStart_B$ is set to $WinEnd_B - WinSize_B + 1$.
- The buffered MSDUs in the receive reordering buffer control may be flushed when the STA starts receiving from a different <TA, TID> pair.

The recipient shall pass MSDUs and A-MSDUs up to the next MAC process in order of increasing sequence number.

#### 10.25.10.6 Originator behavior and block ack state maintenance

In addition to the rules defined for the HT-immediate block ack extension specified in 10.25.6.7 (Originator's behavior) and 10.25.6.8 (Maintaining block ack state at the originator), an originator that utilizes the unsolicited block ack extension mechanism:

- Shall not transmit an A-MPDU corresponding to a tuple <TA, RA, TID> before synchronizing at the recipient the *SSN*, $WinStart_R$, and $WinStart_B$ parameters for the specific tuple. The originator may transmit either an MPDU or a BlockAckReq frame to initiate the synchronization. Synchronization is confirmed by reception of an Ack frame from the recipient when an MPDU was used, or by a BlockAck frame when a BlockAckReq was used.
- Shall not release transmitted buffers (MPDUs) with *SN* equal or higher than the first unsuccessful MPDU.
- At the end of a TXOP or SP, shall set to 0 the acknowledgment status of MPDUs with *SN* equal or higher than the first unsuccessful MPDU even if such MPDUs have been already positively acknowledged.
- At the start of the next TXOP or SP, may transmit all the MPDUs with *SN* equal or higher than the first unsuccessful MPDU, or may send a BlockAckReq frame with (#4200)the Starting Sequence Number field equal to the *SN* of the first unsuccessful MPDU to determine the state of the buffers at the recipient and retransmit MPDUs that are not received or flushed by the recipient.

The originator shall not use the multi-TID variant with a recipient if the recipient has not set the Multi-TID Supported subfield in the recipient's Unsolicited Block Ack Extension element to 1.

## 10.26 No Acknowledgment (No Ack)

When a QoS Data frame is transmitted with No Ack ack policy, there is no MAC-level recovery, and the reliability of this traffic is reduced, relative to the reliability of traffic with other ack policy, due to the increased probability of lost frames from interference, collisions, or time-varying channel parameters. A protective

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

mechanism (such as transmitting using HCCA, RTS/CTS, or the mechanism described in 10.27 (Protection mechanisms)) should be used to reduce the probability of other STAs transmitting during the TXOP.

## 10.27 Protection mechanisms

### 10.27.1 Introduction

These protection mechanisms cause a STA that is a potential interferer to defer any transmission for a known period of time. When these mechanisms are used, non-ERP STAs do not interfere with frame exchange sequences(#109) using ERP PPDUs between ERP STAs and non-HT STAs do not interfere with frame exchanges using HT PPDUs between HT STAs.

### 10.27.2 Protection mechanism for non-ERP receivers

The intent of a protection mechanism is to cause a STA not to transmit an MPDU with the Type subfield equal to Data or an MMPDU with an ERP-OFDM preamble and header unless it has attempted to update the NAV of receiving non-ERP STAs. The updated NAV period shall be longer than or equal to the total time required to send the Data and any required response frames. An ERP STA shall use protection mechanisms (such as RTS/CTS or CTS-to-self) for ERP-OFDM MPDUs with the Type subfield equal to Data or an MMPDU when the Use_Protection field of the ERP element is equal to 1 (see the requirements of 10.6 (Multirate support)). Protection mechanisms frames shall be sent using one of the mandatory Clause 15 (DSSS PHY specification for the 2.4 GHz band designated for ISM applications) or Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification) rates and using one of the mandatory Clause 15 (DSSS PHY specification for the 2.4 GHz band designated for ISM applications) or Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification) waveforms, so all STAs in the BSA are able to learn the duration of the exchange even if they cannot detect the ERP-OFDM signals using their CCA function.

In the case of a BSS composed of only ERP STAs, but with knowledge of a neighboring co-channel BSS having non-ERP traffic, the AP might need protection mechanisms to protect the BSS's traffic from interference. This provides propagation of NAV to all attached STAs and all STAs in a neighboring co-channel BSS within range by messages sent using rates contained in the BSSBasicRateSet parameter. The frames that propagate the NAV throughout the BSS include RTS/CTS/Ack frames, all Data frames with the More Fragments field equal to 1, all Data or Management frames sent in response to a(#375) PS-Poll frame that are not preceded(#1212) in the frame exchange sequence by a Data frame with the More Fragments field equal to 1, and CF-End frames.

When RTS/CTS is used as the protection mechanism, cases exist such as NAV resetting (discretionary, as indicated in 10.3.2.4 (Setting and resetting the NAV)), where a hidden STA may reset its NAV and this might cause a collision. The likelihood of occurrence is low, and it is not considered to represent a significant impairment to overall system operation. A mechanism to address this possible situation would be to use alternative protection mechanisms or to revert to alternative modulation methods.

The rules for calculating RTS/CTS NAV fields are unchanged when using RTS/CTS as a protection mechanism.

Additionally, if any of the rates in the BSSBasicRateSet parameter of the protection mechanism frame transmitting STA's BSS are Clause 15 (DSSS PHY specification for the 2.4 GHz band designated for ISM applications) or Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification) rates, then the protection mechanism frames shall be sent at one of those Clause 15 (DSSS PHY specification for the 2.4 GHz band designated for ISM applications) or Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification) basic rates.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The NonERP_Present bit shall be set to 1 when a non-ERP STA is associated with the BSS. In an IBSS if an IBSS STA detects one or more non-ERP STAs that are members of the same IBSS the NonERP_Present bit should be set to 1. Examples of when the NonERP_Present bit may additionally be set to 1 include, but are not limited to, when:

a) A non-ERP infrastructure BSS or non-ERP IBSS is overlapping (a non-ERP BSS may be detected by the reception of a Beacon frame where the supported rates contain only Clause 15 (DSSS PHY specification for the 2.4 GHz band designated for ISM applications) or Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification) rates).

b) In an IBSS if a Beacon frame is received from one of the IBSS participants where the operational rate set contains no Clause 18 (Extended Rate PHY (ERP) specification) rates and no BSS membership selectors.

c) A Management frame (excluding a Probe Request) is received where the operational rate set contains no Clause 18 (Extended Rate PHY (ERP) specification) rates and no BSS membership selectors.

A non-ERP mesh STA shall set the NonERP_Present and Use_Protection bits to 1, when establishing a mesh peering with a mesh STA.

When a mesh STA establishes a mesh peering with a non-ERP mesh STA, the mesh STA shall set the NonERP_Present bit to 1 and the mesh STA should set the Use_Protection bit to 1. In addition, a mesh STA should set the NonERP_Present bit and the Use_Protection bit to 1 when

— A mesh STA detects the overlapped presence of either a non-ERP BSS, a non-ERP IBSS, or a non-ERP MBSS, or

— A Beacon frame is received from a neighbor STA where the operational rate set contains no Clause 18 (Extended Rate PHY (ERP) specification) rates and no BSS membership selectors, or

— A Management frame (excluding Probe Request) is received where the operational rate set contains no Clause 18 (Extended Rate PHY (ERP) specification) rates and no BSS membership selectors.

A mesh STA may set the NonERP_Present and the Use_Protection bits to 1 based on its internal policies, which is beyond the scope of the standard.

The Use_Protection bit may be set to 1 when the NonERP_Present bit is 1.

If one or more non-ERP STAs are associated in the BSS, the Use_Protection bit shall be set to 1 in transmitted ERP elements.

In an IBSS the setting of the Use_Protection bit is left to the STA. In an IBSS there is no uniform concept of association; therefore, a typical algorithm for setting the Use_Protection bit takes into account the traffic pattern and history on the network. If an IBSS STA detects one or more non-ERP STAs that are members of the same IBSS or receives a Beacon from a member of the same IBSS with the Use_Protection bit equal to 1, then the Use_Protection bit should be set to 1 in the ERP element of transmitted Beacon and Probe Response frames.

An ERP STA shall invoke the use of a protection mechanism after transmission or reception of the Use_Protection bit with a value of 1 in an MMPDU to or from the BSS that the ERP STA has joined or started. An ERP STA may additionally invoke protection mechanism use at other times. An ERP STA may disable protection mechanism use after transmission or reception of the Use_Protection bit with a value of 0 in an MMPDU to or from the BSS that the ERP STA has joined or started.

An ERP mesh STA shall invoke the use of a protection mechanism after the transmission of the Use_Protection bit with a value of 1 in an MMPDU. In addition, an ERP mesh STA may invoke protection

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

mechanism at other times. An ERP mesh STA may disable protection mechanism use after transmission of the Use_Protection bit with a value of 0 in an MMPDU.

When there are no non-ERP STAs associated with the BSS and the ERP element sender's dot11ShortPreambleOptionImplemented is true, then the Barker_Preamble_Mode bit may be set to 0. The Barker_Preamble_Mode bit shall be set to 1 by the ERP element sender if one or more associated non-ERP STAs are not short preamble capable as indicated in their Capability Information field, or if the ERP element senders dot11ShortPreambleOptionImplemented is false.

When dot11ShortPreambleOptionImplemented is true and all peer mesh STAs support the short preamble, the mesh STA may set the Barker_Preamble_Mode bit to 0. When dot11ShortPreambleOptionImplemented is false or any of its peer mesh STAs do not support the short preamble, the mesh STA shall set the Barker_Preamble_Mode field to 1.

If an IBSS STA detects one or more nonshort-preamble-capable STAs that are members of the same IBSS, then the Barker_Preamble_Mode bit should be set to 1 in the transmitted ERP element.

An ERP STA shall use long preambles when transmitting Clause 15 (DSSS PHY specification for the 2.4 GHz band designated for ISM applications), Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification), and Clause 18 (Extended Rate PHY (ERP) specification) frames after transmission or reception of an ERP element with a Barker_Preamble_Mode value of 1 in an MMPDU to or from the BSS that the ERP STA has joined or started, regardless of (#402)the value of the Short Preamble subfield in the Capability Information field from the same received or transmitted MMPDU that contained the ERP element. An ERP STA may additionally use long preambles when transmitting Clause 15 (DSSS PHY specification for the 2.4 GHz band designated for ISM applications), Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification), and Clause 18 (Extended Rate PHY (ERP) specification) frames at other times. An ERP STA may use short preambles when transmitting Clause 15 (DSSS PHY specification for the 2.4 GHz band designated for ISM applications), Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification), and Clause 18 (Extended Rate PHY (ERP) specification) frames after transmission or reception of an ERP element with a Barker_Preamble_Mode value of 0 in an MMPDU to or from the BSS that the ERP STA has joined or started, regardless of (#402)the value of the Short Preamble subfield in the Capability Information field from the same received or transmitted MMPDU. A non-ERP STA may also follow the rules given in this paragraph.

An ERP mesh STA shall use long preambles when transmitting Clause 15 (DSSS PHY specification for the 2.4 GHz band designated for ISM applications), Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification), and Clause 18 (Extended Rate PHY (ERP) specification) frames after transmission or reception of an ERP element with a Barker_Preamble_Mode value of 1 in an MMPDU to or from the MBSS to which the ERP mesh STA belongs. A Mesh STA may use long preambles when transmitting Clause 15 (DSSS PHY specification for the 2.4 GHz band designated for ISM applications), Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification), and Clause 18 (Extended Rate PHY (ERP) specification) frames at other times.

### 10.27.3 Protection mechanisms for transmissions of HT PPDUs

#### 10.27.3.1 General

Transmissions of HT PPDUs, referred to as *HT transmissions*, are protected if there are other STAs present that cannot interpret HT transmissions correctly. The HT Protection and Nongreenfield HT STAs Present fields in the HT Operation element within Beacon and Probe Response frames are used to indicate the protection requirements for HT transmissions.

The HT Protection field may be set to no protection mode only if the following are true:

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

- All STAs detected (by any means) in the primary or the secondary channel are HT STAs, and
- All STAs that are known by the transmitting STA to be a member of this BSS are either
  - 20/40 MHz HT STAs in a 20/40 MHz BSS, or
  - 20 MHz HT STAs in a 20 MHz BSS.

The HT Protection field may be set to nonmember protection mode only if the following are true:

- A non-HT STA is detected (by any means) in either the primary or the secondary channel or in both the primary and secondary channels, that is not known by the transmitting STA to be a member of this BSS, and
- All STAs that are known by the transmitting STA to be a member of this BSS are HT STAs.

The HT Protection field may be set to 20 MHz protection mode only if the following are true:

- All STAs detected (by any means) in the primary channel and all STAs detected (by any means) in the secondary channel are HT STAs and all STAs that are members of this BSS are HT STAs, and
- This BSS is a 20/40 MHz BSS, and
- There is at least one 20 MHz HT STA associated with this BSS.

The HT Protection field is set to non-HT mixed mode otherwise.

NOTE 1—The rules stated above allow an HT AP to select non-HT mixed mode at any time.

In an IBSS, the HT Protection field is reserved, but an HT STA shall protect HT transmissions as though the HT Protection field were equal to non-HT mixed mode. An IBSS STA shall protect HT-greenfield format PPDUs and RIFS sequences, adhering to the same requirements as described in the line of Table 10-26 (Protection requirements for HT Protection field values nonmember protection mode and non-HT mixed mode) labeled "Use_Protection = 0 or ERP element is not present (HT Protection field equal to non-HT mixed mode)."

**Table 10-26—Protection requirements for HT Protection field values nonmember protection mode and non-HT mixed mode**

| Condition | Requirements |
|---|---|
| Use_Protection = 0 or ERP element is not present<br>(HT Protection field equal to non-HT mixed mode) | The protection requirements for HT transmissions using HT-greenfield format are specified in 10.27.3.1 (General).<br><br>The protection requirements for HT transmissions using RIFS within the HT transmission burst are specified in 10.27.3.3 (RIFS protection).<br><br>The protection mechanism for other transmissions not already described above is based on one of the sequences defined in Table 10-27 (Applicable HT protection mechanisms). |
| Use_Protection = 1<br>(HT Protection field equal to nonmember protection mode or non-HT mixed mode) | All HT transmissions shall be protected using mechanisms as described in 10.27.2 (Protection mechanism for non-ERP receivers). |

In an MBSS, the HT Protection field and the Nongreenfield HT STAs Present field are determined as described in 10.27.3.5 (Protection rules for an HT mesh STA).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

In an IBSS and an MBSS, the RIFS Mode field of the HT Operation element is reserved, but an HT STA shall operate as though this field were equal to 1.

When the HT Protection field is equal to no protection mode or 20 MHz protection mode and the Nongreenfield HT STAs Present field is equal to 0, no protection is required since all HT STAs in the BSS are capable of decoding HT-mixed format and HT-greenfield format transmissions.

When the HT Protection field is equal to no protection mode or 20 MHz protection mode and the Nongreenfield HT STAs Present field is equal to 1, HT transmissions that use the HT-greenfield format shall be protected. This protection may be established by transmitting a PPDU with the TXVECTOR FORMAT parameter set to HT_MF or any of the methods described in Table 10-27 (Applicable HT protection mechanisms).

**Table 10-27—Applicable HT protection mechanisms**

| HT protection mechanism |
|---|
| Control frames such as RTS/CTS or CTS-to-self prior to the HT transmissions:<br>— 20 MHz transmissions use the rates defined in Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) or Clause 18 (Extended Rate PHY (ERP) specification)<br>— 40 MHz transmissions use non-HT duplicate frames defined in Clause 19 (High Throughput (HT) PHY specification(#2297)) |
| As the first PPDU in the TXOP, send one of:<br>— A non-HT PPDU containing a frame that requires an immediate response<br>— An HT-mixed format PPDU containing a frame that requires an immediate response in a non-HT PPDU<br>PPDUs after the first PPDU exchange may be HT-greenfield format PPDUs and/or be separated by RIFS. |

When the HT Protection field is equal to nonmember protection mode and the Use_Protection field in the ERP element is equal to 0, HT transmissions should be protected. When the HT Protection field is equal to nonmember protection mode, the Use_Protection field in the ERP element is equal to 0, and the Nongreenfield HT STAs Present field is equal to 1, HT transmissions using HT-greenfield format shall be protected. When the HT Protection field is equal to nonmember protection mode and the Use_Protection field in the ERP element is equal to 1, HT transmissions shall be protected according to the requirements described in Table 10-26 (Protection requirements for HT Protection field values nonmember protection mode and non-HT mixed mode).

When the HT Protection field is equal to non-HT mixed mode, HT transmissions shall be protected. The type of protection required depends on the type of transmission as well as the type of the non-HT STAs that are present in the BSS. Protection requirements that apply when the HT Protection field is equal to non-HT mixed mode are described in Table 10-26 (Protection requirements for HT Protection field values nonmember protection mode and non-HT mixed mode).

NOTE 2—Rules for rate selection for the HT protection mechanisms listed in Table 10-27 (Applicable HT protection mechanisms) are described in 10.6 (Multirate support).

If the HT Protection field is equal to no protection mode and the Secondary Channel Offset field is equal to SCA or SCB, a STA may transmit a 40 MHz HT PPDU (TXVECTOR parameter CH_BANDWIDTH set to HT_CBW40) to initiate a TXOP provided that the restrictions specified in 10.6 (Multirate support) are obeyed. When the HT Protection field is not equal to no protection mode or the Secondary Channel Offset field is equal to SCN, a STA shall not transmit a 40 MHz HT PPDU (TXVECTOR parameter CH_BANDWIDTH set to HT_CBW40) to initiate a TXOP.

This is an unapproved IEEE Standards Draft, subject to change.

### 10.27.3.2 Protection rules for HT STA operating a direct link

An HT STA operating a direct link with another HT STA in a non-HT BSS shall operate according to the rules found in 10.27 (Protection mechanisms) as though the following fields have the settings indicated:

a) The RIFS Mode field of the HT Operation element equal to 1
b) The HT Protection field equal to non-HT mixed mode
c) The Nongreenfield HT STAs Present field equal to 1
d) The OBSS Non-HT STAs Present field equal to 1
e) The Basic HT-MCS Set field equal to all 0s

### 10.27.3.3 RIFS protection

If the HT Protection field is equal to nonmember protection mode or non-HT mixed mode, the AP may set the RIFS Mode field to 0 according to (M118)implementation specific criteria (i.e., such as to protect overlapping non-HT BSSs in the primary or secondary channels).

If the HT Protection field is not equal to nonmember protection mode and it is not equal to non-HT mixed mode, the RIFS Mode field shall be set to 1.

If the RIFS Mode field of an AP's HT Operation element is equal to 1:

a) A STA that is associated with the AP may protect RIFS sequences when the HT Protection field of the HT Operation element transmitted by the AP is equal to nonmember protection mode.
b) A STA that is associated with the AP shall protect RIFS sequences when the HT Protection field of the HT Operation element transmitted by the AP is equal to non-HT mixed mode.

### 10.27.3.4 Use of OBSS Non-HT STAs Present field

The OBSS Non-HT STAs Present field allows HT APs to report the presence of non-HT STAs that are not members of its BSS in the primary channel, the secondary channel, or in both primary and secondary channels.

A second HT AP that detects a first HT AP's Beacon frame with the OBSS Non-HT STAs Present field equal to 1 may cause HT-greenfield format and RIFS sequence transmissions of the second AP's BSS to be protected by setting the HT Protection field of its HT Operation element to non-HT mixed mode. If the NonERP_Present field is equal to 1 in the first AP's Beacon frame, the Use_Protection field may also be set to 1 by the second AP.

An HT STA may also scan for the presence of non-HT devices either autonomously or, for example, after the STA's AP transmits an HT Operation element with the HT Protection field equal to nonmember protection mode. Non-HT devices can be detected as follows:

— Reception of a Management frame that does not carry an HT Capabilities element and the frame is required to carry this element when transmitted by an HT STA, or
— Reception of a Beacon frame containing an HT Operation element with the OBSS Non-HT STAs Present field equal to 1.

When non-HT devices are detected, the STA may enable protection of its HT-greenfield format and RIFS sequence transmissions.

NOTE—If a non-HT device is detected and the STA determines that its HT-greenfield format or RIFS sequence transmissions are affecting the operation of the non-HT device, then the STA might enable protection of its HT-greenfield format and RIFS sequence transmissions.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

See also 11.8.8.5 (HT-greenfield transmissions in operating classes that include a behavior limit of DFS_50_100_Behavior), which defines rules for the OBSS Non-HT STAs Present field related to HT-greenfield transmissions in certain operating classes.

### 10.27.3.5 Protection rules for an HT mesh STA

A mesh STA determines the HT Protection and Nongreenfield HT STAs Present fields in the HT Operation element in the transmitting frame as follows:

The HT Protection field in a mesh STA may be set to no protection mode only if

- All STAs detected in the primary or the secondary channel are HT STAs, and
- All mesh STA members of this MBSS that are one-hop neighbors of the transmitting mesh STA are either:
  - 20/40 MHz HT mesh STAs in a 20/40 MHz MBSS, or
  - 20 MHz HT mesh STAs in a 20 MHz MBSS.

The HT Protection field in a mesh STA may be set to nonmember protection mode only if

- A non-HT STA is detected in either the primary or the secondary channel or in both the primary and secondary channels, that is not known by the transmitting mesh STA to be a member of this MBSS, and
- All mesh STA members of this MBSS that are one-hop neighbors of the transmitting mesh STA are HT mesh STAs.

The HT Protection field in a mesh STA may be set to 20 MHz protection mode only if

- All STAs detected in the primary and all STAs detected in the secondary channel are HT STAs, and
- All mesh STA members of this MBSS that are one-hop neighbors of the transmitting mesh STA are HT mesh STAs, and
- The MBSS is a 20/40 MHz MBSS, and
- There is at least one 20 MHz HT mesh STA that is one-hop neighbor of the transmitting mesh STA.

The HT Protection field in a mesh STA is set to non-HT mixed mode otherwise.

If two peer HT mesh STAs report the same protection mode in HT Protection field, the protection mechanisms of the related mode shall be used to protect the transmission between the peer HT mesh STAs.

If an HT mesh STA and its peer HT mesh STA report different protection modes in HT Protection field, the following rules shall be used:

a) If an HT mesh STA or its peer HT mesh STA reports non-HT mixed mode, the protection mechanisms of non-HT mixed mode shall be used to protect the transmission between the peer HT mesh STAs.

b) If an HT mesh STA or its peer HT mesh STA reports nonmember protection mode and non-HT mixed mode is not reported by any of these HT mesh STAs, the protection mechanisms of nonmember protection mode shall be used to protect the transmission between the peer HT mesh STAs.

c) If an HT mesh STA or its peer HT mesh STA reports 20 MHz protection mode and neither non-HT mixed mode nor nonmember protection mode is reported by any of these HT mesh STAs, the protection mechanisms of 20 MHz protection mode shall be used to protect the transmission between the peer HT mesh STA.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

If at least one HT peer mesh STA in its mesh neighborhood indicates the Nongreenfield HT STAs Present equal to 1, the protection rules related to Nongreenfield HT STAs Present should also be applied to the communication between HT peer mesh STAs.

### 10.27.4 L_LENGTH and L_DATARATE parameter values for HT-mixed format PPDUs

L_LENGTH and L_DATARATE determine the duration that non-HT STAs do not transmit, equal to the remaining duration of the HT PPDU, following the non-HT portion of the preamble of the HT-mixed format PPDU.

The L_DATARATE parameter of the TXVECTOR shall be set to the value 6 Mb/s.

A STA that is transmitting a PPDU with the FORMAT parameter of the TXVECTOR equal to HT_MF shall set the value of the L_LENGTH parameter to the value (in octets) given by Equation (10-17):

$$\text{L\_LENGTH} = \left\lceil \frac{((\text{TXTIME} - \text{Signal Extension}) - \text{NonHTLength})}{\text{aSymbolLength}} \right\rceil \times N_{OPS} - \left\lceil \frac{\text{PHYServiceLength} + \text{PHYConvolutionalTailLength}}{8} \right\rceil \quad (10\text{-}17)$$

where

| | |
|---|---|
| TXTIME | is the duration (in microseconds) of the HT PPDU defined in 6.7.5 (PLME-TXTIME.request) |
| Signal Extension | is 0 μs when TXVECTOR parameter NO_SIG_EXTN is true and is aSignalExtension as defined in Table 19-25 (HT PHY characteristics) of 19.4.4 (HT PHY) when TXVECTOR parameter NO_SIG_EXTN is false |
| aSymbolLength | is the duration of a symbol (in microseconds), defined in 6.7.4 (PLME-CHARACTERISTICS.confirm) |
| NonHTLength | is 20 μs, the duration of the non-HT PHY preamble and L-SIG |
| $N_{OPS}$ | is the number of octets transmitted during a period of aSymbolLength at the rate specified by L_DATARATE |
| PHYServiceLength | is 16 bits, the number of bits in the PHY SERVICE field |
| PHYConvolutionalTailLength | is 6 bits, the number of bits in the convolutional code tail bit sequence |

NOTE 1—The last term of the L_LENGTH definition corrects for the fact that non-HT STAs add the length of the SERVICE field and tail bits (assuming a single convolutional encoder) to the value communicated by the L_LENGTH field.

Equation (10-17) can be simplified to Equation (10-18)

$$\text{L\_LENGTH} = \left\lceil \frac{((\text{TXTIME} - \text{Signal Extension}) - 20)}{4} \right\rceil \times 3 - 3 \quad (10\text{-}18)$$

A STA shall not transmit a PPDU with the FORMAT parameter set to HT_MF in TXVECTOR if the corresponding L_LENGTH value calculated with Equation (10-17) exceeds 4095 octets.

NOTE 2—The transmission of frames with L_LENGTH above 2332 octets (i.e., a Data frame containing an unencrypted 2304-octet MSDU) might be accompanied by a protection mechanism (e.g., RTS/CTS or CTS-to-self protection) if it is determined that the use of L_LENGTH fails to effectively suppress non-HT transmissions. How this is determined is outside the scope of this standard.

This is an unapproved IEEE Standards Draft, subject to change.

### 10.27.5 Protection rules for VHT STAs

A VHT STA is subject to all of the rules for HT STAs that apply to its operating band, except that a PPDU with the TXVECTOR FORMAT parameter set to VHT may be substituted for a PPDU with the TXVECTOR FORMAT parameter set to HT_MF and that the applicable HT protection mechanisms are extended to include 80, 160 and 80+80 MHz transmissions using non-HT duplicate frames defined in Clause 21 (Very high throughput (VHT) PHY specification).

### 10.27.6 Protection rules for HE STAs(11ax)

An HE STA operating in the 2.4 GHz band is subject to all of the rules for HT STAs that apply to that band, except that a PPDU with the TXVECTOR parameter FORMAT set to HE_SU, HE_ER_SU, HE_MU, or HE_TB may be substituted for a PPDU with the TXVECTOR parameter FORMAT set to HT_MF.

An HE STA operating in the 5 GHz band is subject to all of the rules for VHT STAs that apply to that band, except that a PPDU with the TXVECTOR parameter FORMAT set to HE_SU, HE_ER_SU, HE_MU, or HE_TB may be substituted for a PPDU with the TXVECTOR parameter FORMAT set to VHT.

Additionally, an HE STA can use the MU-RTS/CTS frame exchange sequence(#109) procedure.

### 10.27.7 Protection mechanisms for transmissions of EDMG PPDUs(11ay)

The intent of the protection mechanism is to cause an EDMG STA not to transmit an EDMG PPDU unless it has attempted to update the NAV of receiving non-EDMG STAs. The updated NAV period shall be longer than or equal to the total time required to send the Data and any required response frames. An EDMG STA shall use protection if a TXOP is obtained using the contention based channel access and may use protection at service period access. The protection mechanism does not need to be used if all PPDUs in the obtained TXOP are transmitted by MCS 0.

Frames used to support the protection mechanism shall be transmitted using MCS 0 as defined in Clause 20 or non-EDMG duplicate control mode MCS 0 as defined in Clause 28 (Enhanced directional multi-gigabit (EDMG) PHY specification(11ay)), so STAs in the BSA that receive such frames are able to learn the duration of the exchange even if they cannot detect the EDMG signals using their CCA function.

RTS, DMG CTS, DMG CTS-to-self, DMG DTS and CF-End frames are used as the protection mechanism according to the procedures defined in 10.3.2.4 (Setting and resetting the NAV), 10.3.2.9 (CTS and DMG CTS procedure), and 10.3.2.18 (EDMG RTS procedure(11ay)). The rules for calculating the Duration field value of RTS/DMG CTS frames are unchanged when using RTS/DMG CTS frames as a protection mechanism.

Control frames that are not RTS, DMG CTS, DMG CTS-to-self, DMG DTS and CF-End frames are sent according to the rules defined in 10.6.7.2 (Rate selection rules for Control frames transmitted by DMG STAs) and 10.6.7.6 (Channel Width selection for Control frames transmitted by EDMG STAs(11ay)).

## 10.28 MAC frame processing

### 10.28.1 Introduction

Subclauses 10.28.2 (Revision level field processing) to 10.28.9 (Extensible subelement parsing) describe MAC frame and element processing requirements to provide frame(#2181), element, and subelement extensibility.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 10.28.2 Revision level field processing

A MAC entity that receives a frame with a higher revision level than it supports shall discard the frame without indication to the sending STA or to LLC.

### 10.28.3 Duration/ID field processing

When the contents of a received Duration/ID field, treated as an unsigned integer and without regard for address(#3522), type, and subtype (even when type or subtype contain reserved values), are less than 32 768, the duration value is used to update the network allocation vector (NAV) according to the procedures defined in 10.3.2.4 (Setting and resetting the NAV), 10.23.3.4 (NAV operation of a TXOP under HCCA), or 10.38.10 (Updating multiple NAVs), as appropriate.

When the contents of a received Duration/ID field, treated as an unsigned integer, are greater than 32 768, the contents are interpreted as appropriate for the frame type and subtype or ignored if the receiving MAC entity does not have a defined interpretation for that type and subtype(#3128).

### 10.28.4 Response to an invalid Action or Action No Ack frame(#550)

If a STA receives an individually addressed Action or Action No Ack frame(#550) with an unrecognized Category field or some other syntactic error and the MSB of the Category field equal to 0, then the STA shall discard the frame(#3128)(#550).

### 10.28.5 Operation of the Dialog Token field

A dialog token is an integer value that assists a STA in grouping Management frames sent or received at different times as part of the same dialog. The algorithm by which the integer value for the dialog is selected is implementation specific, but should be selected in a manner that minimizes the probability of a frame associated with one dialog being incorrectly associated with another dialog.

### 10.28.6 Element parsing

A STA that encounters an element with an unknown or reserved element ID value, or an element with an element ID extension whose element ID extension value is unknown or reserved, in a Management frame received without error, shall ignore that element and shall parse any remaining management frame body for additional elements with recognizable element ID (and, if present, element ID extension) values.(#1541)(#6098)

### 10.28.7 Vendor specific element parsing

A STA receiving a Vendor Specific element that it does not support shall ignore the Vendor Specific element.

### 10.28.8 Extensible element parsing

Table 9-130 (Element IDs) indicates which elements are considered extensible in future revisions of the standard, by placing a Yes in the Extensible column. Each element that has a Yes in the Extensible column has an Information field with a known length that can be determined from the definition of the Information field in this standard; i.e., the Information field has a fixed structure or has a variable structure whose length is determined by fields within the Information field. A STA that receives an extensible element in which the Length field exceeds the known length of the Information field of that element shall discard any part of the Information field beyond the known length and shall otherwise process the element as though this truncated element had been received.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 10.28.9 Extensible subelement parsing

A subelement has the structure defined in 9.4.3 (Subelements) and is contained within an element or subelement.

A STA that encounters an unknown, unsupported, or reserved subelement ID value contained in an element or subelement shall ignore the subelement with that subelement ID value and shall continue to parse any remaining element or subelement body for additional subelements with recognizable subelement ID values.

A STA that receives an element or subelement for which a vendor-specific subelement is defined and that contains a vendor-specific subelement that it does not support shall ignore this vendor-specific subelement and shall continue to parse any remaining element or subelement body for additional subelements with recognizable subelement ID values.

Subelements are defined locally in each subclause that defines a structure containing subelements. Subelement ID numbering is private to that structure. A STA that receives an extensible subelement that is not extensible using subelements and in which the Length field exceeds the length of the structure of the subelement defined in this standard shall discard any part of the subelement beyond that length and shall otherwise process the subelement as though this truncated subelement had been received.

### 10.28.10 Extensible TLV parsing

A TVHT STA that receives a frame containing a TLV tuple with an unknown Type value shall discard the tuple and continue processing the next tuple.

### 10.28.11 Element fragmentation

The general format of elements limits the size of the information to 255 octets in an element without Element ID Extension field (Figure 10-47 (Example of the element fragmentation without Element ID Extension)) or 254 octets in an element with Element ID Extension field (Figure 10-48 (Example of the element fragmentation with Element ID Extension)). A STA may transmit information that is too large to fit in a single element by fragmenting the element into a series of elements consisting of the element that the information does not fit, immediately followed by one or more Fragment elements as illustrated in Figure 10-47 (Example of the element fragmentation without Element ID Extension). Information that fits in a single element shall not be fragmented. (#1018)The rules related to element fragmentation for the case where a fragmentable element is carried as a subelement within an element that is not fragmentable are described in 10.28.13 (Element fragmentation within a subelement of a nonfragmentable element(M118)(#1018)). All the information for a fragmented element shall be in the same MMPDU.

The information to be fragmented is divided into $M + N$ portions, where the following define each variable:

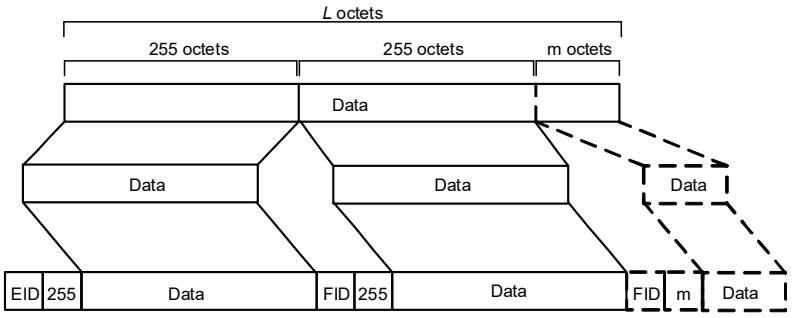
For an element without an Element ID Extension field:

- $L$ is the size of the information in octets.
- $M$ is $\lfloor L/255 \rfloor$ .
- $N$ is equal to 1 if $L$ mod 255 > 0 and equal to 0 otherwise.

For an element with an Element ID Extension field:

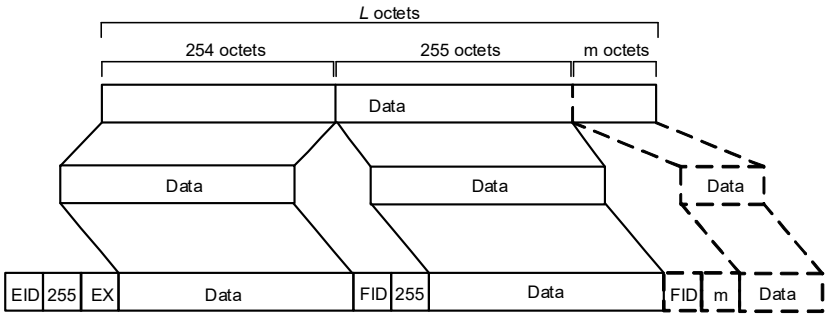
- $L$ is the size of the information in octets.
- $M$ is $\lfloor (L + 1)/255 \rfloor$ .(#3752)
- $N$ is equal to 1 if $(L–254)$ mod 255 > 0 and equal to 0 otherwise.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.



EID: The element ID of the fragmented element
FID: The Fragment element ID
m: *L* mod 255

**Figure 10-47—Example of the element fragmentation without Element ID Extension**



EID: The element ID of the fragmented element
EX: the element ID extension of the fragmented element
FID: The Fragment element ID
m: (*L*–254) mod 255 (The dashed Fragment element is present when (*L*–254) mod 255 is not equal to 0)

**Figure 10-48—Example of the element fragmentation with Element ID Extension**

The element into which the information does not fit is filled with the first portion of information and is termed the leading element. The leading element contains 255 octets of information for the element without Element ID Extension or 254 octets of information for the element with Element ID Extension. This element is immediately followed by $M - 1$ Fragment elements, each containing the next portion of 255 octets of information. If $N = 1$ these elements are immediately followed by the last portion of information.

NOTE—A Fragment element never follows an element with fewer than 255 octets of information without Element ID Extension, and an element with fewer than 254 octets of information with Element ID Extension. A Fragment element is never fragmented.

### 10.28.12 Element defragmentation

Elements that have had their information fragmented shall be followed by one or more Fragment elements. To reconstruct the original information, the portion of information from the leading element shall be concatenated, in order, with the portions of information from the series of Fragment elements that follow it. (#1018)The rules related to element defragmentation for the case where a fragmentable element is carried as a subelement within

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

an element that is not fragmentable are described in 10.28.14 (Element defragmentation within a subelement of a nonfragmentable element(#1018)(M118)). The defragmentation procedure shall complete when any element other than a Fragment element is encountered, or the end of the MMPDU is reached.

### 10.28.13 Element fragmentation within a subelement of a nonfragmentable element(M118)(#1018)

If a (M118)nonfragmentable element (i.e., has a No in the Fragmentable column in Table 9-130 (Element IDs)) includes a fragmentable element, as a subelement, then the maximum octets of the fragmentable element that can be carried within the subelement are limited by the remaining length in the subelement. In such a case, if the remaining length of the subelement is less than the length of the Information field of the fragmentable element, then the element is fragmented by following procedures described in 10.28.11 (Element fragmentation) where the length considerations are based on the pending octets in the subelement(s) that carries it. In addition, the (M118)nonfragmentable element is followed by at least one element having the same value in the Element ID field and Element ID Extension field (if applicable) as the (M118)nonfragmentable element (e.g., see Figure 11-5 (Example of nontransmitted BSSID profile fragmented across multiple Multiple BSSID elements(11ax)(#1018))). Each subsequent (M118)nonfragmentable element includes, as a first subelement, the same subelement (that carried the fragmented element) and carries a Fragment element (see 9.4.2.187 (Fragment element)) containing the remainder of the contents of the fragmented element. The maximum length of the Fragment element is based on the pending octets in the subelement. The fragmentable element may be fragmented across subelements carried across multiple elements. An example of a fragmentable element carried in a Nontransmitted BSSID Profile subelement of a Multiple BSSID element is shown in Figure 10-49 (Example of a fragmentable element in a nontransmitted BSSID profile carried across Multiple BSSID elements(#1018)).

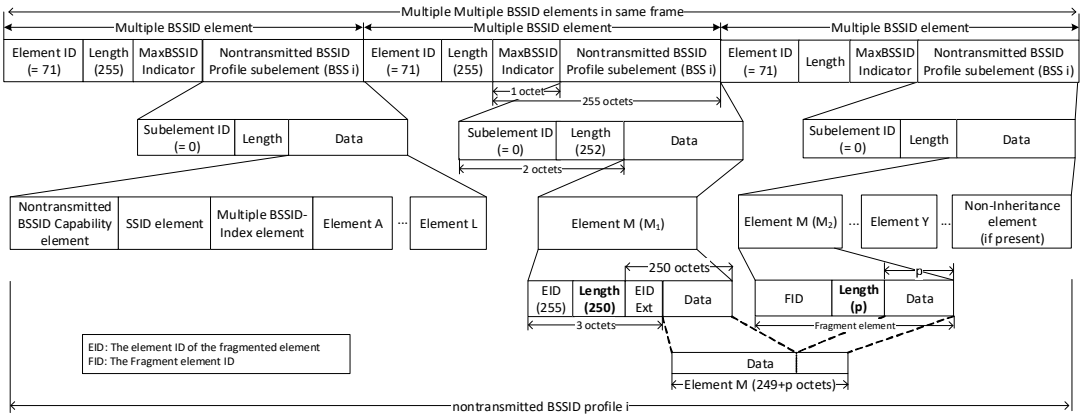


**Figure 10-49—Example of a fragmentable element in a nontransmitted BSSID profile carried across Multiple BSSID elements(#1018)**

### 10.28.14 Element defragmentation within a subelement of a nonfragmentable element(#1018)(M118)

When an element that is fragmentable is carried as a subelement within an element that is not fragmentable, the procedure for defragmentation shall be the same as that described in 10.28.12 (Element defragmentation) with the additional consideration that the fragments of the element are carried across subelements contained in multiple (M118)nonfragmentable elements.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

## 10.29 Reverse direction protocol

### 10.29.1 General

The RD protocol may be supported by an HT STA, by an S1G STA, and by a DMG STA(11ay) that is not an EDMG STA. The RD protocol shall be supported by an EDMG STA if dot11DMGChannelAccessScheme is either dmgChannelAccessOnly or dmgAndTddMixedChannelAccess. A STA receiving an RDG is never required to use the grant.

An HT STA indicates support of the RD feature as an RD responder using the RD Responder subfield of the HT Extended Capabilities field of the HT Capabilities element or the RD Responder subfield of the HE 6 GHz Band Capabilities element. A STA shall set the RD Responder subfield to 1 in frames that it transmits containing the HT Capabilities element in the 2.4 GHz or 5 GHz band and sets the RD Responder subfield to 1 in frames that it transmits containing the HE 6 GHz Band Capabilities element in the 6 GHz band if dot11RDResponderOptionImplemented is true. Otherwise, the STA shall set the RD Responder subfield to 0. In a non-HE HT STA, the RDG/More PPDU subfield and the AC Constraint subfield are present in the HTC field. In an HE STA, the RDG/More PPDU subfield and the AC Constraint subfield are present in the CAS Control subfield.(11ax)

A DMG STA indicates support of the RD feature using the Reverse Direction subfield of the DMG STA Capability Information field of the DMG Capabilities element. A STA shall set the Reverse Direction subfield to 1 in frames that it transmits containing the DMG Capabilities element if dot11RDResponderOptionImplemented is true. Otherwise, the STA shall set the Reverse Direction subfield to 0. In a DMG STA, the RDG/More PPDU subfield and the AC Constraint subfield are present in the QoS Control field.

An S1G STA indicates support of the RD feature as an RD responder using the RD Responder subfield of the S1G Capabilities element. A STA shall set the RD Responder subfield to 1 in frames that it transmits containing the S1G Capabilities element if dot11RDResponderOptionImplemented is true. Otherwise, the STA shall set the RD Responder subfield to 0. (11ay)For an EDMG STA, dot11RDResponderOptionImplemented shall always be set to true if dot11DMGChannelAccessScheme is either dmgChannelAccessOnly or dmgAndTddMixedChannelAccess. For an S1G STA, the RDG/More PPDU subfield and the AC Constraint subfield are present in the HTC field.

### 10.29.2 Reverse direction (RD) frame exchange sequence(#109)

An RD (#109)frame exchange sequence comprises the following:

a) The transmission of a PPDU by a TXOP holder or SP source containing an RD grant (the *RDG PPDU*), which is indicated by the PPDU containing one or more +HTC or DMG MPDUs in which the RDG/More PPDU subfield is equal to 1. The STA that transmits this PPDU is known as the *RD initiator*. The rules for an RD initiator apply only during a single RD (#109)frame exchange sequence, i.e., after the transmission of an RDG PPDU and up to the end of the last PPDU in the RD (#109)frame exchange sequence.

b) The transmission of one or more PPDUs (the *RD response burst*) by the STA addressed in the MPDUs of the RDG PPDU. The first (or only) PPDU of the RD response burst contains at most one immediate BlockAck or Ack frame. The last (or only) PPDU of the RD response burst contains any MPDUs requiring a response that is an immediate BlockAck or Ack frame. The STA that transmits the RD response burst is known as the *RD responder*. The rules for an RD responder apply only during a single RD (#109)frame exchange sequence, i.e., following the reception of an RDG PPDU and up to the transmission of a PPDU by the RD responder in which the RDG/More PPDU subfield is equal to 0.

c) The transmission of a PPDU by the RD initiator containing an immediate BlockAck frame or Ack frame (the *RD initiator final PPDU*), if so required by the last PPDU of the RD response burst.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

NOTE 1—An RD initiator might include multiple RD (#109)frame exchange sequences within a single TXOP or SP. Each RD (#109)frame exchange sequence within a single TXOP or SP might be addressed to a different recipient, and any single recipient might be given more than one RDG within a single TXOP or SP.

NOTE 2—If the RD responder is a VHT AP, the RD response burst can contain VHT MU PPDUs that might have TXVECTOR parameter NUM_USERS > 1. If the RD responder is an HE AP, the RD response burst can contain HE MU PPDUs that might have TXVECTOR parameter NUM_USERS > 1.(11ax)

NOTE 3—If the RD responder is an S1G AP, the RD response burst can contain S1G MU PPDUs that might have TXVECTOR parameter NUM_USERS > 1.

(11ax)If the RD initiator is an HE STA and the RD responder is an HE AP, the RD response burst may contain one or more Basic Trigger frames. The Basic Trigger frames shall trigger the RD initiator and at least one other STA in a full-bandwidth UL MU-MIMO transmission.

An example of an RD (#109)frame exchange sequence is given in O.3 (Example of RD frame exchanges(#109)).

### 10.29.3 Rules for RD initiator

An RDG shall not be present unless the MPDU carrying the grant, or every MPDU carrying the grant in an A-MPDU, matches one of the following conditions:

— (11ay)For a STA that is not an EDMG STA, a QoS Data frame with an ack policy other than (#3263)(11ay)No explicit acknowledgment or Scheduled Ack (i.e., including Implicit BAR), or

— (11ay)For an EDMG STA, a QoS Data frame with the Ack Policy field equal to any value except (#3263)No explicit acknowledgment, or

— (11ay)For a non-DMG STA, a BlockAckReq frame related to an HT-immediate block ack agreement, or

— (11ay)For a non-DMG STA, an MPDU not needing an immediate response (e.g., block ack under an HT-immediate block ack agreement, or Action No Ack).(#3263)

NOTE 1—These rules together with the rules in 9.7.3 (A-MPDU contents) cause an RDG to be delivered in a PPDU that either requires no immediate response or requires an immediate response that is a BlockAck or Ack frame.

NOTE 2—An RD initiator is not required to examine the RD Responder field of a potential responder before deciding whether to send a PPDU to that STA in which the RDG/More PPDU subfield is set to 1.

NOTE 3—An RD initiator is required according to 10.8 (HT Control field operation) to examine the +HTC-HT Support field of a potential responder before deciding whether to send a PPDU to that STA in which the RDG/More PPDU subfield is set to 1.

Transmission of a +HTC or DMG frame by an RD initiator with the RDG/More PPDU subfield equal to 1 (either transmitted as a non-A-MPDU frame,, or within an A-MPDU) indicates that the duration indicated by the Duration/ID field is available for the RD response burst and RD initiator final PPDU (if present).Transmission of an MPDU by an HE RD initiator that contains a CAS Control subfield with the RDG/More PPDU subfield equal to 1 indicates that the duration indicated by the Duration/ID field is available for the RD response burst and RD initiator final PPDU (if present).(11ax)

An RD initiator that sets the RDG/More PPDU field to 1 in a +HTC or DMG frame transmitted during a TXOP shall set the AC Constraint subfield to 1 in that frame if the TXOP was gained through the EDCA channel access mechanism and shall otherwise set it to 0. An RD initiator that sets the RDG/More PPDU field to 1 in a DMG frame transmitted during an SP can set the AC Constraint subfield to 1 to limit the Data frames transmitted by the RD responder.An HE STA RD initiator that sets the RDG/More PPDU field to 1 in a CAS Control subfield in a frame transmitted during a TXOP may set the AC Constraint subfield in the CAS Control subfield to 1.(11ax)

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

(11ay)If an RD initiator and an RD responder are EDMG STAs with the Scheduled RD Supported field in their EDMG Capabilities element equal to 1, then the RD initiator may set the ack policy of MPDUs contained in A-MPDU transmitted within an RDG PPDU to Scheduled Ack. In this case, the RD initiator shall include at least one Block Ack Schedule frame with Response Offset and Response Duration fields set to nonzero values in an A-MPDU transmitted within the RDG PPDU. If an A-MPDU is transmitted not as a part of an EDMG MU PPDU, the RD initiator shall set the value of the Response Offset field in the Block Ack Schedule frame equal to SIFS.

An RD initiator shall not transmit a +HTC or DMG frame with the RDG/More PPDU subfield set to 1 that requires a response MPDU that is not one of the following frames:

— Ack
— Compressed BlockAck
— Extended Compressed BlockAck
— Multi-STA BlockAck(11ax)
— EDMG Compressed BlockAck(11ay)
— EDMG Multi-TID BlockAck(11ay)

Subject to TXOP or SP constraints, after transmitting an RDG PPDU, an RD initiator may transmit its next PPDU as follows:

a) *Normal continuation:* The RD initiator may transmit its next PPDU a minimum of a SIFS after receiving a response PPDU that meets one of the following conditions:
   1) Contains one or more received +HTC or DMG frames with the RDG/More PPDU subfield equal to 0
   2) In an HT STA or an S1G STA, contains one or more received frames that are capable of carrying the HT Control field but did not contain an HT Control field
   3) Contains a received frame that requires an immediate response
   4) In a DMG STA, none of the correctly received frames in the PPDU carry the QoS Control field
b) *Error recovery:* For TXOPs and non-DMG SPs, the RD initiator may transmit its next PPDU (11ax)if the CS mechanism (see 10.3.2.1 (CS mechanism)) indicates that the medium is idle at the TxPIFS slot boundary (see Figure 10-29 (EDCA mechanism timing relationships(#14)(#1058))). For DMG SPs, the RD initiator shall not transmit its next PPDU earlier than PIFS following its last PPDU transmission. Transmission is a continuation of the current TXOP or SP.

NOTE 4—Error recovery of the RDG mechanism is the responsibility of the RD initiator.

NOTE 5—Control response frames generated by HE STAs do not carry the HT Control field.(11ax)

A STA that transmits a QoS +CF-Ack Data frame according to the rules in 10.23.3.5 (HCCA transfer rules) may also include an RDG in that frame provided that

— It is a non-A-MPDU frame, and
— The target of the +CF-Ack is equal to the Address 1 field of the frame.

NOTE 6—In a non-DMG BSS, the RD initiator can transmit a CF-End frame according to the rules for TXOP truncation in 10.23.2.10 (Truncation of TXOP) following an RD transmit sequence. An RD responder never transmits a CF-End.

NOTE 7—In a DMG network, the RD initiator can transmit a CF-End frame according to the rules for TXOP truncation in 10.23.2.10 (Truncation of TXOP) or SP truncation in 10.38.8 (Dynamic truncation of service period), as appropriate, following an RD transmit sequence. An RD responder never transmits a CF-End.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

(11ay)The value in the TID Aggregation Limit subfield in a transmitted Block Ack Schedule frame shall be less than or equal to *MT* + 1, where *MT* is the value indicated in the EDMG Multi-TID Aggregation Support subfield within the EDMG Capabilities element transmitted by the EDMG AP or EDMG PCP of the BSS.

### 10.29.4 Rules for RD responder

(11ay)If an RDG was granted by an MPDU contained in an A-MPDU with the ack policy different from Scheduled Ack, an RD responder shall transmit the initial PPDU of the RD response burst a SIFS after the reception of the RDG PPDU. PPDUs in a response burst are separated by SIFS or RIFS. The RIFS rules in the RD are the same as in the forward direction; the use of RIFS is constrained as defined in 10.3.2.3.2 (RIFS) and 10.27.3.3 (RIFS protection).

(11ay)If an RDG was granted by an MPDU contained in an A-MPDU with the ack policy equal to Scheduled Ack, an RD responder shall transmit the initial PPDU of the RD response burst at a time equal to *T_Offset* from the end of RDG PPDU, where *T_Offset* is the value of Response Offset subfield of the Block Ack Schedule frame in the A-MPDU that has the MPDU that granted the RDG. The duration of the RD response burst shall not exceed the value of the Response Duration subfield of the Block Ack Schedule frame in the A-MPDU that has the MPDU that granted the RDG.

NOTE 1—The transmission of a response by the RD responder does not constitute a new channel access but a continuation of the RD initiator's TXOP or SP. An RD responder ignores the NAV when responding to an RDG.

The recipient of an RDG may decline the RDG by

- Not transmitting any frames following the RDG PPDU if(11ax) no response is otherwise required, or
- (11ay)For a non-DMG STA, transmitting a control response frame with the RDG/More PPDU subfield set to 0, or
- (11ay)For a non-DMG STA, transmitting a control response frame that contains no HT Control field, or(11ax)
- Transmitting a control response frame aggregated with other MPDUs with the RDG/More PPDU subfield set to 0.(11ax)

An RD responder that is a non-DMG STA may transmit a +CF-Ack non-A-MPDU frame in response to a QoS Data +HTC non-A-MPDU frame that has the Normal Ack ack policy and the RDG/More PPDU subfield equal to 1.

The RD responder shall ensure that its PPDU transmission(s) and any expected responses fit entirely within the remaining TXOP or SP duration, as indicated in the Duration/ID field of MPDUs within the RDG PPDU.

An RD responder shall not transmit an MPDU (either individually or aggregated within an A-MPDU) that is not one of the following frames:

- Ack
- Compressed BlockAck
- Compressed BlockAckReq
- Extended Compressed BlockAck
- Extended Compressed BlockAckReq
- Multi-STA BlockAck(11ax)
- QoS Data(11ax)
- QoS Null(#4416)
- Management
- Basic Trigger(11ax)

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

(11ax)(11ay)For an EDMG Multi-TID A-MPDU or an EDMG MU PPDU, if the AC Constraint subfield is equal to 1, the RD responder shall transmit Data frames following the rules specified in this subclause and in 10.70 (EDMG A-MPDU with multiple TIDs(11ay)). Otherwise, if the AC Constraint subfield is equal to 1, the RD responder shall transmit Data frames of only the same AC as the last frame received from the RD initiator. If the AC Constraint subfield is equal to 1 in the last frame received from an RD initiator,

— A non-HE RD responder shall transmit Data frames of only the same AC as the last frame received from the RD initiator.

— An HE RD responder may transmit an A-MPDU or multi-TID A-MPDU with MPDUs from one or more ACs that have a priority that is equal to or higher than the lowest priority AC of the MPDU(s) carried in the last PPDU received from the RD initiator (see 10.12 (A-MPDU operation)) and if the RD initiator is an HE STA subject to the additional rules defined in 26.6.3 (Multi-TID A-MPDU and ack-enabled single-TID A-MPDU).

(11ax)For a BlockAckReq or BlockAck frame, the AC is determined by examining the TID field. For a Management frame, the AC is AC_VO. The RD initiator shall not transmit a +HTC or DMG MPDU with the RDG/More PPDU subfield set to 1 from which the AC cannot be determined. If the AC Constraint subfield is equal to 0, the RD responder may transmit Data frames of any TID.

NOTE 2—If the RD initiator's last PPDU contained an A-MPDU, the last frame is the last Data frame in the A-MPDU.

During an RD response burst any PPDU transmitted by an RD responder shall contain at least one MPDU with an Address 1 field that matches the MAC address of the RD initiator (11ax)or at least one Trigger frame that addresses the RD initiator, and the inclusion of traffic to STAs other than the RD initiator in a VHT MU PPDU, S1G MU PPDU, or HE MU PPDU(11ax) shall not increase the duration of the(11ax) PPDU beyond that required to transport the traffic to the RD initiator. The RD responder shall not transmit(11ax) a frame that is not a Basic Trigger frame and that causes a response after a SIFS(#6587) with an Address 1 field that does not match the MAC address of the RD initiator. The RD responder shall not transmit any PPDUs with a CH_BANDWIDTH that is wider than the CH_BANDWIDTH of the PPDU containing the frame(s) that delivered the RD grant.

(11ax)An RD responder that transmits a Basic Trigger frame shall set the CS Required subfield to 1 and shall allocate a number of streams for the RD initiator that is not smaller than the number of streams of the RD initiator's last PPDU.

(11ax)If an RD initiator sets the RDG/More PPDU field to 1 in a +HTC frame transmitted during a TXOP and sets the AC Constraint subfield to 1 in that frame, the RD responder shall set the Preferred AC subfield of the Trigger Dependent User Info field in the Trigger frame to the same AC as the last frame received from the RD initiator.

If an RDG PPDU also requires an immediate block ack response, the BlockAck frame shall be included in the first PPDU of the response.

When a PPDU is not the final PPDU of a response burst, an HT Control field carrying the RDG/More PPDU subfield set to 1 shall be present in every MPDU within the PPDU capable of carrying the HT Control field, or if the PPDU is transmitted in a DMG BSS, the RDG/More PPDU subfield within the QoS Control field shall be set to 1 in every MPDU within the PPDU. The last PPDU of a response burst shall have the RDG/More PPDU subfield set to 0 in all +HTC or DMG MPDUs contained in that PPDU.

The RD responder shall not set the RDG/More PPDU subfield to 1 in any MPDU in a PPDU that contains an MPDU that requires an immediate response.

NOTE 3—If the RD responder transmits a PPDU that expects a transmission by the RD initiator after a SIFS(#6587) and no such transmission is detected, the RD responder does not retry the exchange before either another RDG or its own TXOP or SP.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

After transmitting a PPDU containing one or more +HTC or DMG MPDUs in which the RDG/More PPDU subfield is equal to 0, the RD responder shall not transmit any more PPDUs within the current response burst.

NOTE 4—If an RD-capable STA that is not the TXOP holder or SP source receives a PPDU that does not indicate an RDG, there is no difference in its response compared to a STA that is not RD-capable.

(11ay)As part of an RDG, an RD responder that is a DMG STA shall not transmit a PPDU following a BlockAck frame unless the BlockAck frame is transmitted as part of an A-MPDU that includes an MPDU (e.g., QoS Null) that has the RDG/More PPDU subfield set to 1.

(11ay)The following provides additional rules for an RD responder that constructs a multi-TID A-MPDU in response to an MU PPDU.

(11ay)A non-AP and non-PCP EDMG STA with dot11EDMGAMPDUwithMultipleTIDOptionImplemented set to true shall not send a multi-TID A-MPDU to an EDMG AP or EDMG PCP unless all the following conditions are met:

— The EDMG Multi-TID Aggregation Support subfield in the AP's or PCP's EDMG Capabilities element is greater than 0.
— The RDG/More PPDU subfield is set to 1 in the QoS Control field of all MPDU(s) in the EDMG MU PPDU transmitted by the AP or PCP.
— The TID Aggregation Limit field in the Block Ack Schedule frame sent to the STA within the EDMG MU PPDU is nonzero.

(#4245)(11ay)The number of different TID values for QoS Data frames in the multi-TID A-MPDU shall not exceed the value in the TID Aggregation Limit subfield in the Block Ack Schedule frame the EDMG STA received in the MU PPDU. The multi-TID A-MPDU may contain no more than one Management frame, with exception of Action no Ack frames that can occur more than once. Any number of QoS Null frames with the Ack Policy field set to No Ack may be aggregated in the A-MPDU, irrespective of the value of the TID Aggregation Limit subfield and the value of the Preferred AC subfield in the Block Ack Schedule frame.

(11ay)(#4251)An EDMG Multi-TID BlockAck frame is used to acknowledge the MPDUs in a multi-TID A-MPDU. The rules for (#4251)EDMG Multi-TID BlockAck are defined in 10.70 (EDMG A-MPDU with multiple TIDs(11ay)).

(11ay)When a multi-TID A-MPDU is sent in an SP in response to an MPDU with the RD Grant field set to 1 and the AC Constraint field set to 0 as specified in 10.29.3 (Rules for RD initiator), an EDMG STA may aggregate MPDUs from any TID in the multi-TID A-MPDU for transmission in the SP as long as the transmission of the multi-TID A-MPDU does not cause the STA to exceed the current SP duration.

(11ay)An EDMG STA operating as an RD responder that constructs a multi-TID A-MPDU in response to an MU PPDU shall aggregate MPDUs in the A-MPDU in the following order:

— MPDUs with TIDs originating from the same or higher AC as indicated in the Preferred AC subfield of the received Block Ack schedule frame.
— MPDUs with TIDs originating from any other AC in the A-MPDU carried in the MU PPDU, if the responding EDMG STA has no buffered MPDU for TIDs belonging to the same or higher priority AC indicated in the Preferred AC subfield.
— MPDUs with TIDs originating from other ACs within the remaining time of the Response Duration subfield value indicated in the Block Ack Schedule Information field of the received Block Ack Schedule frame.

### 10.29.5 Reverse direction for EDMG DL MU-MIMO(11ay)

An EDMG STA with dot11EDMGScheduledRDImplemented equal to true shall support the reverse direction for EDMG DL MU-MIMO mechanism described in this subclause.

To start a DL MU PPDU transmission with reverse direction, an AP or PCP shall set the RDG/More PPDU subfield to 1 and the Ack Policy Indicator subfield to Scheduled Ack in the QoS Control field of an MPDU contained in the PPDU and addressed to the intended RD responder. The AP or PCP shall also include at least one Block Ack Schedule frame with nonzero Response Offset, Response Duration and Next PPDU Start Offset fields in an A-MPDU addressed to the intended RD responder.

Upon receiving an RD grant as part of a DL MU-MIMO transmission, an RD responder shall respond according to the rules that are defined in 10.29.4 (Rules for RD responder). The duration of the RD response burst shall be equal to the value of the Response Duration subfield of the last Block Ack Schedule frame received from the RD initiator.

An RD responder that intends to elicit a BlockAck frame from the RD initiator shall set the Ack Policy Indicator subfield of MPDUs addressed to RD initiator to Scheduled Ack.

Upon receiving an RD response burst with the ack policy of MPDUs contained in A-MPDU equal to Scheduled Ack, the RD initiator that granted an RD as part of a DL MU-MIMO transmission shall respond to the RD responder by aggregating a BlockAck frame into the next PPDU transmitted to the RD responder.

Figure 10-50 (Example of reverse direction for DL MU-MIMO(11ay)) illustrates an example of the RD sequence during DL MU-MIMO transmissions. The RD initiator (e.g., an AP) transmits an MU PPDU to STA 1 and STA 2. The RD initiator requests a BlockAck frame and grants an RD to STA 1 by setting RDG/ More PPDU to 1, Ack Policy Indicator subfield set to Scheduled Ack and including a Block Ack Schedule frame with the schedule for the RD response burst. The A-MPDU sent to STA 2 has RDG/More PPDU set to 0, Ack Policy set to Scheduled Ack and includes a Block Ack Schedule frame with the schedule for a BlockAck frame transmission.

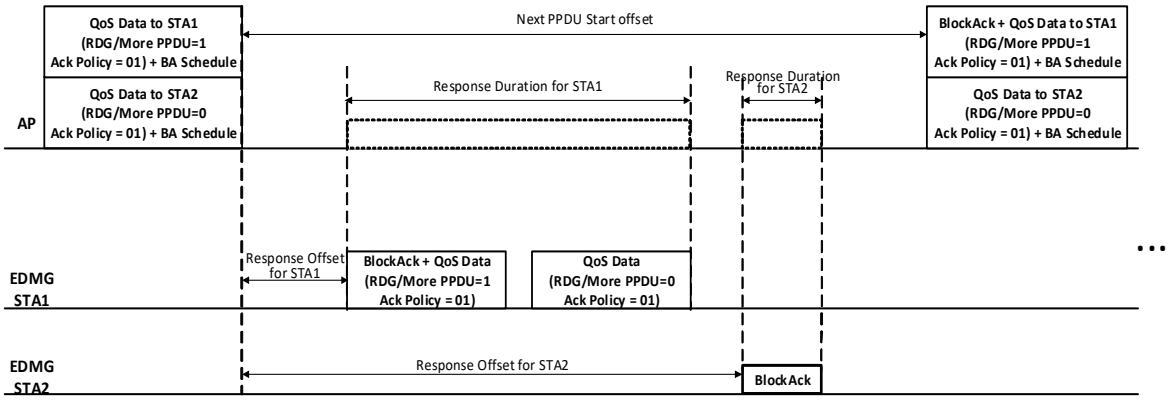

**Figure 10-50—Example of reverse direction for DL MU-MIMO(11ay)**

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Following the reception of the RD grant, STA 1 transmits its RD response burst in multiple PPDUs during the scheduled time slot defined by Response Offset and Response Duration subfields of the received Block Ack Schedule frame. The first PPDU is an A-MPDU, which includes the BlockAck to the RD initiator and QoS Data frames with RDG/More PPDU equal to 1. A PPDU in the RD response burst contains QoS DATA with RDG/More PPDU equal to 1 if it is not the last PPDU, and it contains QoS Data with RDG/More PPDU equal to 0 if it is the last PPDU of the RD response burst. STA 1 requests the acknowledgment for the RD response burst by setting the Ack Policy Indicator subfield to Scheduled Ack. STA 2 did not receive an RD grant, and so it uses the scheduled time slot for the transmission of only a BlockAck frame. After a period of time equal to the value of the Next PPDU Start Offset subfield starting from the end of the EDMG MU PPDU, the AP transmits another MU PPDU to both STA 1 and STA 2. In addition to QoS Data and Block Ack Schedule frames, the A-MPDU sent to STA 1 also includes a BlockAck to the RD response burst.(#3263)

## 10.30 Sounding PPDUs

The behavior described in this subclause is specific to the use of the HT variant HT Control field and CMMG variant HT Control field.

A sounding PPDU is a PPDU for which the SOUNDING parameter of the corresponding RXVECTOR or TXVECTOR has the value SOUNDING. Sounding PPDUs are transmitted by STAs to enable the receiving STAs to estimate the channel between the transmitting STA and the receiving STA.

A STA transmits sounding PPDUs when it operates in the following roles:

- MFB requester (see 10.31.2 (Link adaptation using the HT variant HT Control field) and 10.31.4 (Link adaptation using the CMMG variant HT Control field))
- HT beamformee responding to a training request, calibration initiator, or responder involved in implicit transmit beamforming (see 10.33.2.2 (Unidirectional implicit transmit beamforming), 10.33.2.3 (Bidirectional implicit transmit beamforming), and 10.33.2.4 (Calibration))
- HT beamformer involved in explicit transmit beamforming (see 10.33.3 (Explicit feedback beamforming))
- ASEL transmitter and ASEL sounding-capable transmitter involved in ASEL (see 10.34.2 (ASEL frame exchange procedure))
- CMMG beamformer involved in explicit transmit beamforming (see 10.33.5 (Explicit feedback beamforming for CMMG STAs))

A STA receives sounding PPDUs when it operates in the following roles:

- MFB responder (see 10.31.2 (Link adaptation using the HT variant HT Control field) and 10.31.4 (Link adaptation using the CMMG variant HT Control field))
- HT beamformer sending a training request, calibration initiator, or responder involved in implicit transmit beamforming (see 10.33.2.2 (Unidirectional implicit transmit beamforming), 10.33.2.3 (Bidirectional implicit transmit beamforming), and 10.33.2.4 (Calibration))
- HT beamformee involved in explicit transmit beamforming (see 10.33.3 (Explicit feedback beamforming))
- Transmit ASEL responder and ASEL receiver involved in ASEL (see 10.34.2 (ASEL frame exchange procedure))
- CMMG beamformee involved in explicit transmit beamforming (see 10.33.5 (Explicit feedback beamforming for CMMG STAs))

When transmitting a sounding PPDU, the transmitting STA follows the rules stated below to determine the maximum number of space-time streams for which channel coefficients can be simultaneously estimated:

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

- When transmitting a sounding PPDU that
  - Contains a +HTC frame with the MRQ subfield equal to 1, or
  - Is sent as a response to a +HTC frame with the TRQ field equal to 1, or
  - Is sent during a calibration sounding exchange, or
  - Is sent by an HT beamformer involved in explicit transmit beamforming, or
  - Is sent in transmit or receive ASEL exchanges,
  - Is sent by a CMMG beamformer involved in explicit transmit beamforming
- Then:
  - If the sounding PPDU is not an NDP sounding PPDU, the NUM_EXTEN_SS parameter in the TXVECTOR shall not be set to a value greater than the limit indicated by the Channel Estimation Capability subfield in the Transmit Beamforming Capabilities field transmitted by the STA that is the intended receiver of the sounding PPDU.

    NOTE—The maximum number of space-time streams for which channel coefficients can be simultaneously estimated using the HT-LTFs corresponding to the data portion of the PPDU is limited by the Rx MCS Bitmask subfield of the Supported MCS Set field and by the Rx STBC subfield of the HT Capability Information field. Both fields are part of the HT Capabilities element.

  - If the sounding PPDU is an NDP, the number of spatial streams corresponding to the MCS parameter of the TXVECTOR shall not exceed the limit indicated by the Channel Estimation Capability subfield in the Transmit Beamforming Capabilities field transmitted from the STA that is the intended receiver of the NDP (see 10.35.2 (Transmission of an HT NDP) for details on setting the MCS parameter).

(#402)If a STA sets the Receive Staggered Sounding Capable subfield in the Transmit Beamforming Capabilities field to 1, the STA shall set the Channel Estimation Capability subfield in the Transmit Beamforming Capabilities field to indicate a dimension that is greater than or equal to the dimension indicated by the Supported MCS Set field of the HT Capabilities element.

## 10.31 Link adaptation

### 10.31.1 Introduction

To fully exploit MIMO channel variations and transmit beamforming on a MIMO link, a STA can request that another STA provide MIMO channel sounding and MFB.

Link adaptation may be supported by immediate response or delayed response as described below. Unsolicited MFB is also possible.

- *Immediate.* An immediate response occurs when the MFB responder transmits the response in the TXOP obtained by the TXOP holder. This approach allows the MFB requester to obtain the benefit of link adaptation within the same TXOP.
- *Delayed.* A delayed response occurs when the MFB responder transmits the response in the role of a TXOP holder in response to an MRQ in a previous TXOP obtained by the MFB requester.
- *Unsolicited.* An unsolicited response occurs when a STA sends MFB independent of any preceding MRQ.

For an S1G STA, the same link adaptation procedure specified in 10.31.3 (Link adaptation using the VHT variant HT Control field) is applied with the following qualifications:

- “VHT” is replaced by “S1G” when referring to characteristics of an S1G STA or when referring to the contents of an S1G PPDU. More specifically:

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

- "VHT Capabilities Info field in the VHT Capabilities element" is replaced by "S1G Capabilities Information field in the S1G Capabilities element"
- "VHT NDP Announcement frame" is replaced by "VHT NDP Announcement frame carried in an S1G PPDU"
- "VHT MU PPDU" is replaced by "S1G MU PPDU"

### 10.31.2 Link adaptation using the HT variant HT Control field

The behavior described in this subclause is specific to the HT variant HT Control field.

A STA that supports link adaptation using the HT Control field shall set the MCS Feedback field of the HT Extended Capabilities field to Unsolicited or Both, depending on its specific MFB capability, in HT Capabilities elements that it transmits. A STA shall not send an MRQ to a STA that has not set the MCS Feedback subfield to Both in the HT Extended Capabilities field of the HT Capabilities element. A STA whose MCS Feedback field of the HT Extended capabilities field of the HT Capabilities element is equal to Unsolicited or Both may transmit unsolicited MFB in any frame that contains a +HTC field.

The MFB requester may set the MRQ subfield to 1 in the MAI subfield of the HT Control field of a +HTC frame to request a STA to provide MFB. In each MRQ, the MFB requester shall set the MSI subfield in the MAI subfield to a value in the range 0 to 6. How the MFB requester chooses the MSI value is implementation dependent.

The appearance of more than one instance of an HT Control field with the MRQ subfield equal to 1 within a single PPDU shall be interpreted by the receiver as a single request for MFB.

An MFB requester shall transmit +HTC frames with the MRQ subfield equal to 1 in one of the following ways:

- Within a sounding PPDU, or
- With the HT NDP Announcement subfield in the +HTC frame set to 1 and following the +HTC frame by an NDP transmission.

The number of HT-LTFs sent in the sounding PPDU or in the NDP is determined by the total number of spatial dimensions to be sounded, including any extra spatial dimensions beyond those used by the data portion of the frame.

An MFB-capable STA (identified by the MCS Feedback field in the Extended HT Capability Information field equal to 3) shall support the following:

- MFB estimate computation and feedback on the receipt of MRQ (MRQ=1 in +HTC) in a sounding PPDU for which the RXVECTOR NUM_EXTEN_SS parameter contains 0 in the PHY-RXSTART.indication primitive.
- MFB estimate computation and feedback on the receipt of MRQ (MRQ=1 in +HTC) in a staggered sounding PPDU if this STA declares support for receive staggered sounding by setting the Receive Staggered Sounding Capable subfield of the Transmit Beamforming Capabilities field to 1.
- MFB estimate computation and feedback on the receipt of NDP (see 10.35 (Null data PPDU (NDP) sounding)) if this STA declares support for receiving NDP sounding by setting the Receive NDP Capable subfield of the Transmit Beamforming Capabilities field to 1. The MFB requester shall set the MRQ subfield to 1 in the frame where the HT NDP Announcement subfield is equal to 1.

On receipt of a +HTC frame with the MRQ subfield equal to 1, an MFB responder initiates computation of the MCS estimate based on the associated sounding PPDU and labels the result of this computation with the MSI value. The MFB responder includes the received MSI value in the MFSI field of the corresponding response frame. In the case of a delayed response, this use of MSI and MFSI fields allows the MFB requester to correlate the MFB with the related MRQ.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The responder may send a response frame with any of the following combinations of MFB and MFSI:

- MFB = 127, MFSI = 7: no information is provided for the immediately preceding request or for any other pending request. This combination is used when the responder is required to include an HT Control field due to other protocols that use this field (i.e., the reverse direction protocol) and when no MFB is available. It has no effect on the status of any pending MRQ.
- MFB = 127, MFSI in the range 0 to 6: the responder is not providing feedback for the request with he MSI value that matches the MFSI value.(M118)
- MFB in the range 0 to 126, MFSI in the range 0 to 6: the responder is providing feedback for the request that had the MSI value that matches the MFSI value.
- MFB in the range 0 to 126, MFSI = 7: the responder is providing unsolicited feedback.

Hardware and buffer capability may limit the number of MCS estimate computations that an MFB responder is capable of computing simultaneously. When a new MRQ is received either from a different MFB requester or from the same MFB requester with a different MSI value, and the MFB responder is not able to complete the computation for MRQ, the MFB responder may either discard the new request or may abandon an existing request and initiate an MCS estimate computation for the new MRQ.

An MFB responder that discards or abandons the computation for an MRQ should indicate this action to the MFB requester by setting the MFB to the value 127 in the next transmission of a frame addressed to the MFB requester that includes the HT Control field. The value of the MFSI is set to the MSI value of the sounding frame for which the computation was abandoned.

When computing the MCS estimate for an MFB requester whose Tx MCS Set Defined field is equal to 1, the number of spatial streams corresponding to the recommended MCS shall not exceed the limit indicated by the Tx Maximum Number Spatial Streams Supported field. The MFB responder shall not recommend an MCS corresponding to UEQM unless the MFB requester supports such modulation, as indicated by the Tx Unequal Modulation Supported bit in the Supported MCS Set field.

If the MFB is in the same PPDU as a Noncompressed Beamforming frame or a Compressed Beamforming frame, the MFB responder should estimate the recommended MCS under the assumption that the MFB requester uses the steering matrices contained therein.

After the MCS estimate computation is completed, the MFB responder should include the MFB in the MFB field in the next transmission of a frame addressed to the MFB requester that includes an HT Control field. When the MFB requester sets the MRQ subfield to 1 and sets the MSI subfield to a value that matches the MSI subfield value of a previous request for which the responder has not yet provided feedback, the responder shall discard or abandon the computation for the MRQ that corresponds to the previous use of that MSI subfield value.

A STA may respond immediately to a current request for MFB with a frame containing an MFSI field value and MFB field value that correspond to a request that precedes the current request.

Bidirectional request/responses are supported. A STA may act as both the MFB requester for one direction of a duplex link and the MFB responder for the other direction and include both MRQ and MFB in the same HT Data frame.

If an HT beamformer transmits a PPDU with the TXVECTOR EXPANSION_MAT_TYPE set to either COMPRESSED_SV or NON_COMPRESSED_SV, it should use the recommended MCS associated with those matrices reported in a Noncompressed Beamforming frame or a Compressed Beamforming frame.

### 10.31.3 Link adaptation using the VHT variant HT Control field

This subclause applies to frame exchange sequences that include PPDUs containing an HT variant HT Control field. The VHT variant HT Control field may be used by VHT STAs and S1G STAs.

A STA that supports VHT link adaptation using the VHT variant HT Control field shall set the VHT Link Adaptation Capable subfield in the VHT Capabilities Information field in the VHT Capabilities element to Unsolicited or Both, depending on its specific link adaptation feedback capability. A STA shall not send an MRQ to a STA that has not set the VHT Link Adaptation Capable subfield to Both in the VHT Capabilities Information field of the VHT Capabilities element. A STA whose VHT Link Adaptation Capable subfield of the VHT Capabilities Information field of the VHT Capabilities element is either set to Unsolicited or Both may transmit unsolicited MFB in any frame that contains a VHT variant HT Control field.

The MFB requester or MFB responder that is an S1G STA shall set the S1G subfield in the VHT variant HT Control field to 1. Otherwise the S1G field shall be reserved.

An S1G STA shall not transmit a +HTC Control frame to another S1G STA that does not support VHT link adaptation.

An S1G STA that sets the +HTC VHT Capable to 1 and supports sending control response frames that are not NDP CMAC PPDUs for link adaptation shall set (#402)Link Adaptation Without NDP CMAC PPDU Capable subfield in the S1G Capabilities element to 1. Otherwise it shall set it to 0. An S1G STA shall not elicit a Control frame that is not an NDP CMAC PPDU for link adaptation from another S1G STA when the received Link Adaptation Without NDP CMAC PPDU Capable subfield in the received S1G Capabilities element from the STA is 0.

An S1G STA that is an MFB requester shall set the TXVECTOR parameter RESPONSE_INDICATION to NORMAL_RESPONSE if it intends to elicit link adaptation feedback in the immediate control response frame. Otherwise, it shall not set the TXVECTOR parameter RESPONSE_INDICATION to Normal Response, unless it is permitted to do so as described in 10.25 (Block acknowledgment (block ack)), 10.3.2.11 (Acknowledgment procedure), and 10.46 (Target wake time (TWT)).

An S1G STA that is an MFB responder may transmit a +HTC Control frame as an immediate response to an eliciting frame for which the RXVECTOR parameter RESPONSE_INDICATION is equal to NORMAL_RESPONSE. The +HTC control response frame shall be one of the following:

- +HTC Ack frame if the eliciting frame requires an Ack frame as a response (see 10.3.2.11 (Acknowledgment procedure))
- +HTC BlockAck frame or +HTC BAT frame if the eliciting frame requires a BlockAck frame or BAT frame as a response (see 10.25 (Block acknowledgment (block ack)))
- +HTC TACK frame or +HTC STACK frame if the eliciting frame requires a TACK frame or STACK frame as a response (see 10.46.2 (TWT acknowledgment procedure))
- +HTC CTS frame in the eliciting frame requires an CTS frame as a response (see 10.3.2.9 (CTS and DMG CTS procedure))

Otherwise, the S1G STA shall not transmit a +HTC control response frame.

The MFB requester may set the MRQ field to 1 in the VHT variant HT Control field of a frame to request a STA to provide link adaptation feedback. In each request the MFB requester shall set the MSI/STBC field to a value in the ranges 0 to 6, 0 to 2, or 0 to 3, depending on the settings in the Unsolicited MFB and STBC fields (see 9.2.4.6.3 (VHT variant)). The choice of MSI value is implementation dependent.

The appearance of more than one instance of a VHT variant HT Control field with the MRQ field equal to 1 within a single PPDU shall be interpreted by the receiver as a single request for link adaptation feedback.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

An MFB responder that has set the VHT Link Adaptation Capable subfield to Both in the VHT Capabilities Information field of the VHT Capabilities element shall support both of the following:

— Computation and feedback of the MFB estimate on the receipt of an MFB request (MRQ equal to 1 in the VHT variant HT Control field) in a PPDU that is not a VHT NDP Announcement frame.

— Computation and feedback of the MFB estimate on the receipt of an MFB request (MRQ equal to 1 in VHT variant HT Control field) in a VHT NDP Announcement frame and the receipt of VHT NDPs (see 10.35 (Null data PPDU (NDP) sounding)) if this STA set the SU Beamformee Capable subfield of the VHT Capabilities Information field of the VHT Capabilities element to 1.

On receipt of a VHT variant HT Control field with the MRQ field equal to 1, an MFB responder computes the VHT-MCS, NUM_STS, and SNR estimates based on the PPDU carrying the MRQ or, in the case of a VHT NDP Announcement frame carrying the MRQ, based on the subsequent VHT NDP. The MFB responder labels the result of this computation with the MSI value from the VHT variant HT Control field in the received frame carrying the MRQ. The MFB responder may include the received MSI value in the MFSI field of the corresponding response frame. In the case of a delayed response, this allows the MFB requester to associate the MFB with the soliciting MRQ.

An MFB responder that sends a solicited MFB shall set the Unsolicited MFB subfield in VHT variant HT Control field to 0.

The MFB responder may send a solicited response frame with any of the following combinations of VHT-MCS, NUM_STS, and MFSI:

— VHT-MCS = 15, NUM_STS = 7 in the MFB subfield, MFSI = 7 in a VHT PPDU; and VHT-MCS = 15, NUM_STS = 3, and MFSI = 7 in an S1G PPDU: no information is provided for the immediately preceding request or for any other pending request. This combination is used when the responder is required to include a VHT variant HT Control field due to other protocols that use this field (e.g., the Reverse Direction Protocol) and when no MFB is available. It has no effect on the status of any pending MRQ.

— VHT-MCS = 15, NUM_STS = 7 in the MFB subfield, MFSI in the range 0 to 6 in a VHT PPDU; and VHT-MCS = 15, NUM_STS = 3, and MFSI in the range 0 to 6 in an S1G PPDU: the responder is not providing feedback for the request with the MSI value that matches the MFSI value.(M118)

— VHT-MCS = valid value, NUM_STS = valid value in the MFB subfield, MFSI in the range 0 to 6: the responder is providing feedback for the request that had the MSI value that matches the MFSI value.

An MFB responder that discards or abandons the MFB estimates computed in response to an MRQ may indicate that it has done so by setting the VHT-MCS to 15 and NUM_STS to 7 in the MFB subfield in the next VHT PPDU frame if the frame is carried in a VHT PPDU or by setting the VHT-MCS to 15 and NUM_STS to 3 if the frame is carried in an S1G PPDU containing frames addressed to the MFB requester that includes the VHT variant HT Control field. The value of the MFSI is set to the value of the MSI/STBC subfield of the frame that contains an MRQ for which the computation was abandoned, regardless of whether the MSI/STBC subfield contains an MSI or a Compressed MSI and STBC Indication subfields.

The STA receiving MFB may use the received MFB to compute the appropriate VHT-MCS, SNR, and NUM_STS.

A STA sending unsolicited MFB using the VHT variant HT Control field shall set the Unsolicited MFB subfield to 1.

Unsolicited VHT-MCS, NUM_STS, BW, and SNR estimates reported in the MFB subfield of a VHT variant HT Control field sent by a STA are computed based on the most recent PPDU received by the STA that matches the description indicated by the GID-L, GID-H, Coding Type, STBC Indication, and FB Tx Type fields in the same VHT variant HT Control field.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

In an unsolicited MFB response the GID-L, GID-H, Coding Type, STBC Indication, FB Tx Type, and BW fields are set according to the RXVECTOR parameters of the received PPDU from which the VHT-MCS, SNR, BW, and NUM_STS are estimated, as follows:

- If the VHT-MCS, SNR, BW, and NUM_STS are estimated from a VHT MU PPDU, then the GID-L field is set to the 3 least significant bits and the GID-H field to the 3 most significant bits of the parameter GROUP_ID.
- If the VHT-MCS, SNR, BW, and NUM_STS are estimated from an SU PPDU, then the GID-L field and GID-H field are set to all 1s.
- The Coding Type field is set to 0 if the parameter FEC_CODING is equal to BCC_CODING and set to 1 if equal to LDPC_CODING.
- The STBC Indication field is set to 1 if the parameter STBC is equal to 1 and set to 0 if the STBC parameter is equal to 0.
- The FB TX Type field is set to 1 if the parameter BEAMFORMED is equal to 1 and set to 0 if equal to 0.
- The BW field shall indicate a bandwidth less than or equal to the bandwidth indicated by the parameter CH_BANDWIDTH.

In an MFB response solicited by an MRQ that was not carried in a VHT NDP Announcement frame, the MFB is computed based on RXVECTOR parameters CH_BANDWIDTH, GROUP_ID, NUM_STS, FEC_CODING, BEAMFORMED, and STBC of the received PPDU that carried the MRQ and might additionally be based on other factors that are not part of the RXVECTOR. The NUM_STS subfield of the MFB subfield of VHT variant HT Control field shall be set to an equal or smaller value than the RXVECTOR parameter NUM_STS of the received PPDU that triggered the MRQ.

If the MFB is in the same MPDU as a VHT Compressed Beamforming frame, the MFB responder shall estimate the recommended MFB under the assumption that the beamformer will use the steering matrices contained therein for performing an SU beamformed transmission. In this case the value of the NUM_STS field in the MFB subfield of the VHT variant HT Control field shall be the same as the value of the Nc Index field in the VHT MIMO Control field of the VHT Compressed Beamforming frame and, if the MFB is unsolicited, the Coding Type shall be set to BCC and the FB Tx Type shall be set to 0. Additionally, MFB estimate shall be based on the bandwidth indicated by the Channel Width subfield of the VHT MIMO Control field of the VHT Compressed Beamforming frame. In this case the SNR and BW subfields are reserved and set to 0.

If an unsolicited MFB is not in the same MPDU as a VHT Compressed Beamforming frame, the NUM_STS subfield of the MFB subfield of the VHT variant HT Control field shall be set to an equal or smaller value than the RXVECTOR parameter NUM_STS of the received PPDU from which the MFB parameters are estimated.

If the MFB requester sends the MRQ in a VHT NDP Announcement frame, then the MFB responder shall include the corresponding MFB in (all of) the VHT Compressed Beamforming frame(s) sent in response to the same VHT NDP Announcement frame and NDP sequence.

If the value of the NUM_STS subfield of the MFB field (solicited or unsolicited) is a smaller value than the RXVECTOR parameter NUM_STS of the received PPDU on which the MFB is based, the MFB responder shall estimate the recommended VHT-MCS under the assumption that the MFB requester will transmit the first $N_{STS}$ space-time streams in the corresponding PPDU carrying MRQ. If the MFB is based on an SU PPDU the first $N_{STS}$ space-time streams correspond to columns 1, ..., $N_{STS}$ of the spatial mapping matrix $Q$. If the MFB is based on a VHT MU PPDU, then for the user $u$ the first $N_{STS}$ space-time streams correspond to columns $M_u$+1, ..., $M_u$+$N_{STS,u}$ of the spatial mapping matrix $Q$ ($M_u$ is defined in 21.3.10.11.1 (Transmission in VHT format) and in 23.3.9.11 (OFDM modulation)). The VHT-MCS recommendation shall be a value from the peer's Tx Supported VHT-MCS and NSS Set (see 10.6.13.2 (Tx Supported VHT-MCS and NSS Set)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

A VHT NDP Announcement frame that contains multiple STA Info fields and that contains a VHT format of HT Control field with the MRQ subfield equal to 1 solicits an MFB response from all of the STAs listed in the STA Info fields.

When the MFB requester sets the MRQ subfield to 1 and sets the MSI/STBC subfield to a value that matches the MSI/STBC subfield value of a previous request for which the responder has not yet provided feedback, the responder shall discard or abandon the computation for the MRQ that corresponds to the previous use of that MSI/STBC subfield value and start a new computation based on the new request.

A STA may respond immediately to a current request for MFB with a frame containing an MFSI field value and an MFB field value that correspond to a request that precedes the current request.

Bidirectional request/responses are supported. A STA may act as both the MFB requester for one direction of a duplex link and the MFB responder for the other direction and include both an MRQ and an MFB in the same VHT variant HT Control field.

### 10.31.4 Link adaptation using the CMMG variant HT Control field

The behavior described in this subclause is specific to the CMMG variant HT Control field.

A STA that supports link adaptation using the CMMG variant HT Control field shall set the CMMG Link Adaptation Capable subfield in the CMMG Capabilities Info field of the CMMG Capabilities element to Unsolicited or Both, depending on its specific link adaptation feedback capability. A STA shall not send an MRQ to STAs that have not set the CMMG Link Adaptation Capable subfield to Both in the CMMG Capabilities Info field of the CMMG Capabilities element. A STA whose most recently transmitted MCS Feedback field of the CMMG Extended capabilities field of the CMMG Capabilities element is equal to Unsolicited or Both may transmit unsolicited MFB in any frame that contains a CMMG variant HT Control field.

The MFB requester may set the MRQ field to 1 in the CMMG variant HT Control field of a frame to request a STA to provide link adaptation feedback. In each request the MFB requester shall set the MSI/STBC field to a value in the ranges 0 to 6, 0 to 2, or 0 to 3, depending on the settings in the Unsolicited MFB and STBC fields (see 9.2.4.6.4 (HE variant(11ax))). The choice of MSI value is implementation dependent.

NOTE 1—The MFB requester might use the MSI subfield as an MRQ sequence number, or it might implement any other encoding of the field.

The appearance of more than one instance of a CMMG variant HT Control field with the MRQ field equal to 1 within a single PPDU shall be interpreted by the receiver as a single request for link adaptation feedback.

In OFDM transmission the number of MCTFs sent in the sounding PPDU or in the NDP is determined by the total number of spatial dimensions to be sounded, including any extra spatial dimensions beyond those used by the data portion of the frame.

On receipt of a CMMG variant HT Control field with the MRQ subfield equal to 1, an MFB responder computes the CMMG-MCS, NUM_STS, and SNR estimates based on the PPDU carrying the MRQ or, in the case of a CMMG with the NDP Announcement subfield set to 1 carrying the MRQ, based on the subsequent CMMG NDP. The MFB responder labels the result of this computation with the MSI value from the CMMG variant HT Control field in the received frame carrying the MRQ. The MFB responder may include the received MSI value in the MFSI field of the corresponding response frame. In the case of a delayed response, this allows the MFB requester to associate the MFB with the soliciting MRQ.

An MFB responder that sends a solicited MFB shall set the Unsolicited MFB subfield in CMMG variant HT Control field to 0.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The MFB responder may send a solicited response frame with any of the following combinations of CMMG-MCS, NUM_STS, and MFSI:

— CMMG-MCS = 31, NUM_STS = 3 in the MFB subfield, MFSI = 7: no information is provided for the immediately preceding request or for any other pending request. This combination is used when the responder is required to include a CMMG variant HT Control field due to other protocols that use this field (e.g., the reverse direction protocol) and when no MFB is available. It has no effect on the status of any pending MRQ.

— CMMG-MCS = 31, NUM_STS = 3 in the MFB subfield, MFSI in the range 0 to 6: the responder is not providing feedback for the request with the MSI value that matches the MFSI value.(M118)

— CMMG-MCS = valid value, NUM_STS = valid value in the MFB subfield, MFSI in the range 0 to 6: the responder is providing feedback for the request that had the MSI value that matches the MFSI value.

An MFB responder that discards or abandons the MFB estimates computed in response to an MRQ may indicate that it has done so by setting the CMMG-MCS to 31 and NUM_STS to 3 in the MFB subfield in the next frame addressed to the MFB requester that includes the CMMG variant HT Control field. The value of the MFSI is set to the value of the MSI/STBC subfield of the frame that contains an MRQ for which the computation was abandoned, regardless of whether the MSI/STBC subfield contains an MSI or a Compressed MSI and STBC Indication subfields.

The STA receiving MFB may use the received MFB to compute the appropriate CMMG-MCS, SNR, BW, and NUM_STS.

When computing the MCS estimate for an MFB requester whose Tx MCS Set Defined field is equal to 1, the number of spatial streams corresponding to the recommended MCS shall not exceed the limit indicated by the Tx Maximum Number Spatial Streams Supported field.

Hardware and buffer capability may limit the number of MCS estimate computations that a MFB responder is capable of computing simultaneously. When a new MRQ is received either from a different MFB requester or from the same MFB requester with a different MSI value and when the MFB responder is not able to complete the computation for MRQ, then the MFB responder may either discard the new request or abandon an existing request in order to initiate computation for the new MRQ.

A STA sending unsolicited MFB feedback using the CMMG variant HT Control field shall set the Unsolicited MFB subfield to 1.

Unsolicited CMMG-MCS, NUM_STS, BW, and SNR estimates reported in the MFB subfield of a CMMG variant HT Control field sent by a STA are computed based on the most recent PPDU received by the STA that matches the description indicated by the STBC Indication and FB Tx Type fields in the same CMMG variant HT Control field.

In an unsolicited MFB response the STBC Indication, FB Tx Type, and BW fields are set according to the RXVECTOR parameters of the received PPDU from which the CMMG-MCS, SNR, BW, and NUM_STS are estimated, as follows:

— The STBC Indication field is set to 1 if the parameter STBC is equal to 1 and set to 0 if the parameter STBC is equal to 0.

— The FB TX Type field is set to 1 if the parameter BEAMFORMED is equal to 1 and set to 0 if the parameter BEAMFORMED is equal to 0.

— The BW field shall indicate a bandwidth equal to or less than the bandwidth indicated by the parameter CH_BANDWIDTH.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

In an MFB response solicited by an MRQ that was not carried in a CMMG NDP announcement(#1989)(#177), the MFB is computed based on RXVECTOR parameters CH_BANDWIDTH, NUM_STS, BEAMFORMED, and STBC of the received PPDU that carried the MRQ and might additionally be based on other factors that are not part of the RXVECTOR. The NUM_STS subfield of the MFB subfield of the CMMG variant HT Control field shall be set to an equal or smaller value than the RXVECTOR parameter NUM_STS of the received PPDU that triggered the MRQ.

If the MFB is in the same PPDU as a CMMG Compressed Beamforming frame, the MFB responder should estimate the recommended MFB under the assumption that the MFB requester uses the steering matrices contained therein.

If the MFB is in the same MPDU as a CMMG Compressed Beamforming frame, the MFB responder shall estimate the recommended MFB under the assumption that the beamformer uses the steering matrices contained therein. In this case the value of the NUM_STS field in the MFB subfield of the CMMG variant HT Control field shall be the same as the value of the Nc Index field in the CMMG MIMO Control field of the CMMG Compressed Beamforming frame; and, if the MFB is unsolicited, the FB Tx Type shall be set to 0. Additionally, MFB estimate shall be based on the bandwidth indicated by the Channel Width subfield of the CMMG MIMO Control field of the CMMG Compressed Beamforming frame. In this case the SNR and BW subfields are reserved and set to 0.

If an unsolicited MFB is not in the same MPDU as a CMMG Compressed Beamforming frame, the NUM_STS subfield of the MFB subfield of the CMMG variant HT Control field shall be set to an equal or smaller value than the RXVECTOR parameter NUM_STS of the received PPDU from which the MFB parameters are estimated.

After the MFB estimate computation is completed, the MFB responder should include the MFB in the MFB field in the next transmission of a frame addressed to the MFB requester that includes a CMMG variant HT Control field. When the MFB requester sets the MRQ subfield to 1 and sets the MSI subfield to a value that matches the MSI subfield value of a previous request for which the responder has not yet provided feedback, the responder shall discard or abandon the computation for the MRQ that corresponds to the previous use of that MSI subfield value.

A STA may respond immediately to a current request for MFB with a frame containing an MFSI field value and MFB field value that correspond to a request that precedes the current request.

NOTE 2—If a CMMG STA includes the CMMG variant HT Control field in the initial frame of an immediate response exchange and the responding CMMG STA includes the CMMG variant HT Control field in the immediate response frame, the immediate response exchange effectively permits the exchange of the CMMG variant HT Control field elements.

NOTE 3—If an MRQ is included in the last PPDU in a TXOP and there is not enough time for a response, the recipient might transmit the response MFB in a subsequent TXOP.

NOTE 4—Bidirectional request/responses are supported. In this case, a STA acts as the MFB requester for one direction of a duplex link and a MFB responder for the other direction and transmits both MRQ and MFB in the same CMMG Data frames.

## 10.32 CMMG beamforming

A CMMG STA may use beamforming transmission to achieve diversity gain with directional beamforming or the spatial multiplex gain with transmit beamforming.

— Directional beamforming (BF) that does not use an omnidirectional antenna pattern or quasi-omni antenna pattern is a mechanism that is used by a pair of STAs to achieve the necessary link budget for subsequent communication. Directional BF training is a bidirectional sequence of BF frame

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

transmissions that uses sector sweep and provides the necessary signaling to allow each STA to determine appropriate antenna system settings for both transmission and reception. CMMG STAs shall follow the same beamforming training rules defined in 10.41 (DMG beamforming). BF frame transmitted by a CMMG STA is contained in CMMG PPDU.

— Transmit beamforming (see 10.33 (Transmit beamforming)) that uses an omnidirectional antenna pattern or quasi-omni antenna pattern.

## 10.33 Transmit beamforming

### 10.33.1 HT steering matrix calculations

In order for an HT beamformer to calculate an appropriate steering matrix for transmit spatial processing when transmitting to a specific HT beamformee, the HT beamformer needs to have an accurate estimate of the channel over which it is transmitting. Two methods of calculation are defined as follows:

— *Implicit feedback*: When using implicit feedback, the beamformer receives long training symbols transmitted by the HT beamformee, which allow the MIMO channel between the HT beamformee and HT beamformer to be estimated. If the channel is reciprocal, the HT beamformer can use the training symbols that it receives from the HT beamformee to make a channel estimate suitable for computing the transmit steering matrix. Generally, calibrated radios in MIMO systems can improve reciprocity. See 10.33.2 (HT transmit beamforming with implicit feedback).

— *Explicit feedback*: When using explicit feedback, the HT beamformee makes a direct estimate of the channel from training symbols sent to the HT beamformee by the HT beamformer. The HT beamformee may prepare CSI or steering feedback based on an observation of these training symbols. The HT beamformee quantizes the feedback and sends it to the HT beamformer. The HT beamformer can use the feedback as the basis for determining transmit steering vectors. See 10.33.3 (Explicit feedback beamforming).

An HT STA shall not transmit a PPDU with the TXVECTOR EXPANSION_MAT parameter present if dot11BeamFormingOptionActivated is false.

In order for a CMMG beamformer to calculate an appropriate steering matrix for transmit spatial processing when transmitting to a specific CMMG beamformee, the CMMG beamformer needs to have an accurate estimate of the channel over which it is transmitting. The method of calculation for CMMG beamformer based on explicit feedback is defined as follows:

— When using explicit feedback, the CMMG beamformee makes a direct estimate of the channel from training symbols sent to the CMMG beamformee by the CMMG beamformer. The CMMG beamformee may prepare CSI or steering feedback based on an observation of these training symbols. The CMMG beamformee quantizes the feedback and sends it to the CMMG beamformer. The CMMG beamformer can use the feedback as the basis for determining transmit steering vectors. See 10.33.5 (Explicit feedback beamforming for CMMG STAs).

A CMMG STA shall not transmit a PPDU with the TXVECTOR EXPANSION_MAT parameter present if dot11BeamFormingOptionActivated is false.

### 10.33.2 HT transmit beamforming with implicit feedback

#### 10.33.2.1 General

The procedures for HT transmit beamforming with implicit feedback use only HT and non-HT PPDUs, and the HT Control field, when present, is the HT variant HT Control field.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Transmit beamforming with implicit feedback can operate in a unidirectional or bidirectional manner. In unidirectional implicit transmit beamforming, only the HT beamformer sends beamformed transmissions. In bidirectional implicit transmit beamforming, both STAs send beamformed transmissions, i.e., a STA may act as both HT beamformer and HT beamformee.

Calibration of receive/transmit chains should be done to improve performance of transmit beamforming using implicit feedback. Over-the-air calibration is described in 10.33.2.4 (Calibration). For implicit transmit beamforming, only the HT beamformer, which is sending the beamformed transmissions, needs to be calibrated.

A STA that advertises itself as being capable of being an HT beamformer and/or HT beamformee using implicit feedback shall support the requirements in Table 10-28 (STA type requirements for transmit beamforming with implicit feedback).

**Table 10-28—STA type requirements for transmit beamforming with implicit feedback**

| STA capability | Required support |
|---|---|
| Beamformer | Shall set the Implicit Transmit Beamforming Capable subfield to 1 of the Transmit Beamforming Capability field of the HT Capabilities element in HT Capabilities elements that it transmits.<br>Shall set the Implicit Transmit Beamforming Receiving Capable subfield to 1 of the Transmit Beamforming Capability field of the HT Capabilities element.<br>Shall support(#546) receiving a sounding PPDU for which the SOUNDING parameter is SOUNDING and the NUM_EXTEN_SS is equal to 0 in the RXVECTOR in the PHY-RXSTART.indication primitive, independently of the values of the Receive Staggered Sounding Capable and Receive NDP Capable subfields.<br>Shall set the Calibration subfield to 3 of the Transmit Beamforming Capability field of the HT Capabilities element to advertise full calibration support. |
| Beamformee | Shall set the Implicit Transmit Beamforming Receiving Capable subfield to 1 of the Transmit Beamforming Capability field of the HT Capabilities element in HT Capabilities elements that it transmits.<br>Shall support(#546) setting the SOUNDING parameter to SOUNDING and the NUM_EXTEN_SS to 0 in the TXVECTOR in the PHY-TXSTART.request primitive when transmitting a sounding PPDU, as a response to TRQ=1, independently of the values of the Transmit Staggered Sounding Capable and Transmit NDP Capable subfields. |

A STA that performs one of the roles related to transmit beamforming with implicit feedback shall support the associated capabilities shown in Table 10-29 (Transmit beamforming support required with implicit feedback).

**Table 10-29—Transmit beamforming support required with implicit feedback**

| Role | Required support |
|---|---|
| HT beamformee:<br>A receiver of transmit beamformed PPDUs | Shall transmit sounding PPDUs as a response to TRQ=1. |
| Beamformer:<br>A transmitter of beamformed PPDUs | Can receive sounding PPDUs.<br>Can compute steering matrices from MIMO channel estimates obtained from long training symbols in sounding PPDUs received from the HT beamformee. |

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 10-29—Transmit beamforming support required with implicit feedback**

| Role | Required support |
|---|---|
| A responder in a calibration exchange | Can receive and transmit sounding PPDUs.<br>Can respond with a CSI frame that contains channel measurement information obtained during reception of a sounding PPDU. |
| An initiator in a calibration exchange | Can receive and transmit sounding PPDUs.<br>Can receive a CSI frame sent by a calibration responder. |

When an HT beamformee transmits a sounding PPDU, the SOUNDING parameter in the TXVECTOR in the PHY-TXSTART.request primitive shall be set to SOUNDING. If the HT beamformee is capable of implicit transmit beamforming and the HT beamformer is capable of receiving implicit transmit beamforming, the sounding PPDU from the HT beamformee may be steered.

A PPDU containing one or more +HTC MPDUs in which the TRQ field is equal to 1 shall not be sent to a STA that sets the Implicit Transmit Beamforming Receiving Capable subfield of the Transmit Beamforming field of the HT Capabilities element to 0.

If a PPDU containing one or more +HTC MPDUs in which the TRQ field is equal to 1 requires an immediate response, either the response from the HT beamformee shall be included in a sounding PPDU, or the HT NDP Announcement subfield of the HT Control field shall be set to 1 and the PPDU shall be followed by an NDP. If the PPDU in which the TRQ field is equal to 1 does not require an immediate response, either the HT beamformee shall transmit a sounding PPDU in the next TXOP obtained by the HT beamformee, or the HT beamformee shall transmit a PPDU in the next TXOP obtained by the HT beamformee in which the HT NDP Announcement subfield of the HT Control field is set to 1 and that PPDU shall be followed by an NDP. The use of NDP as a sounding PPDU is described in 10.35 (Null data PPDU (NDP) sounding).

NOTE—A STA that acts as an HT beamformer using implicit feedback expects to receive a sounding PPDU in response to a training request. The STA can compute steering matrices from the channel estimates obtained from the received sounding PPDU.

At the end of the TXOP the final PPDU from the HT beamformer shall not have the TRQ field set to 1 in a frame that requests an immediate response if there is not enough time left in the TXOP for the HT beamformee to transmit the longest valid sounding PPDU with its response.

### 10.33.2.2 Unidirectional implicit transmit beamforming

Figure 10-51 (Example PPDU exchange for unidirectional implicit transmit beamforming) shows an example of a PPDU exchange used in unidirectional implicit transmit beamforming using the Clause 19 (High Throughput (HT) PHY specification(#2297)) PHY. In this example, sounding PPDUs are used that carry MPDUs (i.e., an example of implicit beamforming using NDPs is not shown here.) STA A is the beamformer that initiates the PPDU exchange, and STA B is the beamformee.

The PPDU exchange can be summarized as follows:

a) STA A initiates the frame exchange sequence by sending an unsteered PPDU to STA B. The PPDU includes a training request (TRQ= 1) in a +HTC MPDU.

b) STA B sends a sounding PPDU in response to the training request from STA A.

c) On receiving the sounding PPDU, STA A uses the resulting channel estimate to compute steering matrices and uses these matrices to send a steered PPDU back to STA B.

d) The steered PPDU transmitted in step c) and subsequent steered PPDUs transmitted by STA A may include training requests (TRQ=1) in a +HTC MPDU. In response to each training request, STA B

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

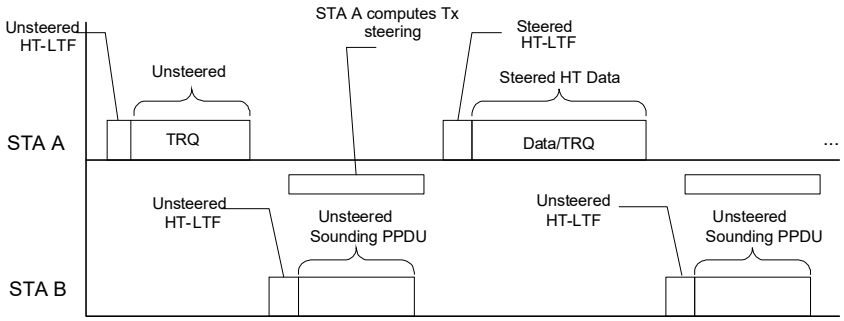

**Figure 10-51—Example PPDU exchange for unidirectional implicit transmit beamforming**

returns a sounding PPDU to STA A, which enables STA A to update its steering vectors. If the steering vectors resulting from step c) or subsequent sounding PPDUs are deemed stale due to delay, the sequence may be restarted by returning to step a).

Step d) in the above PPDU exchange represents steady-state unidirectional transmit beamforming operation.

During the PPDU exchange neither the receiving nor the transmitting STA should switch antennas.

### 10.33.2.3 Bidirectional implicit transmit beamforming

Figure 10-52 (Example PPDU exchange for bidirectional implicit transmit beamforming) shows an example of a PPDU exchange used in bidirectional implicit transmit beamforming, using the Clause 19 (High Throughput (HT) PHY specification(#2297)) PHY. In this example, sounding PPDUs are used that carry MPDUs. STA A initiates the frame exchange sequence(#109), and STA A and STA B alternate in the roles of HT beamformer and HT beamformee.

The PPDU exchange can be summarized as follows:

a) STA A initiates the frame exchange sequence by sending an unsteered PPDU to STA B. The PPDU includes a training request (TRQ= 1) in a +HTC MPDU.

b) STA B sends a sounding PPDU in response to the training request. In addition, this PPDU includes a training request in a +HTC MPDU to enable implicit transmit beamforming in the RD.

c) On receiving the sounding PPDU, STA A uses the resulting channel estimate to compute steering matrices and uses these matrices to send a steered PPDU back to STA B. This steered PPDU is also a sounding PPDU in response to the training request from STA B.

NOTE 1—Steering matrices with nonorthonormal columns should not be used in transmitting sounding PPDUs for implicit feedback. In general, bidirectional implicit beamforming (M118)does not function as described here when the steering matrices have nonorthonormal columns. See 19.3.12.2 (Implicit feedback beamforming).

d) On receiving the sounding PPDU, STA B uses the resulting channel estimate to compute steering matrices and uses these matrices to send a steered PPDU back to STA A. The steered PPDU transmitted in step c) and subsequent steered PPDUs transmitted by STA A may include training requests in HTC. In response to each training request, STA B returns a sounding PPDU to STA A, which enables STA A to update its steering vectors. If the steering vectors resulting from step c) or subsequent sounding PPDUs are deemed stale due to delay, the sequence may be restarted by returning to step a).

e) The steered PPDU transmitted in step d) and subsequent steered PPDUs transmitted by STA B may include training requests in HTC. In response to each training request, STA A returns a sounding PPDU to STA B, which enables STA B to update its steering vectors. If the steering vectors

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

resulting from step d) or subsequent sounding PPDUs are deemed stale due to delay, the sequence may be restarted by returning to step a).

Steps d) and e) in the above PPDU exchange represent steady-state bidirectional transmit beamforming operation.

During the PPDU exchange neither the receiving nor the transmitting STA should switch antennas.

NOTE 2—The TRQ protocol used with the beamforming training process is not sufficient to permit STA B to transmit Data frames in the RD. In the example shown in Figure 10-52 (Example PPDU exchange for bidirectional implicit transmit beamforming), STA A would additionally have to follow the rules of the reverse direction protocol (see 10.29 (Reverse direction protocol)).

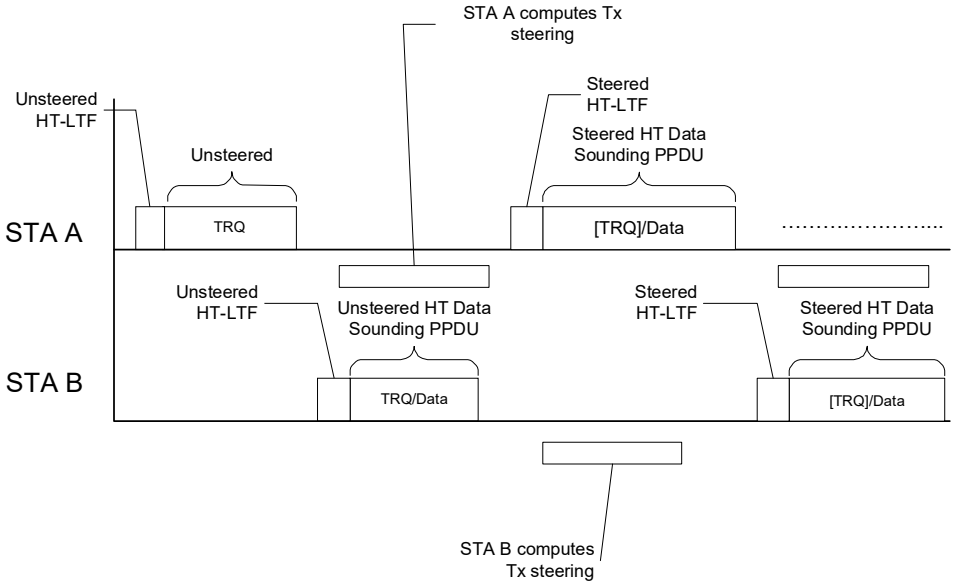

**Figure 10-52—Example PPDU exchange for bidirectional implicit transmit beamforming**

### 10.33.2.4 Calibration

#### 10.33.2.4.1 Introduction

Differences between transmit and receive chains in a STA degrade the inherent reciprocity of the over-the-air time division duplex channel and cause degradation of the performance of implicit beamforming. Calibration acts to remove or reduce differences between transmit and receive chains and enforce reciprocity in the observed baseband-to-baseband channels between two STAs.

A STA acting as an HT beamformer should be calibrated to maximize performance. A STA acting only as an HT beamformee does not need to be calibrated. In order to perform calibration, the STA follows the procedure described below.

The calibration procedure involves the computation of correction matrices that cause the observed channel matrices in the two directions of the link to be transposes of each other and thus renders the resultant channel reciprocal. See 19.3.12.2 (Implicit feedback beamforming) for a more detailed description. If it is able to do so, a STA should calibrate upon association.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

NOTE—STAs with two or more transmit chains should be calibrated in order to engage in implicit transmit beamforming. STAs with any number of RF chains, including those with a single RF chain, can participate in a calibration exchange as a calibration responder.

#### 10.33.2.4.2 Calibration capabilities

A STA that sets the Implicit Transmit Beamforming Capable subfield of the Transmit Beamforming Capabilities field to 1 shall support calibration and shall set the Calibration subfield of the Transmit Beamforming Capabilities field to 3 (indicating full support of calibration) in HT Capabilities elements that it transmits. A STA that does not set the Implicit Transmit Beamforming Capable subfield of the Transmit Beamforming Capabilities field to 1 may support calibration and shall set the Calibration subfield of the Transmit Beamforming Capabilities field to the value that indicates its calibration capability in the Transmit Beamforming Capabilities field in HT Capabilities elements that it transmits (see Table 9-228 (Subfields of the Transmit Beamforming Capabilities field)), when the Transmit Beamforming Capabilities field exists.

A STA that is capable of initiating calibration (the Calibration subfield of the Transmit Beamforming Capabilities field is equal to 3) shall set the CSI Max Number of Rows Beamformer Supported subfield to an appropriate value, even if the STA sets the Explicit Transmit Beamforming CSI Feedback subfield to the value 0.

In order to support calibration, a STA that advertises that it is capable of responding to a calibration request shall support(#546) transmitting a CSI frame in which the value of the Grouping subfield of the MIMO Control field is 0 (no grouping) and the Coefficients Size subfield of the MIMO Control field is 3 ($Nb = 8$ bits) in response to a CSI feedback request indicated by the CSI/Steering subfield of the HT Control field equal to 1 and the Calibration Position subfield of the HT Control field equal to 3, independently of the advertised values of the Explicit Transmit Beamforming CSI Feedback subfield in the Transmit Beamforming Capabilities field in the HT Capabilities element. A STA that advertises that it is capable of initiating a calibration request shall support(#546) receiving a CSI frame in which the value of the Grouping subfield of the MIMO Control field is equal to 0 (no grouping) and the Coefficients Size subfield of the MIMO Control field is equal to 3 ($Nb = 8$ bits) as a response to CSI feedback request indicated by the CSI/Steering subfield of the HT Control field equal to 1 with the Calibration Position subfield equal to 3, independently of the advertised values of the Explicit CSI Transmit Beamforming Capable subfield in the Transmit Beamforming Capabilities field in the HT Capabilities element.

A STA may initiate a calibration training frame exchange sequence with another STA if that STA supports calibration. A STA shall not initiate a calibration training frame exchange sequence(#109) with another STA if that STA does not support calibration.

If the (#402)Receive NDP Capable subfield is equal to 1, the value of the Calibration subfield is equal to 1 or 3, and the device supports transmitting sounding PPDUs for which two or more channel dimensions can be estimated (two or more columns of the MIMO channel matrix), then transmission of NDPs shall be supported (and the (#402)Transmit NDP Capable subfield shall be set to 1).

#### 10.33.2.4.3 Sounding exchange for calibration

Figure 10-53 (Calibration procedure with sounding PPDU containing an MPDU) illustrates the calibration PPDU exchange using sounding PPDUs that contain an MPDU.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

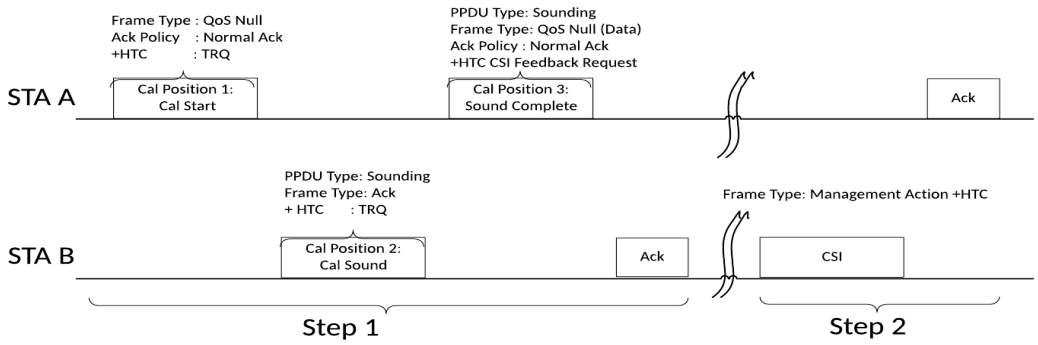

**Figure 10-53—Calibration procedure with sounding PPDU containing an MPDU**

The calibration procedure begins with a calibration (#109)sounding frame exchange sequence shown as Step 1 in Figure 10-53 (Calibration procedure with sounding PPDU containing an MPDU). The Calibration Sequence subfield in the HT Control field shall be incremented each time a new calibration procedure is started.

STA A (the calibration initiator) shall transmit a Calibration Start frame (Calibration Position subfield set to 1) with the TRQ field in the HT Control field set to 1. This frame initiates a calibration procedure. It shall be a QoS Null frame with Normal Ack ack policy.

In response, STA B (the calibration responder) shall transmit a Calibration Sounding Response frame (Calibration Position subfield set to 2), a SIFS after the end of the Calibration Start frame, using a sounding PPDU. This step allows STA A to estimate the MIMO channel from STA B to STA A. In the Calibration Sounding Response frame, the Calibration Sequence subfield in HT Control field shall be set to the same value that is indicated in the Calibration Start frame. The Calibration Sounding Response frame shall have a frame type of Ack+HTC, and the TRQ field in the HT Control field in this frame shall be set to 1.

In response, STA A shall transmit a Calibration Sounding Complete frame (Calibration Position subfield set to 3) that contains the CSI/Steering subfield of the HT Control field set to 1, a SIFS after the end of the Calibration Sounding Response frame, using a sounding PPDU. This step allows STA B to estimate the MIMO channel from STA A to STA B. In this Calibration Sounding Complete frame, the Calibration Sequence subfield in the HT Control field shall be set to the same value that is indicated in the Calibration Sounding Response frame. The Calibration Sounding Complete frame shall be a QoS Null+HTC with Normal Ack ack policy.

A frame in which the Calibration Position subfield is equal to 2 or 3 shall be transmitted in a sounding PPDU (a PPDU for which the SOUNDING parameter is set to SOUNDING). The number of Long Training fields (LTFs) used to obtain MIMO channel estimation that are sent in the sounding PPDU shall be determined by the number of transmit chains ($N_{TX}$) used in sending these LTFs at the STA transmitting the sounding PPDU. The transmit chains used at the calibration initiator are those for which calibration is required.

The calibration responder may train up to maximum available transmit chains to maximize the quality of the resulting calibration, although the number of space-time streams for data symbols shall be determined by the rule described in 10.6 (Multirate support).

When transmitting a sounding PPDU during Step 1 of a calibration procedure, if the Receive Staggered Capability subfield in the Transmit Beamforming Capability field of the HT Capabilities element transmitted by the intended receiver is 0, then,

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

— If the sounding PPDU is not an NDP, the number of antennas used by the sender shall be less than or equal to the maximum number of space-time streams indicated by the Rx MCS Bitmask subfield of the Supported MCS Set field and the Rx STBC subfield of the HT Capabilities element transmitted by the intended receiver.

— If the sounding PPDU is an NDP, the number of antennas used by the sender shall be less than or equal to the number indicated by the Channel Estimation Capability subfield in the Transmit Beamforming Capability field of the HT Capabilities element transmitted by the intended receiver.

Sounding PPDUs in which the Calibration Position subfield is equal to 2 or 3 shall use the spatial mapping matrices defined in 19.3.12.3 (Explicit feedback beamforming). The calibration responder shall not remove the spatial mapping from the CSI to be fed back to the initiator of the frame exchange sequence(#109).

NOTE 1—The calibration initiator of this frame exchange sequence(#109) is responsible for accounting for the spatial mapping in both its local channel estimate as well as in the quantized CSI fed back to it.

The row order in the CSI feedback matrix transmitted from STA B shall correspond to the association of the rows of the spatial mapping matrix (#4181)(see Equation (19-75)) to its transmit antennas. For example, the receive antenna at STA B associated with row *i* in the CSI feedback matrix in each subcarrier is the same as its transmit antenna associated with row *i* in the spatial mapping matrix used for transmitting the sounding response with Calibration Position equal to 2.

Figure 10-54 (Calibration procedure with NDP) and Figure 10-55 (Calibration procedure with NDP when STA B supports transmitting sounding PPDUs for which only one channel dimension can be estimated (i.e., a single column of the MIMO channel matrix)) illustrate the calibration PPDU exchange using NDPs.

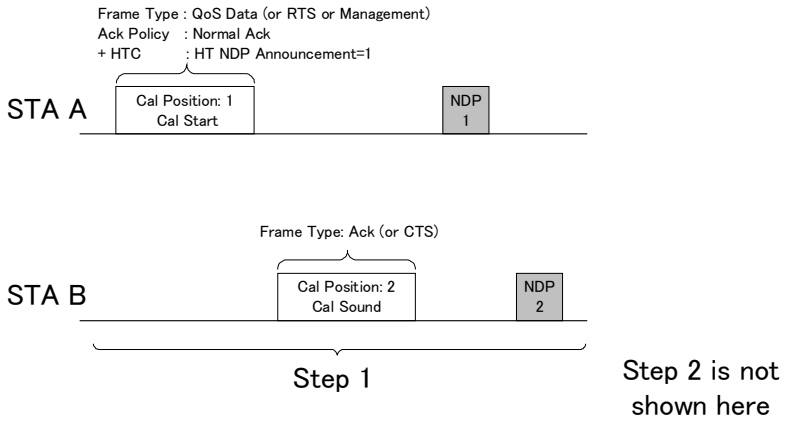

**Figure 10-54—Calibration procedure with NDP**

The calibration procedure begins with a calibration (#109)sounding frame exchange sequence, shown as Step 1 in Figure 10-54 (Calibration procedure with NDP) and Figure 10-55 (Calibration procedure with NDP when STA B supports transmitting sounding PPDUs for which only one channel dimension can be estimated (i.e., a single column of the MIMO channel matrix)), when STA B supports transmitting sounding PPDUs for which only one channel dimension can be estimated (i.e., a single column of the MIMO channel matrix). The Calibration Sequence subfield in the HT Control field shall be incremented each time a new calibration procedure is started.

NDP transmission within a calibration procedure follows the rules defined in 10.35.1 (HT NDP sounding protocol). STA A transmits a Calibration Start frame (i.e., with the Calibration Position subfield set to 1) with the HT NDP Announcement subfield set to 1 and CSI/Steering subfield of the HT Control field set to 1. Only the current TXOP holder may set both the Calibration Position and HT NDP Announcement subfields to 1. This frame initiates a calibration procedure.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

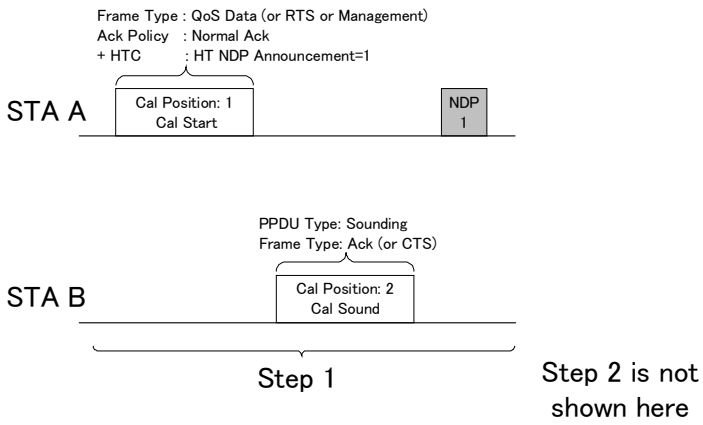

**Figure 10-55—Calibration procedure with NDP when STA B supports transmitting sounding PPDUs for which only one channel dimension can be estimated (i.e., a single column of the MIMO channel matrix)**

STA B shall transmit a Calibration Sounding Response frame (i.e., with the Calibration Position subfield set to 2) after a SIFS after the received Calibration Start frame. If STA B supports transmitting sounding PPDUs for which only one channel dimension can be estimated (i.e., a single column of the MIMO channel matrix), this Calibration Sounding Response frame is sent with the SOUNDING parameter of the TXVECTOR set to SOUNDING (see Figure 10-55 (Calibration procedure with NDP when STA B supports transmitting sounding PPDUs for which only one channel dimension can be estimated (i.e., a single column of the MIMO channel matrix))).

As determined by NDP rules a) or b) in 10.35.1 (HT NDP sounding protocol), STA A sends the first NDP as a sounding PPDU a SIFS after receiving the Calibration Sounding Response frame. This step allows STA B to estimate the MIMO channel from STA A to STA B. In the Calibration Sounding Response frame, the Calibration Sequence subfield in HT Control field shall be set to the same value that is contained in the Calibration Start frame. The Calibration Sounding Response frame shall contain an HT Control field, and the type and subtype of the frame are determined by the Calibration Start frame.

As determined by NDP rule d), STA B might transmit a second NDP as a sounding PPDU a SIFS after receiving the first NDP. This second NDP allows STA A to estimate the channel from STA B to STA A.

NOTE 2—STA B does not transmit an NDP when it supports transmitting sounding PPDUs for which only one channel dimension can be estimated (see Figure 10-55 (Calibration procedure with NDP when STA B supports transmitting sounding PPDUs for which only one channel dimension can be estimated (i.e., a single column of the MIMO channel matrix))).

Otherwise [i.e., if STA B supports transmitting sounding PPDUs for which only one channel dimension can be estimated (single column of the MIMO channel matrix)], the transmission of the sounding PPDU in Calibration Position 2 allows STA A to estimate the channel from STA B to STA A.

NDP sounding PPDUs shall use the spatial mapping matrices defined in 19.3.13.3 (Sounding PPDU for calibration). The calibration responder shall not remove the spatial mapping from the CSI to be fed back to the initiator of the frame exchange sequence(#109).

NOTE 3—The calibration initiator of this frame exchange sequence(#109) is responsible for accounting for the spatial mapping in both its local channel estimate as well as in the quantized CSI fed back to it.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

#### 10.33.2.4.4 CSI reporting for calibration

The remaining message exchange in the calibration procedure is not time critical.

The calibration initiator should not transmit any frames that are part of the calibration sequence shown in Step 1 in Figure 10-53 (Calibration procedure with sounding PPDU containing an MPDU) if either of the response frames from the calibration responder (the frames shown as Calibration Position 2 and Ack in Step 1) is not received correctly within an AckTimeout interval (as defined in 10.3.2.11 (Acknowledgment procedure)) after the PHY-TXEND.confirm primitive. If the calibration initiator aborts the calibration sequence, it may restart the calibration sequence with a value of the Calibration Sequence subfield in the Calibration Control subfield of the HT Control field that is different (i.e., incremented) from the value used in the aborted sequence. Within a non-NDP calibration sequence, the calibration responder should not transmit any further frames that are part of the calibration sequence shown in Step 1 if the frame having Calibration Position 3 is not received correctly within an AckTimeout interval (as defined in 10.3.2.11 (Acknowledgment procedure)) after the PHY-TXEND.confirm primitive.

When the MIMO channel measurements become available at STA B, STA B shall send one or more CSI frames that contain the CSI report (Step 2 in Figure 10-53 (Calibration procedure with sounding PPDU containing an MPDU)). This CSI report shall have full precision, i.e, *Ng*=1 (no grouping) and *Nb*=3 (8 bits). In these CSI frames, the Calibration Sequence subfields in HT Control fields shall be set to the same value that is indicated in the Calibration Sounding Complete frame. These CSI frames shall have a frame type of Management Action +HTC.

STA B should finish transmission of the first CSI frame within aMaxCSIMatricesReportDelay (in milliseconds) after the reception of the frame containing the CSI feedback request or HT NDP announcement.

NOTE—If necessary, the CSI Report field can be split into up to 8 segments as specified in Table 9-85 (Subfields of the MIMO Control field).

A STA that has started but not completed the calibration procedure and that receives some other request that requires the buffering of CSI (such as another calibration initiation frame, MFB request, CSI feedback request for link adaptation, or feedback request for explicit Transmit Beamforming) may ignore the other request.

From the beginning of Step 1 of the calibration procedure and continuing through the end of Step 2 of the calibration procedure, neither the receiving nor the transmitting STA should switch antennas.

### 10.33.3 Explicit feedback beamforming

The procedures in this subclause apply only to HT and non-HT PPDUs for which the HT Control field, if present, is the HT variant HT Control field.

In this subclause, the terms *HT beamformer* and *HT beamformee* refer to STAs that are involved in explicit feedback beamforming.

An HT beamformer uses the feedback response that it receives from the HT beamformee to calculate a beamforming feedback matrix for transmit beamforming. This feedback response may have one of three formats:

- *CSI*: The HT beamformee sends the MIMO channel coefficients to the HT beamformer.
- *Noncompressed beamforming*: The HT beamformee sends calculated beamforming feedback matrices to the HT beamformer.
- *Compressed beamforming*: The HT beamformee sends compressed beamforming feedback matrices to the HT beamformer.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The supported formats shall be advertised in the HT beamformee's HT Capabilities element.

NOTE 1—An HT beamformer might discard the feedback response if the TSF time when the PHY-CCA.indication(IDLE) primitive corresponding to the feedback response frame's arrival minus the value from the Sounding Timestamp field in the feedback response frame is greater than the coherence time interval of the propagation channel.

An HT beamformee's responding capabilities shall be advertised in HT Capabilities elements that are transmitted by the HT beamformee. Devices that are capable of acting as an HT beamformee shall advertise one of the following response capabilities in the Explicit Transmit Beamforming CSI Feedback subfield of the Transmit Beamforming Capability field:

— *Immediate*: The HT beamformee is capable of sending a feedback response a SIFS after receiving a sounding PPDU and/or is capable of sending a feedback response aggregated in a PPDU that contains a MAC response within the HT beamformer's TXOP.

— *Delayed*: The HT beamformee is not capable of sending the feedback response within the HT beamformer's TXOP, but it is capable of sending the feedback response in a TXOP that it obtains.

— *Immediate and Delayed*: The HT beamformee is capable of sending a feedback response a SIFS after receiving a sounding PPDU, sending a feedback response aggregated in a PPDU that contains a MAC response within the HT beamformer's TXOP, or sending the feedback response in a TXOP that it obtains.

The sounding frame types supported by the HT beamformee, staggered and/or NDP, are advertised in the HT Capabilities element in frames that are transmitted by the HT beamformee.

A STA that sets any of the Explicit Transmit Beamforming CSI Feedback Capable, Explicit Noncompressed Beamforming Feedback Capable, or Explicit Compressed Beamforming Feedback Capable fields to 1 shall transmit explicit feedback based on the receipt of a +HTC sounding PPDU in which the CSI/Steering subfield has a nonzero value and that does not contain Extension HT-LTFs (HT-ELTFs). This requirement is independent of the values of the Receive Staggered Sounding Capable and the Receive NDP Capable fields.

An HT beamformer shall set the SOUNDING parameter of the TXVECTOR to SOUNDING in the PHY-TXSTART.request primitive corresponding to each PPDU that is used for sounding.

An HT beamformer shall set the response type format indicated in the CSI/Steering subfield of the HT Control field of any sounding frame excluding the NDP and of any PPDU with the (#8105)HT NDP Announcement field equal to 1 to one of the nonzero values (CSI, Compressed Beamforming, or Noncompressed Beamforming) that corresponds to a type that is supported by the HT beamformee.

The receipt of a PHY-RXSTART.indication primitive with the RXVECTOR SOUNDING parameter value equal to SOUNDING indicates a sounding PPDU. A non-NDP request for feedback is a sounding PPDU with a +HTC MPDU that contains a nonzero value of the CSI/Steering subfield and that has the HT NDP Announcement subfield equal to 0.

An NDP request for feedback is the combination of a +HTC MPDU that contains a nonzero value of the CSI/Steering subfield and that has the HT NDP Announcement subfield equal to 1 and the NDP that follows.

An HT beamformee that transmits a feedback frame in response to a sounding PPDU sent by an HT beamformer shall transmit a frame of the type (CSI, Compressed Beamforming, or Noncompressed Beamforming) indicated in the CSI/Steering subfield of the HT Control field transmitted by the HT beamformer.

The HT beamformee decides on any subcarrier grouping to be used in the explicit Beamforming feedback. The value selected shall be a value supported by the HT beamformer as indicated in the Minimal Grouping subfield of the HT beamformer's HT Capabilities element.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

An HT beamformee that sets the Explicit Transmit Beamforming CSI Feedback field of its HT Capabilities element to either 2 or 3 shall transmit Explicit CSI feedback after a SIFS(#6587) or later in the HT beamformer's TXOP as a response to a non-NDP request for feedback in a frame that is appropriate for the current frame exchange sequence following Table 10-30 (Rules for HT beamformee immediate feedback transmission responding to non-NDP sounding). An HT beamformee that sets the Explicit Noncompressed Beamforming Feedback Capable field of its HT Capabilities element to either 2 or 3 shall transmit Explicit Noncompressed Beamforming feedback after a SIFS(#6587) or later in the HT beamformer's TXOP as a response to a non-NDP request for feedback in a frame that is appropriate for the current frame exchange sequence following Table 10-30 (Rules for HT beamformee immediate feedback transmission responding to non-NDP sounding).

**Table 10-30—Rules for HT beamformee immediate feedback transmission responding to non-NDP sounding**

| Type of response | Rule |
|---|---|
| CTS response | If the transmission of a CTS is required in response to the non-NDP request for feedback, the transmission of the feedback response frame shall be delayed until the HT beamformee's next transmission within the TXOP. This feedback response frame may be aggregated in an A-MPDU with an Ack or BlockAck frame. |
| Acknowledgment response | If the transmission of an Ack or BlockAck frame is required in response to the non-NDP request for feedback, both the feedback response frame and the control response frame may be aggregated in an A-MPDU. |
| No control response | If the transmission of a control response frame is not required in response to the non-NDP request for feedback, the feedback response frame shall be sent a SIFS after the reception of the sounding PPDU containing the request for feedback. |
| Later aggregation of feedback and acknowledgment | If the immediate-feedback-capable HT beamformee cannot transmit an aggregated or immediate CSI/Steering response in a SIFS after the end of the received sounding PPDU and the HT beamformee is subsequently required to transmit an Ack or BlockAck frame in the same TXOP, it may transmit the feedback response in an A-MPDU with the Ack or BlockAck frame. |

An HT beamformee that sets the Explicit Compressed Beamforming Feedback Capable field of its HT Capabilities element to either 2 or 3 shall transmit Explicit Compressed Beamforming feedback after a SIFS(#6587) or later in the HT beamformer's TXOP as a response to a non-NDP request for feedback in a frame that is appropriate for the current frame exchange sequence following Table 10-30 (Rules for HT beamformee immediate feedback transmission responding to non-NDP sounding).

An HT beamformee that sets the Explicit Transmit Beamforming CSI Feedback field of its HT Capabilities element to either 2 or 3 shall transmit the Explicit CSI feedback after a SIFS(#6587) or later in the HT beamformer's TXOP as a response to an NDP request for feedback in a frame that is appropriate for the current frame exchange sequence following Table 10-31 (Rules for HT beamformee immediate feedback transmission responding to NDP sounding).

An HT beamformee that sets the Explicit Noncompressed Beamforming Feedback Capable field of its HT Capabilities element to either 2 or 3 shall transmit the Explicit Noncompressed Beamforming feedback after a SIFS(#6587) or later in the HT beamformer's TXOP as a response to an NDP request for feedback in a frame that is appropriate for the current frame exchange sequence following Table 10-31 (Rules for HT beamformee immediate feedback transmission responding to NDP sounding).

An HT beamformee that sets the Explicit Compressed Beamforming Feedback Capable field of its HT Capabilities element to either 2 or 3 shall transmit the Explicit Compressed Beamforming feedback after a

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 10-31—Rules for HT beamformee immediate feedback transmission responding to NDP sounding**

| Type of response | Rule |
|---|---|
| Control response | If the transmission of a control response frame is required in response to the NDP request for feedback, the control response frame is transmitted a SIFS after reception of the PPDU that elicited the control response, and the feedback response frame may be transmitted a SIFS after the reception of the NDP.<br>— If the feedback response frame is not transmitted a SIFS after the reception of the NDP and the HT beamformee is subsequently required to transmit an Ack or BlockAck frame in the same TXOP, then the feedback response may be aggregated with the Ack or BlockAck frame.<br>— If the feedback response frame is not transmitted a SIFS after the reception of the NDP and is not transmitted with an aggregated Ack or BlockAck frame in the same TXOP, then the feedback response frame is delayed until the HT beamformee's next transmission within the TXOP. |
| No control response | If the transmission of a control response frame is not required in response to the NDP request for feedback, the feedback response frame may be sent a SIFS after the reception of the NDP.<br>— If the feedback response frame is not transmitted a SIFS after the reception of the NDP and the HT beamformee is subsequently required to transmit an Ack or BlockAck frame in the same TXOP, then the feedback response may be aggregated with the Ack or BlockAck frame.<br>— If the feedback response frame is not transmitted a SIFS after the reception of the NDP and is not transmitted with an aggregated Ack or BlockAck frame in the same TXOP, then the feedback response frame is delayed until the HT beamformee's next transmission within the TXOP. |

SIFS(#6587) or later in the HT beamformer's TXOP as a response to an NDP request for feedback in a frame that is appropriate for the current frame exchange sequence following Table 10-31 (Rules for HT beamformee immediate feedback transmission responding to NDP sounding).

When the HT beamformee sets the Explicit Transmit Beamforming CSI Feedback field of its HT Capabilities element to either 2 or 3 and the HT beamformer has transmitted an NDP or a(#1426) non-NDP Explicit Beamforming CSI feedback request in a frame that does not require immediate control response, the HT beamformer shall not transmit the next PPDU to the HT beamformee until PIFS after transmitting the sounding request.

When the HT beamformee sets the Explicit Noncompressed Beamforming Feedback Capable field of its HT Capabilities element to either 2 or 3 and the HT beamformer has transmitted an NDP or a(#1426) non-NDP Explicit Noncompressed Beamforming feedback request in a frame that does not require immediate control response, the HT beamformer shall not transmit the next PPDU to the HT beamformee until PIFS after the sounding request.

When the HT beamformee sets the Explicit Compressed Beamforming Feedback Capable field of its HT Capabilities element to either 2 or 3 and the HT beamformer has transmitted an NDP or a(#1426) non-NDP Explicit Compressed Beamforming feedback request in a frame that does not require immediate control response, the HT beamformer shall not transmit the next PPDU to the HT beamformee until PIFS after transmitting the sounding request.

An HT beamformee shall not transmit a CSI, Compressed Beamforming, or Noncompressed Beamforming frame except in response to a request for feedback.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

NOTE 2—Error recovery in a TXOP is not affected by sounding. An HT beamformer that is a TXOP holder and that fails to receive an expected response to a sounding PPDU can continue transmission as specified in 10.23.2.8 (Multiple frame exchange sequences in an EDCA TXOP(#109)).

An HT beamformee transmitting a feedback response after a SIFS(#6587) or later in the HT beamformer's TXOP shall use an Action No Ack frame or an Action No Ack +HTC frame (defined in 9.3.3.14 (Action No Ack frame format)).

An HT beamformee transmitting delayed feedback response shall use an Action frame or an Action +HTC frame to send this information within a separate TXOP.

If necessary, the CSI Report field, Noncompressed Beamforming Report field, or Compressed Beamforming Report field may be split into up to 8 frames. The length of each segment shall be equal number of octets for all segments except the last, which may be smaller.

NOTE 3—A STA that has been granted an RDG can act as an HT beamformer during the RDG time period, provided that the RD rules are obeyed.

An HT beamformee that advertises itself as delayed-feedback-capable shall not transmit an immediate feedback response unless it also advertises itself as immediate-feedback-capable.

An HT beamformer may use worst-case parameters to estimate the duration of the expected frame that contains the feedback response, e.g. the lowest rate/MCS in the basic rate/MCS set, HT-mixed format if an HT PPDU is expected, and no grouping.(#280)

An Explicit Feedback Request may be combined with an MRQ. If the response contains a beamforming feedback matrix, the returned MCS shall be derived from the same information that was used to generate this particular beamforming feedback matrix. If the response contains channel coefficients, the returned MCS shall be derived from an analysis of the sounding frame that was used to generate the channel coefficients. The MFB field set to 127 (meaning no feedback) may be used when the HT beamformee is unable to generate the MCS in time for inclusion in the response transmission frame. A CSI-capable STA may be incapable of generating MFB.

Explicit feedback shall be calculated only from a sounding PPDU.

An HT beamformee that transmits a feedback frame of type Compressed Beamforming in response to a sounding PPDU sent by an HT beamformer shall set the *Nr* Index subfield in the MIMO Control field of the feedback frame to indicate the same value as the number of streams in the sounding PPDU.

### 10.33.4 VHT MU beamforming

An MU beamformer may transmit a VHT MU PPDU with a single nonzero TXVECTOR parameter NUM_STS[$p$], where $0 \le p \le 3$ .

An MU beamformer shall not transmit a VHT MU PPDU with a nonzero TXVECTOR parameter NUM_STS[$p$], where $0 \le p \le 3$ , to a STA whose MU Beamformee Capable field is equal to 0.

When transmitting a VHT MU PPDU, an MU beamformer shall order the per-user arrays of TXVECTOR parameters so that the per-user USER_POSITION array is in ascending order.

### 10.33.5 Explicit feedback beamforming for CMMG STAs

In this subclause, the terms *CMMG beamformer* and *CMMG beamformee* refer to STAs that are involved in explicit feedback beamforming.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

A CMMG beamformer uses the feedback response that it receives from the CMMG beamformee to calculate a beamforming feedback matrix for transmit beamforming. This feedback response has the following format:

— *Compressed beamforming*: The CMMG beamformee sends compressed beamforming feedback matrices to the CMMG beamformer.

The supported formats shall be advertised in the beamformee's CMMG Capabilities element.

NOTE 1—An HT and CMMG beamformer might discard the feedback response if the TSF time when the PHY-CCA.indication(IDLE) primitive corresponding to the feedback response frame's arrival minus the value from the Sounding Timestamp field in the feedback response frame is greater than the coherence time interval of the propagation channel.

A CMMG beamformee's responding capabilities shall be advertised in CMMG Capabilities elements contained in DMG Beacon, Probe Request, Probe Response, Association Request, Association Response, Action, and Action No Ack frames that are transmitted by the CMMG beamformee. Devices that are capable of acting as a CMMG beamformee shall advertise one of the following response capabilities in the Explicit Compressed Beamforming Feedback Capable subfield of the Transmit Beamforming Capability field:

— *Immediate:* The CMMG beamformee is capable of sending a feedback response (#319)a SIFS after receiving a sounding PPDU and/or is capable of sending a feedback response aggregated in a PPDU that contains a MAC response within the CMMG beamformer's TXOP.

— *Delayed:* The CMMG beamformee is not capable of sending the feedback response within the CMMG beamformer's TXOP, but it is capable of sending the feedback response in a TXOP that it obtains.

— *Immediate and Delayed:* The CMMG beamformee is capable of sending a feedback response (#319)a SIFS after receiving a sounding PPDU, sending a feedback response aggregated in a PPDU that contains a MAC response within the CMMG beamformer's TXOP, or sending the feedback response in a TXOP that it obtains.

The sounding frame types supported by the CMMG beamformee, staggered and/or NDP, are advertised in the CMMG Capabilities element in frames that are transmitted by the CMMG beamformee.

A STA that sets Explicit Compressed Beamforming Feedback Capable fields to 1 shall transmit explicit feedback based on the receipt of a sounding PPDU in which the CSI/Steering subfield has a nonzero value. This requirement is independent of the values of the Receive Staggered Sounding Capable and the Receive NDP Capable fields.

A CMMG beamformer shall set the SOUNDING parameter of the TXVECTOR to SOUNDING in the PHY-TXSTART.request primitive corresponding to each PPDU that is used for sounding.

A CMMG beamformer shall set the response type format indicated in the CSI/Steering subfield of the CMMG variant HT Control field of any sounding frame excluding the NDP and of any PPDU with the (#8105)CMMG NDP Sounding Announcement field equal to 1 to the value of the type Compressed Beamforming.

The receipt of a PHY-RXSTART.indication primitive with the RXVECTOR SOUNDING parameter value equal to SOUNDING indicates a sounding PPDU. A non-NDP request for feedback is a sounding PPDU that contains a nonzero value of the CSI/Steering subfield and that has the NDP Announcement subfield equal to 0.

An NDP request for feedback is the combination of a CMMG MPDU that contains a nonzero value of the CSI/Steering subfield and that has the NDP Announcement subfield equal to 1 and the NDP that follows.

A CMMG beamformee that transmits a feedback frame in response to a sounding PPDU sent by a beamformer shall transmit a Compressed Beamforming frame.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The CMMG beamformee decides on any subcarrier grouping to be used in the explicit beamforming feedback. The value selected shall be a value supported by the CMMG beamformer as indicated in the Minimal Grouping subfield of the CMMG beamformer's CMMG Capabilities element.

A CMMG beamformee that sets the Explicit Compressed Feedback Capable field of its CMMG Capabilities element to either 2 or 3 shall transmit explicit compressed beamforming feedback after a SIFS(#6587) or later in the beamformer's TXOP as a response to a non-NDP request for feedback in a frame that is appropriate for the current frame exchange sequence following Table 10-32 (Rules for CMMG beamformee immediate feedback transmission responding to non-NDP sounding).

**Table 10-32—Rules for CMMG beamformee immediate feedback transmission responding to non-NDP sounding**

| Type of response | Rule |
|---|---|
| CTS response | If the transmission of a CTS is required in response to the non-NDP request for feedback, the transmission of the feedback response frame shall be delayed until the CMMG beamformee's next transmission within the TXOP. This feedback response frame may be aggregated in an A-MPDU with an Ack or BlockAck frame. |
| Acknowledgment response | If the transmission of an Ack or BlockAck frame is required in response to the non-NDP request for feedback, both the feedback response frame and the control response frame may be aggregated in an A-MPDU. |
| No control response | If the transmission of a control response frame is not required in response to the non-NDP request for feedback, the feedback response frame shall be sent (#319)a SIFS after the reception of the sounding PPDU containing the request for feedback. |
| Later aggregation of feedback and acknowledgment | If the immediate-feedback-capable CMMG beamformee cannot transmit an aggregated or immediate CSI/Steering response in (#319)a SIFS after the end of the received sounding PPDU and the CMMG beamformee is subsequently required to transmit an Ack or BlockAck frame in the same TXOP, it may transmit the feedback response in an A-MPDU with the Ack or BlockAck frame. |

A CMMG beamformee that sets the Explicit Compressed Beamforming Feedback Capable field of its CMMG Capabilities element to either 2 or 3 shall transmit the explicit compressed beamforming feedback after a SIFS(#6587) or later in the CMMG beamformer's TXOP as a response to an NDP request for feedback in a frame that is appropriate for the current frame exchange sequence following Table 10-33 (Rules for CMMG beamformee immediate feedback transmission responding to NDP sounding).

When the CMMG beamformee sets the Explicit Compressed Beamforming Feedback Capable field of its CMMG Capabilities element to either 2 or 3 and the CMMG beamformer has transmitted an NDP or a(#1426) non-NDP explicit compressed beamforming feedback request in a frame that does not require immediate control response, the CMMG beamformer shall not transmit the next PPDU to the beamformee until PIFS after transmitting the sounding request.

A CMMG beamformee shall not transmit Compressed Beamforming frame except in response to a request for feedback.

NOTE 2—Error recovery in a TXOP is not affected by sounding. A beamformer that is a TXOP holder and that fails to receive an expected response to a sounding PPDU can continue transmission as specified in 10.23.2.4 (Obtaining an EDCA TXOP).

A CMMG beamformee transmitting a feedback response after a SIFS(#6587) or later in the beamformer's TXOP shall use an Action No Ack frame defined in 9.3.3.14 (Action No Ack frame format).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

**Table 10-33—Rules for CMMG beamformee immediate feedback transmission responding to NDP sounding**

| Type of response | Rule |
|---|---|
| Control response | If the transmission of a control response frame is required in response to the NDP request for feedback, the control response frame is transmitted (#319)a SIFS after reception of the PPDU that elicited the control response, and the feedback response frame may be transmitted (#319)a SIFS after the reception of the NDP.<br>— If the feedback response frame is not transmitted (#319)a SIFS after the reception of the NDP and the CMMG beamformee is subsequently required to transmit anAck or BlockAck frame in the same TXOP, then the feedback response may be aggregated with the Ack or BlockAck frame.<br>— If the feedback response frame is not transmitted (#319)a SIFS after the reception of the NDP and is not transmitted with an aggregated Ack or BlockAck frame in the same TXOP, then the feedback response frame is delayed until the CMMG beamformee's next transmission within the TXOP. |
| No control response | If the transmission of a control response frame is not required in response to the NDP request for feedback, the feedback response frame may be sent (#319)a SIFS after the reception of the NDP.<br>— If the feedback response frame is not transmitted (#319)a SIFS after the reception of the NDP and the CMMG beamformee is subsequently required to transmit an Ack or BlockAck frame in the same TXOP, then the feedback response may be aggregated with the Ack or BlockAck frame.<br>— If the feedback response frame is not transmitted (#319)a SIFS after the reception of the NDP and is not transmitted with an aggregated Ack or BlockAck frame in the same TXOP, then the feedback response frame is delayed until the CMMG beamformee's next transmission within the TXOP. |

A CMMG beamformee transmitting delayed feedback response shall use an Action frame to send this information within a separate TXOP.

If necessary, the Compressed Beamforming Report field may be split into up to 8 frames. The length of each segment shall be equal number of octets for all segments except the last, which may be smaller.

NOTE 3—A STA that has been granted an RDG can act as a CMMG beamformer during the RDG time period, provided that the RD rules are obeyed.

A CMMG beamformee that advertises itself as delayed-feedback-capable shall not transmit an immediate feedback response unless it also advertises itself as immediate-feedback-capable.

An explicit feedback request may be combined with an MRQ. If the response contains a beamforming feedback matrix, the returned MCS shall be derived from the same information that was used to generate this particular beamforming feedback matrix. If the response contains channel coefficients, the returned MCS shall be derived from an analysis of the sounding frame that was used to generate the channel coefficients. The MFB field set to 127 (meaning no feedback) may be used when the CMMG beamformee is unable to generate the MCS in time for inclusion in the response transmission frame. A CSI-capable STA may be incapable of generating MFB.

Explicit feedback shall be calculated only from a sounding PPDU.

A CMMG beamformee that transmits a feedback frame of type Compressed Beamforming in response to a sounding PPDU sent by a CMMG beamformer shall set the *Nr* Index subfield in the MIMO Control field of the feedback frame to indicate the same value as the number of streams in the sounding PPDU.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

(#2044)A CMMG beamformer shall set the Number of Sounding Dimensions subfield in the CMMG Capabilities element to a value greater than or equal to 1 (2 STS).

## 10.34 Antenna selection (ASEL)

### 10.34.1 Introduction

The procedures in this subclause apply only to HT and non-HT PPDUs for which the HT Control field, if present, is the HT variant HT Control field.

ASEL is a time-variant mapping of the signals at the RF chains onto a set of antenna elements when the number of RF chains is smaller than the number of antenna elements. The mapping might be chosen based on instantaneous or averaged CSI. ASEL requires the training of the full size channel associated with all antenna elements, which is obtained by transmitting or receiving sounding PPDUs over all antennas. These sounding PPDUs should be sent within a single TXOP. To avoid channel distortions, these sounding PPDUs shall be transmitted consecutively. The training information is exchanged using the HT Control field. When both transmitter and receiver have ASEL capabilities, training of transmit and receive antennas might be done one after another. ASEL supports up to eight antennas and up to four RF chains.

### 10.34.2 ASEL frame exchange procedure

A STA shall not initiate an ASEL training frame exchange(#109) with another STA unless that STA supports ASEL, as determined by the ASEL Capability field (see 9.4.2.54.7 (ASEL Capability field)).

A STA that is capable of supporting ASEL should set each subfield of the ASEL Capability field of the HT Capabilities element to 1 depending on its capabilities in HT Capabilities elements that it transmits (see 9.4.2.54.7 (ASEL Capability field)).

A STA that sets the Explicit CSI Feedback Based Tx ASEL Capable subfield of the ASEL Capability field (see 9.4.2.54.7 (ASEL Capability field)) to 1 shall set the CSI Max Number of Rows Beamformer Supported subfield of the Transmit Beamforming Capabilities field to an appropriate value, even if the STA sets the Explicit Transmit Beamforming CSI Feedback subfield to the value 0.

The frame exchange(#109) for transmit ASEL is shown in Figure 10-56 (Transmit ASEL), where the term *ASEL transmitter* identifies the STA that is conducting transmit ASEL, and the term *transmit ASEL responder* identifies the STA that provides ASEL feedback. The frame exchange comprises the following steps:

a) (Optional) A transmit ASEL responder may initiate the transmit ASEL training by sending a +HTC frame with the ASEL Command subfield set to Transmit Antenna Selection Sounding Request (TXASSR).

b) The ASEL transmitter sends out consecutive sounding PPDUs separated by SIFS in a TXOP of which it is the TXOP holder with no acknowledgment over different antenna sets, each PPDU containing a +HTC frame with the ASEL Command subfield set to Transmit Antenna Selection Sounding Indication (TXASSI or TXASSI-CSI). Each sounding PPDU is transmitted over one antenna set.

   If the ASEL transmitter allows antenna indices feedback (by setting the ASEL Command subfield to TXASSI), the antenna sets from which the sounding PPDUs are transmitted shall be disjoint. If the ASEL transmitter uses NDP sounding PPDUs for the ASEL sounding, the spatial mapping matrix $Q_k$ shall be the identity matrix starting with the first NDP. If the ASEL transmitter uses non-NDP sounding PPDUs for the ASEL sounding, the spatial mapping matrix $Q_k$ shall be an FFT matrix. An

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

FFT matrix of size $N$ is defined as a square matrix of dimension $NxN$ with entries $w_{im}$, (#515)$i$=0, ..., $N$–1, $m$=0, ..., $N$–1 where $w_{im} = \frac{1}{\sqrt{N}} \times \exp\left(-j2\pi\frac{im}{N}\right)$.

The ASEL transmitter shall not include TXASSI-CSI in the command field of the sounding frame if the last received value of the Explicit CSI Feedback Capable subfield of the ASEL Capability field (see 9.4.2.54.7 (ASEL Capability field)) from the receiver was 0.

NOTE 1—For example, in the case of sounding over all disjointed antenna sets, the number of consecutive sounding PPDUs equals the smallest integer that is greater than or equal to the number of antennas divided by the number of RF chains. These sounding PPDUs need to be sent within a single TXOP in order to minimize the change in the channel during this procedure.

c) The transmit ASEL responder estimates the subchannel corresponding to each sounding PPDU.

d) If the ASEL Command subfield in the sounding frames is equal to TXASSI-CSI, after receiving all of the sounding PPDUs, the transmit ASEL responder shall respond with the full size CSI in a subsequent TXOP. If the ASEL Command subfield in the sounding frames is equal to TXASSI, after receiving all of the sounding PPDUs, the transmit ASEL responder may either respond with the full size CSI in a subsequent TXOP, or conduct ASEL computation and provide the selected antenna indices in a subsequent TXOP.

   1) CSI is transported using the MIMO CSI Matrices frame defined in 9.6.11.4 (CSI frame format) contained within either an Action No Ack or Action frame. Multiple CSI frames may be required to provide the complete feedback, in which case the value of the Sounding Timestamp field within each of these CSI frames shall correspond to the arrival time of the sounding frame that was used to generate the feedback information contained in the frame.

   2) Antenna indices feedback is carried in the Antenna Selection Indices Feedback frame, defined in 9.6.11.7 (Antenna Selection Indices Feedback frame format). One octet of the Antenna Selection Indices field is used to carry the selected antenna indices feedback.

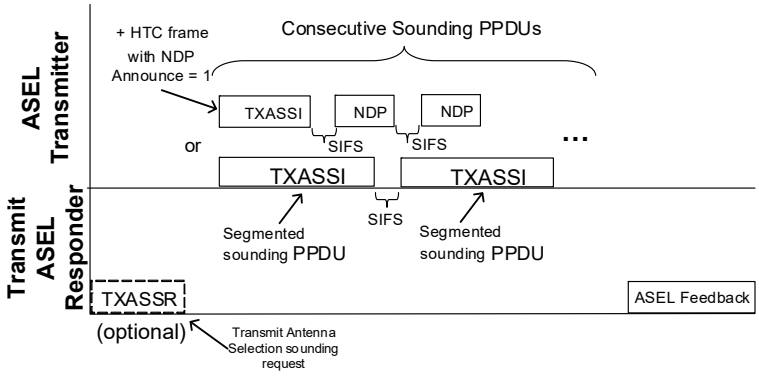

**Figure 10-56—Transmit ASEL**

If the transmit ASEL responder does not correctly receive all of the sounding PPDUs but has correctly received at least one of the preceding sounding PPDUs, it shall send a +HTC frame with the MAI subfield set to the value ASELI (see Table 9-18 (Subfields of Link Adaptation Control subfield)), the ASEL Command subfield set to No Feedback Due to ASEL Training Failure or Stale Feedback to indicate the failure of the ASEL training process, and the ASEL Data subfield set to either of the following:

— The integer value corresponding to the number in sequence of the first sounding PPDU that was not properly received, where 0 corresponds to the first sounding PPDU in the ASEL training sequence or

— The value 0

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

A transmit ASEL responder that determines that the ASEL feedback is stale shall notify the ASEL transmitter by transmitting a +HTC MPDU with the MAI subfield set to ASELI, the ASEL Command subfield set to No Feedback Due to ASEL Training Failure or Stale Feedback, and the ASEL Data subfield set to 0.

If, in response to the transmission of a sequence of sounding PPDUs, the ASEL transmitter receives a +HTC MPDU with the MAI subfield equal to ASELI, the ASEL Command subfield equal to No Feedback Due to ASEL Training Failure or Stale Feedback, and the ASEL Data subfield not equal to 0 to indicate a failed ASEL training frame exchange(#109), the ASEL transmitter may perform any of the following actions:

— Do nothing.

— Restart the failed ASEL training frame exchange(#109) from the point of failure by transmitting a +HTC MPDU with the MAI subfield set to ASELI, the ASEL Command subfield set to TXASSR, and the ASEL Data subfield set to a nonzero value to correspond to the command Transmit Antenna Selection Sounding Resumption (a Resumption MPDU), where the ASEL Data subfield value is the order number (from the original training frame sequence) of the first sounding PPDU transmitted in the restarted ASEL training frame sequence and where 0 corresponds to the first sounding PPDU in the original ASEL training sequence.

— Execute a new ASEL training frame sequence by transmitting a +HTC MPDU with the MAI subfield set to ASELI, the ASEL Command subfield set to TXASSI or TXASSI-CSI, and the ASEL Data subfield set to a nonzero value.

If a transmit ASEL responder receives a +HTC MPDU with the MAI subfield equal to ASELI, the ASEL Command subfield equal to TXASSR, and the ASEL Data subfield not equal to 0 to correspond to the command Transmit Antenna Selection Sounding Resumption (a Resumption MPDU), the transmit ASEL responder shall respond to the training sequence according to the original command value (i.e., TXASSI or TXASSI-CSI) and shall assume a total number of sounding PPDUs that corresponds to the number of sounding PPDUs from the original command frame. The number of sounding frames that follow the Resumption MPDU is equal to the number of sounding PPDUs from the original command frame minus the order number transmitted in the ASEL Data subfield of the Resumption MPDU.

The frame exchange(#109) for receive ASEL is shown in Figure 10-57 (Receive ASEL), where the term *ASEL receiver* identifies the STA that is conducting receive ASEL, and the term *ASEL sounding-capable transmitter* identifies the STA sending the consecutive sounding PPDUs used for receive ASEL calculations. The frame exchange comprises the following steps:

— The ASEL receiver transmits a +HTC frame with the MAI subfield set to ASELI, the ASEL Command subfield set to Receive Antenna Selection Sounding Request (RXASSR), and the ASEL Data subfield set to the number of sounding PPDUs required.

NOTE 2—For example, in the case of sounding over all disjointed antenna sets, the number of total consecutive sounding PPDUs or NDPs equals the smallest integer that is greater than or equal to the number of antennas divided by the number of RF chains.

— The ASEL sounding-capable transmitter responds with the corresponding number of sounding PPDUs in its subsequent TXOP. These PPDUs are separated by SIFS. When using non-NDP sounding, each PPDU contains a +HTC frame in which the MAI subfield is set to ASELI, the ASEL Command subfield is set to Receive Antenna Selection Sounding Indication (RXASSI), and the ASEL Data subfield is set to the remaining number of sounding PPDUs to be transmitted. When using NDP sounding, the PPDU that precedes the first NDP contains a +HTC frame in which the NDP Announce field is set to 1, the MAI subfield is set to ASELI, the ASEL Command subfield is set to RXASSI, and the ASEL Data subfield is set to the remaining number of sounding PPDUs to be transmitted.

The ASEL receiver uses different antenna sets to receive these sounding PPDUs, estimates CSI after receiving all these sounding PPDUs, and conducts the ASEL.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

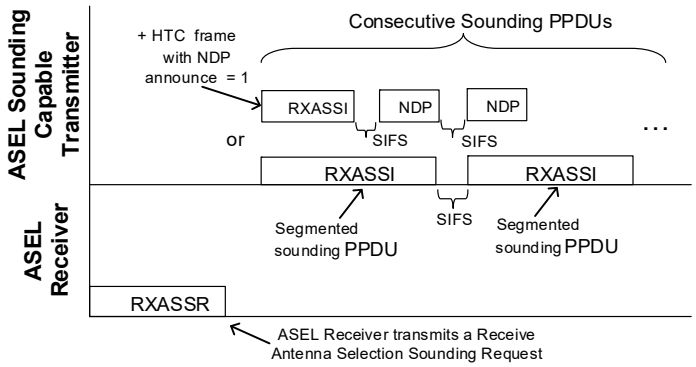

**Figure 10-57—Receive ASEL**

When transmitting the consecutive sounding PPDUs in transmit and receive ASEL exchanges (illustrated in Figure 10-56 (Transmit ASEL) and Figure 10-57 (Receive ASEL)), the transmitter shall not change the TXPWR_LEVEL_INDEX parameter of the TXVECTOR.

When transmitting a sounding PPDU sent in transmit and receive ASEL exchanges (illustrated in Figure 10-56 (Transmit ASEL) and Figure 10-57 (Receive ASEL)), if the Receive Staggered Capability subfield of the Transmit Beamforming Capability field of the HT Capabilities element transmitted by the intended receiver is 0, then,

— If the sounding PPDU is not an NDP, the number of antennas used by the sender, as indicated by the ANTENNA_SET parameter in the TXVECTOR, shall be less than or equal to the maximum number of space-time streams indicated by the Rx MCS Bitmask subfield of the Supported MCS Set field and the Rx STBC subfield of the HT Capabilities element transmitted by the intended receiver.

— If the sounding PPDU is an NDP, the number of antennas used by the sender, as indicated by the ANTENNA_SET parameter in the TXVECTOR, shall be less than or equal to the number indicated by the Channel Estimation Capability subfield of the Transmit Beamforming Capability field of the HT Capabilities element transmitted by the intended receiver.

When both transmitter and receiver have ASEL capabilities, the following constraints apply:

— During a transmit ASEL frame exchange, the transmit ASEL responder shall use a subset of antennas that does not change during the reception of all of the sounding PPDUs of the ASEL sounding sequence.

— During a receive ASEL frame exchange, the ASEL sounding-capable transmitter shall use a subset of antennas that does not change during the transmission of all of the sounding PPDUs of the ASEL sounding sequence.

NOTE 3—When a receiver (either a transmit ASEL responder or an ASEL receiver) conducts ASEL computations (for either transmit or receive ASEL), if there is no transmit beamforming conducted at the same time, to achieve the best performance of ASEL, the receiver assumes that the first $N_{STS}$ columns of the same spatial mapping matrix $Q_k$ used for transmitting ASEL sounding PPDUs, where $N_{STS}$ is the number of space-time streams, are applied for the spatial mapping at the ASEL transmitter after the ASEL exchange as in Figure 10-56 (Transmit ASEL) and Figure 10-57 (Receive ASEL). To achieve the best performance of ASEL, the ASEL transmitter applies the first $N_{STS}$ columns of the same $Q_k$ for spatial mapping after the ASEL exchange as in Figure 10-56 (Transmit ASEL) and Figure 10-57 (Receive ASEL).

## 10.35 Null data PPDU (NDP) sounding

### 10.35.1 HT NDP sounding protocol

Sounding may be accomplished using either staggered sounding PPDU or HT NDP, as described in 19.3.13 (HT Preamble format for sounding PPDUs). The MAC rules associated with sounding using HT NDP are described in 10.35.1 (HT NDP sounding protocol) to 10.35.4 (Determination of HT NDP source).

An HT STA that has set the Receive NDP Capable field of its HT Capabilities element to 1 during association processes an HT NDP as a sounding PPDU if the destination of the sounding PPDU is determined to match itself as described in 10.35.3 (Determination of HT NDP destination) and if the source of the sounding PPDU can be ascertained as described in 10.35.4 (Determination of HT NDP source).

An RXVECTOR LENGTH parameter equal to 0 indicates that an HT PPDU is an HT NDP.

A STA that is a TXOP holder or an RD responder shall not set both the HT NDP Announcement and RDG/More PPDU subfields to 1 simultaneously. The Calibration Position subfield shall not be set to any value except 0 and 1 in any +HTC frame in a PPDU that is also an HT NDP announcement. The Calibration Position subfield shall be set to 0 in any +HTC frame in a PPDU that is an HT NDP announcement that also contains any +HTC frame with the MAI subfield equal to ASELI. The Calibration Position subfield shall be set to 0 in all +HTC frames in a PPDU that is an HT NDP announcement and that contains any +HTC frame with the MRQ subfield equal to 1. The TRQ field shall be set to 0 in all +HTC frames in a PPDU that is an HT NDP announcement.

An NDP sequence contains at least one HT NDP and at least one PPDU that is not an NDP. Only one PPDU in the NDP sequence may contain an HT NDP announcement. An NDP sequence begins with an HT NDP announcement. The NDP sequence ends at the end of the transmission of the last HT NDP that is announced by the HT NDP announcement. A STA that transmits the first PPDU of an NDP sequence is the NDP sequence owner. In the NDP sequence, only PPDUs that are HT NDPs(#4150) and PPDUs each carrying a Control frame as an S-MPDU(#3202) may follow the NDP sequence's starting PPDU.

A STA shall transmit only one HT NDP per HT NDP announcement, unless the HT NDP announcement includes a value in the ASEL Data subfield of the ASEL Command subfield of the HTC Control field that is greater than one. Each PPDU in an NDP sequence shall start a SIFS after end of the previous PPDU.

A STA shall not transmit a VHT NDP in (#2137)an NDP sequence that contains an HT NDP announcement.

A CTS frame that is a +HTC frame shall not contain the HT NDP Announcement subfield set to 1.

NOTE 1—A CTS frame cannot be used for HT NDP announcement: if the CTS frame is a response to an RTS frame, the optional NAV reset timeout that starts at the end of the RTS frame does not include the additional HT NDP and SIFS (see 10.3.2.4 (Setting and resetting the NAV)). Also, if the CTS were the first frame of an NDP sequence, it would not be possible to determine the destination address of the HT NDP.

A STA shall transmit an HT NDP as follows:

a) A SIFS after sending a PPDU that is an HT NDP announcement and that does not contain an MPDU that requires an immediate response.

b) A SIFS after receiving a correctly formed and addressed immediate response to a PPDU that is an HT NDP announcement and that contains an MPDU that requires an immediate response.

c) A SIFS after transmitting an HT NDP if the HT NDP announcement contains an ASEL Command subfield equal to TXASSI, TXASSI-CSI, or RXASSI and the ASEL Data subfield is equal to a value greater than 0 and if the number of HT NDPs sent before this one is less than the value in the ASEL Data subfield + 1.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

NOTE 2—The total number of sent HT NDPs is equal to the value of in the ASEL Data subfield + 1.

d) A SIFS after receiving an HT NDP from a STA whose HT NDP announcement contained one or more +HTC frames with the Calibration Position subfield equal to 1, when the receiving STA supports transmitting sounding PPDUs for which more than one channel dimension can be estimated (i.e., more than one column of the MIMO channel matrix).

This rule enables the NDP receiver to know that it will receive an HT NDP and can determine the source and destination of the HT NDP. It enables the receiver and transmitter to know when the immediate response and HT NDP will be transmitted relative to the frame containing the HT NDP announcement indication.

A STA that has transmitted an HT NDP announcement in a frame that requires an immediate response and that does not receive the expected response shall terminate the NDP sequence at that point (i.e., the STA does not transmit an HT NDP in the current NDP sequence).

A STA that has received an HT NDP announcement in a +HTC with the Calibration Position equal to 1 or 2, and that does not receive the expected HT NDP shall terminate the NDP sequence at that point (i.e., does not transmit an HT NDP in the current NDP sequence) and not transmit any further frames that are a part of this calibration sequence shown in Step 1 of Figure 10-54 (Calibration procedure with NDP).

Feedback information generated from the reception of an HT NDP is transmitted using any of the feedback rules and signaling as appropriate, e.g., immediate or delayed.

### 10.35.2 Transmission of an HT NDP

A STA that transmits an HT NDP shall set the LENGTH, SOUNDING, STBC, MCS, and NUM_EXTEN_SS parameters of the TXVECTOR as specified in this subclause.

— LENGTH shall be set to 0.
— SOUNDING shall be set to SOUNDING.
— STBC shall be set to 0.
— MCS shall indicate two or more spatial streams.

The number of spatial streams sounded is indicated by the MCS parameter of the TXVECTOR and shall not exceed the limit indicated by the Channel Estimation Capability field in the Transmit Beamforming Capabilities field transmitted by the STA that is the intended receiver of the HT NDP. The MCS parameter may be set to any value, subject to the constraint of the previous sentence, regardless of the value of the Supported MCS Set field of the HT Capabilities field at either the transmitter or recipient of the HT NDP. A STA shall set the NUM_EXTEN_SS parameter of the TXVECTOR to 0 in the PHY-TXSTART.request primitive corresponding to an HT NDP transmission.

A STA shall not transmit an HT NDP announcement with an RA corresponding to another STA unless it has received an HT Capabilities element from the destination STA in which the Receive NDP Capable field is equal to 1.

### 10.35.3 Determination of HT NDP destination

The destination of an HT NDP is determined at the NDP receiver by examining the HT NDP announcement as follows:

— The destination of the first HT NDP in the NDP sequence is equal to the RA of any MPDU within HT NDP announcement.
— If Calibration Position subfield is equal to 1 in the HT NDP announcement at the NDP receiver, the destination of the second HT NDP is equal to the TA of that frame. Otherwise, the destination of the second and any subsequent HT NDPs is equal to the destination of the previous HT NDP.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

See O.4 (Illustration of determination of NDP addresses) for an illustration of these rules.

### 10.35.4 Determination of HT NDP source

The source of an HT NDP is determined at the NDP receiver by examining the NDP sequences's starting PPDU as follows:

— If any MPDU within the HT NDP announcement contains two or more addresses, the source of the first HT NDP is equal to the TA of that frame.

— Otherwise (i.e., the HT NDP announcement contains one address), the source of the first HT NDP is equal to the RA of the MPDU to which the HT NDP announcement is a response.

— If the Calibration Position subfield is equal to 1 in an MPDU in the HT NDP announcement, the source of the second HT NDP is equal to the RA of that MPDU. Otherwise, the source of the second and any subsequent HT NDPs is equal to the source of the previous NDP.

See O.4 (Illustration of determination of NDP addresses) for an illustration of these rules.

### 10.35.5 VHT sounding protocol

#### 10.35.5.1 General

Transmit beamforming and (#3367)DL MU-MIMO require knowledge of the channel state to compute a steering matrix that is applied to the transmitted signal to optimize reception at one or more receivers. The STA transmitting using the steering matrix is called the *VHT beamformer*, and a STA for which reception is optimized is called a *VHT beamformee*. An explicit feedback mechanism is used where the VHT beamformee directly measures the channel from the training symbols transmitted by the VHT beamformer and sends back a transformed estimate of the channel state to the VHT beamformer. The VHT beamformer then uses this estimate, perhaps combining estimates from multiple VHT beamformees, to derive the steering matrix.

If dot11VHTSUBeamformerOptionImplemented is true, a STA shall set the SU Beamformer Capable field in the VHT Capabilities element to 1. If dot11VHTSUBeamformeeOptionImplemented is true, a STA shall set the SU Beamformee Capable field in the VHT Capabilities element to 1.

If dot11VHTMUBeamformerOptionImplemented is true, a STA shall set the MU Beamformer Capable field in the VHT Capabilities element to 1. If dot11VHTMUBeamformeeOptionImplemented is true, a STA shall set the MU Beamformee Capable field in the VHT Capabilities element to 1.

If dot11VHTMUBeamformerOptionImplemented is true, a STA shall set dot11VHTSUBeamformerOptionImplemented to true. If dot11VHTMUBeamformeeOptionImplemented is true, a STA shall set dot11VHTSUBeamformeeOptionImplemented to true.

A STA is a VHT SU-only beamformer if it sets the SU Beamformer Capable field to 1 but sets the MU Beamformer Capable field to 0 in transmitted VHT Capabilities elements. A STA is an SU-only beamformee if it sets the SU Beamformee Capable field to 1 but sets the MU Beamformee Capable field to 0 in transmitted VHT Capabilities elements.

If dot11VHTSUBeamformerOptionImplemented is false, a STA shall not act in the role of a VHT beamformer. If dot11VHTSUBeamformeeOptionImplemented is false, a STA shall not act in the role of a VHT beamformee.

For an S1G STA, the S1G sounding protocol is specified in 10.35.5 (VHT sounding protocol) with "VHT" replaced by "S1G", except in this sentence.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

(#2044)A VHT beamformer shall set the Number Of Sounding Dimensions subfield in the VHT Capabilities element to a value greater than or equal to 1 (2 STS). A VHT beamformee shall set the Beamformee STS Capability subfield in the VHT Capabilities element to a value greater than or equal to 1 (2 STS).

(#4014)VHT compressed beamforming feedback comprises the VHT Compressed Beamforming Report information (see Table 9-105 (VHT Compressed Beamforming Report information)) and the MU Exclusive Beamforming Report information (see Table 9-108 (MU Exclusive Beamforming Report information)). Subclause 9.6.22.2 (VHT Compressed Beamforming frame format) specifies how VHT compressed beamforming feedback is converted into a VHT Compressed Beamforming frame, and it also specifies the rules for the presence or absence of the two fields listed here.

### 10.35.5.2 Rules for VHT sounding protocol sequences

A VHT beamformer shall initiate a sounding feedback sequence by transmitting a VHT NDP Announcement frame followed by a VHT NDP after a SIFS. The VHT beamformer shall include in the VHT NDP Announcement frame one STA Info field for each VHT beamformee that is expected to prepare VHT compressed beamforming feedback and shall identify the VHT beamformee by including the VHT beamformee's AID in the AID12 subfield of the STA Info field. The VHT NDP Announcement frame shall include at least one STA Info field.

NOTE 1—A STA that transmits a VHT NDP Announcement frame to a TDLS peer STA obtains the AID for the peer STA from the TDLS Setup Request or TDLS Setup Response frame.

A VHT beamformer shall not transmit either a VHT NDP Announcement+HTC frame or a Beamforming Report Poll+HTC frame that contains an HT variant HT Control field.

A VHT NDP shall be transmitted only following a SIFS after a VHT NDP Announcement frame. A VHT NDP Announcement frame shall be followed by a VHT NDP after a SIFS(#6587).

A VHT beamformer that has not received a VHT Capabilities element from a STA or where the last VHT Capabilities element received from a STA has the SU Beamformee Capable field set to 0 shall not transmit either of the following:

— A VHT NDP Announcement frame addressed to the STA or that includes the STA's AID in one of the STA Info fields
— A Beamforming Report Poll frame addressed to the STA

A VHT beamformer that transmits a VHT NDP Announcement frame to a VHT SU-only beamformee shall include only one STA Info field in the VHT NDP Announcement frame and set the Feedback Type subfield of the STA Info field to SU.

An S1G beamformee with dot11NDPBeamformingReportPollImplemented equal to true shall set the NDP Beamforming Report Poll Supported field in the S1G Capabilities element to 1. Otherwise it shall set the NDP Beamforming Report Poll Supported field in the S1G Capabilities element to 0.

An S1G beamformer may transmit NDP Beamforming Report Poll frames instead of VHT Beamforming Report Poll frames to an S1G beamformee from which it has received a frame containing an S1G Capabilities element with the NDP Beamforming Report Poll Supported field equal to true; otherwise, the S1G beamformer shall not transmit NDP Beamforming Report Poll frames to the S1G beamformee. A non-S1G beamformer or an S1G beamformer working on 1 MHz channel shall not transmit NDP Beamforming Report Poll frames. (#306)A non-AP S1G beamformer shall not transmit NDP Beamforming Report Poll frames to a non-AP beamformee.

If the VHT NDP Announcement frame includes more than one STA Info field, the RA of the VHT NDP Announcement frame shall be set to the broadcast address. If the VHT NDP Announcement frame includes a

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

single STA Info field, the RA of the VHT NDP Announcement frame shall be set to the MAC address of the VHT beamformee.

A VHT NDP Announcement frame shall not include two or more STA Info fields with same value in the AID12 subfield.

A VHT beamformer that transmits a VHT NDP Announcement frame to a VHT beamformee that is an AP, mesh STA or IBSS STA, shall include a single STA Info field in the VHT NDP Announcement frame and shall set the AID12 subfield in the STA Info field to 0.

A VHT NDP Announcement frame with more than one STA Info field shall not carry a VHT variant HT Control field, unless all of the STAs listed in the AID12 subfield of the STA Info fields have set +HTC-VHT Capable to 1 in the VHT Capabilities Information field.

A VHT beamformer that transmits a VHT NDP Announcement frame with more than one STA Info field should transmit any Beamforming Report Poll frames used to retrieve VHT compressed beamforming feedback from the intended VHT beamformees in the same TXOP. If the duration of the TXOP that contained the VHT NDP Announcement frame has insufficient duration to accommodate the transmission of all of the feedback reports, the VHT beamformer may poll for the remaining VHT compressed beamforming feedback in subsequent TXOPs.

A VHT beamformer may use worst-case parameters to estimate the duration of the expected frame(s) that contain(s) the feedback response(s), e.g. the lowest rate/MCS in the basic rate/MCS set, no grouping, and the highest-precision codebook.(#280)

NOTE 2—The transmission of the VHT NDP Announcement, VHT NDP, VHT Compressed Beamforming, and Beamforming Report Poll frames is subject to the rules in 10.23.2.8 (Multiple frame exchange sequences in an EDCA TXOP(#109)).

A VHT beamformer that sets the Feedback Type subfield of a STA Info field to MU shall set the Nc Index subfield of the same STA Info field to a value less than or equal to the minimum of both of the following:

— The maximum number of supported spatial streams for receive operation according to the combination of the corresponding VHT beamformee's Rx VHT-MCS Map subfield in the Supported VHT-MCS and NSS Set field and VHT Capabilities Information field

— The maximum number of supported spatial streams according to the Rx NSS subfield value and, when the value of the VHT Extended NSS BW Capable subfield received from the VHT beamformee is 1 and dot11ExtendedNSSSupported is equal to true, the 160/80+80 BW subfield value in the Operating Mode field of the most recently received Operating Mode Notification frame or Operating Mode Notification element with the Rx NSS Type subfield equal to 0 from the corresponding VHT beamformee, as computed according to 10.6.13.1 (Rx Supported VHT-MCS and NSS Set)

A non-AP VHT beamformee that receives a VHT NDP Announcement frame from a VHT beamformer with which it is associated or has an established TDLS session and that contains the VHT beamformee's AID in the AID12 subfield of the first (or only) STA Info field and also receives a VHT NDP a SIFS after the VHT NDP Announcement frame shall transmit the PPDU containing its VHT compressed beamforming feedback a SIFS after the VHT NDP. A VHT beamformee that is an AP, mesh STA, or IBSS STA, that receives a VHT NDP Announcement frame with the RA matching its MAC address and the AID12 subfield of the only STA Info field set to 0, and that also receives a VHT NDP a SIFS after the VHT NDP Announcement frame shall transmit the PPDU containing its VHT compressed beamforming feedback a SIFS after the VHT NDP. The TXVECTOR parameter CH_BANDWIDTH of the PPDU containing the VHT compressed beamforming feedback shall be set to indicate a bandwidth not wider than that indicated in the RXVECTOR parameter CH_BANDWIDTH of the received VHT NDP. A STA shall (#3683)(#7144)discard received VHT NDP

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Announcement, VHT NDP, and Beamforming Report Poll frames if dot11VHTSUBeamformeeOptionImplemented is false.

A VHT beamformee shall indicate the maximum number of space-time streams it can receive in a VHT NDP in the Beamformee STS Capability subfield of the VHT Capabilities Information field of the VHT Capabilities element. If the beamformee is a non-AP STA, this shall be less than or equal to the maximum total number of space-time streams that the STA can receive in a VHT MU PPDU.

An example of the VHT sounding protocol with a single VHT beamformee is shown in Figure 10-58 (Example of the sounding protocol with a single VHT beamformee).

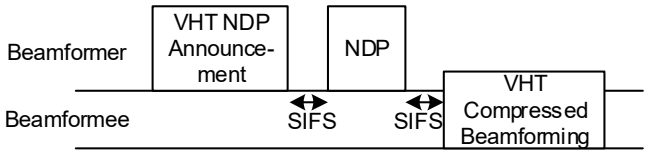

**Figure 10-58—Example of the sounding protocol with a single VHT beamformee**

A non-AP VHT beamformee that receives a VHT NDP Announcement frame from a VHT beamformer with which it is associated or has an established TDLS session and that contains the VHT beamformee's AID in the AID12 subfield of a STA Info field that is not the first STA Info field shall transmit its VHT compressed beamforming feedback a SIFS after receiving a Beamforming Report Poll with RA matching its MAC address and a nonbandwidth signaling TA obtained from the TA field matching the MAC address of the VHT beamformer. If the RXVECTOR parameter CH_BANDWIDTH_IN_NON_HT of the received Beamforming Report Poll frame is valid, the TXVECTOR parameter CH_BANDWIDTH of the PPDU containing the VHT compressed beamforming feedback shall be set to indicate a bandwidth not wider than that indicated by the RXVECTOR parameter CH_BANDWIDTH_IN_NON_HT of the Beamforming Report Poll frame; otherwise, the TXVECTOR parameter CH_BANDWIDTH of the PPDU containing VHT compressed beamforming feedback shall be set to indicate a bandwidth not wider than that indicated by the RXVECTOR parameter CH_BANDWIDTH of the Beamforming Report Poll frame.

An example of the VHT sounding protocol with more than one VHT beamformee is shown in Figure 10-59 (Example of the sounding protocol with more than one VHT beamformee).

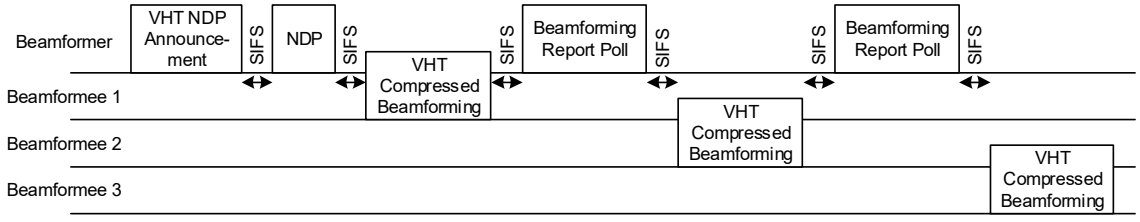

**Figure 10-59—Example of the sounding protocol with more than one VHT beamformee**

The RA field of the VHT Compressed Beamforming frame(s) of the VHT compressed beamforming feedback shall be set to a nonbandwidth signaling TA obtained from the TA field of the VHT NDP Announcement frame or the Beamforming Report Poll frame to which this VHT compressed beamforming feedback is a response.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

If the VHT Beamformee is transmitting VHT Compressed Beamforming frame(s) a SIFS after the VHT NDP, then the VHT Compressed Beamforming frame(s) shall include the VHT Compressed Beamforming Report information and, for the case of MU feedback, the MU Exclusive Beamforming Report information.

A VHT beamformee that transmits a VHT Compressed Beamforming frame shall set the Feedback Type field in the VHT MIMO Control field to the same value as the Feedback Type field in the corresponding STA Info field in the VHT NDP Announcement frame. If the Feedback Type field indicates MU, the STA shall send a VHT Compressed Beamforming frame with the Nc Index field value in the VHT MIMO Control field equal to the minimum of all of the following:

— The Nc Index field value in the corresponding STA Info field in the VHT NDP Announcement Frame
— The maximum number of supported spatial streams for receive operation according to the combination of its Rx VHT-MCS Map subfield in the Supported VHT-MCS and NSS Set field, VHT Capabilities Information field and Operating Mode field (see 10.6.13.1 (Rx Supported VHT-MCS and NSS Set))
— The maximum number of supported spatial streams according to the Rx NSS subfield value and, when the value of the most recently transmitted VHT Extended NSS BW Capable subfield is 1, the 160/80+80 BW subfield value in the Operating Mode field of the most recently transmitted Operating Mode Notification frame or Operating Mode Notification element, as computed according to 10.6.13.1 (Rx Supported VHT-MCS and NSS Set)

If the Feedback Type indicates SU, the Nc Index field value in the VHT MIMO Control field is determined by the VHT beamformee.

The Nr Index field in the VHT MIMO Control field shall be set to the same value as the RXVECTOR parameter NUM_STS of the corresponding VHT NDP. The Nc Index field shall not be set to a value larger than the Nr Index value in the VHT MIMO Control field. A VHT beamformee shall set the value of the Channel Width subfield in the VHT MIMO Control field of a VHT Compressed Beamforming frame to the same value as the RXVECTOR parameter CH_BANDWIDTH of the corresponding VHT NDP.

A VHT beamformee shall not include MU Exclusive Beamforming Report information in VHT compressed beamforming feedback if the Feedback Type subfield in the MIMO Control field of the VHT Compressed Beamforming frame(s) indicates SU. A VHT beamformee shall include both VHT Compressed Beamforming Report information and MU Exclusive Beamforming Report information in VHT compressed beamforming feedback if the Feedback Type subfield in the MIMO Control field of the VHT Compressed Beamforming frame(s) indicates MU.

A VHT beamformee that transmits VHT compressed beamforming feedback shall include neither the VHT Compressed Beamforming Report information nor the MU Exclusive Beamforming Report information, if the transmission duration of the PPDU carrying the VHT Compressed Beamforming Report information and any MU Exclusive Beamforming Report information would exceed the maximum PPDU duration.

The value of the Sounding Dialog Token Number subfield in the VHT MIMO Control field shall be set to the same value as the Sounding Dialog Token Number subfield in the Sounding Dialog Token field in the corresponding VHT NDP Announcement frame.

NOTE 3—The VHT beamformer can use the sounding dialog token in the VHT Compressed Beamforming frame(s) of the VHT compressed beamforming feedback to associate the feedback with a prior VHT NDP Announcement frame and thus compute the delay between sounding and receiving the feedback. The VHT beamformer can use this delay time when making a decision regarding the applicability of the feedback for the link.

NOTE 4—Recovery in the case of a missing response to a VHT NDP Announcement or Beamforming Report Poll frame follows the rules for multiple frame exchange sequence(#109) in an EDCA TXOP (see 10.23.2.8 (Multiple frame exchange sequences in an EDCA TXOP(#109))).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

(#4014)In a frame transmitted by a TVHT STA, the TVHT Compressed Beamforming Report field replaces the VHT Compressed Beamforming Report field.

In a frame transmitted by a TVHT STA, the TVHT MU Exclusive Beamforming Report field replaces the MU Exclusive Beamforming Report field.

### 10.35.5.3 Rules for fragmented feedback in VHT sounding protocol sequences

VHT compressed beamforming feedback shall be transmitted in a single VHT Compressed Beamforming frame unless the result would be a VHT Compressed Beamforming frame that exceeds the VHT beamformer's maximum MPDU length capability.

NOTE 1—The requirement that the VHT compressed beamforming feedback is transmitted in a single VHT Compressed Beamforming frame implies that the VHT beamformee might have to transmit an MPDU that is bigger than its receive capability.

If VHT compressed beamforming feedback would result in a VHT Compressed Beamforming frame that exceeds the VHT beamformer's maximum MPDU length capability, the VHT compressed beamforming feedback shall be split into up to 8 feedback segments, with each feedback segment sent in a different VHT Compressed Beamforming frame and containing successive portions of the VHT compressed beamforming feedback consisting of the VHT Compressed Beamforming Report information followed by any MU Exclusive Beamforming Report information. Each of the feedback segments except the last shall (#4014)be transmitted in a frame that contains the maximum number of octets allowed by the VHT beamformer's maximum MPDU length capability. The last feedback segment may be transmitted in a smaller frame.(#4014) Each feedback segment is identified by the value of the Remaining Feedback Segments subfield and the First Feedback Segment subfield in the VHT MIMO Control field as defined in 9.4.1.46 (VHT MIMO Control field); the other nonreserved subfields of the VHT MIMO Control field shall be the same for all feedback segments. All feedback segments shall be sent in a single A-MPDU and shall be included in the A-MPDU in the descending order of the Remaining Feedback Segments subfield values.

NOTE 2—The feedback segment of VHT compressed beamforming feedback(#4014)(#317) are not MSDU/MMPDU fragments, rather each feedback segment, together with the other fields in the Frame Body field of the VHT Compressed Beamforming frame (see Figure Figure 9-128 (Management frame format) and 9.6.22.2 (VHT Compressed Beamforming frame format)), constitutes a single unfragmented MMPDU.(#4014)

A VHT beamformer, in its first attempt to retrieve VHT compressed beamforming feedback from a VHT beamformee that is not the one indicated by the first STA Info field, shall transmit a Beamforming Report Poll frame to poll all possible feedback segments of the VHT compressed beamforming feedback from the VHT beamformee, by setting all of the bits in the Feedback Segment Retransmission Bitmap field of the Beamforming Report Poll frame to 1.

If a VHT beamformer fails to receive some or all feedback segments of VHT compressed beamforming feedback, the VHT beamformer may, subject to the condition on VHT SU-only beamformees described at the end of this subclause, request a selective retransmission of missing feedback segments by transmitting a Beamforming Report Poll frame with the Feedback Segment Retransmission Bitmap field set as described in 9.3.1.20 (Beamforming Report Poll frame format) to indicate the feedback segments requested for retransmission. If the VHT beamformer fails to receive the feedback segment with the First Feedback Segment field set to 1, the VHT beamformer may request a selective retransmission of missing feedback segments assuming the VHT compressed beamforming feedback is split into 8 feedback segments. The VHT beamformer may also request the retransmission of all feedback segments by setting all of the bits in the Feedback Segment Retransmission Bitmap field of the Beamforming Report Poll frame to 1.

A VHT beamformee that transmits VHT compressed beamforming feedback including the VHT Compressed Beamforming Report information and any MU Exclusive Beamforming Report information in response to a Beamforming Report Poll frame shall either transmit only the feedback segments indicated in the Feedback

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Segment Retransmission Bitmap field in the Beamforming Report Poll frame excluding the indicated feedback segments that do not exist at the VHT beamformee or transmit all of the feedback segments that exist at the VHT beamformee disregarding the Feedback Segment Retransmission Bitmap field in the Beamforming Report Poll frame.

A VHT beamformer shall not transmit a Beamforming Report Poll frame to a VHT SU-only beamformee unless the VHT beamformer has received at least one feedback segment of the VHT compressed beamforming feedback from the VHT beamformee in the current frame exchange sequence.

In a frame transmitted by a TVHT STA, the TVHT Compressed Beamforming Report field replaces the VHT Compressed Beamforming Report field.

In a frame transmitted by a TVHT STA, the TVHT MU Exclusive Beamforming Report field replaces the MU Exclusive Beamforming Report field.

### 10.35.6 Transmission of a VHT NDP

A VHT NDP shall use the SU PPDU format as described in 21.1.4 (PPDU formats). A STA shall transmit a VHT NDP using the following TXVECTOR parameters:

- APEP_LENGTH set to 0
- NUM_USERS set to 1
- NUM_STS indicates two or more space-time streams
- CH_BANDWIDTH set to the same value as the TXVECTOR parameter CH_BANDWIDTH in the preceding VHT NDP Announcement frame
- GROUP_ID and PARTIAL_AID are set as described in 10.19 (Group ID and partial AID in VHT and CMMG PPDUs)

The number of space-time streams sounded and as indicated by the NUM_STS parameter shall not exceed the value indicated in the Beamformee STS Capability field in the VHT Capabilities element of any intended recipient of the VHT NDP. The NUM_STS parameter may be set to any value, subject to the constraint of the previous sentence, regardless of the value of the Supported VHT-MCS and NSS Set field of the VHT Capabilities element at either the transmitter or recipient of the NDP.

(11ax)If an HE STA transmits a VHT NDP where at least one of the intended recipients of the VHT NDP is an HE STA, then the following conditions apply:

- If the bandwidth of an VHT NDP is less than or equal to 80 MHz, the number of space-time streams sounded as indicated by the TXVECTOR parameter NUM_STS shall not exceed the value indicated in the Beamformee STS ≤ 80 MHz subfield in the HE Capabilities element of any intended HE STA recipient of the VHT NDP.
- If the bandwidth of an VHT NDP is greater than 80 MHz, the number of space-time streams sounded as indicated by the TXVECTOR parameter NUM_STS shall not exceed the value indicated in the Beamformee STS > 80 MHz subfield in the HE Capabilities element of any intended HE STA recipient of the VHT NDP.

The intended receiver of a VHT NDP is identified by the RA of the immediately preceding VHT NDP Announcement frame.

The transmitter of a VHT NDP is identified by the TA of the immediately preceding VHT NDP Announcement frame.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 10.35.7 Transmission of an S1G NDP

An S1G NDP shall use the 2 MHz short format as described in 23.1.4 (PPDU formats). An S1G STA transmitting an S1G NDP shall use the following TXVECTOR parameters:

- APEP_LENGTH set to 0 if AGGREGATION is equal to(M118) AGGREGATED
- PSDU_LENGTH set to 0 if AGGREGATION is equal to(M118) NOT_AGGREGATED
- NUM_USERS set to 1
- CH_BANDWIDTH set to the same value as the TXVECTOR parameter CH_BANDWIDTH in the preceding VHT NDP Announcement frame carried in an S1G PPDU
- NUM_STS indicates two or more space-time streams
- PARTIAL_AID set as described in 10.21 (Group ID, partial AID, Uplink Indication, and COLOR in S1G PPDUs)
- NDP_INDICATION set to 0
- RESPONSE_INDICATION set to Long Response

The number of space-time streams sounded as indicated by the NUM_STS parameter shall not exceed the value indicated in the Beamformee STS Capability field in the S1G Capabilities element of any intended recipient of the S1G NDP. The NUM_STS parameter may be set to any value, subject to the constraint of the previous sentence, regardless of the value of the Supported S1G-MCS and NSS Set field of the S1G Capabilities element transmitted by either the transmitter or recipient of the S1G NDP.

The intended receiver of an S1G NDP is identified by the RA of the immediately preceding VHT NDP Announcement frame carried in an S1G PPDU.

The transmitter of an S1G NDP is identified by the TA of the immediately preceding VHT NDP Announcement frame carried in an S1G PPDU.

## 10.36 Null data PPDU (NDP) sounding for CMMG STAs

### 10.36.1 NDP rules

Sounding may be accomplished using a CMMG NDP(#1989)(#177), as described in 25.6.8.14 (CMMG preamble format for sounding PPDU). The MAC rules associated with sounding using a CMMG NDP(#1989)(#177) are described in 10.36.1 (NDP rules) and 10.36.2 (Transmission of a CMMG NDP).

A CMMG STA that has set the Receive NDP Capable field of its CMMG Capabilities element to 1 during association processes a CMMG NDP as a sounding PPDU if the destination of the sounding PPDU is determined to match itself and if the source of the sounding PPDU can be ascertained.

An RXVECTOR LENGTH parameter equal to 0 indicates that the PPDU is a CMMG NDP.

(#1989)(#177)A STA that is a TXOP holder or an RD responder shall not set both the CMMG NDP Announcement and RDG/More PPDU subfields to 1 in the same frame.

An NDP sequence contains at least one CMMG NDP and at least one PPDU that is not an NDP. Only one PPDU in the NDP sequence may contain a CMMG NDP announcement. (#1989)(#177)A *CMMG NDP announcement* is a PPDU containing a +HTC frame with the CMMG NDP Announcement subfield set to 1. An NDP sequence begins with a CMMG NDP announcement. The NDP sequence ends at the end of the transmission of the last CMMG NDP that is announced by the CMMG NDP announcement. A STA that transmits the first PPDU of an NDP sequence is the NDP sequence owner. In the NDP sequence, only PPDUs

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

that are CMMG NDPs(#4150) and PPDUs each carrying a Control frame as an S-MPDU(#3202) may follow the NDP sequence's starting PPDU.(#177)

A STA shall transmit only one CMMG NDP per NDP announcement. Each PPDU in an NDP sequence shall start a SIFS after end of the previous PPDU.

NOTE—A CTS frame cannot be used for CMMG NDP announcement(#1989)(#177) even if it is in a Control Wrapper frame(#1896); if the CTS frame is a response to an RTS frame, the optional NAV reset timeout that starts at the end of the RTS frame does not include the additional CMMG NDP and SIFS. Also, if the CTS frame were the first frame of an NDP sequence, it would not be possible to determine the destination address of the CMMG NDP.

A STA shall transmit a CMMG NDP as follows:

a) A SIFS after sending (#1989)(#177)a CMMG NDP announcement and that does not contain an MPDU that requires an immediate response.

b) A SIFS after receiving a correctly formed and addressed immediate response to (#1989)(#177)a CMMG NDP announcement and that contains an MPDU that requires an immediate response.

This rule enables the NDP receiver to know that it receives a CMMG NDP and can determine the source and destination of the CMMG NDP. It enables the receiver and transmitter to know when the immediate response and CMMG NDP are transmitted relative to the frame containing the CMMG NDP announcement indication.

(#1989)(#177)A STA that has transmitted a CMMG NDP announcement indication in a frame that requires an immediate response and that does not receive the expected response shall terminate the NDP sequence at that point (i.e., the STA does not transmit a CMMG NDP in the current NDP sequence).

Feedback information generated from the reception of a CMMG NDP is transmitted using any of the feedback rules and signaling as appropriate, e.g., immediate or delayed.

### 10.36.2 Transmission of a CMMG NDP

A STA that transmits a CMMG NDP shall set the LENGTH, SOUNDING, NSS, and STBC parameters of the TXVECTOR as specified in this subclause.

— LENGTH shall be set to 0.
— SOUNDING shall be set to SOUNDING.
— STBC shall be set to 0.
— NSS indicates two or more spatial streams.

The number of spatial streams sounded is indicated by the NSS parameter of the TXVECTOR and shall not exceed the limit indicated by the Channel Estimation Capability field in the Transmit Beamforming Capabilities field transmitted by the STA that is the intended receiver of the CMMG NDP.

### 10.36.3 Determination of CMMG NDP destination

The destination of a CMMG NDP is determined at the NDP receiver by examining the CMMG NDP announcement as follows:

— The destination of the first CMMG NDP in the NDP sequence is equal to the RA of any MPDU within the CMMG NDP announcement.
— (#1989)(#177)If the Calibration Position subfield is equal to 1 in the frame containing the CMMG NDP announcement indication, the destination of the second CMMG NDP is equal to the TA of that frame. Otherwise, the destination of the second and any subsequent CMMG NDPs is equal to the destination of the previous CMMG NDP.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 10.36.4 Determination of CMMG NDP source

The source of a CMMG NDP is determined at the NDP receiver by examining the NDP sequences's starting PPDU as follows:

— If any MPDU within the CMMG NDP announcement contains two or more addresses, the source of the first CMMG NDP is equal to the TA of that frame.

— Otherwise (i.e., the CMMG NDP announcement contains one address), the source of the first CMMG NDP is equal to the RA of the MPDU to which the CMMG NDP announcement is a response.

If the Calibration Position subfield is equal to 1 in an MPDU in the CMMG NDP announcement, the source of the second CMMG NDP is equal to the RA of that MPDU. Otherwise, the source of the second and any subsequent CMMG NDPs is equal to the source of the previous NDP.

## 10.37 Mesh forwarding framework

### 10.37.1 General

The term *mesh forwarding* refers to forwarding of MSDUs and MMPDUs on paths determined by the mesh path selection between mesh STAs at the link layer. The mesh paths are contained in the forwarding information. The forwarding information, for instance, the lifetime of a mesh path, may be updated as a consequence of mesh forwarding.

The forwarding of MSDUs and MMPDUs within an MBSS is described in 10.37.3 (Addressing and forwarding of individually addressed mesh Data frames), 10.37.4 (Addressing and forwarding of group addressed mesh Data frames), 10.37.5 (Addressing of Management frames and MMPDU forwarding), and 10.37.8 (MSDU forwarding and unknown destination). The forwarding of MSDUs and MMPDUs between the MBSS and the DS at proxy mesh gates is described in 14.12.3 (Data forwarding at proxy mesh gates).

### 10.37.2 Forwarding information

Forwarding information is created by the active mesh path selection protocol and is utilized for MSDU/MMPDU forwarding as described in 10.37.3 (Addressing and forwarding of individually addressed mesh Data frames) and 10.37.5.2 (MMPDU forwarding using individually addressed Multihop Action frames).

The basic forwarding information to a destination mesh STA consists of the destination mesh STA address, the next-hop address, the precursor list, and the lifetime of this forwarding information.

An entry in the precursor list contains the precursor mesh STA address and the lifetime of this entry. If an existing entry in a precursor list is updated, the lifetime is the maximum of the current and the updated value. If the lifetime of a precursor expires, it will be deleted from the precursor list. Precursors are used to identify legitimate transmitters of individually addressed frames (see 10.37.3.2 (At intermediate and destination mesh STAs (individually addressed))) and for the notification of link failures (in case of HWMP, see 14.11.11 (Path error (PERR) mechanism)).

The forwarding information shall be considered as valid when the active mesh path selection protocol validates it. When a STA performs MSDU/MMPDU forwarding, it shall use valid forwarding information only.

If a STA finds its forwarding information to a particular destination mesh STA is not validated, it shall consider the corresponding next-hop address as unknown and may take necessary actions to forward any

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

MSDU/MMPDU appropriately. See 10.37.8 (MSDU forwarding and unknown destination) and 14.11.9.3 (Conditions for generating and sending a PREQ element) for the HWMP case.

The forwarding information shall be considered as invalid if its lifetime has expired. Also, forwarding information is marked as invalid when certain conditions are met in the processing of mesh path selection elements, e.g., path error processing in HWMP (14.11.11.4 (PERR element processing)).

The active path selection protocol may define additional parameters in the forwarding information. Details on the additional parameters of the forwarding information constructed by the hybrid wireless mesh protocol (HWMP) are described in 14.11.8.4 (Forwarding information).

### 10.37.3 Addressing and forwarding of individually addressed mesh Data frames

#### 10.37.3.1 At source mesh STAs (individually addressed)

MSDUs sent by a mesh STA (as a consequence of an MA-UNITDATA.request primitive with an individual destination address) and destined to another mesh STA in the MBSS shall be transmitted using a frame with the four-address MAC header format (with the Address Extension Mode subfield in the Mesh Control field set to "None" (see Table 9-35 (Valid values for the Address Extension Mode subfield))), where the four address fields are set as follows (see row "Mesh Data (individually addressed)" in Table 9-77 (Address field contents for mesh Data and Multihop Action frames(#462)(#419)))(#3212):

— Address 1: The address of the next-hop mesh STA (toward the destination mesh STA according to the forwarding information; see 10.37.2 (Forwarding information)).
— Address 2: The address of the transmitter mesh STA.
— Address 3: The address of the destination mesh STA.
— Address 4: The address of the source mesh STA.

MSDUs that are sent by a mesh STA as a consequence of an MA-UNITDATA.request primitive with an individual destination address and are destined to an address that is different from the mesh STA at the end of a mesh path shall be transmitted using a frame with the four-address MAC header format (with the Address Extension Mode subfield in the Mesh Control field set to "Address5&6" (see Table 9-35 (Valid values for the Address Extension Mode subfield)))(#3212), where the Mesh Address Extension subfield in the Mesh Control field carries the addresses of the end stations, as specified in row "Mesh Data (proxied, individually addressed)" of Table 9-77 (Address field contents for mesh Data and Multihop Action frames(#462)(#419)). The additional addresses 5 and 6 are defined as follows:

— Address 5: The address of the destination end mesh STA (may be the same as Address 3 if the destination is the mesh STA at the end of the mesh path).
— Address 6: The address of the source end mesh STA (may be the same as Address 4 if the source is the mesh STA at the beginning of the mesh path).

NOTE—The destination address is distinct from the mesh STA at the end of the mesh path in two cases: 1) when the destination is an external address and 2) when the destination is a mesh STA distinct from the destination mesh STA at the end of the mesh path. The former case is described in 14.12.3 (Data forwarding at proxy mesh gates). The latter case might occur if a source mesh STA sends the MSDU to another intermediate mesh STA that sends the MSDU on a different mesh path to the destination mesh STA in the MBSS.

The Mesh TTL subfield in the Mesh Control field shall be set to dot11MeshTTL.The MSDUs are forwarded multiple hops, limited by the Mesh TTL value.

The source mesh STA shall set the Mesh Sequence Number subfield in the Mesh Control field to a value from a modulo $2^{32}$ counter that is (#270)incremented by 1 for each new MSDU (not in an A-MSDU)(#1597) or A-MSDU transmitted with a Mesh Control field and for each new MMPDU transmitted using a Multihop Action frame.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

#### 10.37.3.2 At intermediate and destination mesh STAs (individually addressed)

On receipt of an individually addressed mesh Data frame, a mesh STA shall perform the following:

a) The mesh STA shall decipher the frame and check it for authenticity. If it is not from a peer mesh STA, the frame shall be silently discarded.

b) The mesh STA shall check to see whether the MAC address in the Address 3 field is a known destination address; if it is an unknown destination address, the mesh STA may perform any of the following three actions:

   1) Silently discard the frame.

   2) Trigger a path discovery procedure depending on the path selection protocol that is currently active in the mesh BSS. For HWMP, see 14.11.9.3 (Conditions for generating and sending a PREQ element) Case A.

   3) Inform the mesh STA in Address 2 that the destination is unreachable depending on the path selection protocol that is currently active in the mesh BSS. For HWMP, see 14.11.11.3 (Conditions for generating and sending a PERR element) Case B.

c) If Address 2 is not one of the precursors for this destination mesh STA (see 10.37.2 (Forwarding information)), the frame shall be discarded.

If the frame is not discarded and one or more MSDUs are collected from the frame, the mesh STA may detect duplicate MSDUs according to 10.37.6 (Detection of duplicate MSDUs/MMPDUs) and discard them.

If Address 3 does not match the mesh STA's own address, but is a known individual destination MAC address in the forwarding information then the following actions are taken:

— The lifetime of the forwarding information to the destination (Address 3) is set to its initial value.

— The lifetime of the forwarding information to the source (Address 4) is set to its initial value.

— The lifetime of the precursor list entry for the precursor to the destination (Address 2) is set to the maximum of the initial value and the current value.

— The lifetime of the precursor list entry for the precursor to the source (next hop to the destination) is set to the maximum of the initial value and the current value.

— The Mesh TTL in the corresponding Mesh Control field of the collected MSDU is decremented by 1. If zero has been reached, the MSDU shall be discarded.

— If the MSDU has not been discarded, the mesh STA shall forward the MSDU via a frame with the Address 1 field set to the MAC address of the next-hop mesh STA as determined from the forwarding information (see 10.37.2 (Forwarding information)) and the Address 2 field set to its own MAC address and queue the frame for transmission.

If Address 3 matches the mesh STA's own MAC address, the following actions are taken:

— The lifetime of the forwarding information to the source (Address 4) is set to its initial value.

— The lifetime of the precursor list entry for the precursor to the destination (Address 2) is set to the maximum of the initial value and the current value.

— If the Address Extension Mode subfield in the Mesh Control field is "None" (see Table 9-35 (Valid values for the Address Extension Mode subfield)), the MA-UNITDATA.indication primitive is passed from the MAC sublayer entity to the LLC sublayer entity or entities.

— If the Address Extension Mode subfield in the Mesh Control field is "Address5&6" (see Table 9-35 (Valid values for the Address Extension Mode subfield)) and Address 5 is equal to Address 3, the mesh STA is the final destination of the MSDU, and the MA-UNITDATA.indication primitive is passed from the MAC sublayer entity to the LLC sublayer entity or entities.

— If the Address Extension Mode subfield in the Mesh Control field is "Address5&6" (see Table 9-35 (Valid values for the Address Extension Mode subfield)) and Address 5 is a known destination

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

MAC address in the forwarding information (mesh STA), the mesh STA shall forward the MSDU via a frame as described in 10.37.3.1 (At source mesh STAs (individually addressed)) with the Address 3 field set to the MAC Address of the Address 5 field.

— If the Address Extension Mode subfield in the Mesh Control field is "Address5&6" (see Table 9-35 (Valid values for the Address Extension Mode subfield)), the MSDU is forwarded according to 14.12.3.2 (Forwarding of MSDUs from the MBSS to the DS) in all other cases.

If Address 3 matches the group address, the mesh STA shall perform the procedures as given in 10.37.4.2 (At recipient mesh STAs (group addressed)).

Note that during the forwarding process at intermediate mesh STAs, the content of the MSDU is not changed.

### 10.37.4 Addressing and forwarding of group addressed mesh Data frames

#### 10.37.4.1 At source mesh STAs (group addressed)

MSDUs sent by a mesh STA (as a consequence of an MA-UNITDATA.request primitive with a group destination address) shall be transmitted using a group addressed mesh Data frame (with the Address Extension Mode subfield in the Mesh Control field set to "None" (see Table 9-35 (Valid values for the Address Extension Mode subfield))) (#4181)(see row "Mesh Data (group addressed)" in Table 9-77 (Address field contents for mesh Data and Multihop Action frames(#462)(#419)))(#3212). An implementation may circumvent the unreliability of group addressed transmissions by using multiple individually addressed mesh Data frames, which are individually acknowledged. In such case, the frame may be converted to individually addressed frames and transmitted as individually addressed mesh Data frames to each peer mesh STA as described in 10.37.3.1 (At source mesh STAs (individually addressed)) with the Address 3 field set to the group address. The circumstances for choosing this method are outside the scope of the standard.

In group addressed mesh Data frames, the address fields are set as follows:

— Address 1: The group address

— Address 2: The address of the transmitter mesh STA

— Address 3: The address of the source mesh STA

The source mesh STA shall set the Mesh TTL subfield in the Mesh Control field to dot11MeshTTL in order to control the hop count. The MSDUs are forwarded multiple hops, limited by the Mesh TTL value. For example, if the Mesh TTL subfield is 1, MSDUs are delivered only to immediate neighbors.

The source mesh STA shall set the Mesh Sequence Number subfield in the Mesh Control field to a value from a modulo $2^{32}$ counter that is (#270)incremented by 1 for each new MSDU (not in an A-MSDU)(#1597) or A-MSDU transmitted with a Mesh Control field and for each new MMPDU transmitted using a Multihop Action frame.

Procedures that enhance the reliability or efficiency of group addressed transmissions are outside the scope of this standard.

#### 10.37.4.2 At recipient mesh STAs (group addressed)

On receipt of a group addressed mesh Data frame with Address 1 (DA) equal to the group address, or on receipt of an individually addressed mesh Data frame with Address 3 (Mesh DA) equal to the group address, a mesh STA shall perform the following:

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

a) The mesh STA shall decipher the frame and check it for authenticity. If it is not from a peer mesh STA, the frame shall be silently discarded.

b) If the frame is not discarded and one or more MSDUs are collected from the frame, the mesh STA may detect duplicate MSDUs according to 10.37.6 (Detection of duplicate MSDUs/MMPDUs) and discard them.

c) The mesh STA decrements the Mesh TTL in the Mesh Control field. If the Mesh TTL value has reached zero, the corresponding MSDU shall not be forwarded to other mesh STAs.

d) If the Mesh TTL value has not reached zero and if dot11MeshForwarding is true, the mesh STA shall forward the MSDU via a group address mesh Data frame with the Address 2 field set to its own MAC address.

e) If the Address Extension Mode is "Address4" (see Table 9-35 (Valid values for the Address Extension Mode subfield)) and the recipient mesh STA is a proxy mesh gate and if the Mesh TTL value has not reached zero and if dot11MeshForwarding is true, the MSDU is forwarded according to 14.12.3.2 (Forwarding of MSDUs from the MBSS to the DS).

When the SA and the Mesh SA are not identical (the source address is therefore an external address), the MSDU shall be forwarded by using a frame with the three-address MAC header format (with the Address Extension Mode subfield in the Mesh Control field set to "Address4" (see Table 9-35 (Valid values for the Address Extension Mode subfield)))(#3212) as specified in row "Mesh Data (proxied, group addressed)" of Table 9-77 (Address field contents for mesh Data and Multihop Action frames(#462)(#419)). Otherwise, the MSDU shall be forwarded by using a frame with the three-address MAC header format (with the Address Extension Mode subfield in the Mesh Control field set to "None" (see Table 9-35 (Valid values for the Address Extension Mode subfield)))(#3212) as specified in row "Mesh Data (group addressed)" of Table 9-77 (Address field contents for mesh Data and Multihop Action frames(#462)(#419)).

An implementation may circumvent the unreliability of group addressed transmissions by using multiple individually addressed mesh Data frames, which are individually acknowledged. In such case, the frame may be converted to individually addressed frames and transmitted as an individually addressed mesh Data frame to each peer mesh STAs as described in 10.37.3.2 (At intermediate and destination mesh STAs (individually addressed)) with the Address 3 field set to the group address. If the Address Extension Mode subfield in the Mesh Control field in the group addressed mesh Data frame is equal to "Address4" (see Table 9-35 (Valid values for the Address Extension Mode subfield)), the Address Extension Mode subfield in the Mesh Control field in the individually addressed mesh Data frames is set to "Address5&6" (see Table 9-35 (Valid values for the Address Extension Mode subfield)), the Address 5 field is set to the group address, and the Address 6 field set to the Source Address contained in the Address 4 field of the group addressed mesh Data frame. The circumstances for choosing this method and the ability to determine all of the addresses of the neighbor peer mesh STAs are beyond the scope of the standard.

If one or more MSDUs collected from the frame have not been discarded, the MA-UNITDATA.indication primitive is passed from the MAC sublayer entity to the LLC sublayer entity or entities.

### 10.37.5 Addressing of Management frames and MMPDU forwarding

#### 10.37.5.1 General

All MMPDUs except MMPDUs transmitted using Multihop Action frames are transmitted over only one hop to peer mesh STAs.

NOTE—In several cases, the reception and processing of an Action frame leads to the transmission of a new Action frame of the same type that might include an identical or a modified version of the contents from the elements of the received Action frame. This is called *propagation* in contrast to forwarding.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

A mesh STA may convert a group addressed Management frame to individually addressed Management frames and transmit them as individually addressed frames to each peer mesh STA, if the frame is intended to be delivered only to its peer mesh STAs. The circumstances for choosing this method are outside the scope of the standard.

### 10.37.5.2 MMPDU forwarding using individually addressed Multihop Action frames

MMPDUs sent by a mesh STA and destined to another mesh STA in the MBSS using individually addressed Multihop Action frames (see 9.6.17 (Multihop Action frame details)) shall be transmitted using a Management frame with the three-address MAC header format (with the Address Extension Mode subfield in the Mesh Control field set to "Address4" (see Table 9-35 (Valid values for the Address Extension Mode subfield)))(#3212), where the four address fields are set as follows (see row "Multihop Action (individually addressed)" in Table 9-77 (Address field contents for mesh Data and Multihop Action frames(#462)(#419)))(#3212):

— Address 1: The address of the next-hop mesh STA (toward the destination mesh STA according to the forwarding information; see 10.37.2 (Forwarding information).
— Address 2: The address of the transmitter mesh STA.
— Address 3: The address of the destination mesh STA.
— Address 4: The address of the source mesh STA.

The source mesh STA shall set the Mesh TTL subfield in the Mesh Control field to dot11MeshTTL, and set the Mesh Sequence Number subfield in the Mesh Control field to a value from a modulo $2^{32}$ counter that is (#270)incremented by 1 for each new MSDU (not in an A-MSDU)(#1597) or A-MSDU transmitted with a Mesh Control field and for each new MMPDU transmitted using a Multihop Action frame.

At intermediate and destination mesh STAs, on receipt of an individually addressed Multihop Action frame, the address matching, the reception procedures, the forwarding information update, and the Mesh TTL decrement are performed as described in 10.37.3.2 (At intermediate and destination mesh STAs (individually addressed)), and the MMPDU is forwarded according to the forwarding information and the procedures in 10.37.3.2 (At intermediate and destination mesh STAs (individually addressed)).

At intermediate mesh STAs, frame fields following the Mesh Control field are not required to be examined.

If the Address 3 in the received Multihop Action frame matches the mesh STA's own MAC address or the group address, the mesh STA (destination mesh STA) shall process the content of the MMPDU.

### 10.37.5.3 MMPDU forwarding using group addressed Multihop Action frames

MMPDUs sent by a mesh STA and destined to all other mesh STAs in the MBSS using group addressed Multihop Action frames (see 9.6.17 (Multihop Action frame details)) shall be transmitted using a Management frame with the three-address MAC header format (with the Address Extension Mode subfield in the Mesh Control field set to "None" (see Table 9-35 (Valid values for the Address Extension Mode subfield))], where the three address fields are set as follows (#4181)(see row "Multihop Action (group addressed)" in Table 9-77 (Address field contents for mesh Data and Multihop Action frames(#462)(#419))):

— Address 1: The group address
— Address 2: The address of the transmitter mesh STA
— Address 3: The address of the source mesh STA

An implementation may circumvent the unreliability of group addressed transmissions by using multiple individually addressed Multihop Action frames, which are individually acknowledged. In such case, the frame may be converted to individually addressed frames and transmitted as individually addressed

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Multihop Action frames to each peer mesh STA as described in 10.37.5.2 (MMPDU forwarding using individually addressed Multihop Action frames) with the Address 3 field set to the group address. The circumstances for choosing this method are outside the scope of the standard.

The source mesh STA shall set the Mesh TTL subfield in the Mesh Control field to dot11MeshTTL, and set the Mesh Sequence Number subfield in the Mesh Control field to a value from a modulo $2^{32}$ counter that is (#270)incremented by 1 for each new MSDU (not in an A-MSDU)(#1597) or A-MSDU transmitted with a Mesh Control field and for each new MMPDU transmitted using a Multihop Action frame.

At recipient mesh STAs, on receipt of Multihop Action frame, the address matching, the reception procedures, the forwarding information update, and the Mesh TTL decrement are performed as described in 10.37.4.2 (At recipient mesh STAs (group addressed)), and the MMPDU is forwarded according to the forwarding information and the procedures in 10.37.4.2 (At recipient mesh STAs (group addressed)).

If the Address 1 in the received Multihop Action frame matches the group address, the mesh STA shall process the content of the MMPDU.

Procedures that enhance the reliability or efficiency of group addressed transmissions are outside the scope of this standard.

### 10.37.6 Detection of duplicate MSDUs/MMPDUs

A mesh STA may receive multiple copies of the same MSDU or MMPDU from different neighbor peer mesh STAs.

The filtering of such duplicates is facilitated through the inclusion of a Mesh Sequence Number subfield in the Mesh Control field in mesh Data frames and Multihop Action frames as specified in 9.2.4.8.3 (Mesh Control field).

The receiving mesh STA shall keep a cache of recently received <Mesh SA, Mesh Sequence Number> tuples. The Mesh Source Address (Mesh SA) is contained in Address 4 for individually addressed mesh Data frames and Multihop Action frames. The Mesh Source Address (Mesh SA) is contained in Address 3 for group addressed mesh Data frames.

(#270)A mesh STA shall reject an MSDU, A-MSDU or MMPDU with a Mesh Control field as a duplicate if it matches a <Mesh SA, Mesh Sequence Number> tuple of an entry in the cache.

The rules in 10.3.2.14 (Duplicate detection and recovery) also apply to the filtering of duplicates sent by the same neighbor peer mesh STA.

### 10.37.7 Mesh STAs that do not forward

A mesh STA that has dot11MeshForwarding equal to false does not forward either MSDUs, or Multihop Action frames. The circumstances in which a mesh STA may be allowed to become a non- forwarding entity and the authority to set dot11MeshForwarding to false are beyond the scope of this standard.

A mesh STA that does not forward is a special case of a mesh STA. Such mechanism depends on whether the path selection protocol provides a mechanism to allow mesh STAs not to participate in forwarding. The HWMP path selection protocol provides such a mechanism; see 14.11 (Hybrid wireless mesh protocol (HWMP)).

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

### 10.37.8 MSDU forwarding and unknown destination

A source mesh STA in the MBSS might not able to forward an MSDU that it has received as a consequence of an MA-UNITDATA.request primitive with an individual destination address. This is the case if the destination of the MSDU is unknown to the mesh STA. The destination is unknown to a mesh STA if the mesh STA has no valid forwarding information for this destination or if the destination is not in its proxy information as an external STA (see 14.12.4.2 (Proxy information)). Note that the procedure to determine that an address is unknown depends on the active path selection protocol. It might require an attempt to establish a path to the destination (see 14.9 (Mesh path selection and metric framework)).

If the source mesh STA is not able to forward the MSDU because its destination is unknown, the mesh STA shall assume that the destination is outside the MBSS and shall forward the MSDU to known mesh gates in the MBSS as one or more individually addressed frames according to the procedures for frame addressing and data forwarding of individually addressed frames at source mesh STAs in an MBSS (10.37.3.1 (At source mesh STAs (individually addressed))). These frame(s) shall be transmitted using the four-address MAC header format (with the Address Extension Mode subfield in the Mesh Control field set to "Address5&6" (see Table 9-35 (Valid values for the Address Extension Mode subfield)))(#3212), where the Mesh Address Extension subfield in the Mesh Control field carries the address of the destination end station, as specified in row "Mesh Data (proxied, individually addressed)" of Table 9-77 (Address field contents for mesh Data and Multihop Action frames(#462)(#419)). The address fields are set as follows:

— Address 1: The address of the next-hop mesh STA (toward the known mesh gate in the MBSS according to the forwarding information; see 10.37.2 (Forwarding information)).
— Address 2: The address of the source mesh STA.
— Address 3: The address of the known mesh STA in the MBSS.
— Address 4: The address of the source mesh STA.
— Address 5: The address of the destination end mesh STA, which is the unknown destination address of the MSDU.
— Address 6: The address of the source mesh STA, which is the same as Address 4.

If there is no mesh gate available, the mesh STA shall silently discard the MSDU.

Discovery of mesh gates by mesh STAs is performed using propagated elements, such as a GANN (14.12.2 (Gate announcement (GANN))). Other methods specific to the HWMP path selection protocol are also available, such as the proactive PREQ mechanism (14.11.4.2 (Proactive PREQ mechanism)) or the proactive RANN mechanism (14.11.4.3 (Proactive RANN mechanism)), when the Gate Announcement subfield in the Flags field in these HWMP elements is set to 1.

## 10.38 DMG and CMMG channel access

### 10.38.1 General

Channel access by a DMG STA is related to beacon interval timing and is coordinated using a schedule. A DMG STA operating as an AP or PCP generates the schedule and communicates it to STAs using DMG Beacon and Announce frames. A non-PCP STA that is a non-AP STA and that receives scheduling information accesses the medium during the scheduled periods using the access rules specific to that period. Medium access rules to establish a BSS are defined in 10.39 (DMG and CMMG AP or PCP clustering) and 11.1.4 (Acquiring synchronization, scanning). CMMG STAs follow the same rules of DMG channel access except the specific modification for CMMG STAs as described in 10.38 (DMG and CMMG channel access).

### 10.38.2 Access periods within a beacon interval

Medium time within a DMG or CMMG BSS is divided into beacon intervals. Subdivisions within the beacon interval are called *access periods*. Different access periods within a beacon interval have different access rules. The access periods are described in a schedule that is communicated by the AP or PCP to the non-PCP and non-AP STAs within the BSS. The schedule communicated by the AP or PCP can include the following access periods:

— *BTI:* For DMG STAs, it is an access period during which one or more DMG Beacon frames is transmitted. Not all DMG Beacon frames are detectable by all non-PCP and non-AP STAs (see 10.41.4 (Beamforming in BTI)). Not all beacon intervals contain a BTI. For CMMG STAs, it is an access period during which one or more DMG Beacon frames are transmitted at least in the primary 540 MHz channel. Not all DMG Beacon frames are detectable by all non-PCP and non-AP STAs. A non-PCP STA that is a non-AP STA shall not transmit during the BTI of the BSS of which it is a member.

— *A-BFT:* An access period during which beamforming training is performed with the STA that transmitted a DMG Beacon frame during the preceding BTI (see 10.41.5 (Beamforming in A-BFT)). The presence of the A-BFT is optional and signaled in DMG Beacon frames.

— *ATI:* A request-response based management access period between the AP or PCP and non-AP and non-PCP STAs (see 10.38.3 (ATI transmission rules)). The presence of the ATI is optional and signaled in DMG Beacon frames.

— *CBAP:* An access period during which frame exchange sequences(#109) between STAs that use the channel access rules described in 10.38.5 (Contention based access period (CBAP) transmission rules).

— *SP:* An access period during which frame exchange sequences(#109) between STAs use the channel access rules described in 10.38.6.2 (Service period (SP) allocation).

The BHI comprises the BTI, A-BFT and ATI. The DTI, in turn, comprises contention based access periods (CBAPs) and scheduled service periods (SPs). There is a single BHI and a single DTI per beacon interval.

Figure 10-60 (Example of access periods within a beacon interval) illustrates an example of access periods within a beacon interval comprising a BTI, an A-BFT, an ATI, and two CBAPs and SPs within the DTI. Any combination in the number and order of SPs and CBAPs can be present in the DTI.

(11ay)In an EDMG BSS, the following apply:

— Frames sent during the BTI and ATI shall be transmitted on only the primary channel of the BSS.

— The A-BFT shall be present on the primary channel of the BSS and can also be present on the secondary or secondary1 channel of the BSS (see 10.41.5.1 (Allocation of A-BFT)).

— Transmissions within a CBAP or an SP may span the primary channel and the secondary channel(s).

— The channel width of the primary channel is 2.16 GHz.

Copyright © 2024 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

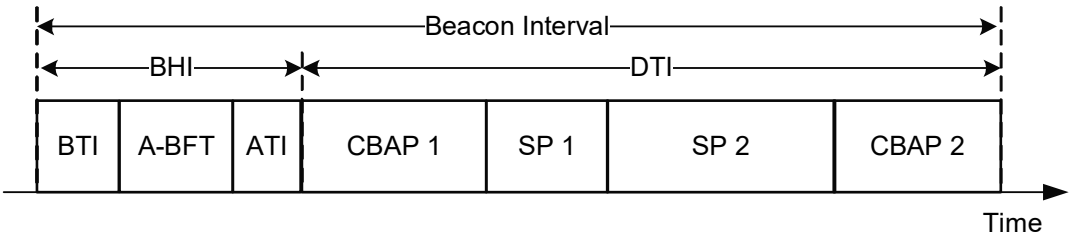

**Figure 10-60—Example of access periods within a beacon interval**

For a 1080 MHz CMMG BSS, the DTI can comprise contention-based access periods (CBAPs) and scheduled service periods (SPs), and the bandwidth of the allocation in the DTI can be 540 MHz and 1080 MHz.

Figure 10-61 (Example of access periods within a beacon interval for CMMG STAs) illustrates an example of access periods within a beacon interval for a 1080 MHz CMMG BSS, comprising a BHI, that may contain BTI, A-BFT, and ATI, and two 540 MHz CBAPs and SPs within the DTI and one 1080 MHz CBAPs and SPs within the DTI. Any combination in the number and order of SPs and CBAPs can be present in the DTI. For a CMMG BSS, the BHI shall be sent on the primary 540 MHz channel and can be sent on the 1080 MHz channel with duplicate format.

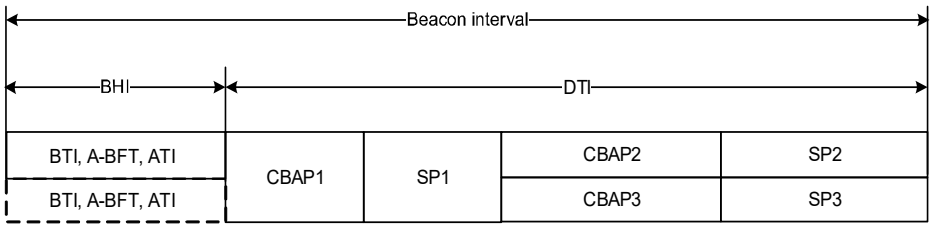

**Figure 10-61—Example of access periods within a beacon interval for CMMG STAs**

The details of the access protocol within each of the access periods are described in the remaining subclauses of 10.38 (DMG and CMMG channel access) and within 10.41 (DMG beamforming).

In the ATI, a non-AP and non-PCP STA shall be ready to receive a transmission from the AP or PCP at least RxAdvanceTime before the expected transmission of a request frame. The destination STA of an SP shall be ready to receive a transmission from the source STA of the SP at least RxAdvanceTime before the start of the SP. A STA that participates in a CBAP shall be ready to receive a transmission within the CBAP at least RxAdvanceTime before the start of the CBAP plus DIFS. In the A-BFT, the AP or PCP should be ready to receive a transmission from a non-AP and non-PCP STA at least RxAdvanceTime before the start of an SSW slot. In all of the preceding rules, RxAdvanceTime is defined as follows:

$$\text{RxAdvanceTime} = \text{Ceil}\left(\left(\frac{C \times T_{DI}}{10^6} + T_P\right),\ T_{TR}\right)$$

where

$C$ is aDMGTSFAccuracy, in ppm

$T_{DI}$ is the time elapsed since a synchronizing reference event, in μs. The synchronizing event is the reception of the Timestamp field from the AP or PCP

$T_P$ is aAirPropagationTime, in μs

$T_{TR}$ is aTSFResolution, in μs

### 10.38.3 ATI transmission rules

The presence of an ATI in the current beacon interval is signaled by the ATI Present field set to 1 in the current DMG Beacon frame (9.3.4.2 (DMG Beacon)). The Next DMG ATI element (9.4.2.134 (Next DMG ATI element)) transmitted in the Announce frame or in the DMG Beacon frame indicates the earliest start time for the next ATI in a subsequent beacon interval and ATI duration.

An example of an ATI is shown in Figure 10-62 (Example of frame exchanges during the ATI).

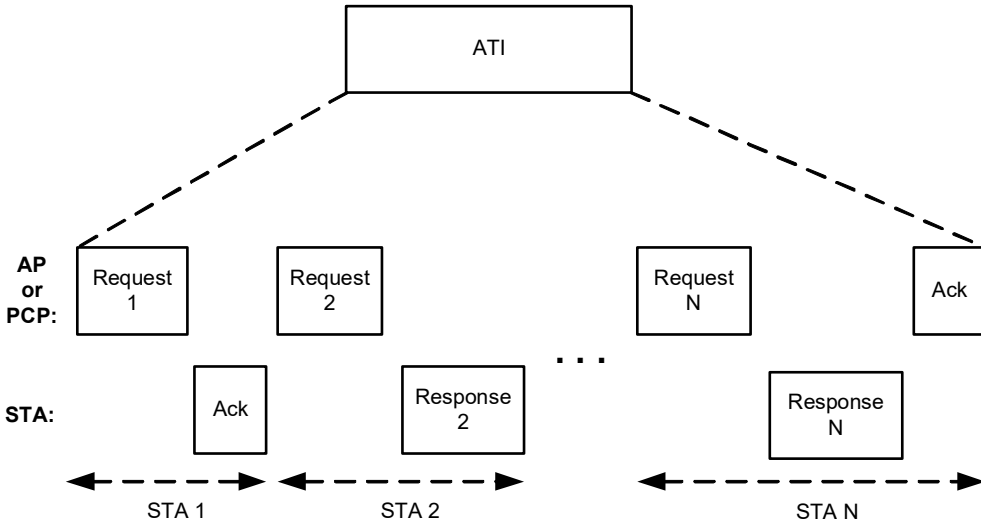

**Figure 10-62—Example of frame exchanges during the ATI**

During an ATI, request and response frames are exchanged between the AP or PCP and any subset of STAs. The AP or PCP initiates all frame exchange sequences that occur during the ATI. The ATI shall not start sooner than Max(guard time, MBIFS), where guard time is defined in 10.38.6.5 (Guard time), following the end of the previous A-BFT when an A-BFT is present in the beacon interval or following the end of the previous BTI when an A-BFT is not present but a BTI is present in the beacon interval. The ATI shall not start before TBTT if the ATI is the first period in the beacon interval(11ay). Once the ATI starts, the AP or PCP may start transmission of a request frame immediately or it may delay the transmission of the request frame if the medium is determined by the CCA mechanism to be busy.

For DMG STAs, during each ATI the AP or PCP shall schedule transmissions to a non-AP and non-PCP STA if the non-AP and non-PCP STA Heartbeat field in the STA's DMG Capabilities element within the Association Request frame of the last successful association attempt is 1. If the non-AP and non-PCP STA does not respond to the frame transmitted by the AP or PCP, the AP or PCP shall use the DMG Control modulation class (10.6.7.1 (Usage of DMG Control modulation class)) at its next transmission attempt to the non-AP and non-PCP STA. The AP or PCP shall use the DMG Control modulation class for all subsequent transmissions to the non-AP and non-PCP STA until it receives a (#3274)frame from the non-AP and non-PCP STA.

For CMMG STAs, during each ATI the AP or PCP shall schedule transmissions to a non-AP and non-PCP STA if the non-AP and non-PCP STA Heartbeat field in the STA's CMMG Capabilities element within the Association Request frame of the last successful association attempt is 1 and the non-AP and non-PCP STA

is in the awake state. If the non-AP and non-PCP STA does not respond to the frame transmitted by the AP or PCP, the AP or PCP shall use the CMMG Control modulation class ((10.6.8.1 (Usage of CMMG Control modulation class)) at its next transmission attempt to the non-AP and non-PCP STA. The AP or PCP shall use the CMMG Control modulation class for all subsequent transmissions to the non-AP and non-PCP STA until it receives a (#3274)frame from the non-AP and non-PCP STA.

A non-AP and non-PCP STA shall not transmit during the ATI except in response to an individually addressed frame whose TA field contains the AP's or PCP's MAC address and whose RA field contains the STA's MAC address.

During the ATI a STA shall not transmit frames that are not request or response frames. Request and response frames transmitted during the ATI shall be one of the following:

- A Management frame
- An Ack frame
- A Grant, Poll, RTS or DMG CTS frame when transmitted as a request frame
- An SPR or DMG CTS frame when transmitted as a response frame
- A frame with the Type subfield equal to Data only as part of an authentication exchange to reach an RSNA security association

NOTE 1—The Announce frame is designed to be used primarily during the ATI and can perform functions of a DMG Beacon frame.

The transmission of Poll frames during the ATI follows the rules described in 10.38.7 (Dynamic allocation of service period). The Response Offset field within a Poll frame transmitted during the ATI shall be set to 0.

The transmission of Grant frame during the ATI follows the rules described in 10.38.7.3 (Grant period (GP)).

Individually addressed request frames transmitted during the ATI shall not be sent using Action No Ack frames.

During the ATI, after an AP or PCP transmits an individually addressed request frame (such as an Announce frame) to a non-AP and non-PCP STA, and the STA receives that frame, the STA shall transmit a response frame addressed to the AP or PCP. The transmission of the response frame shall commence one SIFS after the reception of the request frame. The AP or PCP shall interpret the receipt of the response frame as an acknowledgment of the request frame. Response frames transmitted by non-AP and non-PCP STAs during the ATI shall be individually addressed to the AP or PCP.

NOTE 2—STAs do not transmit a response frame to the AP or PCP when they receive a request frame from the AP or PCP with the RA equal to a group address (see 10.3.6 (Group addressed MPDU transfer procedure)).

The Duration field of a request frame transmitted during the ATI shall be set to cover the remaining duration of the ATI at the end of the request frame transmission. The Duration field of a response frame transmitted during the ATI shall be set to the value of the Duration field within the previously received request frame minus SIFS and minus the duration of the response frame transmission.

When a transmission by a STA is expected by an AP or PCP and a SIFS elapses without its receipt, the AP or PCP may either repeat its individually addressed transmission to that STA or, as early as one PIFS after the end of its previous transmission, transmit a frame to any other STA.

NOTE 3—If acknowledgment is required, the AP or PCP transmits an Ack frame to acknowledge the reception of a response frame during the ATI (see Figure 10-62 (Example of frame exchanges during the ATI)).

Multiple request and response frame exchange sequences(#109) between the AP or PCP and a STA might occur during a single ATI.

For CMMG STAs, the bandwidth of a response frame transmitted during the ATI shall be set to the same as previously received request frame.

### 10.38.4 DTI transmission rules

During the DTI, a STA may initiate a frame exchange sequence(#109) (following the DMG channel access rules for DMG STAs and following the CMMG channel access rules for CMMG STAs) if any of the following conditions are met:

a) During a CBAP for which the STA is identified or included as source or destination (10.38.6.3 (Contention based access period (CBAP) allocation), 10.38.7 (Dynamic allocation of service period), and 10.38.8 (Dynamic truncation of service period))

b) During an SP for which the STA is identified as source or destination (10.38.6.2 (Service period (SP) allocation) and 10.38.7 (Dynamic allocation of service period))
